The formation of zinc ferrite appears to be governed by the iron content of the ore and the temperature of roasting. Ores low in iron may be roasted at high temperature and yet give up nearly all of their zinc. The great trouble is with blendes that are high in combined iron. In the roasting of such ores the metallurgist has two horns of dilemma. If he roasts at high temperature he produces a great deal of zinc ferrite, while if he roasts at low temperature he leaves much undecomposed zinc sulphide in the ore, which also is insoluble. It is not unlikely that a careful study of conditions will enable him to steer a safe way between the two dangers.

Recent work in zinc electrometallurgy has been done at Trail, B. C., and at Bully Hill, Calif. It is intimated that one or both of these plants is shortly going to offer electrolytic zinc in the market. The Anaconda company has also taken up this problem in an experimental way. Mr. Laist, its chief metallurgist, may be expected to approach the subject unobsessed by preconceived ideas, and it is not unlikely that he will blaze some new trails.

The Independent Powder Manufacturers' Chance

The E. I. du Pont de Nemours Powder Co. writes us, with respect to an editorial in the *Journal* of Aug. 7, 1915, that we were wrong in conveying the idea that "the companies now absorbed in filling their great war contracts for high explosives" are neglecting the mining business. It says that its smokeless-powder plants have no relation whatever to its dynamite plants and that it has ample manufacturing capacity for all the dynamite and blasting-powder business it can possibly get and is seeking such business just as assiduously as at any time in its history. We did not say that this company or any other was neglecting its mining business, but we did say that this looks to us like a very good time for independent powder manufacturers to get more broadly into the business, and our article was a plea for the widening of competition, which we are quite sure would be welcomed by miners.

Some light is thrown upon the effect of the war in the explosive industry, and incidentally the mining industry, by a suit for breach of contract, filed in the United States District Court, Aug. 17, by the Nitro Powder Co., of Kingston, N. Y., against the Butterworth-Judson Co., of New York, and Newark, N. J., a manufacturer of chemicals, which on March 30, 1912, agreed to supply the Nitro Powder Co. with all the acids it needed for the manufacture of explosives for its customers, mainly cement and quarrying concerns. This shows the serious situation which the manufacturers of dynamite for blasting purposes are facing in this country as a result of the heavy shipments of explosives to the belligerent nations of Europe and the consequent scarcity of acids in the domestic market. The Nitro Powder Co. in its suit says that within the last three months it has found it practically impossible to get nitric, sulphuric and other acids used in the manufacture of explosives save at prohibitive prices. As a result, the company says it has been temporarily forced to close its doors.

There are of course many manufacturers of explosives in the United States whose supply of acids has not been affected by the war. This should contribute toward giving them an opportunity to equalize the dynamite business for mining and quarrying purposes and spread out beyond the narrowly circumscribed localities that they supply at present.

Byproduct Coke Ovens

The total production of coke in the United States in 1914 is reported by the Geological Survey at 34,555,914 tons, which is a decrease of 11,743,616 tons, or 25% from 1913. Coke is so closely associated with iron-making, it is to be expected that a dull iron year should show a loss in coke.

The remarkable point in the production of the year, however, is the steady growth in the proportion of byproduct coke. While the beehive product in 1914 decreased 30.5% as compared with the previous year, the falling off in byproduct coke was only 11.8%. In part this difference may have direct connection with the fact that most of the byproduct plants are operated in connection with large iron and steel works and so may be kept at work except in extreme case of depression; while the merchant-coke plants are nearly all equipped with beehive ovens, and are the first to stop when demand falls off. Quite a sufficient explanation can be found in the statement that the value of the byproducts saved was approximately $17,500,000, an average of $1.55 per ton of coke made.

The growth of the byproduct-coke industry is shown by the statement that in 1901 only 5.4% of the coke made came from byproduct ovens, 94.6% being made in beehive ovens. In 1914 the proportion was 32.5% in byproduct and 67.5% in beehive ovens. The proportion is likely to increase, even this year, when improvement in the iron trade is calling for an increased production of coke.

That almost all the increase in coke-making capacity is likely to be in the byproduct line is shown by the statement that at the close of 1914 there were 93,946 beehive ovens existing, and 605, or 0.6% of that number, under construction. There were 5809 byproduct ovens standing at the same time and 644 under construction, the proportion being 11%. It must be remembered that the average output of a byproduct oven is much larger than that of a beehive, and the proportion of coke made to a ton of coal is also somewhat greater.

Fifteen years ago the byproduct oven was having a hard struggle to establish itself against prejudice and the inertia which fights against all changes and improvements. Now it is not only firmly established in its place but is fairly on the way to supersede its ancient rival.

The orgies in spelter and lead are about over. The drunken men are staggering home. The katzenjammer will come later. The copper producers did not have any spree worth mentioning, and therefore probably will not experience any great suffering. The positions of copper and spelter are totally different. Suppose the war should terminate suddenly. The consensus of opinion is that a total collapse in spelter would be very prompt in coming. On the other hand, a boom in copper is looked for in all quarters.

BY THE WAY

This comes from Galena, Kan. The P. C. Millikin livery barn was built several years ago when zinc ore was considered virtually worthless on account of the low price paid for it. The ore was thrown away at that time in large boulders, and some of them were used in the foundation of the barn. Last Easter Sunday the barn burned down. In cleaning up the lot, workmen discovered the ore in the foundation and immediately secured a lease of the lot from Mr. Millikin and proceeded to clean up the ore, from which they realized over $300 for a few days' work from the dirt and rock which years ago was considered worthless.

⁂

How the Comstock Lode acquired its name is thus described by Charles E. Van Loan in the *Saturday Evening Post* in his interesting account of Virginia City's past glories:

The finding of America's richest orebody, second only in production to the gold reefs of the Rand, was an accident due to an insufficient water supply. Even the naming of it was an accident, traceable to the overwhelming assurance and conversational powers of one Henry Thomas Paige Comstock, a skirmisher on the flying wedge of exploration. The lode which will always bear his name might with more fairness be called the O'Riley, the McLaughlin or the Grosch. By some it is claimed that Allen and Hosea Grosch discovered the outcroppings of the lode; the credit is generally accorded to Peter O'Riley and Patrick McLaughlin. . . .

In the spring of 1859 came Peter O'Riley and Patrick McLaughlin, intending to locate somewhere in Six Mile Cañon. There was nothing left for them on the lower ground, and rather than waste the trip they decided to try the mountain. They began work in the bed of a tiny stream fed by a spring in the rocks above. The surface indications were not promising, and in addition to this the stream was not large enough to serve their purpose, so they dug a pit in order to collect sufficient water to operate their rocker.

Noticing a change in the appearance of the soil from the bottom of the pit, they dumped a bucket of it into the rocker and washed it. The gold was there in abundance—a shining film on the riffles of the rocker—and with it a mass of heavy black stuff which O'Riley and McLaughlin believed to be base metal of some sort and worthless. They threw it away.

"About that time," says the Oldest Inhabitant, "along came this fellow, Comstock. He was hunting his horse. The most you can say for him is that he had plenty of nerve and wind. He wasn't what you would call a smart man, but he knew a chance when he saw it. And there was the gold, right in front of him. Well, sir, Comstock started in to run a blazer on those Irishmen. 'This stream of water is mine,' says he. 'I've filed on it and you'll have to go somewhere else.'

"It was the rawest bluff in the world, but it worked. Comstock out-talked 'em. They offered him a share of the claim not to make trouble, and of course that was all he was after. And when that part of it was settled what does Comstock do but make himself a kind of general manager. Work? Not him! He sat down and told the Irishmen what to do.

"They decided to call the claim the Ophir, but when the other miners came up from below to see what they'd found, there was Comstock to do the talking, and it was 'My mine this,' and 'My mine that,' until everybody got to calling the Ophir Comstock's mine. When they went deeper it was Comstock's vein, and after that the Comstock Lode. He just talked himself into it, from start to finish—and that's how the Comstock got its name."

⁂

The New Haven R.R. has sued the Post Office Department for $1472, the damages for being required to carry gold by postal parcel service in manner contrary to law, says the New York *Times*. The packages were not sealed or stamped as required of first-class mail. The weight limit was exceeded, and the packages were not prepared for convenient inspection. The railway alleges that the gold packages were not mail matter of any sort and were not shipped as freight or express. Besides the gold, the company was required to transport seven men as guards, although it has no contract covering such service. Nevertheless the service had to be performed, and it was performed, and the company demands pay for transportation of both gold and men according to fair value received. The case is a mild one. The Pennsylvania R.R. carried $99,000,000 gold for nothing—200 tons of it—and 100 clerks and guards. Gold is not the only thing which is put into the parcels post and carried by the railways for nothing. The only thing which the parcels post has refused to carry is a baby. The postmaster at St. Paul ruled that babies were live stock and not mailable. Seven hundred bushels of oats could not be declined, and five tons of ore in 50-lb. sacks was shipped to the Washoe works, Anaconda, Mont. It was a losing job for Uncle Sam, even worse than for the railways.

A butcher reduced a steer to mailable weights and sent him at a profit, at the expense of the railways, although the Government got the thanks. There are reports of postal contractors who have made business for themselves by means of the parcels post. A West Virginia postmaster, who also was a grocer, received an order for four barrels of flour. So he sold himself stamps and delivered the flour in bags through the parcels post. The Government was bound to supply him with the stamps canceled through his office, and also was bound to deliver his flour. Nobody paid for the transportation of the flour. The railway was bound to carry it under its four-year contract. The Government paid nothing for the additional service.

The transaction was strictly regular in all respects, and yet there is something about it better worth consideration than the oddities of the case. There are six mail-order houses shipping 100,000 packages apiece on which the freight and express charges are avoided. They know their rights, and it is an easy guess that they could tell strange tales of how they put it over the railways and Uncle Sam. The people value the parcels-post service and do not want it crippled: also they do not want it abused. The Government itself sets the worst example in this respect.

⁂

Mogollon Gold & Copper Co. Holdings Sold

At a public sale held in Socorro, N. M., Aug. 5, to satisfy a judgment of $416,626 obtained through court procedure by the Equitable Trust Co., holders of bonds to that amount, the entire property of the Mogollon Gold & Copper Co., at Mogollon, was bid in by the Socorro Mining & Milling Co. for $100,000; this includes 29 claims covering 500 acres, part of them patented, and a 40-acre mill-site and a mill.

This winds up the affairs of the Mogollon Gold & Copper Co., which has had a more or less troubled existence since its organization in 1901. The company paid dividends to the amount of $22,500. The capitalization was for $1,250,000, the par value of shares being $1 each. The R. G. Dun estate, of New York, was at one time heavily interested in the company.

PERSONALS

Roscoe H. Channing was in New York this week.

H. P. Henderson has returned to New York from California.

R. C. Coffee has been appointed superintendent of the Schumacher mill, Porcupine.

Frederick L. Hoffman is making an extended tour through the West, studying sanitary conditions in various mines.

R. H. Stewart, general manager of the Consolidated Mining & Smelting Co. of Canada, visited the Porcupine and Cobalt camps recently.

Hugh McMillan, formerly of the Timiskaming & Hudson Bay Co., Cobalt, is in charge of the work of the Goodfish Lake Mines Co. near Sesikinika.

At the last meeting of the board of directors of the Eden Mining Co. of Philadelphia, a subsidiary of the Tonopah Mining Co., W. W. Charles was elected vice-president.

R. G. McConnell, Canadian Deputy Minister of Mines, is on a trip through western Canada, and before his return will make some explorations in the Rocky Mountain district.

Charles W. Merton, superintendent of the Consolidated Interstate Callahan Mining Co., of Wallace, Idaho, recently spent several days on business for the Butte Ballaklava Copper Co. in Butte.

Simon S. Martin, formerly general superintendent of the Maryland Steel Co., Sparrows Point, Md., has been elected vice-president and director of the Algoma Steel Corporation, Sault Ste. Marie, Ontario.

John A. Rice, mining engineer of El Paso, Tex., has made an examination of the Lustre mine at Magistral in Durango and is now in Ontario where he is in charge of the operations at the Curry mine at South Lorrain, Cobalt district.

Henry E. Wood, of the Henry E. Wood Ore Co., of Denver, Colo., was in Toronto recently making inquiries as to molybdenite ore. Since the outbreak of the war the export of molybdenite outside of the British Empire has been prohibited.

S. R. Guggenheim, chairman of the executive committee of the Guggenheim interests, accompanied by C. W. Whitley, general manager of the American Smelting & Refining Co., inspected the properties in which he is interested in Bingham recently.

H. T. Dickinson, assistant general manager of the De Beers Consolidated Mines, Ltd., Kimberley, So. Africa, is expected in San Francisco about Oct. 1. His address while in the United States will be Columbia University Club, 18 Gramercy Park, New York City.

William Thum, superintendent of the electrolytic lead refinery at East Chicago, Ind., is visiting the western properties of the United States Smelting, Refining & Mining Co. and will spend some time at the Expositions before returning. L. M. Kniffin is acting superintendent.

It may interest those who came in contact with James Ralston Bell during his eighteen years' stay in the United States and Canada, to know that he joined the Sixth Royal Scots on the outbreak of the European War. In May he went to the Dardanelles attached to the Fourth Royal Scots and has been officially reported as seriously wounded in the engagement of June 28 there.

Edward W. Parker, whose resignation as Chief of the Bureau of Statistics of the United States Geological Survey was noted in these columns in May last, is now in charge of the Anthracite Bureau of Information, supported by the anthracite mining operators of the United States, with offices at 1032 Miners Building, Wilkes-Barre, Penn. The work of this bureau has been combined with that of the Bureau of Anthracite Coal Statistics, which was formerly under the direction of the late W. W. Ruley, and since his death in charge of A. A. Armstrong. Mr. Armstrong will remain in charge of that portion of the work.

H. M. Roy, formerly chief field engineer with the American Zinc & Chemical Co. on the construction of its zinc smelting plant, modern town and coal mine at Langeloth, Penn., has accepted a position with the Stone & Webster Engineering Corporation at Keokuk, Iowa, on construction of a zinc plant. He was graduated from the University of Illinois in 1905, and after spending two years in the United States Coast and Geodetic Survey on harbor surveys and precise leveling, entered the engineering department of the Pennsylvania Lines west of Pittsburgh, where he was engaged on various construction and maintenance work until 1912, when he left the railroad to take charge at Langeloth.

SOCIETIES

Santa Clara University is entertaining the geological expedition sent out by the St. Louis University. The purpose of the expedition is to study the geological formations in Arizona and the Canadian Rockies, including a visit to the Panama expositions at San Francisco and San Diego. They visited the Lick Observatory under the direction of Father Selga who resides permanently at the observatory.

Utah Society of Engineers—An address on road-building was given by C. L. Crandall, dean emeritus of the College of Engineering of Cornell University, at a banquet held by this society on the evening of July 19, at the Newhouse Hotel, Salt Lake City. The methods of road-building employed in the state of New York and the results achieved since 1903, when active work began were described. Forty-two members were present. C. J. Ullrichs, secretary of the society, presiding.

American Electrochemical Society—The September meeting of the American Electrochemical Society will be held at San Francisco, from Sept. 16 to 18. Special transportation facilities have been arranged for by a committee of which J. M. Muir, 229 West 39th St., New York, is chairman. Various routings are offered and full particulars can be obtained by addressing Mr. Muir. The regular Society train will leave New York, Sept. 11, and the special engineers' train on Sept. 9. At the time of holding the meetings, the American Institute of Mining Engineers and the American Institute of Electrical Engineers will also be in session, and joint meetings have been arranged with these societies for Sept. 17. During the following week the International Engineering Congress will hold its meetings. A number of papers have been accepted to date and will be presented by members of the Society at the time of the meeting.

Among the papers announced for the meeting are the following of special interest to metallurgists: A. G. Betts, "Electrolytic Antimony Refining"; C. W. Bennett, Rose and Tinkler, "Electrodeposition of Nickel"; W. D. Bancroft, "Electromotive Forces"; Wills and Schuyler, "Heat Losses from an Electric Steel Furnace"; F. T. Snyder, "Electric Steel Costs"; R. S. Wile, "Melting of Ferro-Alloys in the Electric Furnace"; L. Addicks, "The Electrolysis of Copper Sulphate Liquors Using Carbon Anodes"; F. R. Pyne, "Solution Stratification as an Aid to the Purification of Electrolytes"; F. M. Sebast, "Electrical Resistance of Copper-Nickel-Chromium Alloys"; J. W. Beckman, "Electro-chemical Possibilities on the Pacific Coast."

INDUSTRIAL NEWS

The Chas. A. Schieren Co. has received a gold medal at the San Francisco exposition.

At the Foundry & Machine Exhibit at Atlantic City, Sept. 25 to Oct. 1, a Snyder electric furnace will be in commercial operation, melting cold scrap and pouring three times each day, at 11 a.m., 2 p.m. and 5 p.m. The major part of the Snyder Electric Furnace Co.'s booth will be given over to molding and pouring floor.

The Mesta Machine Co., Pittsburgh, Penn., has just received an order for a 1500-hp. mill engine for the Broken Hill Proprietary Co., Ltd., New Castle, N. S. W. The engine is for rolling-mill service and is of the heavy-duty tandem-compound Corliss-valve type. The cylinders are 30 and 54 in. in diameter and the stroke 48 in. This engine, when installed, will make the fourth unit that the Mesta Machine Co. has built for the Broken Hill Proprietary Co.

The Morse Bros. Machinery & Supply Co. has instituted a machinery exchange department. On account of the many changes in treatment, machinery is often displaced by other because it is not suitable to the problem in hand. This machinery at another mine or mill may be just what is needed. Mines are requested to send them lists of anything available with the price asked and it will be listed and advertised without expense. Those wishing machinery should write them their requirements as it is possible at some mine near to them is the very article that they are looking for. A considerable saving is often made in freight as well as in the purchase price. This department will handle goods that on account of distance cannot be purchased and shipped to Denver.

Editorial Correspondence

SAN FRANCISCO—Aug. 11

Forest Fires in California in 1914 were fewer and less disastrous than in 1913. In 1914 there were 152 fires less and the loss was $190,689 less than in 1913. There were 559,370 acres burned over in 1913 as compared to 164,418 acres in 1914. There were 1819 fires in 1914, the losses totaling $320,388. In 1913 there were 1971 fires. The timber land burned in 1914 amounted to 20,835 acres; the brush land amounted to 87,800 acres and the grass land to 55,783 acres. These improved conditions in 1914 are largely due to the activity of government and state foresters aided somewhat by rains extending late in the spring season.

Placer Mining Is to Be Resumed in many of the old time districts in the region of Nevada City. Many of these properties have been idle since the hydraulic law has been in operation. It is expected to conform to the law by building large restraining dams. One such dam is now under construction just north of the Nevada County line at the Omega mine in Sierra County. This dam is of the basket type, designed by J. M. Howells, of San Francisco. It is expected to take care of all the débris that the giants can handle. There is a large amount of gravel exposed in the Omega and other properties in this region. In Trinity and Siskiyou Counties also the present placer mining season has been unusually profitable. Some of the companies are now making final cleanups while the larger mines have sufficient water to continue work probably into August. Late snow and rains extended the regular season. In these counties the legal hydraulic restrictions do not interfere.

You Bet Mining District, situated in the southern edge of Nevada County, just west of Dutch Flat, famous in the early mining days for large productions of placer gold, is to be put on the map again by Chinese drift miners. The You Bet Mining Co. which operated the Goodwin and the Nicholls claims, recently sublet the mining interest to a company of Chinese who it is reported will start work with about 75 Chinese miners. It is believed that the Chinese Six Companies of San Francisco are back of the project. A triple ownership is involved in the claims which have been held under bonds by the You Bet Mining Co. The Goodwin estate and four Nicholls brothers of Dutch Flat own equal interests. The holdings include the Nevada claims formerly owned by the old South Yuba Water Co., and taken over by the Pacific Gas & Electric Co. with the absorption of the South Yuba Water Co. The You Bet Mining Co. is owned principally by George Wight and the Bannings, of Los Angeles. It is reported that the Nicholls interests have received $50,000 in full payment and that three payments are yet to be made to the Goodwin estate by July 1, 1916, a large payment having been made in July, 1915. The total purchase amount is said to be $50,000. The Pacific Gas & Electric Co. will receive $25,000 for its interests, the payments are now being made in quarterly installments at the rate of $1000 per month, the payments to be completed in June, 1916. This makes a total of $125,000 to be paid for the properties by the You Bet Mining Co. The history of the You Bet has never been, and probably never will be, fully written. The early working was by Chinese who are not at all extravagant with information which they give out regarding their own business. The situation of You Bet mine is so close to the Placer County line that in making their records when selling gold to the United States mint, it was an easy matter for the Chinese to report Nevada County gold as having been produced in Placer County. One Chinese who worked a channel under short lease was credited by the mint with having taken out $300,000 about six or seven years ago. It is believed that the amount was actually double that, and that Placer County got credit for the balance. It is known that other Chinese leasers within recent years took out $50,000. And these figures are no part of the early day results of mining at You Bet.

SPOKANE—Aug. 10

Contracts for Ore from Minor Producers of the Coeur d'Alenes are being sought by representatives of the Northport smelter, according to word brought to Spokane by mining men in close touch with the Northport situation. Ore shipments will be begun immediately, it is stated, the Trail smelter handling the tonnage until the Northport plant is rebuilt

BETHEL, ALASKA—June 30

There is a Renewal of Activity in the territory about Bethel now that supplies and provisions are going in. Steamship "Alience" and gasoline schooners "Bender Bros." and "Ruby" are leaving here tomorrow after unloading supplies for the different trading stations on Kuskokwim River. Three Bagleys scrapers were shipped in this spring, one for Bear Creek and two for the Jakutna district on the Upper River. This makes four in all as one is now in operation on the Aralic River below Kwinhagamut. Three dredges will be shipped in here as soon as the legal preliminaries are settled, one for Bear Creek and one large 300-ton dredge for Candle Creek, which produced several thousand ounces of gold last summer. Owing to lack of provisions last winter little work was done on Aniak, Tuluksak and other rivers, Cañon, Windy and Fork Creeks. On Kwisluk River there is a great deal of activity and a good camp is looked forward to. Four men last summer took out $17,000 in Cañon Creek and this summer there are about 30 men working and more are going in, as there are good prospects there. On other creeks it is frequent to find 50c. pans, and 4-in. drill holes to a depth of 5 ft. have prospected as high as 7c. Bethles and McDonald's quartz property is under bond for $200,000 to Iditarod capitalists. The property is located only 7 mi. from Kolmakopsky on Kuskokwim River.

SALT LAKE CITY—Aug. 12

Following the Suit Against the Ohio Copper Co. by the Empire Trust Co., as trustee under the mortgage bond, Henry T. Catrow and Charles T. Lark were appointed receivers by Judge M. L. Ritchie, of the district court, July 30. A $50,000 bond was required, and the affairs of the company have been taken over. The bond holders have been trying to have a receiver appointed until affairs should be settled. This will be done under the supervision and control of the court. The mine and mill are at present under lease to the General Exploration Co., which is operating and treating in the neighborhood of 2000 tons of ore daily. One of the receivers, Mr. Catrow, has long been a stockholder and bondholder in the company.

Utah Mines Paid Dividends amounting to $615,500 during July. The Daly-Judge of Park City, $75,000; Iron Blossom, Tintic, $50,000; Eagle & Blue Bell, Tintic, $90,000; Silver King Coalition, Park City, $187,500; Silver King Consolidated, Park City, $63,000; Utah Consolidated, Bingham, $150,000. In addition there were dividends of $425,530 by the United States Smelting, Refining & Mining Co., which derives part of its income from operations in this state. A new dividend payer has been added to Utah mines by the posting of the initial dividend of the Utah Apex Co. at Bingham. This is for 12½c. a share, payable Oct. 1, and amounts to $63,000. The company has accumulated a large cash reserve, and it is probable that quarterly dividends of a like amount will be paid. Production amounts to more than 30,000,000 lb. a year, at a cost of about 3½c. per lb. A flotation process is now being installed at the mill.

Plants Smelting Ore in Salt Lake Valley and vicinity at the beginning of August are as follows: The United States Co. at Midvale is running five lead furnaces. This company has recently added 250 tons to the capacity of its wet concentrator, and is enlarging the Huff electrostatic plant. The latter will be increased from 60 tons to 100 tons capacity. Both improvements are expected to be completed about Sept. 1. The American Smelting & Refining Co. at Murray, is running five furnaces on lead ore. The Garfield smeltery of the A. S. & R. has five reverberatory and two blast furnaces on copper ores. All of the reverberatories have been equipped to burn powdered coal instead of oil. Around 3600 tons of charge or 2700 tons of ore and concentrates are smelted daily. Utah Copper concentrates at present amount to 1400 or 1500 tons daily. The Garfield smeltery produced 18,000,000 lb. copper in one month recently, as compared with the usual output of 14,000,000 lb. The International smeltery at Tooele is running its lead plant at capacity, having five lead furnaces in blast. There have been two reverberatory furnaces smelting copper ores, until a few weeks ago, when a third reverberatory was blown in.

DENVER—Aug. 12

River Smelting & Refining Co., recent Maine incorporation, has purchased old plant of the Rocky Mountain Smelting Co. at Florence and will immediately reëquip along modern lines and start operations on low-grade, complex ores.

Cresson Gold Mining Co., close corporation, paid dividends for first quarter of 1915 amounting to $1,050,000 on its capital stock of $1,000,000. Dividends distributed during second quarter have not been made public but they were probably large inasmuch as the mine continues to output heavy tonnage of rich ore from an extension of the famous "vug" opened but a short time ago.

New Freight Rates established by the Interstate Commerce Commission prove distinctly advantageous to those Colorado manufacturers having trade on the Pacific coast and in the Orient. Until recently, steel plants in the east could ship to San Francisco via the Canal for 41c. per hundred as against a rate from Denver by rail of 55c. Now the freight from Pueblo, where is located the great steel plant of the Colorado Fuel & Iron Co., to the coast is 40c., while the freight from the Atlantic seaboard is 45c.

Suit Against A. S. & R. Co. by the Government has been dismissed on payment by the smelting company of $112,766, as damages and rent for the use of 3475 acres of southern Colorado lands, valued at $1,000,000. The payment followed the institution by the government of a suit in equity, in which it was charged that the lands in question had been secured fraudulently through the use of "dummy" entrymen. The company was allowed to retain 205 acres, upon which stands the plant of the "model mine" at Cokedale, upon payment for the land. All the land is in the vicinity of Cokedale and Aguilar, Colo. Some of it is under lease to the Victor-American Fuel Co., and the Government will allow the lease to stand, thus becoming a coal mine landlord.

Inspection of the Roosevelt Tunnel and careful measurement of the water now issuing from the heart of the Cripple Creek mining district have been made by Edward P. Arthur, Jr., and John T. Hawkins. A flow of 11,100 gal. per min. is reported, this being the greatest quantity recorded since the first important water course was encountered some years ago. It indicates that the bore is rapidly draining the main basin or crater, the breast of this great adit being now in Raven territory. In the Elkton mine, whenever crevices carrying water are struck, "water galleries" or enlarged openings in the crevices are excavated to permit rapid flows. By this scheme the recession of water level in this mine is at the rate of about 6 in. per day.

Schedule of Fees That May Be Charged under provisions of the new compensation act, by surgeons attending workmen who meet with injuries, has been prepared by the State Industrial Commission. For treating fractures, the fee may be from $5 to $30; for dislocations from $5 to $25; for minor amputations, $10; for amputation of leg at hip, the charge must not exceed $55. The commission announces, also, that it is illegal for an employer to cause employees to stand, directly or indirectly, the payment of premiums on the indemnity insurance. This ruling does not apply to arrangements already in force whereby employees pay a monthly fee for medical and surgical attendance, this being an issue distinct from indemnity insurance.

EAGLE, COLO.—Aug. 12

Strike of Vanadium Ore, of large proportion, has been discovered in the Swarthout Hills within eight miles of Eagle, by Capt. A. H. Swarthout of Denver. The original discovery was made last August, but has been kept very quiet during the opening up of the deposit and securing of other claims in the locality which now cover about 400 acres, on all of which vanadium ores are traceable.

CRIPPLE CREEK, COLO.—Aug. 10

The Recent Rich Discovery on the Ella W on Tenderfoot Hill, has created considerable local excitement. Michael Johnson has opened up, in the course of careful surface prospecting, a veritable quarry of rich ore in an open pit which is now about 20 ft. wide, 30 ft long and 20 ft. deep. The rock seems to be a partly decomposed andesite breccia and does not suggest the presence of rich ore upon casual examination. However, some of the rock shows a little free gold upon careful inspection. So far the lessee has taken out of the open pit about 10 carloads of ore which assays from 1 to 4 oz. of gold a ton. Three partings are noticeable in the pit, two parallel and about 6 ft. apart, and one cutting across, but nothing prominent enough to be called a vein has been exposed. The ore is determined from the waste by panning without roasting, and so far no other method of determining the ore has been developed. The extent of the orebody has not yet been delimited. Preliminary hoisting equipment will soon be installed and a shaft will be sunk in the ore. From the point of discovery the ore seems to be extending easterly and southerly, with an apparent flat dip to the east. The discovery has greatly stimulated prospecting on Tenderfoot Hill, and many new pits and trenches are being dug in the immediate neighborhood. The development of the find will be watched with great interest by all property owners in this locality.

HOUGHTON—Aug. 14

Two Additional Heads are to be built at once at the "little" Tamarack mill, owned now by the Lake Smelting, Milling & Refining Co., the subsidiary of the Calumet & Hecla company that was taken over with the Allouez and Centennial mines when the Fay management retired from those properties. Isle Royale's third head goes into commission soon. Copper Range Consolidated is continuing to run the Champion mill to capacity on the highest-grade copper rock ever produced from this property. It is stated that the record for one shaft, No. 2, in one month showed better than 50 lb. per ton. Baltic mill is handling both Baltic and Trimountain rock which is running close to 20 lb. to the ton at present. The Trimountain mill is handling the rock that comes from the Lake mine and some of the Champion overflow.

HIBBING, MINN.—Aug. 14

Threat to Attach the Ore on stockpile and at the docks has been made by Mayor V. L. Power of Hibbing in the controversy over nonpayment of $750,000 taxes due the city from the mining companies.

The Steam-Shovel Stripping Record for Cuyuna Range was broken on Aug. 9 when 324 cars of 16-yd. capacity were removed in a 10-hr. period. A force of 150 men working. A. Guthrie & Co., contractors.

DOUGLAS, ARIZ.—Aug. 12

Nacozari Having Been Cut Off from communication with Douglas for three months there was great rejoicing when the first train arrived the first of the month, but this train only brought in coal and supplies for the Moctezuma Copper Co., which has had to close its concentrator as there was no coal in camp. Several bridges were cribbed up to allow the train to get in and then the cribbing was taken out and new bridges put in so that on Aug. 9 the first train went to Douglas; and now Nacozari is having regular trains every day. Agua Prieta, which has been the only port in Sonora held by Carranza, and Nacozari which has been held by Maytorena, are each at an end of the railroad so that neither side would allow the trains to run and all the bridges were destroyed. Now the Carranza garrison has been reinforced and has routed the army of Maytorena and has taken all the line of the Nacozari railroad driving Maytorena into Nogales, which town is now under siege. There being no Maytorena soldiers close, it is probable that the operation of the railroad will not be molested for some time. The Moctezuma Copper Co. is shipping about 30 cars of concentrates a day and at this rate it will take them about three weeks to get out the concentrates that they have stored in Nacozari.

TORONTO—Aug. 14

The Zinc and Copper Required for ammunition manufacture will be made in Canada, it is announced by Gen. Bertram, chairman of the Canadian Shell Committee. As the result of several conferences between the Shell Committee and the Canadian Government, agreements have been perfected for the refining at Trail, B. C., of both copper and zinc. The Government has also arranged for the opening of a plant for the smelting of zinc ore at Welland, Ont., by a company which will be incorporated as the Canadian Zinc Co., capitalized at $500,000. This concern is backed by the Weedon Mining Co. of Sherbrooke, Que., which owns large zinc deposits on the north shore of the St. Lawrence. The company has secured a vacant factory on a lease for 2½ years. The ore will be smelted by the electric process for which 4000 hp. will be required and the company is negotiating with the Hydro-Electric Commission for a supply.

VICTORIA, B. C.—Aug. 11

The First Shipment of Copper Ore from the Sooke district on south end of Vancouver Island that has been made for a number of years was sent out to the Tacoma smeltery in July by Mellin & Hincks, operating under lease the Willow Grouse group. The shipment consisted of 130 tons, averaging 11% copper, with small quantities of gold and silver. Ore is being mined from surface workings and a tunnel is being run to strike deposit at shallow depth, after which development will have to be continued by sinking. The ore occurs in shear zones in gabbro and diorite. The leasers expect to ship 100 tons per month.

The Mining News

ALASKA

GRANBY (Hadley)—Infill runners go out on strike for higher wage scale at Mamie and 11 mines in the Ketchikan district. Mines idle for present.

READY BULLION MINE (Ketchikan)—Has just sent out gold brick that weighs close to $2000. Harry Webber, manager, states that work is progressing rapidly and cleanups this size will be regular this summer.

ALASKA GOLD (Juneau)—In July mill treated 118,200 tons of ore compared with 90,792 tons in June; 73,500 in May; 57,000 in April and 40,000 in March. Average heads sent to mill $1.50 per ton. Cost for July, including mining, milling, transportation, and overhead charges, 65c.

DUNTON PROPERTY (Ketchikan)—Shaft on this property near Hollis is now down 200 ft. and drifts are being driven both ways in good ore. More men and supplies have been sent in recently and Superintendent Reece is planning installation of another 50-ton unit to mill.

NASCOT ASSOCIATION (Ruby)—One of biggest cleanups ever made in north was made recently on this property when $100,000 was taken from sluice boxes. A considerable portion of gold was in nuggets ranging from $2.50 up. Dump was taken out last fall and was known to be rich but actual value was unexpected.

STIKINE (Devils Elbow)—J. G. Galvin and Sam Silverman have purchased this property situated about 100 miles up Stikine river from Wrangell. Amount of purchase price is not known but it is claimed to be one of largest mining deals pulled off in this section this year. L. Dixon and J. Boderl of Telegraph were sellers.

SPEEL RIVER POWER PROJECT (Juneau)—Announcement comes that new company has been formed with Dunn the California power magnate as president and Eugene Kennedy, formerly mine superintendent at Alaska Treadwell as vice-president. This proposition involves much litigation with Bradley interests and was cause for entire change in personnel of Alaska Treadwell and Alaska Juneau officials last year.

ARIZONA

Gila County

RAY HERCULES (Kelvin)—Syndicate in which Joseph B. McCall and George A. Huhn, of Philadelphia; J. Guthrie Hopkins, of Virginia, and E. P. Earle, N. F. Brady, August Heckscher and Frank C. Armstrong, of New York, are interested has taken over control of Ray Hercules Copper Co. of Maine, which has acquired properties immediately adjoining Ray Consolidated. Hercules orebody has been developed by drifting under direction of Henry Krumb, consulting engineer for new company. Ray Development Co., owning water-supply of Ray camp, is also controlled by this group. C. E. Addams, formerly mines manager for De Beers Consolidated Mines, Ltd., South Africa, and until July 1 last in charge of mining for Ray Consolidated, has been appointed general manager of company. It is planned to equip mine for an output of 3000 tons per day and to erect mill for ore treatment.

Mohave County

UNITED EASTERN (Oatman)—Reported that a large mill will be built in near future. Hayden, Stone-Jackling crowd said to have invested $200,000 in property.

Pinal County

MAGMA (Superior)—Crosscut on 900-ft. level shows vein first 7 ft. of which assays copper, 17%; silver, 13 oz.; gold, $3 per ton. The next 5 ft. assayed 3% copper; silver and gold not reported. Face of crosscut still in mineralized vein matter carrying some chalcopyrite. This is hanging-wall streak; on 1000-ft. level encountered fairly good copper shoot on foot, but of little lower grade.

Yavapai County

CROWN KING (Crown King)—O. W. Blickenstaff and Henry Braun, who are working ores of old dump, will build 100-ton addition to existing mill on property. Latter will be renovated and brought up to date by addition of concentrating tables, additional tanks and larger engine.

CALIFORNIA

Amador County

DEFENDER (Defender)—Two new oreshoots recently disclosed. One is 3½ ft. wide in old shaft; the other is smaller vein in new shaft. L. C. Dibert Co., engineers of San Francisco, are installing new device for saving gold from mill tailing. Details of installation are not available.

ALTAMONT PASS portion of improved highway between Sacramento, Stockton and San Francisco will be accepted by State Highway Commission, and opened to traffic. Old Patterson Pass used while Altamont was being completed will be abandoned.

Calaveras County

ECONOMIC (Esmeralda)—Electric power to drive 20-stamp mill is now installed and water made available for milling. Mill is equipped with seven Frue vanners. Floor of concentrating room is 40x45 ft. built of concrete. Main building is 100x60 ft. covered with corrugated iron. Cost of mill complete, approximately $60,000.

Fresno County

COPPER KING (Fresno)—New owners are preparing for extraction of large amount of ore which is exposed in old workings. Ore said to average 3% copper.

Kern County

BALTIC (Johannesburg)—First milling of ore since Fraser Bros. took over the property was cleaned up recently, showing a recovery of $600 from 100 tons.

SUNSHINE (Randsburg)—Leasers contemplate sinking another 100 ft. Sulphide ore disclosed in February has proven to be one of most valuable orebodies ever opened in camp. Has produced about $40,000. Ore being crushed in three-stamp mill and concentrated on Wilfley table.

Nevada County

GOLDEN CENTER (Grass Valley)—Installation of new hoist has begun. Headframe will be 93 ft. high. New incline shaft has been connected with old workings and old crooked shaft abandoned. When hoist is ready, sinking will proceed to 1000-ft. point.

SOUTH IDAHO AND GOLD POINT (Grass Valley)—Purchase bond has been secured by Errol MacBoyle of San Francisco. Properties have been worked only superficially but they are situated in good neighborhood in vicinity of the Idaho, Maryland and other prominent producers. Old Idaho vein, which produced several million dollars, is believed to extend into these properties.

Placer County

DYER (Dutch Flat)—Satisfactory progress made in bedrock drift being driven under old river channel from which upraise will be driven. Continued development and operation will depend upon character of gravel tapped by upraise. B. T. Dyer is manager.

Plumas County

SPRING GARDEN (Spring Garden)—Property being worked by shooter and bedrock being cleaned. Coarse gold has been found, some nuggets running $50 and one worth $700. Dutre & Taunt operating on adjoining claims also recovered coarse gold. Frank Woodward and Charles Copelin are operating shooter on another claim adjoining on Squirrel Creek. Shooter is also being installed on Shinn property on Greenhorn Creek below Spring Garden.

San Luis Obispo County

LITTLE BONANZA (Cambria)—E. S. Rigdon has seeured purchase option on this quicksilver mine and also Klau mines near Paso Robles. Both mines have been producers.

Shasta County

A NUGGET weighing 14 oz., 10 dwt. was found in cleanup of an old gravel bar on Squaw Creek, recently, by Charles Boding. It is valued at $246.92. Bar, which is known as Black Pup, was worked about 16 years ago by Frank Cox, an early resident of Kennett.

DELTA CONSOLIDATED (Delta)—Arrangement being made for installation of new reduction plant. Fair tonnage of $10 ore has been developed in upper workings and later development in lower adit is satisfactory.

CONSTRUCTION OF NEW DREDGE will be started at once by L. Gardella, of Oroville, on recently purchased McCormick-Saeltzer ranch of 2700 acres. Pit being dug; dredge to cost $100,000. Other dredges may be used later.

GOLINSKY (Kennett)—This group of 14 claims has been bonded to Mammoth Copper. Work will be done by Mammoth company on large scale. Stated property formerly bonded to Guggenheims for $100,000.

UNCLE SAM (Coram)—Lessees operating 10-stamp mill eight hours per day, will install settling tanks and pump so mill water can be saved and used over, giving sufficient water supply for continuous operation. Compressor will also be installed. Ore is gold-bearing, of good milling grade.

STOWELL (Kennett)—Preliminary surveys being made for aerial tramway for mine, 11 miles west of Kennett, to connect with upper terminal of Balaklala Consolidated Copper Co.'s tramway at Kimberly. Ore can then be sent over this tramway to Coram, and thence by railroad to Mammoth smelting plant at Kennett. Mammoth Copper has an option on Stowell group and is doing considerable development work.

BALAKLALA (Coram)—Edward Newhouse, vice-president of American Smelting & Refining Co., reported to have stated that mine and smeltery will resume operation in 1915 or by first of 1916. Installation of the improved Cottrell system of fume control is contemplated. Should this report prove true, is expected that not only Balaklala but Trinity copper mine will be worked. Balaklala smeltery has been idle since July, 1911, having closed down on account of the opposition of farmers in Shasta County. It is estimated that the cost of repairs to smeltery and installation of Cottrell system will amount to about $350,000.

Tuolumne County

SPRINGFIELD TUNNEL & DEVELOPMENT Co. (Sonora)—Application made to State Corporation Department to sell $1,271 shares, par value $1, proceeds to be used in continuing development.

COLORADO

Boulder County

MARY McKINNEY (Gold Hill)—American Mines Co., James N. Caldwell, manager and secretary, has opened up large outcropping veins of free-milling gold ore and will erect small mill on property.

Chaffee County

HIRSCHBERGER (Salida)—Contract has been let to drive adit 500 ft. further into Cameron Mt. to reach orebodies opened higher up mountain-side.

MADONNA (Monarch)—Because of dangerous conditions in main shaft, mine is closed down pending arrangements for sinking new shaft. E. D. Denison, manager, has gone east.

OHIO & COLORADO SMELTING & REFINING (Salida)—Effective Aug. 11, wages of 285 employees raised approximately 5%. Lowest wage around plant is now $2.10 for eight hours.

Clear Creek County

BIG FIVE (Idaho Springs)—Power plant at portal of big tunnel has been increased by installation of 1700-cu.ft. air compressor motor driven. Haulage department has new 4-ton gasoline locomotive.

Gilpin County

BROCK HOLLOW (Black Hawk)—Has been purchased by C. A. Frost who will reopen old tunnel workings and push development. Has been idle many years.

Lake County

DERRY RANCH DREDGE (Snowden)—New 42x107-ft. hull of boat has been launched.

ROBERT EMMET (Leadville)—Although mine has tremendous reserves of high-grade blende ore, shipments are prevented by lack of contracts whereby it can be marketed. Regular shipments are made of ore averaging about 25 oz. silver and 21% lead.

ARKANSAS VALLEY SMELTERY (Leadville)—American Smelting & Refining Co., taking exception to tax assessment levied by county officials, appealed to district court. Trial occupied about a week. Point of controversy is assessment on capital involved in equipment for manufacturing purposes at the smeltery, the plant for such purposes being valued at $557,600 on which 1914 taxes are approximately $15,000. Several experts have inspected this equipment and their valuations on many items caused much discussion in court. Case is before Judge Cavender.

Ouray County

REVENUE TUNNEL (Ouray)—St. John Mining Co., Ltd., London, Eng., has made second payment and taken possession of this development and mining project. It is understood that earnest work will be undertaken as soon as British government removes its embargo on exploitation of foreign enterprises.

IDAHO

Shoshone County

MAYFLOWER (Wallace)—This company, developing claims lying about four miles up Ninemile Creek from Wallace, is installing electrically-driven compressor.

HECLA (Wallace)—Steps have been taken to have stock of Hecla company, which has not missed monthly dividend for about 12 years, listed on New York curb.

OOM PAUL (Kellogg)—By recent decision of Secretary of Interior, Oom Paul will receive patents to several claims contested by Forestry Department since 1908.

NATIONAL COPPER (Mullan)—Mill will be operating soon after Sept. 1, according to advices received from management.

GERTIE (Wallace)—Seventeen men are employed driving crosscut adit, which is expected to cut vein at 3700 ft. from portal late in October. The portal of the adit is just above Burke schoolhouse; adit is 685 ft. in clear.

TERRIBLE EDITH (Kellogg)—Promising Pine Creek property, has new smelter contract calling for minimum of 50 and maximum of 150 tons of zinc concentrate a month. Work is being pushed on new 1300-ft. adit, which will give depth of 500 ft.

HIGHLAND SURPRISE (Kellogg)—The 100-ton mill is being thoroughly renovated and will be started shortly. This mine has been one of regular shippers from Pine Creek. Smelter contract, following tests on two car-load lot, being negotiated for increased output of concentrate.

HYPOTHEEK (Wallace)—Orebins have been completed and high-grade ore stored on 500-ft. level will be hoisted at once, hauled to railway station at Kingston, and shipped to smeltery. Skip-pocket on 1100 has been cut and crosscut has been started to vein.

CROWN POINT (Kellogg)—Crown Point Leasing Co. resumed work on Silver King about two months ago. Two carloads of concentrate have been shipped and these netted enough to pay operating expenses and to wipe out indebtedness from former work. Twenty-two men are employed. Ore is concentrated at Stewart mill.

BUNKER HILL & SULLIVAN (Kellogg)—Earnings of company are in excess of dividend requirements and a large surplus is accumulating. The new dry-house, constructed of reinforced concrete at cost of $15,000, is nearing completion. There is persistent but unverified rumor that company will take lead in establishing plant in Coeur d'Alenes for production of metallic lead.

MICHIGAN

Copper

SOUTH LAKE (Houghton)—Mill run showed 24 lb. of mineral per ton of rock. Mineral expected to show close to 70% in smeltery.

HANCOCK CONSOLIDATED (Hancock)—Is now shipping 330 tons a day. Quincy is getting No. 7 ready, rebuilding partially dismantled hoist and fixing up skip-way.

FRANKLIN (Houghton)—Mill is handling South Lake rock at rate of two cars a day.

ONONDAGA (Houghton)—Drill core is in sandstone, but whether it is above or below mineralization zone is question. Five of most noted geologists in the district, Pryor, Fesing, Allen, Lane and Seman are going to property to make an examination.

Iron

FORBES (Iron River)—New coal trestle is being erected here. Will have capacity of 2000 tons. Tracks from railroad are now being constructed to it.

RAVENNA (Crystal Falls)—Orders given by M. A. Hanna Co. to resume work here. Mine has been idle a year. Ten new houses will be erected at the Monongahela location near by. All ore at the Ravenna and Carpenter mines will be shipped.

CLEVELAND-CLIFFS IRON CO. (Ishpeming)—New mine to be opened at North Lake, Hoose & Person Construction Co., of Iron Mountain, given contract to strip 75,000 cu.yd. overburden from small area near Morris and Lloyd properties of company. Ore lies about 30 ft. below surface. Ore is so close to surface, with sand over it, that it could not be taken out from underground; will be extracted by mill-hole method. Shipping will be started next spring. Deposit contains about 200,000 tons.

MINNESOTA

Cuyuna Range

CUYUNA-MILLE LACS (Ironton)—A 1600-ft. air compressor, largest on Cuyuna Range, will shortly be installed.

KENNEDY (Cuyuna)—Shipments now going to dock via Northern Pacific tracks instead of Soo Line as heretofore.

PENNINGTON (Ironton)—Operations started Aug. 1. It is unofficially stated that 100,000 tons will go forward this season. Pit was idle last season.

ARMOUR NO. 1 (Crosby)—Steam shovel operations started in new pit Aug. 1. Production will come entirely from pit; no work being done underground.

IRON MOUNTAIN (Ironton)—Shipping 2 cars daily, one to Ashland, Wis., and one to Manistique, Mich. Company reports that this ore averages 39.25% manganese, 24% iron and 0.054% phosphorus.

ADAMS (Oreland)—Preparations being made to unwater this South Range property. Operation was suspended about year ago and mine permitted to fill with water. Electric pumping equipment will be installed.

Mesabi Range

CORSICA (Elba)—New timber shaft now being sunk, and main working shaft deepened 75 ft.

ALEXANDRIA (Leonard)—Hill ore interests will shortly start work sinking a shaft at Alexandria property ½ mi. west of Leonard. Ore is non-Bessemer. Hill properties are at present shipping 5000 to 6000 tons.

MISSOURI—KANSAS

BIG JACK MINE (Baxter Springs, Kan.)—Has started up again; is turning out large quantity of lead silicate, and as soon as some repairs are made a double shift will be put on.

SWEENEY (Baxter Springs, Kan.)—Has started pumps on land south of Baxter and as soon as ground is unwatered, production of ore will commence.

KATY MINE (Baxter Springs, Kan.)—South of here on Kansas and Oklahoma line has good body of ore and is making about two cars a week.

LUCKY FIVE (Joplin, Mo.)—On their lease on Colorado land south of Joplin struck ore at 40 ft. in new shaft and are still in ore at 50 ft.; they have started drift and are carrying 10-ft. face of ore.

ST. JOE (Joplin, Mo.)—On Connor land near Chitwood has framework of new mill up and ready for machinery which they expect to install right away. In sinking mill shaft, large quantity of pay dirt was taken out and is piled up ready to be milled when plant is completed.

MONTANA

Park County

WESTERN SMELTING & POWER CO. (Cooke City)—According to Mr. Tanzer, president of company which owns group of mines in Cooke City mining district, company will purchase 10 or more heavy automobile trucks to haul ore from Cooke to Gardiner and thus dispose of hardest question that has confronted district, namely getting transportation to a railroad point at a reasonable price. Trucks will carry coke on their return to camp. Power plant which was constructed last year will be in operation within two weeks and company will operate saw-mill and furnish light for Cooke City. Smeltery will be ready for operation next month.

Silver Bow County

EAST BUTTE (Butte)—At present East Butte is producing at rate of about 20,000,000 lb. of copper a year at a cost said to be about 10c. a pound.

TOULUMNE (Butte)—The $35,000 required to resume operations at the company's mine having been secured, active mining was started beginning with unwatering of shaft. Water is down to 2400 level; there still remains 200 ft. of shaft.

DAVIS-DALY (Butte)—For quarter ending June 30, 16 cars of ore aggregating 1422 tons were shipped. Ore averaged 3.7% copper and 6.4 ounces silver. Management believes that ore shipments will nearly pay operating costs.

NORTH BUTTE (Butte)—From January, when operations were only 50% of normal, North Butte increased output until now it is 90% capacity. This is equivalent to a production of 2,000,000 lb. of copper per month.

BUTTE-BALLAKLAVA (Butte)—Ore is being hoisted at rate of from 300 to 400 tons a day. In July mines were down for half the month on account of trouble with hoist. During 15 running days about 5000 tons of ore were taken out assaying 3% copper and giving an approximate profit of $4 a ton after deducting all charges for mining and extraction. August production will run close to 600,000 lb. of copper. Most of ore is now being taken from 1300- and 1600-ft. levels.

BUTTE & SUPERIOR (Butte)—All previous records in output of ore and concentrates by this company were broken in July. Estimated that about 45,000 tons of ore were taken from Black Rock mine during month; average of about 1500 tons a day. Total amount of zinc produced was between 13,000,000 and 14,000,000 lb. Payroll of company for July was in vicinity of $175,000. According to quarterly report period ending June 30, dry tons of ore milled 124,080; average zinc contents of ore 17.003%. Produced during quarter 17,686,000 lb. of zinc concentrates with an average zinc contents of 52.706%. Operating costs for quarter were $916,972.

NEVADA

Clark County

ANCHOR (Goodsprings)—Crosscut from lower level has intersected orebody in foot-wall of main vein. Now shipping about 500 tons of zinc-carbonate ore per month. Contracts have been let for erection of 50-ton dry concentrating mill for separation of lead and zinc minerals, and some machinery has already arrived.

YELLOW PINE (Goodsprings)—New shaft has reached depth of 900 ft. and crosscut is to be driven at this depth to intersect vein. Special dividend of 5c. per share, amounting to total of $50,000 has been declared payable Aug. 5. Beginning June 1, company has paid bonus of 10% to each employee; this action having been taken on account of increased earnings due to higher prices of metals.

Elko County

BLUSTER CONSOLIDATED (Jarbidge)—Is crushing 50 tons of ore per day and will install 50-ton cyanide plant; construction to be started immediately. Ore averages about $20 per ton.

Esmeralda County

MERGER MINES (Goldfield)—Receiver for Merger Mines discharged by Judge after filing by counsel of stipulation settling case out of court.

JUMBO EXTENSION (Goldfield)—President Sprague is quoted as stating that all possibility of litigation between Jumbo Ex and Merger Mines, growing out of dissatisfaction of minority interests of Merger over sale of Velvet claim to Jumbo, has passed.

Nye County

TONOPAH ORE PRODUCTION for week ended Aug. 7 amounted to 10,722 tons valued at $218,956 compared with 10,407 tons week previous. Producers were: Tonopah Belmont, 3587; Tonopah Mining, 2900; Tonopah Extension, 1850; West End, 1015; Jim Butler, 1100; North Star, 66; and miscellaneous leasers 204 tons.

TONOPAH EXTENSION (Tonopah)—Receipts from operation in June $110,157; current expenses $73,201; operating profits $36,955.

NEW JERSEY

Sussex County

NEW JERSEY ZINC (Franklin Furnace)—Normal production of this mine is 30,000 tons per month. Owing to demands for high-grade spelter for war munitions, production has been increased to 70,000 tons per month without addition of further equipment or adding to personnel except as to underground miners.

NEW MEXICO

Hernalillo County

CONSOLIDATED MINING & SMELTING CO. (Cerrillos)—Ore concentrator being remodeled and zinc-lead ores will be treated. Custom ores will be accepted.

EL MORO MINING & MILLING CO. (Albuquerque)—Company has filed articles of incorporation. Capitalization $50,000 with $2000 paid in. A. P. Gibson, L. E. Carson and J. McNutt are incorporators.

Grant County

EIGHTY-FIVE MINING (Lordsburg)—New electric hoist being installed in main adit. Company will ship over new A. & N. M. spur from Shakespeare. New location for ore hauling road being sought by caterpillar tractors.

SAVANNAH COPPER (Silver City)—Reports from company's Duluth office state offer of $700,000 has been refused for holdings at Pinos Altos and Burro mountains. Lessees working company's ground.

BIDS FOR BRIDGE ACROSS GILA RIVER are being called for by county commissioners of Grant county. If contracts are let, it will mean the overcoming of an obstacle in transportation to Mogollon. Rivers being forded to disadvantage or loads are transferred over cable-way. Specifications call for three 112-ft. steel spans on concrete foundations and two 20-ft. wooden approaches. Bids will be opened Aug. 28.

SOUTH DAKOTA

Lawrence County

ORO HONDO (Deadwood)—Shaft is nearly 1700 ft. deep. Cross cutting is going forward both easterly and westerly on 1500 level.

MOGUL (Terry)—De LaVergne 100-hp. oil engine being installed, which, with one now in use, will allow cyanide mill to almost double capacity.

WASP NO. 2 (Flatiron)—Forty tons of wolframite ore, hand sorted, contained 56% tungstic oxide and brought net returns of over $16,000. Lower grade material is on dump; it runs about 10%. Wolframite is found on top of quartzite. It is removed first, and then quartzite goes to cyanide mill.

TROJAN (Trojan)—Test is being made of the practicability of dispensing with rolls, which have previously been used between crusher and chilean mills. From data so far gathered in 30-days test it appears that perfectly good results can be obtained without rolls.

WISCONSIN

Zinc-Lead District

FRONTIER (Benton)—At Hird mine has finished shaft to 125 level after severe troubles and heavy expense due to flow of 2200 gal. of water per min. which had to be handled.

WILKINSON (Benton)—Largest shipper of pyrites in district, lost its plant by fire. Will be rebuilt at once.

WISCONSIN ZINC (Galena)—Cleveland Separator at Galena, first in district, has been leased to treat some of its low-grade ores.

HARRIS-MURPHY (Platteville)—Rich strike of zinc and lead ore at 105 to 119 ft. was made by churn drill on Felix Murphy farm six miles south of Platteville.

QUINCY (Platteville)—A. L. Utt and others have secured lease on this tract three miles southwest of Platteville and will assemble complete mining and milling equipment.

CAPITOLA (Platteville)—Adam Miller and others have put up small milling plant and are operating this old mine which has been idle for 10 years.

SPINK (Platteville)—Local company has made valuable discovery of zinc ore on August Spink farm four mines south of Platteville.

UTAH

Juab County

EMERALD (Mammoth)—Rock mineralized with manganese, and carrying some lead, silver and gold has been cut recently in winze below 700 level.

RIDGE & VALLEY (Eureka)—Ore running high in lead, with some silver is being mined from 1650 level. This is being hoisted through main Gemini shaft.

EAGLE & BLUE BELL (Eureka)—No attempt will be made to connect the newly acquired Victoria ground with the Eagle & Blue Bell workings until new equipment at latter property has been installed. This will include hoist, capable of sinking 2000 ft.

Salt Lake County

UTAH COPPER (Bingham)—Present output is about 28,500 tons of ore daily.

UTAH METAL & TUNNEL (Bingham)—Ore valued at approximately $60,000 was shipped in July. The output will be increased up to 150 tons daily. Present shipments amount to 120 tons.

UTAH ORE SAMPLING (Salt Lake)—Declared its regular quarterly dividend of 6c. a share, Aug. 9. On this date one car from Idaho, three from Nevada, two from California, one from Colorado, and eight cars of ore from Utah were sampled.

SOUTH HECLA (Alta)—Ore a foot thick has been cut on the 500 level. Wedge fissure was cut sooner than expected, though ore may be stringer from this fissure. New lease on Quiney level, 1000 ft. east of Wedge workings, is showing improvement. About one car of ore daily is being shipped from main stopes on 250 level.

Summit County

PARK CITY ORE SHIPMENTS for month of July were among heaviest this year amounting to 217 cars, total 10,051 tons. Shippers were: Silver King Coalition, 4440 tons; Daly-Judge, 2265; Silver King Consolidated, 1725; Daly West, 368; Ontario Silver, 983; E. J. Beggs, 47; G. A. Keep, 46; Big Four Exploration, 1041; Daly, 76.

SNAKE CREEK TUNNEL (Park City)—During July face was advanced 368 ft. Tunnel is now in 12,000 ft. of the 14,000 ft. to be driven. About 16 ft. progress a day is being made.

DALY-JUDGE (Park City)—Callow pneumatic flotation plant of daily capacity of 75 tons will be installed in mill to treat fines. New electric hoist for the Anchor shaft and other machinery has been ordered.

SILVER KING CONSOLIDATED (Park City)—During July shipments of between 60 and 70 tons a day were made. It is probable that tunnel may be driven from some point near railroad to avoid wagon-haul from mine to loading station.

Washington County

HAYES-MONETTE (Modena)—This leasing company has taken over Dora Jane group of six claims at Goldstrike, and will start work at once. Shaft is to be sunk.

CANADA

Ontario

ORE SHIPMENTS OVER THE T. & N. O. RY. for month of July were: From Cobalt proper—Beaver, 32 tons; Chambers Ferland, 28 tons; Cobalt Comet, 76 tons; Coniagas, 86 tons; Crown Reserve, 118 tons; Kerr Lake, 68 tons; La Rose, 136 tons; McKinley-Darragh, 116 tons; Mining Corporation of Canada, Ltd., Cobalt Lake Mine, 107 tons, Townsite City Mine, 56 tons; Nipissing, 47 tons; Penn Canadian, 70 tons; Peterson Lake, 63 tons; Right of Way, 44 tons; from New Liskeard—Casey Cobalt, 29 tons, making total silver-ore shipments, 1107 tons; from Schumacher—gold, McIntyre, 5 tons; Porcupine Vipond, 1 ton; from Porquis Jct.—Alexo Mine, nickel, 1070 tons.

MEXICO

Sonora

NORTH TIGRE (Ysabel)—Mill is again in operation and shipment of concentrates on road to smelter.

MINNEAPOLIS COPPER (Cumpas)—After being closed down for about a year this property is again being opened up and force of men are at work cleaning up mine in preparation for actual mining which will start within week. It is expected to ship three or four cars of ore a month to Douglas smelters.

MONTECRISTO SONORA (Moctezuma)—An El Paso company has bought this property from heirs of C. C. Soto and it is now being operated under management of R. A. Meyer who has already located vein which was faulted on 5th level and ore is again being taken from vein at this place. Ore has also been located in other parts of the mine and one car of ore has been shipped and one awaiting shipment at Nacozari and another at mine. New plant of machinery is at mine and will be installed as soon as conditions settle a little.

AFRICA

Transvaal

GOLD PRODUCTION IN JULY is reported by cable at 770,000 oz., being 14,720 oz. more than in June and 45,000 oz. more than in July, 1914. For the seven months ended July 31 the total production was 4,818,247 oz. in 1914, and 5,178,048 oz in 1915; an increase of 359,801 oz., or 7.5%, this year.

The Market Report

Metal Markets

NEW YORK—Aug. 18

Tin and lead declined slightly, while copper and spelter became practically demoralized during last week, copper declining more than 1c. a lb. and spelter about 2c. a lb.

Copper, Tin, Lead and Zinc

Copper—The alleged news published in the Wall Street papers on Saturday and Monday that large buying of copper had taken place was all "moonshine." Not even any inquiries were addressed to some of the largest producers, to whom prospective buyers would naturally go. The principal producers, whose salesbooks are still fat with orders entered two to three months ago, have a nominal asking price, but do not get any new business, as to which they are temporarily more or less indifferent. On the other hand, some of the smaller agencies and producers are eager for business, and make sharp concessions to get it. The business transacted during the last week was relatively small in the aggregate, but included several 500,000-lb. and 1,000,000-lb. transactions, upon which there was sharp competition. An order for export to England was taken at £80, which at the present rate of exchange was figured as netting 16.10c., net, New York.

Stocks at refineries are reported as not increasing to any great extent as yet, owing to the large deliveries still being made on old orders. However, production is proceeding at a high rate; one estimate in the trade is 160,000,000 lb. per month. There is some gossip among the producers about taking steps to curtail the output.

Copper Sheets are quoted at 24c. base, with the usual advance for cold rolled. Wire is 20c. per lb. at mill.

Tin—After an early decline the market became steady. Spot tin is closely held and its owners were not disposed to sell lower than 34½c. per lb. A pretty fair business was done. There was a good demand for contracts for future delivery and sales were made covering deliveries far ahead. The uncertainty respecting the future rate of sterling exchange is, however, a perplexing feature.

Lead—The week was characterized by renewed interest on the part of buyers, who took considerable quantities, nearly all the producers making sales. The terms were rather variable, being governed to a large extent by the conditions and time of delivery. On the ordinary shipment business prices ranged from 4.35@4.50c., New York, but during the latter part of the week some large contracts for delivery in the last quarter of the year were taken at 4.25@4.30c. In the St. Louis market rather a large tonnage of lead was offered at relatively low prices.

Spelter—The business actually transacted was relatively light, but prices went off sharply on offerings from many quarters. Anybody who needed spelter had ample opportunity to do shopping. There were plenty of sellers and but few buyers. A large differential between spot and contracts for future delivery is maintained nominally, but it would probably contract if important business came in sight. Stocks of metal available for prompt delivery are beginning to increase. Rather than sell such metal at the present market, some producers are anticipating deliveries on their later contracts. Reselling by consumers does not appear to have ended. At the close of the week there were bids of 9c. for round lots for September-October delivery, producers asking 9¾c. There are thought to be some signs that galvanizers may become buyers again at around 9c.

Zinc Sheets are in active demand. The base price for carload lots is $17 per 100 lb. f.o.b. Peru, Ill., less 8% discount. Usual extras are charged.

Other Metals

Aluminum—There was not much activity in this metal, but No. 1 ingots were quoted at 33@35c. per lb., New York.

Antimony—There has been but little spot demand, but some small orders have been filled at 32@33c. for outside brands; Cookson's remains nominal at 48@50c., with few sales.

Quicksilver—The market was quiet at the beginning of the week but is asuming a firmer tone. New York quotations for large orders are $91@92 per flask of 75 lb., and for smaller lots $92@95. San Francisco market began quietly at $85, rising to $87.50 and finally to $95. London quotes £18 per flask.

Minor Metals—Current sales of **Bismuth** are at $2.75@3 per lb., New York. The London price is quoted at 10s., or $2.49 per lb. there.—**Cadmium** is quoted at 6s., or $1.44 per lb. in London, $1.50 per lb., New York.—**Tellurium** is reported sold at 80s., or $19.20 per lb. in London.—**Selenium** is quoted at $2@3 per lb. New York for larger quantities; $4.50@5 for retail lots.

DAILY PRICES OF METALS IN NEW YORK

Aug.	Sterling Exchange	Silver, Cts. per Oz.	Copper: Electrolytic, Cts. per Lb.	Tin: Spot, Cts. per Lb.	Lead: New York, Cts. per Lb.	Lead: St. Louis, Cts. per Lb.	Zinc: St. Louis, Cts. per Lb.
12	4 71½	48⅛	16½ @17½	34¼	4 35 @4 40	4 25 @4 35	11 @12
13	4 71½	47⅞	16½ @17	34¼	4 35 @4 40	4 25 @4 30	10½ @11½
14	4 70	47⅝	16½ @16½	34¼	4 35 @4 50	4 25 @4 30	10½ @11½

18	4 65	46½	16 @16½	34¼	4 25 @4 50	4 15 @4 20	9¾ @10½

*Nominal.

The quotations herein are our appraisal of the average markets for copper, lead, spelter and tin based on wholesale contracts for the ordinary deliveries of the trade as made by producers and agencies; and represent, to the best of our judgment, the prevailing values of the metals, reduced to basis of New York, cash, except where St. Louis is given as the basing point. St. Louis and New York are normally quoted 0.17c. apart.

The quotations for electrolytic copper are for cakes, ingots and wirebars. Electrolytic copper is commonly sold at prices including delivery to the consumers and is subject to discounts, etc. The price quoted for copper on "regular terms" is the gross price including freight to the buyer's works and is subject to a discount for cash. The difference between the price delivered and the New York cash equivalent is at present about 0.20c. on domestic business. The price of electrolytic cathodes is 0.05 to 0.10c. below that of electrolytic. Quotations for lead represent wholesale transactions in the open market for good ordinary brands. Quotations for spelter are for ordinary Prime Western brands. Only the St. Louis price is herein quoted, St. Louis being the basing market. We quote the New York price at 17c. per 100 lb. above the St. Louis price.

Silver quotations are in cents per troy ounce of fine silver.

Some current freight rates on metals per 100 lb. are: St. Louis-New York, 17c.; St. Louis-Chicago, 6.3c.; St. Louis-Pittsburgh, 13.1c.

LONDON

Aug.	Silver	Copper: Standard Spot	Copper: Standard 3 Mos.	Copper: Electrolytic £ per Ton	Copper: Electrolytic Cts per Lb.	Tin: Spot	Tin: 3 Mos	Lead: £ per Ton	Lead: Cts. per Lb.	Zinc: £ per Ton	Zinc: Cts per Lb.
12	23⅛	67¼	68½	81½	17 35	150¼	152¼	20⅝	4 32	65	13 84
13	23	67	68¼	81½	17 27	149½	151¾	20¼	4 36	63	13 22
14	22⅞										
16	22⅞	67¼	69¼	80½	16 90	151	153	20⅜	4 33	63	13 14
17	22⅛	67¼	68½	80	16 67	150	152	20¼	4 34	59½	12 34
18	22¼	66¾	68	80	16 68	148¾	150	20⅜	4 35	58	12 07

The above table gives the closing quotations on London Metal Exchange. All prices are in pounds sterling per ton of 2240 lb., except silver which is in pence per troy ounce of sterling silver, 0.925 fine. Copper quotations are for standard copper, spot and three months, and for electrolytic, price for the latter being subject to 3 per cent. discount. For convenience in comparison of London prices, in pounds sterling per 2240 lb., with American prices in cents per pound the following approximate ratios are given, reckoning exchange at 4.80. £15 = 3.21c.; £20 = 4.29c.; £30 = 6.43c.; £40 = 8.57c.; £60 = 12.85c. Variations, £1 = 0.21½c.

Gold, Silver and Platinum

Gold in the United States, Aug. 2 is estimated by the Treasury Department as follows: In Treasury against gold certificates outstanding, $1,177,131,169; in Treasury current balances, $226,076,821; in banks and circulation, $603,191,549; total, $2,006,399,539. This is an increase of $12,850,524 during July.

Silver—The market jumped to 23⅛d. on Aug. 12 on London buying for Indian account, but buyers being satisfied London price has reacted to 22⅞d. and closes fairly steady. The New York price has been seriously lowered on account of the phenomenal drop in sterling exchange from 4.75 to 4.64 in one week.

Coined silver in the United States, Aug. 2 is estimated by the Treasury Department as follows: Standard dollars, $568,272,478; subsidiary coins, $185,476,523; total, $753,749,001. Of the silver dollars $485,669,000 are held in the Treasury against silver certificates outstanding.

Platinum was stronger this week with an upward tendency, $39.50@41 per oz. being quoted for refined platinum and $47 per oz. for hard metal.

Zinc and Lead Ore Markets

PLATTEVILLE, WIS.—Aug. 14

The base price paid this week for 60% zinc ore was $85 per ton, down to $60 at end of the week. The base price offered for 80% lead ore was $50 per ton. No sales of lead ore were reported.

SHIPMENTS WEEK ENDED AUG. 14

	Zinc Ore, Lb.	Lead Ore, Lb.	Sulphur Ore, Lb.
Year	117,452,340	4,083,160	17,392,770
Week	3,313,120	.....	702,820

Shipped during week to separating plants, 4,814,530 lb. zinc ore.

JOPLIN, MO.—Aug. 14

Blende, high price, $88; base price per ton of 60% zinc, premium ore, $85, medium $80@70, lower grades down to $60; Calamine, base per ton of 40% zinc, $70@50; average, all grades of zinc, $83.78 per ton, many settlements being made on previous week's buying.

Lead, high price $58.30, base price $56@50 per ton of 80% metal content; average, all grades of lead, $52.86 per ton.

SHIPMENTS WEEK ENDED AUG. 14

	Blende	Calamine	Lead	Values
Totals this week..	10,077,660	600,750	1,776,610	$494,300
Totals this year..	354,735,370	28,977,260	54,297,540	15,529,190

Blende value, the week, $431,370; 33 weeks, $13,451,180.

Calamine value, the week, $15,980; 33 weeks, $632,530.

Lead value, the week, $46,950; 33 weeks, $1,445,480.

The demand for zinc with less than one-half of 1% of lead continues very strong, with iron content up to 6%, but ore carrying over that low-lead marking finds slow sale and heavy penalty. One recleaning plant has been constructed and other large producing companies are figuring on making such an addition. The Church Mines at Miami have raised their zinc product from an unsalable commodity to one in active demand. The recleaning is estimated to net $10 per ton.

Iron Trade Review

NEW YORK—Aug. 18

The steel mills are now running at practically their capacity, but of course are not producing as large tonnages as they could in more moderate weather. In few if any of the finishing departments is capacity fully engaged except in the case of the merchant-bar mills, and the steel trade finds it was not so difficult as was expected to engage the steel-industry's capacity. Rails have been in as poor demand this year as last, the sheet mills are operating at only 75 to 80% of capacity, the pipe mills are operating at only about 75%, demand for oil-country goods being exceptionally light, while bookings of the fabricators in July, although heavier than in June or May, are reported at only 86% of capacity. Exports are easily at record rate and seem to be increasing, but are only absorbing about 25% of the current steel output.

PITTSBURGH—Aug. 17

Specifications on finished-steel contracts are good, but new buying is light. Prices continue to show an upward trend. The Carnegie Steel Co. yesterday began quoting bars, plates and shapes at 1.35c., and other mills are expected to advance to this basis. Blue annealed sheets are firm at 1.35c., with sales for forward shipment at 1.40c., and prompt material is expected to advance to that level within a week. Galvanized sheets are lower, with the decline in spelter, at 3.75c. to 4c., and demand is quiet but prices light. The National Tube Co. has issued a new pipe list dated Aug. 16, showing no change in black, but reductions of six points in galvanized pipe 6-in. and under and four points on 7- to 12-in. On base sizes the spread between black and galvanized is now 15½ points, against 8½ points before the rise in spelter started. A point is equivalent to about $1.90 per net ton.

Pig Iron—Bessemer and basic continue to show an advancing tendency. Fair-sized tonnages of bessemer have sold at $15.25, Valley, and small lots at $15.50, representing advances of 25 to 50c. during the week. Basic is reported to have sold at $14.25 and $14.50, Valley, but these reports are not fully authenticated. Foundry iron is strong. The advances in pig iron, now totaling $1 to $1.50 since early in July, appear to be genuine, but have occurred upon a smaller turnover than has usually characterized such movements. Apparently the furnaces were well filled before the advances started. Few additional furnaces are blowing in. Shenango No. 4 is to go in this week, on basic. We quote: Bessemer, $15.25@15.50; basic, $14@14.50; No. 2 foundry and malleable, $13.50@13.75; gray forge, $13.25@13.50 at Valley furnaces, 95c. higher delivered Pittsburgh. Cleveland furnaces are reported to have advanced No. 2 foundry 50c. to $14.50, delivered Cleveland.

Ferromanganese—The prompt market remains at $100@105 for small lots. There is no contract price. English producers would probably quote $100, Baltimore, but are uncertain whether they can ship, on account of the restrictions lately placed by the English Government.

Steel—There is no regular market on billets and sheet bars, mills being well sold up for prompt and being unwilling to make commitments for late delivery, while middlemen, who probably control considerable steel, are nursing their resources. Roundly the market can be quoted at about $23 for billets and $24 for sheet bars, Youngstown, prices delivered Pittsburgh being about $1 higher. Rods are firm at $27, Pittsburgh.

Exports of those articles of iron and steel which are reported by tonnage were as follows for June and the fiscal year ended June 30, in long tons:

	1914	1915	Changes
June	143,953	355,829	I. 211,876
Year	2,076,364	2,003,798	D. 72,566

The large increase in exports now reported did not begin until April or May of this year. Imports given by tonnages were as follows:

	1914	1915	Changes
June	23,075	31,610	I. 8,535
Year	293,774	251,251	D. 42,523

Imports fell off quite steadily through the fiscal year, some loss being shown almost every month.

The sensation of the market just now is the sudden demand for pig iron and the rapid advance in prices. In the past two weeks bessemer and basic pig have gone up $1.25 per ton; Northern No. 2 foundry from $1 to $1.50, while Southern No. 2 has advanced $1.50 at Birmingham, with some furnaces withdrawn from the market altogether.

FERROALLOYS

Late London quotations are: Ferrochrome, $153.60 per ton for 4-6% carbon down to $120 for 8-10% carbon. Ferrotungsten, 75 to 85% tungsten and not over 1% carbon, $1.20 per lb. Ferromolybdenum, 70 to 80%, $4.32 per lb. Ferrosilicon, 45%, $69.60; 25%, $50.40 per ton.

Late quotations for American ferrosilicon are $71@73 per ton at furnace, according to size of order.

COKE

Coke production of the Connellsville region for the past week is reported by the "Courier" at 366,840 short tons; shipments, 369,725 tons. Production of Greensburg and Upper Connellsville districts, 42,664 tons.

Chemicals

NEW YORK—Aug. 18

Nitrate of Soda—The outlook is improving and nitrate is now quoted at 2.40c. per lb. for all positions.

Arsenic—The demand is improving slightly, in part due to the substitution of arsenic for antimony in the glass industry. Large lots are quoted at 3¼c. and smaller orders at 4c. per lb.

Copper Sulphate—Trade is steady but prices remain unchanged at $7.25 per 100 lb. for carload lots and $7.50 for small parcels.

New Developments in the Coeur d'Alenes, Idaho

By Hubert I. Ellis*

SYNOPSIS—The Coeur d'Alene district has benefited through the high prices ruling for lead and zinc. While these prices will undoubtedly be reduced under normal conditions, the development induced by the present high prices will be of lasting benefit. A review of present activity is given.

The Coeur d'Alene country is in the midst of a mild boom owing to the high prices prevailing for the base metals, especially lead and zinc. With the exception of the Snowstorm, Hercules, and National all the regular producers are working at normal capacity, or in excess of normal. The orebodies of the Snowstorm, for years the only important producer of copper in the district, were exhausted about Sept. 1, 1914. Further prospecting was barren of results and the mine was finally shut down in June, 1915. The management hopes by purchasing a new mine, however, to continue the life of the company. In a circular letter recently sent to the stockholders by Manager Greenough, it is stated that the company has on hand $160,000, and also has a complete mill, as well as surface and underground mining equipment. Options have been taken on several properties, including the Missoula copper mine, which lies in the same belt as the Snowstorm. This option, originally calling for 50c. a share for the Missoula stock, is said to have been renewed at 25c. Some definite decision in regard to the options held will probably be taken at the meeting scheduled to be held at Larsen on July 27.[1]

STANDARD MINE AT MACE, IDAHO. THE GREENHILL-CLEVELAND IS WORKING THROUGH THE OLD STANDARD TUNNEL

The National copper mine, in Deadman Gulch, about three miles northeast of Mullan, and supposed to be the same deposit as the Snowstorm, is making no production at present but is pushing development work under the

*Kellogg, Idaho.

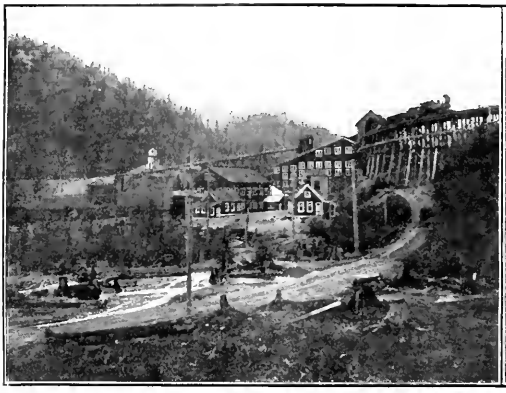
[1]This article was written before this date.—EDITOR.

direction of R. R. Catching. A two-compartment winze, 6x11 ft. in the clear, is being sunk from the level of the adit, which is 5000 ft. long. Three shifts are working and sinking is at the rate of 5 ft. per day. It is hoped to have the station at the 200-ft. level finished by Sept. 1, and to have the mill running by the middle of that month. Hoisting is by air compressed with current from the lines of the Washington Water Power Co. The mill is situated at the railway near Mullan and is reached from the mine by a three-mile tram road, equipped for electric haulage. The mill has a capacity of 500 tons a day; concentration is chiefly by flotation methods.

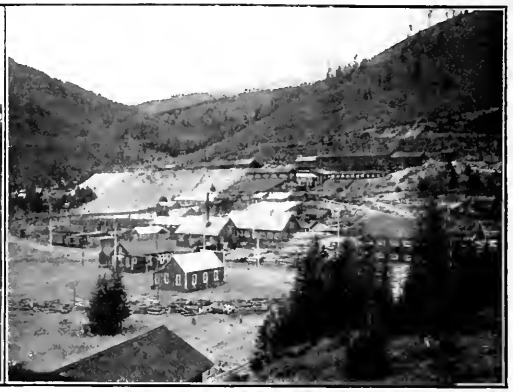
The Hercules mine, on Cañon Creek near the town of Burke, is closed down pending the negotiations of a satisfactory smelting contract. Current report is that the company formerly had a more favorable rate than other obtained for the concentrates. A new building, 42x230 ft., is under construction at the mine. This will house the machine shop, the blacksmith shop, the carpenter shop, and the electrical shop. A new section has also been added to the mill orebin, giving it a capacity of 25 cars of mill feed. Buffalo track scales have been installed.

The Gold Hunter mine, just above Mullan, is sending 340 tons of ore daily to the mill. The ore is hard to treat, about 50% of the concentrates being obtained by flotation. The total recovery is 85%. The Hecla mine, another old producer, is at Burke and the mill is three miles down Cañon Creek. The mill is treating 380 tons of ore per day by jigging, table concentration, and flotation.

The Marsh mine is also at Burke, but the ore is shipped by rail to the old Black Cloud mill on Ninemile Creek



SWEENEY MILL, TWO MILES FROM KELLOGG



MORNING MILL, JUST BELOW MULLAN

Coeur d'Alene mines which have now demanded the same treatment as that accorded the Hercules. The smelters unwilling to lower other rates to agree with that of the Hercules, refused to renew the Hercules contract at the old figure. The Hercules objected to the increased rate and the management is considering the construction of a smelting plant of its own or the purchase of the Northport smeltery. Meanwhile advantage is being taken of the shutdown to make some repairs and to put mine and mill in shape for continued production as soon as an outlet is and treated there. The mine, which was closed down for some time, was started up this spring and is producing 200 tons of ore a day. The mill has been remodeled after a series of careful tests and is making a saving of nearly 90%. A controlling interest in the Success, a Ninemile Creek mine, was recently sold by H. F. Samuels, to a Duluth capitalist for a price reported to be more than $1,000,000. The mine is producing 250 tons of lead-zinc ore per day and is shipping 2000 tons monthly of zinc concentrate and 200 tons of lead concentrate. Concentration is by jigs, Wilfley tables, flotation, and magnetic separation.

The Interstate-Callahan, situated near the head of Ninemile, at an elevation of 4500 ft., is the sensation of the district. This company, which was almost unknown a year

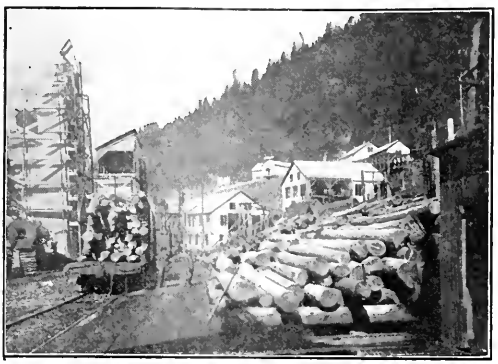
or two ago, paid a dividend of $115,000 on Apr. 1 and another of $575,000 on July 1. It is reported from Duluth that at a meeting of the board of directors held July 17, an extra dividend of $2 a share was declared, payable Aug. 10. This aggregates $920,000, bringing the total for the year to $1,620,000, or $3.50 per share. Provision has also been made for regular disbursements of 25c. on Oct. 1 and Jan. 1, making a total of $1,840,000 for 1915. If the present high price of zinc is maintained there is every reason to believe that other special dividends will be declared and that the total for the year will be nearly $3,000,000.

The ore occurs in the Prichard slate and is remarkably rich. At the mill, which is situated half a mile below the mine and which is served by an aërial tram, waste,



HERCULES MINE

crude lead ore and crude zinc ore are sorted out. Twenty per cent. of the shipping product is obtained in the sorting plant, yet the ore going to the mill proper still carries 28% zinc and about 5% lead. The mill, originally designed to treat 250 tons of lead ore, has been remodeled to treat 360 tons of zinc-lead ore. Concentrates are hauled two miles to the railway terminal by wagon, as many as 16 to 18 four- and six-horse teams being required for this work. An aërial tram two miles long is under construction to a loading station on the railway and this is expected to reduce the shipping cost by about a dollar a ton. At the mine it is planned to build a number of cottages, a new dryhouse and a new bunkhouse, all of which will have every modern convenience. Although the remarkable strides made by this mine in the last half-year are due in no small measure to the high price of zinc, it is evident from the richness of the orebodies that its continued prosperity is not dependent on abnormal conditions. The management is in excellent hands and there is no reason to doubt that the Interstate-Callahan will maintain its position for years as one of the leading mines of the Coeur d'Alene district.

The group of mines near Kellogg under the management of Stanly A. Easton, including the famous Bunker Hill & Sullivan, the Caledonia, the Sierra Nevada, the Stewart, and the Ontario, are in a prosperous condition. The three mills of the Bunker Hill & Sullivan Mining & Concentrating Co. are treating 2000 tons of ore a day. The ore is of about the same grade as that sent to the mill during the last 30 years, carrying 10% lead, less than 1% zinc, and 4 oz. of silver per ton. Production of lead is at the rate of more than 100,000,000 lb. a year. The West mill is treating the bulk of the ore from the main workings of the company by the usual process of jigging, table concentration and flotation. The South mill is treating ore from the Caledonia and Sierra Nevada mines and from the leases in the old workings. The North mill, originally laid out to treat accumulated tailings from the other mills, is now used as an experimental plant. The Bunker Hill is working in coöperation with the United States Bureau of Mines on an electrochemical process for producing metallic lead, zinc and silver directly from their ores without recourse to smelting. Some metal is actually being produced from ordinary mill feed and the results are considered by the management to be very encouraging. The Ontario mine is under lease to Mr. Easton and associates. Ore from the Stewart is milled at the Cañon Creek mill, just out of Wallace. The Stewart, according to persistent rumor, will soon be placed on a dividend basis of 10c. per share per month. The disbursements of the company to date, including a dividend payable July 29, total 150% on the par value of the stock, which is $1. In 1913 dividends aggregated 32½%; in 1914, 62½%, and so far in 1915, 55%. The net profit in June, due to increased metal prices, was over $120,000 as against $83,000 in May and $73,000 in April. The company is also accumulating a surplus for the development of its copper property at Quatsino Sound, B. C. Production has been increased from 3,000,000 lb. of lead a month to 4,000,000 lb.

Progress of the Federal Group of Properties

Little information is available concerning the activities of the mines under the control of the Federal Mining & Smelting Co., including the Morning near Mullan, the

WINTER IN KELLOGG, IDAHO

Frisco and the Cleveland-Greenhill on Cañon Creek, the Tamarack-Custer on Ninemile, and the Last Chance at Wardner. The Tamarack-Custer is said to be in very good shape. The Frisco mill, with a capacity of 250 tons, is treating about 125 tons—concentrating by jigs, tables, flotation and magnetic separation. The Greenhill-Cleveland uses selective flotation for keeping zinc and lead concentrate separate. The ore runs 3 to 4% zinc and 6 to 9% lead. A small amount of pine oil is added and the zinc is floated off. More oil is then added to the tailings from the zinc cell and the lead is thus removed.

Besides the larger and older mines, several new properties are coming to the front and there is a large amount of prospecting and development work being carried on throughout the district. At a meeting of the board of di-

rectors held a short time ago at Wallace it was stated that a fund of $200,000 was available for further development of the Ray-Jefferson, which adjoins the Interstate-Callahan. An oreshoot exposed for 340 ft. in the present tunnel is thought to be in the extension of the Interstate-Callahan lode. The company has a good millsite at the junction of Beaver and Carbon Creeks and plans to start construction work on a 250-ton mill about Apr. 1, 1916. The Rex, another promising property tributary to Ninemile, has been bonded to capitalists who plan to unwater the shaft and start production as soon as possible. Included in the equipment of the company is a 15-drill compressor, electric driven, and the mill now used under lease by the Tamarack & Custer.

There is considerable activity in the copper belt near Mullan. The Reindeer-Queen has obtained money for further development work by the sale of 100,000 shares of stock to J. P. Gearon. Carbonate Hill, Carney Copper, and Idaho Giant are working small crews.

Of the outlying districts, Pine Creek, where more than 30 prospects are in various stages of development, is attracting the most attention. A promising strike of zinc-lead ore was recently made at the Little Pittsburg, which is situated between the Surprise and the Nabob. The 800-ft. crosscut adit tapped the vein at a depth of 380 ft., and it is reported on good authority that the vein at the intersection consists of 6 ft. assaying 8% lead, 18 in. of lead-zinc ore of milling grade, and 14 in. of high-grade zinc ore. It is planned to increase the force of 15 men employed at the Constitution, which is being operated by Thwaite & Hamilton, lessees. The output will be increased at once to 300 tons per month and a small mill will probably be built later in the season. A promising body of high-grade galena was recently found by workmen engaged in grading for a wagon road. It is announced that the Amy will soon call for bids for the construction of a concentrator on Pine Creek. Active development work has been under way for more than a year and some good orebodies are said to have been opened up.

Work on the North Fork Properties

Several properties on the North Fork of Coeur d'Alene River are showing up well. Jerome Day has been given an option on the claims of the Lead Crystal Mining Co., located on Cottonwood Creek near Union. High-grade galena has been found in the upper adit which is 500 ft. long. A tunnel at a lower elevation also shows some good ore. The Paragon has two carloads of ore ready for shipment. It is planned to work a crew of 20 men and to make an output of 500 tons a month. The five-year smelting contract of the company with Beer-Sondheimer expires next May, and as much concentrate as possible will be shipped before that time. W. H. and Charles Conn, lessees on the Terrible Edith, will ship two carloads of concentrates soon. A rockhouse has been built and a new crusher installed; three jigs have also been added to the mill equipment. The H. E. M. Mining Co., after making a series of careful tests under the direction of W. D. Buckby, is building a 100-ton concentrator. Four tunnels have been driven on the property, the lowest of which will give a depth of 1000 ft. A total of 8000 ft. of development work has been done at a cost of $75,000, all of which was obtained from the sale of treasury stock. Work done in 1914 aggregated 2979 feet.

In general it is safe to assume that although the present activity in prospecting in the Coeur d'Alenes is partly due to the high metal prices, there are a good many orebodies that will be worked with profit when prices recede to normal. The smaller operators, as in other zinc-lead districts, complain of the difficulty of disposing of their small lots of concentrate at a figure that they consider fair in view of the high quotations for the metals, particularly zinc, and this undoubtedly has a slight tendency to discourage the prospector.

Ray Consolidated Copper Co.

The Ray Consolidated Copper Co. reports a production for the second quarter of 1915 of 14,524,380 lb., made up as follows: April, 5,303,213; May, 5,016,048; June, 4,205,119; giving an average monthly production of 4,841,460 lb., as compared with a monthly average of 4,821,071 lb. in the previous quarter. In addition to this production of copper in concentrates, there was a total of 277,851 lb. of copper contained in ore shipped direct to smelters.

The total amount of ore milled for the period was 679,004 dry tons averaging 1.677% of copper, as compared with 656,652 dry tons averaging 1.667% for the previous quarter. The tonnage corresponded to a daily average of 7462 tons, as compared with 7296 tons for the previous quarter. Milling costs were 44.53c. per ton. The average mining and coarse crushing cost of ores milled was 60.959c. per ton, of which 3.256c. was the cost of coarse crushing, leaving a net mining cost of 57.703c. per ton. The underground development for the quarter was 10,769 ft., making a total development to date of 469,842 ft. The average cost per pound of net copper produced from milling ores for the quarter, after allowing for smelter losses and applying dividends of the Ray & Gila Valley R.R., with no other miscellaneous income as a credit to costs, was 9.122c. The combined cost per pound of net copper produced from milling ore and direct-shipping ore for the quarter was 9.123c. These costs include all operating and general charges, as well as 12½c. per ton of ore milled, which is applied to the extinguishment of mine-development cost. If all miscellaneous income were credited to the reduction of costs the per pound cost of net copper produced for April was 8.665c., for May 8.891c., for June 9.735c. Net operating income for the quarter was $1,361,737; miscellaneous income, $9399; total, $1,377,136. Bond interest amounted to $2250, and dividends to $517,035, leaving a net surplus over bond-interest and dividend requirements of $793,851. The earnings for the second quarter are based upon a price of 18.635c. per lb. for copper, compared with 14.324c. for the first quarter. All unsold copper on hand and in transit is carried at 14c. per lb.

Mining in Venezuela, according to recent consular report, was affected last year by the general unfavorable business conditions. Nevertheless, considerable attention was given during the year to the development of gold mining in the Guiana section, and some of the new mines have yielded satisfactorily. There have been rumors for many years of the finding of diamonds in that part of Venezuela or in the Orinoco Valley. These rumors have been verified by the exhibition of specimens found. So far as known, no examination of that section has been made by experts familiar with diamond mining.

The Wisconsin Zinc District—II

By H. C. George*

SYNOPSIS—Continuing the discussion of the Wisconsin zinc fields, an estimate of a typical orebody is made up. Mining methods are explained, with descriptive details of drilling, blasting, timbering, etc. The use of the various types of hoisting machines is described.

A plan map of a hypothetical orebody blocked out for a total length of 1000 ft. by drill holes is shown in Fig. 20. The west 600 ft. of this orebody shows an average width of 80 ft. The east 400 ft. of the orebody shows an average width of 120 ft., with a higher zinc content and a lower iron content for the average assay of the drill holes than the west 600 ft. The west 600 ft. of mine had 12 drill holes in ore and the east 400 ft. had eight drill holes in ore. On the basis of the assays of these holes, and the thickness, width and length of the orebody, I will make an estimate of tonnages, grades and values, using the same costs as the State Tax Commission has used as the average of the district:

WEST 600 FT. OF OREBODY

Hole No.	Footage	Zinc Assay	Iron Assay
1	40	7.8	6.2
2	29	4.2	8.8
3	39	3.0	5.5
4	22	1.3	10.4
5	36	7.0	4.1
6	6	2.1	6.7
7	26	10.7	7.0
8	42	12.6	5.4
9	32	8.6	6.0
10	33	5.8	7.9
11	31	7.2	7.0
12	18	4.1	12.0
Average	28.7	6.73	6.42

EAST 400 FT. OF OREBODY

Hole No.	Footage	Zinc Assay	Iron Assay
13	33	11.1	5.4
14	62	6.5	6.4
15	29	8.0	2.0
16	4	13.8	7.6
17	7	8.3	12.6
18	69	8.2	7.7
19	83	4.0	5.8
20	45	9.7	2.6
Average	41.6	7.37	5.66

*Chief engineer, Wisconsin Zinc Co., Platteville, Wis.

Concentrating (milling) operations in the district have shown that about 70% of the zinc content and about 50% of the iron content of the ore, as shown from the drill-hole record, are recovered in the concentrates. I will use these factors to show recovery from drill-hole assays.

WEST 600 FT. OF OREBODY

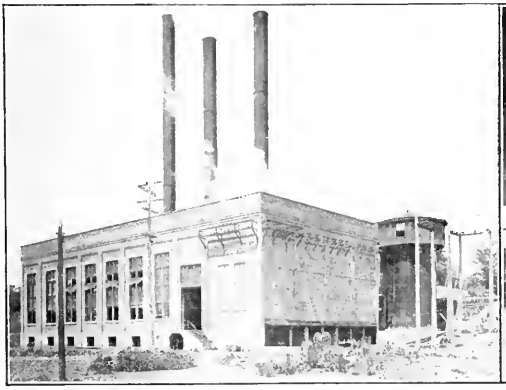
$6.73 \times 0.7 = 4.711\%$ recov. zinc; $4.711 \times 1.5 = 7.07\%$ recov. ZnS
$6.42 \times 0.5 = 3.21\%$ recov. iron; $3.21 \times 2.2 = 7.06\%$ recov. FeS_2
$7.07 + 7.06 = 14.13\%$ recov. mineral as concentrates.
$4.711 = 33.3\%$ zinc in concentrates
14.13

$28.7 \times 80 \times 600 = 1{,}377{,}600$ cu.ft. (12 cu.ft. = 1 ton)
$= 114{,}800$ tons of ore in place

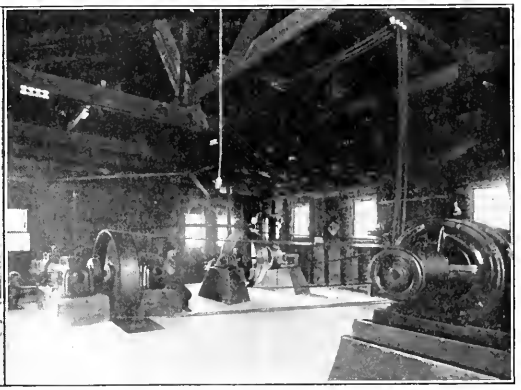
Based on 5c. spelter, $40 per ton for 60% Zn concentrates, 33.3% zinc concentrates will be worth $17 per ton.
$114{,}800 \times 0.1413 = 16{,}221.2$ tons of 33.3 % Zn concentrates
$16{,}221.2 \times \$17 = \$275{,}760.40$, gross value concentrates

EAST 400 FT. OF OREBODY

$7.37 \times 0.7 = 5.159$ recov. zinc; $5.159 \times 1.5 = 7.74\%$ recov. ZnS
$5.66 \times 0.5 = 2.83$ recov. iron; $2.83 \times 2.2 = 6.23\%$ recov. FeS_2
$7.74 + 6.23 = 13.97\%$ recov. mineral as concentrates
$5.159 = 36.9\%$ zinc in concentrates
13.97



INTERSTATE LIGHT & POWER CO.'S PLANT, GALENA, ILL.



POWER ROOM OF THE CLEVELAND MINE, HAZEL GREEN, WIS.

$41.6 \times 120 \times 400 = 1{,}996{,}800$ cu.ft. (12 cu.ft. = 1 ton) = 166,400 tons of ore in place.

On same basis as above, 36.9% Zn concentrates will be worth $20 per ton; $166{,}400 \times 0.1397 = 23{,}246.1$ tons of 36.9% Zn concentrates; $23{,}246.1 \times \$20 = \$464{,}922$ gross value of concentrates in east 400 ft. of mine.

Gross value of concentrates in west 600 ft. of mine, $275,760.
Total value of zinc concentrates of mine, $740,682.

Tons of ore in place, west 600 ft.	114,800
Tons of ore in place, east 400 ft.	166,400
Total	281,200
50% added for ground broken outside of drill holes (see Fig. 21)	140,600
Total tonnage to be mined	421,800

The average operating cost, as shown by the report of the Wisconsin Tax Commission, is about $1.25 per ton mined. I will use this figure for the estimates.

Operating cost, 421,800 tons at $1.25	$527,250
Cost of 150-ton mill and mining equipment	30,000
Total	$557,250

Gross value of concentrates	$740,682
Less 10% royalty to landowner	665,614
Operating cost, mill and equipment	557,250
Net operating profit	$109,364

A concentrating plant such as planned for the above-mentioned property, running two shifts per day and "culling" the "boulders" before the mine ore, or "dirt," goes

to the crusher, will handle about 100,000 tons of mine ore per year, so that the life of the mine would be about 4.2 years.

Some of the mining companies of the district own the property on which they mine, but most operations are conducted on leased land. The owner generally receives 10% of the gross receipts of the sales of ores. Technically this 10% is part of the profit, but from the standpoint of the mining company it is an operating expense.

Mining Methods

The mines vary in depth from 75 to 200 ft. The shafts are usually vertical and vary in size, depending on the tonnage to be handled, the depth of orebody and the amount of water to be taken care of. Common sizes for shafts are 5x7 ft., 5x9 ft., 6x10 ft., 7x12 ft., and 7x14 ft.

Shafts seldom have to be cribbed to a greater depth than 30 ft., but there are cases where it has been necessary to a depth of 75 ft. The different kinds of cribbing used are 4x10-in. plank or 6x6-in. timber in soft ground, or, in small mines, 2x10-in. plank. Several shafts in the district have been cribbed with reinforced concrete. A recent state law limits the size of the hoisting compartment to a minimum of 5½x5½ ft. in the clear when power machinery is used for hoisting. Most of the shafts are sunk from 5 to 10 ft. deeper than the deepest mine level. The last 5 or 10 ft. is floored over and is used as a sump from which all of the mine water is pumped. Nearly all mine shafts are equipped with ladders, usually of the vertical continuous type, without landings. They are made with uprights of 2x4-in. pine, and the rungs are usually hardwood or pipe. In most cases these ladders are used only for emergency, the men being hoisted in the cage or tub used for hoisting ore. The cost of shaft-sinking in the district varies from $7 to $20 per ft., depending on the size and depth.

The amount of water to be pumped from the mine workings varies from a small amount to 3000 gal. per min. Several of the largest mines of the district have pumped so little water that a supply for jigging the ore in the concentrating process has had to be secured from other sources. Others have had so much that they run their mine water direct to the concentrating plant and require no pond for returning it.

The pumps used are the different types of one-stage lift pumps, such as the Cornish walking beam, the crosshead and the steam head, and different types of one- and two-stage motor-driven centrifugal pumps. The water pumped is usually not acid, so there is seldom any difficulty due to its chemical action on the pumping equipment. Most pump troubles are caused by blowing out of gaskets, wearing out of packing, or breaking of pump rods, where the last exist.

General Underground Work

The method of working a mine in the district depends on the size, shape and position of the orebody. When the orebody has been blocked out by prospect drilling, the shaft is located at the most desirable point, usually near the middle of the orebody along the hanging wall, or at the lowest point in the structural basin, or at the point where the orebody is the deepest.

Most of the orebodies lie in a nearly horizontal position, so that they can be worked from one level, or at least the hoisting can be from one level. All the ore is broken down to this level or dumped into hoppers, from which it is drawn at the level. If the orebody is of the long, narrow type, several shafts may be sunk and the ore carried by aërial or surface tramways to the concentrating plant, but the usual system is to operate from one shaft and hoist from one level. In most mines in the district no attempt has been made to grade and classify the ore, or to select the ore to be mined at a given time by blocking out the mine with haulage drifts and crosscuts. The usual system has been to start at the shaft and mine away from it in all directions showing ore, taking the ore as it comes, and leaving it only where necessity requires it in the form of pillars. Experience has shown that about 10% of the ore in the mines of the district has been left in pillars, and subsequently lost.

Recently several mining companies with large orebodies blocked out have introduced new mining methods to meet existing conditions. In one case (shown in Figs. 22 and 23) the orebody pitched along the strike and at right angles to the strike. Fig. 22 shows a vertical cross-section and Fig. 23 shows a vertical longitudinal section of the mine. As shown at *X* in both figures, main haulage drifts were driven along the foot of the pitch of the orebody and at regular intervals raises started; and by overhead stoping, orepockets were made into which all of the ore along the pitch up to the top flat *Z* was broken and drawn at *X*. The ore in the top flat *Z* had to be shoveled into cars and trammed to the edge of the stope and dumped into the pocket below.

In another case the orebody shows variations both vertically and horizontally, in the grade of ore. Figs. 24 and 25 show the method of mining being used at this property. The orebody averages about 100 ft. in width and 60 ft. in height. A main haulage drift *X* is driven along the foot of the pitch, and about every 250 ft. a crosscut drift *Y* is driven across the orebody. In each of these crosscut drifts there are two raises, which are converted into pockets, and the high-grade ore in the upper half of the mine *A* will be broken and dumped into these pockets. The lower-grade ore in the lower half of the mine *B* will be worked out later on a high market. Each of the stopes *C, D, E, F, G* and *H* will be worked in this manner, and the stope to be worked at a given time will depend on the grade of concentrates it will produce and the existing market conditions.

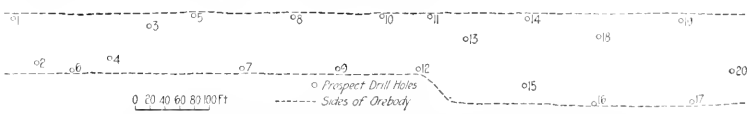


FIG. 20. HYPOTHETICAL OREBODY IN THE WISCONSIN FIELD, SHOWING PROSPECT DRILL HOLES

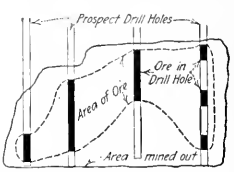

FIG. 21. VERTICAL CROSS-SECTION OF OREBODY

Fig. 26 shows a vertical cross-section of a mine worked on two levels. The part of the stope above the line *XY* was worked out first because the lower part of the stope was mineralized only in the part marked *A*. In several cases in the district the heading above the line *XY* has been carried ahead of the lower part of the stope *A*, and the tracks on the floor of stope *B* are graded down to the level of the floor of stope *A* toward the shaft, so that all of the hoisting is done from the level of stope *A* and mining is carried on simultaneously on both levels.

System of Mining

The usual system of mining is by underhand stoping, as shown in Fig. 27. The heading is usually carried with a machine drill on a 6- or 7-ft. post; and when the heading gets 15 or 20 ft. ahead of the stope the benches are drilled with a machine drill mounted on a tripod, and broken, starting at the top and working toward the bottom. The benches are carried about 10 ft. high. Heading holes are drilled 8 or 10 ft. deep and stope holes are drilled 10, 12 or 14 ft. deep. Three or four holes are usually drilled per round in the heading.

Fig. 28 shows a horizontal cross-section of a mine heading in which *A*, *A'* and *A''* represent the three "set-ups" necessary to drill rounds 1, 2, 3 and 4. The heavily shaded portion represents the portion of the heading broken by these rounds, and *B*, *B'* and *B''* represent the three "set-ups" necessary for breaking the next three blocks of the heading represented by the three unshaded blocks *C*, *C''* and *C'''*.

Drilling Methods

In the earlier use of machine drills in the district it was customary to drill stope holes straight down at right angles to the bedding planes, but this custom has been entirely abandoned. Stope holes are now drilled horizontally, parallel to the bedding planes or pointing down but slightly. The ground foreman has to use the best judgment in placing holes and in determining the depth of holes to get the best results. The nature of the rock has to be taken into consideration—whether it is hard or soft, compact or loose, or full of crevices and openings. In heading work a machine man should be able to drill from 50 to 100 ft. per shift, and in stope work he should be able to drill from 30 to 60 ft. per shift. In heading work there should be at least 1 ton of rock broken for each foot drilled, and in stope work sometimes an average as high as 10 tons per foot drilled is reached. An average mine figure would be from 1.5 to 5 tons of ore broken per foot drilled, depending on the height and width of stope and the presence of openings at the top flat of ore in the heading.

Types of machine drills commonly used in the district are the Ingersoll-Rand Butterfly piston machine, Sullivan "Liteweight" with water attachment, the Wood piston drill, Ingersoll-Leyner hammer machine and the Ingersoll-Rand "Jackhamer."

The common explosives used in the district are 30, 35 and 40% blasting gelatin, and ammonia-nitrate explosives. The explosive comes in boxes containing 50 lb., with 85 to 130 sticks to the box. The explosive is kept in a surface magazine placed at a considerable distance from the surface plant. The thawing house is seldom placed nearer than 300 ft. from the mine buildings.

At most of the mines the machine drillers blow out, load and shoot the holes they drill. Blasting on both day and night shifts is usually done at about 3:30 o'clock. In some of the mines "boulders," or large, loose fragments of rock broken loose by the previous shift, are broken at the lunch hour in the middle of the shift. Some of the mining companies eliminate most of the large boulders and break the rock finer by drilling more holes and using less explosive in each hole. The practice of squibbing except in deep stope holes is disappearing from the district.

After completing drilling for the day each machine man blows out his holes and loads them by shoving the split sticks of powder into the hole with a wooden "tamping" bar tipped with wood or copper. The cap or detonator is put in one of the last two or three sticks of explosives placed in the hole. The detonator used is No. 6 or No. 8. After placing all of the explosive in the hole some companies fill the hole to the collar with a specially prepared tamping, or damp clay or earth. A 50-lb. box of 35% explosive should break from 40 to 60 tons of ore in heading work and from 75 to 100 tons in stope work. A general mine average is from 50 to 100 tons per box of powder.

Few of the mines require any timber. [illegible] few posts to give warning of any settling of [illegible] where

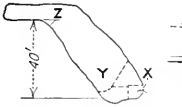

FIG. 22. VERTICAL SECTION OF OREDOBY

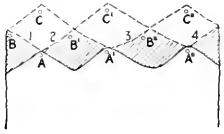

FIG. 28. HOLES FOR BREAKING HEADING

the pillars are not close; but the roof in most of the mines is a solid, thick-bedded limestone. One shallow mine in the district with no solid roof uses the square-set system of timbering.

Mucking Usually Done by Contract

The ore as broken from the stopes and headings is shoveled into sheet-iron tubs or cans, cylindrical in shape and made in sizes 24x24 in., 28x30 in., and 30x30 in.; and where cages are used, cars of different sizes are employed. The 30x30-in. and 28x30-in. cans are called 1000 lb. of ore. Since it takes about 12 cu.ft. of broken ore to make 1000 lb., the 30x30-in. can probably most nearly represents 1000 lb. of ore, especially since the cans are not filled level with the top.

Most of the loading is done by contract shovelers who receive 5, 6 or 7c. per 1000-lb. can, depending on the distance they have to tram the loaded cans. Most of the contract shovelers are foreigners—Bulgarians, Slavs, Poles and Russians.

Several systems of haulage are used. In most of the mines the cans (placed on ground cars), or the ore cars after being loaded, are shoved or trammed to the shaft by men who do nothing else. In other mines mule haulage is used for conveying the ore, and in several others gasoline locomotives are used. When the face of the ore is not more than 300 or 400 ft. from the shaft the contract shovelers convey the loaded ore to the shaft. Underground-rope haulage, electric-motor haulage and compressed-air locomotive haulage have never been attempted in the mines of the district.

Geared and Belted Hoists Used

Motor-driven or steam-driven geared hoists or hoists belt-driven by gasoline engines are used in the district. The latter type is not used in the larger and deeper mines. The hoist is usually placed on the landing platform of the hoisting derrick when "cans" or skips are used for hoisting the ore; but it is usually placed on the ground when cages are used for hoisting. In the former case no attempt has been made to balance the load, but in the latter case the cage has been balanced. When a cage or skip is used for hoisting the ore, cars are used underground instead of cans. When the cage is used the cars are carried to the surface on the cage platform, and when a skip is used the underground cars are dumped into an ore pocket, from which the ore is drawn into the skip.

The hoists in the larger mines are from 35 to 75 hp., and make the round trip with hoisting load in from 25 to 45 sec., and can handle from 200 to 500 tons per 9-hr. shift. The usual size of hoisting cable used is 5/8 in. The can and tub bails are usually 1 1/4-in. Norway iron. The cable hooks are 1 1/4-in. Norway iron. Two types are used in the district—one a snap hook and the other the pig-tail or spiral type.

The larger mines use steam or electric power. Some of the smaller ones use gasoline- or oil-engine power.

Much of the electric power is purchased from the Interstate Light & Power Co., of Galena, Ill., or the Mineral Point Light & Power Co., of Mineral Point, Wis. Most of the mining properties of the district require from 75 to 150 hp. for mining, milling and pumping operations. The tendency of the district is toward all-electric power for mining operations.

(To be concluded)

Tenderfoot Hill, Cripple Creek

Special Correspondence

Tenderfoot Hill, Cripple Creek, is at the north end of the district. It was along Poverty Gulch at the base of this hill that Bob Womack, in December, 1890, found rich ore. Here also, E. M. De la Vergne and T. F. Frisbee, two months later laid off the first mining claim in the district. This was recorded as the El Paso lode claim (not the same as the present well-known mine) but was subsequently renamed the Gold King. From it, the first shipment of ore from the region was made by wagon to Pueblo and gave returns of over $200 per ton. During the early years of the district, this mine produced $262,000. The vicinity was prospected, of course, and numerous mines were operated for a few years. But interest was gradually withdrawn by the successes being made in other parts of the district and, finally, when the official geological survey was published and it was shown that Tenderfoot Hill was on the rim of the extinct volcano, only a few miners and investors retained faith in the vicinity. One by one, after the removal of easily discovered oreshoots, the pioneer mines on this hill were closed down. One such mine was the Mollie Kathleen—just north of the El Paso-Gold King—belonging to M. C. Gortner who, from his 700-ft. shaft and two short levels, prior to 1904, produced about $200,000. His vein was pyritiferous and related to a basaltic dike in breccia.

A revival in prospecting has recently swept over this district and miners have taken leases on mines that were long neglected. Activity is being shown in nearly all the Poverty Gulch and Tenderfoot Hill properties, especially so in the Abe Lincoln, Midget, Proper, Black Diamond, Lady Campbell, Jay Gould, Queen Bess, Ella W., Gold King and Mollie Kathleen mines as well as in the Sangre de Cristo tunnel. These are being reopened and developed anew and very interesting results are being reported. On the Ella W. claim, Lessees Mack and Johnson started a new hole and at grass roots encountered low-grade ore. They are shipping the stuff and have opened a pit or quarry, the limits or walls of the shoot not having as yet been reached in any direction. The few hundreds of tons thus far shipped have shown an average profit of about $16.50 per ton after deducting all costs and royalties.

Close upon this discovery came a strike in the Mollie Kathleen. This old mine recently changed ownership between members of the Gortner family at a valuation of less than $100, if we may believe the deed and the affixed war-tax stamps. It is under lease to Van Horn and Long, who have pushed ahead in the old drift on the 700 level and have opened 28 in. of very high-grade sylvanite and free-gold ore. Contemporaneously with this second disclosure on the north edge of the district, a strike of importance was made in the lower workings of the Ajax mine at the southern edge of the district, some miles distant. Large shipments from this last orebody are returning nearly $200 per ton.

A Blast Furnace Nearly Half a Century Old is reported as making a good record lately. This is No. 8 furnace of the Thomas Iron Co. at Alburtis, Penn., built in 1867. On July 15 the stack made 75 tons of foundry iron, the largest output ever reported from the furnace. The total for the week was 500 tons. The Thomas Iron Co. is now tearing down No. 2 and No. 4 stacks at Hokendauqua. Both are old stone furnaces and have not been in use for more than 10 years.

Cost of Mill Construction

By Harry T. Curran*

SYNOPSIS—Cost of mill construction varies with many conditions and circumstances, but the figures given in this article will serve as a basis for intelligent estimates. Actual costs of various operations are given.

Mill-construction costs are widely variable and the subject is a broad one. No two mills are alike, nor will their construction be carried on under the same conditions, yet the construction work itself is much the same in all. The figures given in this article are taken from my field notes and by modification they can be applied to any similar work.

The results of laborious search into metallurgical literature for mill-construction data are discouraging at the best. Little has been written on the subject, and the operator is prone to place too much reliance on "general figures," which in varied modern practice comprise the last word in unreliability. General figures are useful, however, in rough preliminary estimations. After it has been determined just what kind of a plant is needed, the site selected and drawings made, a thorough organization of plans should be established and every detail gone over in the mind's eye.

Preparation of Costs of Material

The first step is to estimate the yardage to be excavated, the amount of masonry or concrete work required, and then a complete list of all material should be made. The tendency is to overlook a multitude of small things which have considerable value in the aggregate. To the machinery specifications should be added a complete list of lumber, doors, windows, all hardware down to nails, pulleys, belts, lime, sand, broken rock—in fact everything that goes into the construction. The cost and weight of this can readily be determined by consulting reliable dealers and adding the necessary freight charges.

Planning the Preliminary Work

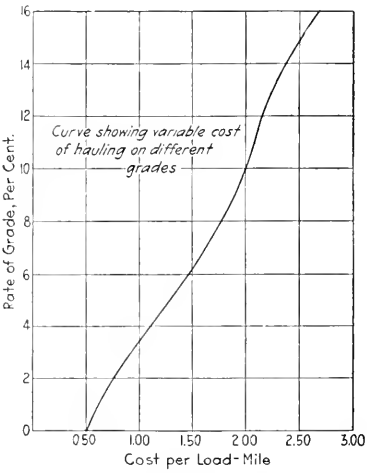
The next step should be the working out of a thorough development plan and an estimate of its cost. Everything should be made ready, so that when actual construction starts there will be neither confusion nor delay. The cost of this work is considerable and it is often neglected, with the consequent addition of excessive costs to some other part of the work. A great amount of future trouble and worry can be avoided by a careful planning for a few important features, which will be mentioned.

Unloading facilities and material and tools to do it with should be provided. A good road to the plant should be built and convenient deliveries arranged for. It is a noticeable fact that many a well-constructed mill has such poor facilities for receiving supplies that the extra cost for a year would probably build everything needed to make such work easy and cheap. Ample room ought to be set aside for timber yards and all lumber should be marked and piled so that a glance will determine just what part of the job it was bought for.

*206 Ideal Bldg., Denver, Colo.

A handy place should be marked off for a storage house and its cost estimated. It is surprising what a number of small things will be lost or misplaced without such storage. Roomy framing plots, as level as possible, should be marked off and handy places for machinery storage determined, keeping in mind pieces which will be first used and their situation. The supply of gravel, sand and rock must be looked into and arrangements made for its cheap delivery at any point. All details for disposing of rock and earth excavated with the least possible amount of handling should be planned.

The labor question must be studied and complete arrangements made for the comfort of the men. Their efficiency will vary directly with the conditions of their surroundings. Recently, in the West, a so-called mining man, who had never given human nature a moment's thought attempted to build a mill in an out-of-the-way place with no fit accommodations for anyone but himself. The results were disastrous for the company. Good men



HAULING COSTS IN MILL CONSTRUCTION

could not be kept and the mill was finished up at an excess in cost of more than $50,000. Some of the tanks collapsed on their foundations with the first filling.

The cost of all this preliminary work can be estimated by the man on the ground; it averages from 5 to 10% of the total. If it is neglected, confusion and delays throughout the job are the inevitable result. Good organization is just as essential to the construction of a plant as to its operation.

Consideration of Erection Costs

Erection costs are variable and can only be obtained by experience or by comparison with other jobs. If all necessary steps are taken to avoid delays estimates can be made dependable within reasonable limits. Fixed rules cannot be given for this part of the work. They will vary with the wages, efficiency of labor, climatic conditions

and the experience of the man in charge. However, if the rules given in this article are applied for summer work in the United States, the estimate will come approximately close to actual cost. Labor wage is based on the average paid in Western mining camps.

Superintendence can be figured when conditions are known, and will average, including cost of plans, from 3 to 5% of the total. Excavation by picking, shoveling, and hauling average earth in wheelbarrows, moving 100 ft., will cost about 15c. per cu.yd.; add 1/3 of hourly wage of laborer for every additional 100 ft. Where mine cars can be used to advantage this may be cut to 35c. per cu.yd., moving 100 ft.; add 1/5 of hourly wage for every additional 100 ft., which covers placing the track. Breaking rock by hand-like hauling conditions, will cost from $1.25 to $1.75 per cu.yd., with 100 ft. haul. It will cost a few cents more per yd. than in earth work for every additional 100 ft. There are so many unknown quantities entering into excavating that these figures are only roughly approximate.

Masonry and Concrete Construction

Rubble masonry will average $5 per cu.yd., using cement mortar. A mix of one part of portland cement to five parts of sharp, clean sand will give good results. Such walls will average about 15-in. courses and will require from 1/4 to 1/3 cu.yd. of mortar per cu.yd. of wall. Concrete work can be figured to a nicety when conditions are known. With a mechanical mixer $1 a yd. will cover the cost of mixing and placing in the average mill. On a large job it is well to determine just what mix is required with the material used. The duty of the sand is to fill the voids in the broken rock and, when the two are mixed, the resultant voids should be filled with cement. It is well to allow 10% excess in each case, but there is nothing gained by using a richer mix for retaining walls and foundation. However, if a weaker mix is desired it can be obtained by puddling instead of cutting down the proportion of sand and cement. In forms of any size puddling is good practice and the strength of the concrete is by no means decreased. Clean, firm rock should be used and the edges should not touch. On the average mill job concrete will not cost more than $7 per cu.yd. for large forms, $8 for medium, and $10 for small and heavy-duty machine foundations, including the cost of the forms. By using old iron, reinforced concrete can be made for 50c. per yd. more. Floors with a 5-in. base and 1-in. covering will average from $10 to $11 per cu.yd.

Unloading and hauling depend upon conditions. There will be a fixed average charge of from 30c. to 40c. per ton. Small pieces should be handled for less, but large unyielding pieces, such as a tube mill, can easily cost to $1 per ton. Probably 15c. per ton-mile would be a good average for hauling on any kind of a decent road and grade. By consulting local freighters these things can be definitely settled. The accompanying curve shows the variable cost of hauling on different grades. For example, consider 50c. per load as a cost unit, representing a reasonable cost per mile on level roads, so that a comparison of costs on different grades can be found.

Carpenter work with a well organized crew of millwrights will average about $24 per M for framing and erecting; $12 to $15 per M for siding and roofing and $2.50 per M for shingles or 75c. to $1 per square for corrugated iron roofing and siding. With a picked-up local crew, $28 to $31 per M for framing and erecting, $19 per M for siding and roofing and $2.50 per M for shingles or $1.25 per square for iron, will be the average figures. The nails required in this work per M will be about as shown in the table.

NAILS REQUIRED IN ERECTION

	D	Lb.
Siding and roofing	8	18 to 21
Flooring (1-in. material)	8	28 to 32
Flooring (2-in. material)	20 or 30	20 to 25
Studding, etc.	10	14
Shingles (per 1000)	4	6

Assembling and erecting machinery depends upon the nature of the machinery. A good point to emphasize here is that poorly stored machinery may easily add several dollars per ton to erection costs. An experienced engineer will size up the job and divide the material into different classes. It is then usually figured on a tonnage basis. Generally speaking, the heavier the piece the less the erection cost per ton. Steel tanks over 3/8 in. thick can be erected for $35 per ton; for 3/8 in. or less from $40 to $45 per ton. To place engines, stamps, crushers, pumps, to line up shafting, set electric motors, including wiring, etc., about $45 per ton of iron. To set up concentrating machinery, classifiers, filters, etc., from $50 to $65 per ton. These figures cover the necessary carpenter work, placing pulleys, belts, and adjustments. When the carpenter work is figured separately these figures are high. Under these conditions it will cost from $25 to $30 per ton of iron to place engines, stamps, crushers, lineup shafting, etc. To set up concentrating machinery, classifiers, filters, etc., from $30 to $45 per ton. This of course includes placing pulleys, belts, and adjustments. The pipe work in the average mill will cost from $40 to $45 per ton. Erecting wooden tanks costs around $12 per M. Reduction works constructed wholly of steel are now becoming popular where the winters are not too severe. Framework of steel can be erected for $12 to $15 per ton by contract. A good contractor with a crew of construction men will make money at these figures. However, the amateur will do well if he shades the figures at all.

Recently the construction of a 50-ton combination concentrating and cyanide plant came under my notice. The contract was taken for just a little under $30 per M, and the same price per ton for machinery erection, which also included all foundations and concrete work. The total cost of the mill was around $30,000, but it is just under a finished product in every way and is bound to give considerable trouble that will eventually cost more, not considering delays, than the extra thousand or two dollars it would have taken to make it a finished mill in the first place.

Small items are important and there are a number of them. Considerable timber is required for staging and a number of unavoidable losses must be allowed for. The building should be painted, fire protection and heating arranged and office and laboratory equipment bought.

Cost of Making Alterations

The expense of the breaking-in period and necessary alterations are often overlooked. Here we have the personal equation entering. It is a bet by the designer and constructor on his own ability. It is a good idea

to allow 10% of the total cost for possible changes, while any excess is often useful to cover the expense of unavoidable delays. I have in mind two mills, designed by two well-known metallurgists, where the starting-up period took in one case 5% of the total expenditure and 15% in the other. The operator has a problem different from that of the man who follows construction only. When the former designs and constructs a mill he must worry through the breaking-in period and come out with a mill that is satisfactory in every way. On the other hand, the construction man generally has a contract and his responsibility ends by turning over a mill that is up to specifications, which may mean a good mill or a very poor one from the operator's standpoint.

Difficulties of Winter Construction

In the northern United States winter work is a tough undertaking at its best and should be avoided if possible. With an average winter the excess cost will easily foot up to 33% of the total labor expenditure. With an open, mild winter these figures are high, but with a cold, snowy winter they may easily reach 50%. Concrete work often costs 35% more, as complete arrangements must be made for heating and protecting against frost until after the preliminary set. After 12 hr., freezing can only retard the final set, but cannot injure the concrete.

A brief description of methods used in a winter concrete job may be of interest. A steam coil 12x12 ft. was made out of 2-in. pipe spaced one ft. apart, and perforated every 6 in. with $\frac{3}{16}$-in. holes. This made it possible to keep plenty of broken rock heated ahead of the mixer. Barrels were arranged on the mixer platform so that the water could be heated to the boiling point with steam. A 10% salt solution was made, which in no way seemed to damage the concrete. The sand was not heated. Live steam was turned into the forms before pouring, sufficient time being allowed to draw the frost a few inches. Large forms were simply well covered with canvas after filling; the concrete stayed above the freezing point for a couple of days even in the coldest weather. Small forms were protected by steam hose and fires for 12 hr. Calcium chloride is probably better than sodium chloride, since its solution freezes at a lower temperature and it also increases the waterproof quality of the concrete. It has been proven that concrete with 2% of calcium chloride gives the best resistance. More than 2% of it unduly increases the speed of setting and weakens the concrete. Since from 10 to 15% of water is used in mixing concrete, a 2% mix would be given by using a 15 or 20% solution. A 20% sodium-chloride solution freezes at about 7° F., while a 20% calcium-chloride solution will not freeze until it reaches about the zero mark.

On a winter job of any size an inclosed framing shed will pay for itself many times over. It is not only useful during the framing period, but is a happy addition on a bitter cold day during the erecting period when the carpenters would otherwise have to be laid off. There are always launders, doors, plate beds, or a multitude of small things that they can work at under protection from the weather. When the mill is finally under cover it can be kept comfortable and the work will go on much more efficiently.

Remodeling old mills is in a class by itself and each case presents a special problem depending upon the extent of the work and the condition of the mill. Like a new mill the cost of excavating, concrete, machinery, etc., can be rather accurately figured on, but the amount of hardware and lumber that can be used again and the amount of new material required is often misleading. The carpenter work and assembling of machinery will generally cost twice as much as in a new plant. It is a tearing down and building up process that no rules can be given for.

The main causes for underestimates are:

Guess work, lack of good organization, false economy, omissions and change of plans, neglect of preliminary work, too much reliance placed on general figures, and inefficiency of labor resulting from surroundings. Under unavoidable circumstances may be mentioned unexpected strikes or inefficient labor, bad-weather delays and the failure of railroads or supply houses to deliver material as expected.

Any reputable machine house will give valuable information. Nearly all have one or more experienced engineers and will gladly go into all details with the buyer. It is a mistaken idea to think that they let their responsibility end with the last car of machinery that leaves their plant. This is far from being the truth, as I know through personal experience that they will go to considerable expenditure of time and money to start a plant right or to give sound advice at any time. There are plenty of would-be metallurgists who are always willing to build a plant for half the bid of a reputable house, but without exception they are a most expensive "economy." This also applies to the manufacturer of untested goods. Almost without exception a small mining company cannot afford to experiment with such things. If there is merit in the innovation the larger companies will soon pick it up and demonstrate it.

While realizing that these figures are subject, to a certain extent, to the criticism of experienced construction engineers, they are given with the hope that they may be useful to some operator who finds himself up against a mill-construction job. If the plans are followed, a good organization maintained and efficient labor secured, the figures will be found a little higher than actual costs. Mill construction is by no means an exact science, but experience will give every one his own empiric formulas upon which he can bank. Sectionalized machinery for mule-back haulage cannot be erected at these prices.

Platinum Production in 1914

According to statistics compiled by J. M. Hill for the Geological Survey, the production of refined platinum in the United States in 1914 was 3541 oz., or more than three times that reported in 1913, when it was 1034 oz. The production in 1914 included 570 oz. crude platinum from placer mining in Oregon and California, equal to 525 oz. refined metal; this was an increase of 141 oz. over the previous year. Of the crude metal 108 oz. came from Oregon and 462 oz. from the dredge operations of Butte, Yuba, Sacramento and Calaveras Counties in California.

The second source of platinum in 1914 was the Boss gold mine near Goodsprings, Nev., where platinum was first recovered and saved in 1913. In 1914 the mine produced 110 oz., which was parted from the gold.

Besides the platinum thus obtained from placers and mines there was 2906 oz. saved by smelters and refiners of gold and copper bullion and matte. This includes material of both foreign and domestic origin, and the total compares with 650 oz. in the previous year.

The secondary platinum industry in 1914 handled 40,826 oz. metal, which was obtained from scrap and sweepings of the jewelry and dental manufacturing trades, and from scrap dishes and other chemical utensils. Imports in 1914 were 40,156 oz. ingots, bars, plates, etc., and 32,111 oz. unmanufactured; a total of 72,267 oz. platinum, besides chemical ware valued at $39,143, the weight of which is not given.

Proposed Export Tax in Peru

The mining industry of Peru after enjoying immunity from special taxation for 18 years, now faces a serious problem in the proposed export-tax bills, which have been drafted by the Consejo Superior de Minería and which will be acted upon by the Peruvian Congress in November. The *West Coast Leader* of July 1, 1915, publishes some of the proposed tariffs and discusses the effects that such taxes may have on the mining industry of Peru:

> When the period of 18 years was set for the free exportation of minerals from Peru, it was doubtless considered that in this time the industry would achieve such prosperity and vigorous life that it could well afford to pay a special contribution into the coffers of the state. Unfortunately this has not been the case. Railway development, the primary factor

* As reported by the "West Coast Leader." With copper selling at 17c. per lb., the proposed tax on, say, a 50,000,000-lb. production in Peru by Cerro de Pasco would mean an annual tax of about $250,000. In Chile the proposed tax would cost the Chile Exploration Co. over $600,000 annually for a production of 120,000,000 lb. † L.p. = libra peruana, equivalent to the pound sterling when exchange is at a parity.

> in exploiting the natural resources of Peru, has fallen thousands of kilometers behind the expectations of two decades ago. In fact, during this period there has not been a single line of the first magnitude constructed. With the exception of the connections established by the Cerro de Pasco company, the principal mining districts are as remote from important railway lines as they were in the days of Pizarro. The casual reader may pick up any one of a dozen articles on mining possibilities of Peru and find somewhere the damning information that such and such rich deposits are "too far from railway or water transportation to be worked profitably." The mining industry of Peru, in other words, is still in its infancy. Its future prosperity depends on that magical touchstone of all new countries—the ingress of foreign capital.
>
> The ingress of foreign capital depends primarily upon the wisdom and farsightedness with which the Government formulates its laws and regulations pertaining to the exploitation of the natural resources. The vital question now awaiting resolution is how heavy a mortgage the lawmakers of Peru will place upon the future of the mining industry in order to obtain a few thousand pounds ready cash for the exigencies of today.

The *West Coast Leader* presents for comparison the proposed export tax on copper now before the Chilean Congress and the export tax actually in existence in Bolivia. The high scale of both of these countries in comparison with the proposed Peruvian scale is, it says, easily explainable through the fact that in Chile the transportation of mineral products from mines to ports is comparatively easy; in Bolivia, the principal producers work a native copper ore which is easily reduced.

The Sociedad Nacional de Minería has submitted to the council its protest against the proposed measures as they stand, claiming they will be oppressive to the mining industry and subversive in ultimate effect on the progress of the country, as well as on the people directly employed in mining. Mineral exports in 1913 were 46.82% of the total exports of the country. The committee on copper recommended that the proposed tax of L.p.0.2.50 per metric ton, instead of applying to the London price of £50-£55, begins at £65-£70, and continues upward as shown in the table to a maximum of L.p.3.7.50 when copper is £100 or over in London.

The main sources of revenue from the proposed tax in Peru will of course be the Cerro de Pasco and the Backus & Johnston companies. Notwithstanding that these companies will be badly affected by the new tax, the small producer will be in a still more hazardous position. The discouragement of the small producer or of the operator of moderate size will mean a serious setback to the mining industry of Peru. It is putting a premium on the sort of development that took place in Peru from the 15th to the 20th century, instead of the building up of such industries as that of Cerro de Pasco, which has spent over $25,000,000, built 125 miles of railway, and furnishes steady employment for several thousands of people in its various towns.

Shipping Ore by Parcel Post

SPECIAL CORRESPONDENCE

Shipping ore by parcel post will be continued even at increased cost by the mines in the Clearwater district of central Idaho which will not suffer so much as was feared from the new parcel-post schedule effective Sept. 1. From a ton to a ton and a half of concentrate has been shipped weekly by parcel post to the Washoe smeltery by way of Spokane at a cost of $1.08 a hundred, or $21.60 a ton. On account of poor roads from the mines to the railway the Government has been losing heavily on the deal and it was proposed at one time to spend $100,000 on roads in order to overcome the difficulty.

In the recent order of the postmaster-general advantage is taken of the roundabout routing of the mail to place the mines in the third-rate zone from Anaconda instead of the second. The mines are about 150 miles in an air line from the Anaconda plant, but the distance by the mail route is about 300 miles. The new regulations provide that, where the second-zone rate should apply but the distance by the mail route is more than 300 miles, the third-zone rate shall apply beginning Sept. 1. Clearwater operators propose to meet the situation by shipping by parcel post to Stites, a station on the Northern Pacific Ry., at $21.50 a ton, and reshipping from there to Butte by freight at $5 a ton in carload lots. The total cost of transportation from the mines to the smelter will therefore be $26.60 instead of $21.60, but this difference is not considered to offer a serious handicap to profitable operations. Several new mines at Elk City, Newsome, Ten Mile and Dixie are being put in shape for production and it is probable that shipments of concentrate will soon be materially increased.

Electrical Plant of the Wakefield Iron Co.

By Holman I. Pearl* and Joe Green†

SYNOPSIS—Electrical power plant in district where electrical installations are rare. Supplies two shafts 2000 ft. apart. Boilers fitted with automatic stokers, superheaters and induced draft. Turbo-generators provided with new overload device to absorb peak loads of hoisting without resort to expensive Ilgner flywheel installation. Elaborate switchboard equipment. All underground pumps driven by induction motors.

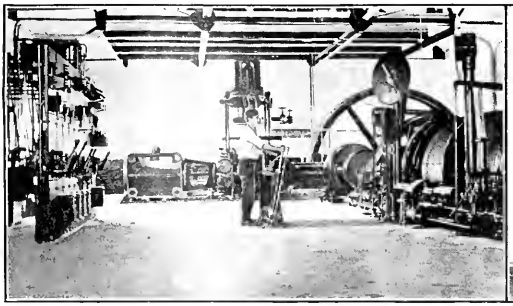
The advantages of electrical power over steam power for mine operation and the relative merits and efficiency of the two methods have long been favorite topics for discussion among mine operators and managers of the Lake Superior district, and yet the advocates of electrical operation who have actually put their theories to the test in this district, are few. The most recent electrical installation on the Lake Superior ranges is that at the Wakefield mine at Wakefield, Mich., on the Gogebic Range; and mining men of the district are awaiting with interest the results to be obtained by some of the modern features of this new plant.

The Wakefield mine, a soft hematite property, is a comparatively young entrant into the producing field—shaft-sinking having started in February, 1913. With the exception of underground and stock-pile trestle haulage, the mine has been operated by steam power up to the present. Construction of the new power plant and its substations was begun a year ago, and the electrical installation is expected to be completed and put into operation on Sept. 1. As soon as the underground pumping installation is completed the plant will be run on full time, all the hoisting, underground and surface haulage, lighting, underground fan ventilation, air compression and pumping being done by electricity generated on the Wakefield property.

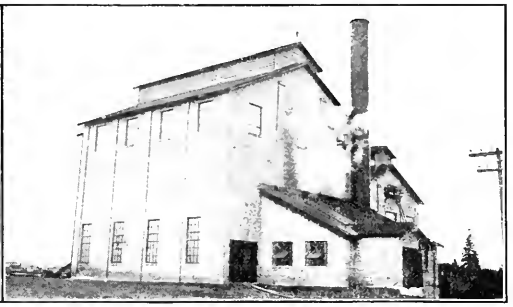
The mine is worked by both underground and open pit methods, the Wakefield Iron Co. being the only one to have successfully worked an openpit on the Gogebic Range. Stripping was started in September, 1913. During the season of 1914 there were shipped from the pit 240,000 tons of ore. Two shafts, 2000 ft. apart, are being operated; *A* shaft, now at a depth of 250 ft., and *B* shaft, at a depth of 100 ft. The relative locations of the shafts, pit and mine buildings are indicated on the accompanying plan (p. 350).

The power plant, which is steam driven, is located for convenience of water supply on the banks of a branch of the Black River, 2000 ft. east of *B* shaft. Electrical power is transmitted at 2300 volts from the generators to the hoist houses at *B* and at *A* shafts.

The power-plant building measures 48x80 ft., with a 20x37-ft. addition, to house the feed pumps and draft fan. The boiler room is 48x48ft. with a height of 38 ft. to the roof trusses; the engine room is 32x48 ft. with a height of 15 ft. to the roof trusses, and a basement with 8-ft. headroom.



INTERIOR OF B HOIST HOUSE



THE STEAM POWER PLANT

High Pressure and Superheat Used

The boiler-plant equipment consists of two 250-hp. vertical water-tube Wicke boilers, fitted with Roney new model automatic stokers. The boilers are designed to operate at 175-lb. pressure and are provided with Foster superheaters, in the first pass, designed to give 100 deg. of superheat. The gases from the boilers pass through a Green fuel economizer to a short stack, and draft is maintained by a 7-ft. induced-draft fan. Automatic control of the draft is maintained by a Foster regulator, which varies the speed of the fan in accordance with the steam pressure in the header. Provision has been made in the boiler room for the addition of another boiler, and the economizer is also arranged so that another section of tubes can be installed when the load conditions demand the third boiler. As a further allowance for extensions a temporary end wall has been built on the boiler house, so that the building can be enlarged conveniently.

The steam-piping system is all constructed of extra-heavy pipes, and all fittings are cast steel. All valves are specially constructed for use on superheated steam.

*Mining engineer, Wakefield Iron Co., Wakefield, Mich.
†Electrical engineer, Wakefield Iron Co., Wakefield, Mich.

Edwards non-return valves are fitted on the boilers to prevent accident in the event of the blowing out of a tube.

Screenings, having a calorific value of 13,000 B.t.u., will be used as fuel, being stocked by trestle in a storage yard of 6000-tons capacity adjacent to the power plant, and conveyed by car to the boiler room through a tunnel running under the coal pile. At the boiler house the coal car is raised by an electrically driven elevator, to a track running over the coal bunkers which have a capacity of 60 tons. The coal is fed through chutes, having regulating gates, into the stokers. It is estimated that one man working one shift will handle coal enough for a 24-hr. run.

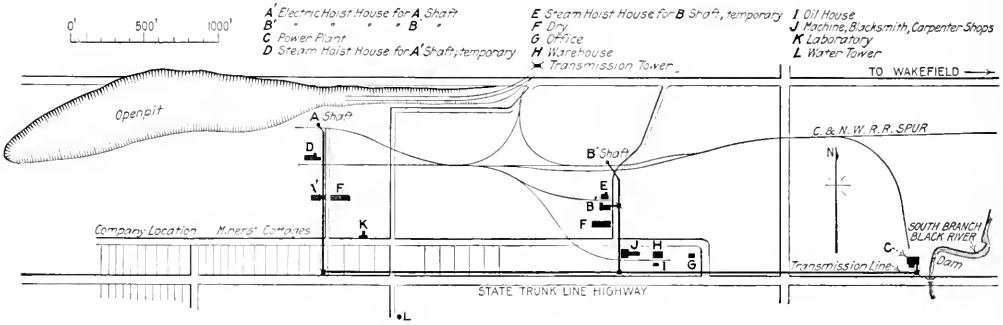
Ashes are dumped directly from the grate into concrete hoppers which feed into a car running in a tunnel under the boilers and are then hoisted by an hydraulic lift elevator to the dumping ground.

Boiler feed water is obtained from a centrally located storage tank, having a capacity of 30,000 gal., which also furnishes the water supply for the whole mine operation. Cast-iron water mains are laid throughout the system. The tank is served by a two-stage motor-driven turbine pump having a capacity of 180 gal. per min. against a 160-ft. head, located in the basement of the power-station engine room, and controlled automatically from a float in the tank.

A steam pump has also been installed as a standby in case of failure of electric power at any time. The boiler-feed water, before going to the economizer, is passed through a Hoppes open-type feed-water heater, which receives the exhaust steam from all the auxiliaries in the plant. In connection with the heater a Hoppes water weigher and recorder has been installed, which records on a chart daily the amount of feed water passing to the boilers. The boiler-feed pumps consist of two 10x6x10-in. duplex center-packed Worthington plunger pumps. Special attention has been given to the feed-water piping to eliminate any possibility of shutdowns. As a result, each boiler is provided with two independent sources of supply which are piped in at two separate places, one supply coming from the economizer and the other direct from the pump. The pumps also have two sources of supply—one from the heater and one from the main tank direct—and as throw-over valves are provided in both the suction and discharge it is possible to operate the pumps simultaneously on hot and cold water, and at the same time feed one boiler through the economizer and the other direct.

To provide for sufficient power to carry over the peak load of acceleration of hoisting and at the same time to avoid the heavy expense of the Ilgner flywheel system or the maintenance of otherwise unnecessarily large generating units, a specially designed Curtis turbo-generator was made for the plant by the General Electric Co. The design of this unit marks an innovation in electric-hoisting practice, with respect to absorbing peaks.

The governor is arranged to pass live steam into the second stage of the turbine at peak load. Normally the unit is rated at 750 kv.-a., but it is capable of developing 1125 kv.-a., and maintaining it for 10 sec.—the accelerating period of the hoists. The turbine runs condensing and is provided with an Alberger spiroflo surface condenser and dry-vacuum pump. The condensate is pumped back to the feed-water heater by a small electrically driven centrifugal pump. Circulating water for the condenser is pumped from a concrete well in the basement of the generator room—connected by a tunnel to the river above a small dam—and discharged into a well connected by a second tunnel with the river below the dam, a difference in head being thereby maintained, so that a syphon action is obtained which materially reduces the power required by the circulating pump.



PLAN OF SURFACE ARRANGEMENTS, WAKEFIELD IRON CO.

A second unit is provided consisting of a 100 kv.-a., two-stage Curtis turbine with a jet condenser. Provision, however, has been made throughout for the future installation of another unit similar to the special turbo-generator first described. The condensing apparatus and pumps are installed in the basement of the generator room; the turbines, dry-vacuum pump, and switchboard are on the main floor.

Power is generated at 2300 volts. Three-phase, 60-cycle a. c. is used throughout the system, with the exception of the lights and some of the small motors for which it is transformed to 440 and 220 volts, and the underground and surface haulage which operate at 250 volts, d. c., furnished by motor-generator sets.

Switchboard

The switchboard in the power plant consists of a six-panel board divided as follows: Two generator panels, a regulator panel, an exciter panel, and two feeder panels, with remote-control oil switches mounted on pipe framework in the back of the board. Each feeder panel is provided with a recording wattmeter and an ammeter; generator panels are provided with indicating wattmeters and

ammeters, turbine-governor control switches and proper arrangements for synchronizing. Voltage is maintained constant on the feeders by a Tyril voltage regulator. All current and potential transformers, rheostats, etc., are installed in a vault directly under the switchboard. Lightning arresters and choke coils are installed where feeders leave the building.

Power is transmitted to the substations at *A* and *B* hoist houses by two 3-phase circuits, with switching arrangement at *B* for cutting either *A* or *B* stations, or both, onto either feeder. A 3-phase circuit is also carried for lighting of residences and mine buildings, and a series lighting system with type-C Mazda lamps for lighting highways and yards.

Substations

The hoist house at *A* shaft is 34x62 ft. with a height of 12 ft. to the roof trusses. The *B* hoist house is essentially the same size, with a 21x52-ft. addition to house the compressor, which supplies air to both shafts.

Both stations have the same hoisting equipment, consisting of a double drum ore hoist capable of lifting three tons of ore in 3400-lb. skips with a rope speed of 750 ft. per min.; driven by a 250-hp., 450-r.p.m. induction motor of the slip-ring type, and a single drum man-hoist driven by a 150-hp. motor. The hoists were manufactured by the Nordberg Co., and were described in the *Journal* of Apr. 24, 1915. They are controlled and operated by a contactor panel with master controller arranged for automatic acceleration. Complete automatic safety devices to prevent overwind are installed. These are driven from each drum of the hoist and automatically slow up the motor as the skip approaches the surface and shut the current off entirely through the master controller as it enters the dump. Provision is made for the automatic application of the brakes as soon as the skip passes the winding limit, and as an added precaution a limit switch is installed on the headframe which is engaged by the bail of the skip.

A motor-generator of 100 kw. capacity, generating 250 volts d. c., is provided for underground and surface haulage. A low frequency current of 80 volts furnished by a small motor-generator set is used for the signalling bells, which are of the a.c., polarized type. Return push buttons and tell-tales are provided at the landing, collar, and on all levels of the shaft.

The compressor, of 1800 cu.ft. per min. capacity, is rope driven from a 325-kv.-a., 2200-volt, synchronous motor running at 360 r.p.m.

Underground Pumping Equipment

On the 250-ft. level at *A* shaft there is being installed a power-type geared pump, supplied by the Imperial Iron Works of Duluth, having a capacity of 1000 gal. per min., driven by a 100-hp., 2200-volt slip-ring induction motor through herring-bone gearing. This pump is arranged for automatic control from a float in the sump so that it will always operate at full-load conditions. This tends to economy, since the pump has a capacity of nearly twice the normal water flow owing to the necessity of handling the drainage from the open-pit, which of course varies with the rainfall. Large water storage permits of this method of operation. As a further protection in case extremely heavy rains suddenly increase the flow from the open-pit, a Worthington two-stage centrifugal pump, having a capacity of 1500 gal. per min. and driven by a 150-hp. motor, is being installed.

On the 100-ft. level at *B* shaft the pumping equipment consists of a power type Prescott pump with a capacity of 600 gal. per min., driven by a 75-hp., 2200-volt slip-ring motor through herring-bone gearing. This pump is also automatically controlled by means of a float in the sump.

Power will be transmitted to the pumping stations in both shafts through self-supporting three-conductor armored and leaded cambric cables.

All electrical units are of G. E. manufacture and are housed in modern buildings of brick and steel construction erected during the summer of 1914 by the Worden-Allen Co., Chicago. These buildings are of the same type as and designed to harmonize with two large "drys" (one at each shaft, accommodating 400 men each), a combined machine, blacksmith and carpenter shop, a warehouse and an oil-storage house.

The plant was designed by Robert S. Walker of Duluth, chief mechanical and electrical engineer of the operating company. Aleck Noal, master mechanic of the company, had charge of the construction and installation. W. C. Hart is superintendent for the Wakefield Iron Co.

Electro-Thermic Iron-Ore Smelting in Scandinavia

Special Correspondence

Professor Farup, comparing the relative progress of Norway and Sweden in the domain of electro-thermic iron-ore smelting, gives the total of Sweden's electrically produced pig iron from Jan. 1 to June 30, 1914, as 16,367 tons, and the estimated amount in 1915 at about 40,000 to 50,000 tons. At the Tinfoss ironworks in Norway the treatment of Norwegian ores is proceeding satisfactorily. In Sweden, especially at Domnarfvet and Trollhattan, there are a number of smelting plants in full operation. Dealing with the several types of furnace in use Farup does not take it for granted that, as in the blast-furnace industry, a special type would be adopted and that type a shaft furnace. It should be borne in mind that in the electro-thermic method the available gas quantities are far less than those derived by the ordinary blast-furnace process. As a matter of fact, it was only one-tenth as much. As a result the use of these gases, which is the main object of the shaft furnace, is of lesser consequence and thereby also the shaft. The advantage of the shafts consists in the lesser consumption of coke as a reducing material—about 60 kg. less per ton of pig iron. There is also about 10% less electric power used. On the other hand the shaft furnace involves the so-called "shaft troubles," which the shaftless type naturally does not. The shaftless furnace is much cheaper in construction and of far greater unit power. An undoubted advantage in the shaft furnaces is, nevertheless, the shaft reduction. Economically considered, too little regard is paid to ore costs. In Norway, the latter is anything up to 40 kroner (1 kroner = 27c.), whereas in Sweden the limit is 15 to 16 kroner per ton of pig iron. In Sweden, rich ores (60% Fe) are used. In Norway low-grade ores are partly resorted to (the Hardanger iron works uses those of 40% Fe). And the lower the grade of ore the less should be the ore costs. In that connection, Norway's

ore cost per ton should be less than that in Sweden, but it should be noted that the committee appointed in Norway in 1907 to consider the question did not even take the low-grade ores into account. But where power and ore are cheap it will be possible to employ low-grade ores. The utilization of the electric energy by the electric furnace is of the utmost importance. In Norway, the loss is put at 10%, while in Sweden (at Trollhattan) it is 15% of one furnace. With the construction of more furnaces this loss, however, will be reduced. The unequal load, peculiar to the electric furnace, is most unfortunate. Were it possible to establish a contract for electric power on the basis that a certain minimum could be maintained and the overloading paid per scale, it would be of immense advantage. At the Hardanger ironworks, Norway, the load was not only very unequal, but the transformer was too small to deal with higher tensions. Low-grade ores were also used, with a consequent large consumption of limestone; the cold limestone so affected the electrodes that they would not "bite," so to speak. When in addition the ore was likewise zinc-containing, it is strange that the Hardanger proposition held out as long as it did.

Straight Briquettes Work Poorly in Furnace

Sydvaranger, Norway, briquettes were also brought into use, but these showed the unfavorable property of carbonizing and increasing in volume in the shaft. The briquettes split and collapsed. This might be considered as of bad omen for Norwegian smelting, where only slig and briquettes are available, but Professor Farup has no fears for the future in that respect. At Hardanger a roaster was also experimentally employed to bring the slig together in lumps, but the result was not as anticipated, for not a single lump was formed. Failing this, the slig was used together with a cheap ore which, being also associated with much limestone, formed a solid mass, as the tension was insufficient. Too much stress should not, however, be laid upon the unfortunate result of the workings at Hardanger. For when one has reached an ore cost of 40 kroner per ton, without a sufficiently high tension to deal with the ore, electro-thermic iron-ore smelting is no longer justifiable.

As regards the question of limestone, it was certain that burning before use would have to be adopted. Many limestones have the quality of crumbling to a powder and choking the furnace, and in many cases this defect has been attributed to the coke when the limestone was solely in fault. Not all limestones, however, have this defect. They may be divided into three groups: (1) Those which crumble to powder before the maximum temperature is reached; (2) those which collapse on burning; (3) those which do not crumble. By previously burning the limestone, one obviates all that CO_2 gas which permeates the furnace when the limestone is directly used. This, so to speak, is like laying a "cold poultice" on the furnace shaft. A trouble in using burnt lime is its taking up water and thereby dissolving to powder. But this point can be inexpensively met by "dead-burning" the lime.

Passing to the much debated subject of coke versus charcoal, one of the most important questions connected with electric iron-ore smelting is, "Can coke be employed where charcoal can be used?" The volume taken up by charcoal is three times that of coke. This property in the charcoals should be of the greatest advantage over coke, as the gases have a better opportunity of working on the charge and the furnace is not so easily obstructed. But it is not volume alone which is the favorable factor in this respect. Equally advantageous is the interspace formed by the material in the furnace. And in that connection coke is the better of the two. The charcoal's quality of taking up water is very unfortunate. Charcoal which has been stored a short time often contains over 30% water. To dissipate this, a shaft heat is necessary. Likewise the charcoals may vary considerably in quality. Some of them are so loose that they collapse in the furnace and thereby stultify their claim to a large volume. As a reducing material coke is less variable, but the shady side of the coke problem is its large ash and sulphur content (10% ash and 0.8 to 1.0% S). One is accustomed, in Norway, to the dictum that charcoal cannot be procured in that country at reasonable prices. But this is not always the case. Swedish charcoal is furnished from the northern part of that country, right up to Finland. From those tracts as cheap a charcoal can be transported to Trondhjem, Norway, as to middle Sweden, the center of the Swedish furnace industry. An even cheaper freight may be obtained to the Norwegian port of Narvik. In Jämtland, Sweden, charcoal can be had for 75 ore (100 ore = 1 kroner = 27c.) per hl., and in central Sweden from 75 to 80 ore per hl. It was at one time thought that the byproducts from charcoal would prove valuable. At the most, the byproducts can be represented by 10 to 12 ore per hl., if they all may be utilized; but this is impossible, as one would thereby secure a considerable over-production of them, and prices would be depressed.

Coke Probably Not Responsible for Choking Shaft Furnaces

The charcoals are about 10 kroner per ton of pig iron dearer than coke. As against this disadvantage, there is the trouble connected with the use of coke, namely, the alleged obstruction of the furnace, though it is very improbable that it actually does this. More probable is it that the obstruction is due to inferior limestone. It has been said that it is possible to treat more slig with charcoal than with coke. The worst defect of the slig consists in its liability to run down and cause obstruction. To obviate this, coke is often better than charcoal. Part of the trouble with slig is associated with the smelting chamber where it forms "bridges" in the mass. That coke contributes to an uneven load is barely probable. Experiences at Hardanger do not prove this.

The use of coke in Norway is greatly to be preferred, even if others choose to adhere to charcoal. Consequently, it is for Norwegians to pursue their own investigations in a country where water power and coke are cheap. If charcoal iron is of better quality than coke iron, the latter, on the other hand, can be marketed at a much lower figure.

Coal and Petroleum Mining in Venezuela, according to a recent U. S. consular report, is still largely in the prospecting stage, the most active perhaps being the Caribbean Petroleum Co., an American corporation which has discovered oil in large quantities and should soon be exporting its product. The Venezuela Oil Concessions, Ltd. (British), is also making progress. The Caribbean Coal Co. has had engineers on its properties north of Maracaibo throughout the year and has about completed the preliminary work. If its plans meet the approval of the Government, it expects to build a railroad from its mines to the small port of Cojoro, which is outside the Maracaibo bar, deepening and enlarging the harbor.

Details of Practical Mining

Fourth of July Hand-Drilling Contest Results

The usual single- and double-hand drilling contests were held the Fourth of July in Western camps. From Idaho and Nevada came the following results:

At Wallace, drilling 15 min. in hard granite, Kinsella and Leaf, from the Tamarack & Custer mine, won first money, $350, by putting the steel down 31 11/16 in.; Rossman and Haff, with 33 7/8 in. to their credit, took second money; while St. Germain and Morrison, the Osburn drillers, were third with 33 3/16 in. Stokes brothers, of Moon Creek, drilled 32 3/16 in.

At Goldfield, drilling in a block of granite from Rockland, Calif., Collins and Lindquist won first money, $500, by drilling 40 3/4 in.; Hughes and Jelik were second, 39 7/16 in.; Schram and Olson third, 38 3/8 in. Single handed, Lindquist drilled 23 7/8 in., winning $252; Brooks was second, with 19 5/16 in., and Malli was third, with 18 9/16 in. to his credit.

Quick Solar Reduction by Slide-Rule

Engineers and surveyors do not make so much use as they should of direct solar observations by transit to locate the meridian. The principal reason for this is the fact that the formula for the reduction is involved and is easily forgotten. Recently a slide-rule has been developed for solving this equation, and the process is so much shortened that it may become popular. Accuracy is obtained by making the slide-rule scales 20 in. (50 cm.) long.

The front face of the slide-rule of the duplex type carries 7 scales which solve the equation

$$\cos Azimuth = \frac{\sin d}{\cos h \cos l} - \tan h \tan l$$

in which d = declination, l = latitude, h = altitude of the sun, ascertained by observation.

The scales on the front of the rule are, in order downward: Regular D scale; sin d from 2° 22′ to 24°; cos l and cos h scale from 0 to 84° 15′; regular C scale in the middle of the slide; tan scale from 5° 43′ to 45°; inverted tan scale from 20° 50′ to 55° and at the bottom an enlarged cos scale with adjacent scale of equal parts, for angles from 0° to 60°. Either this scale or the cos l and h scale in conjunction with the C scale is used for getting the final result, the azimuth angle, from the cos *Azimuth* which is obtained by subtracting two slide-rule results.

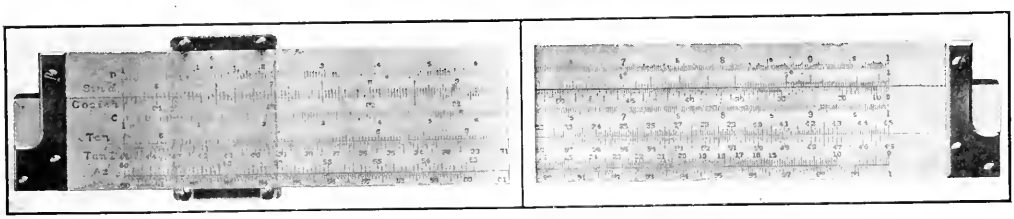
The following example to illustrate the use of the rule is given by B. J. Campbell, of the Keuffel & Esser Co., makers of the rule:

Latitude 40° 45′ N.; Longitude 74° 1′ W.; date Mar. 18, 1915, 3:57 p.m.; observed altitude 23° 49′; horizontal circle 156° 30′. Required the bearing angle with the meridian of an east station at zero of the horizontal circle.

The refraction correction to the observed altitude is,

$$\frac{0.96}{\tan h} = 2\ 2'$$

which is to be subtracted from the observed altitude, making the corrected altitude 23° 47′. The declination, taken from the ephemeris as —1° 15′ 49″ is corrected for change from Greenwich noon by multiplying the hourly correction by the elapsed time between noon plus the hour-angle of longitude of the place of observation west of Greenwich, in this case $59.3'' \times (4 + \frac{74}{15}) = 8'\ 50''$, making the corrected declination —1° 7′. This gives all the quantities necessary for solving the formula. The first part of the equation is solved by setting opposite 1° 7′ on the scale of sin d[1] the value cos 23° 47′ on the top scale of the slide, then moving the runner to the 0 index of the slide and again shifting the slide to bring cos 40° 45′ under the runner. The index of the slide then reads 281, which is to be read as —0.0281. The second half of the formula is obtained by setting 23° 47′ on the tan scale opposite 40° 45′ on the tan inverted scale just below, and reading opposite the left-hand index of the tan inverted scale the value 3798 on the C scale on the middle line of the slide. This is to be read as 0.3798. Subtracting the second term from the first gives —0.4079 as cos Azimuth. Setting this value on the C scale we read on the cos l and h scale the angle 65° 56′. This is measured from the 180° point, as the cosine is negative; since the observation is in the afternoon, the actual azimuth is 245° 56′. Subtracting the reading of the horizontal circle gives the true bearing of the zero point as 89° 26′.



FRONT OF SLIDE-RULE FOR REDUCING SOLAR OBSERVATIONS FOR AZIMUTH

A 20-in. rule, of duplex construction. The back carries regular slide-rule scales and a pair of stadia reduction scales

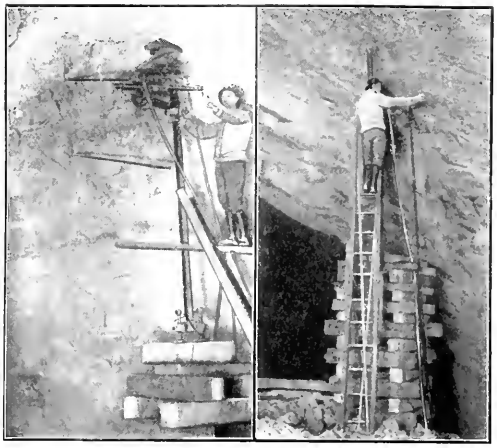
The slide-rule is of still further interest because of the equipment on its reverse side. This has the regular A, B, C and D scales (20 in. long), and on the middle of the slide an inverted C scale; and a pair of scales for reducing stadia observations, one of them a 31-in. scale for ($\frac{1}{2}$ sin 2 a), and the other a 6-in. scale for ($\cos^2 a$), giving respectively the elevation and the horizontal correction.—*Engineering News.*

[1] The sin d scale does not go below 2° 30′; but for other angles ½ sin 2d is equal to sin d, with very small error, and as one of the scales on the back of the rule gives ½ sin 2d, the present example uses this scale instead of

Backstoping with Breast Holes

By H. K. Sherry*

In a stope of Mine No. 1 of the American Zinc Co., at Mascot, Tenn., the sill floor had been cut out in previous operations to a height of 8 to 10 ft., leaving from 20 to 25 ft. of ore above. A longitudinal section of the



BACK STOPING WHERE HIGH BACK REQUIRES MUCH BLOCKING AND LONG COLUMNS

stope before beginning work and a cross-section of the stope parallel to the dip are shown in Fig. 1.

Leyner-Ingersoll machines with Carr bits were used in drilling holes up to 14 ft. in depth. Uppers were first drilled as deep as the steel could be changed, and shot. These left the stope in some such shape as shown in Fig. 2. The machine was then set on the muck pile and 14-ft. holes drilled nearly horizontal. In this manner a breast

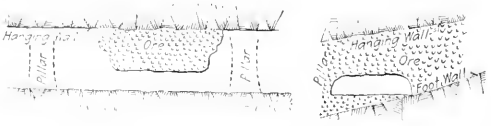


FIG. 1. LONGITUDINAL AND CROSS-SECTIONS OF STOPE

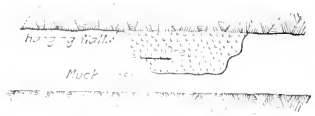

FIG. 2. SHOWING METHOD OF BREAST-HOLE STOPING

was carried 8 or 10 ft. high across the stope, after which another round of uppers was put in and another breast carried across. At times an irregularity in the back was taken advantage of, and by letting the holes look up, a new breast was started. A round of such holes, 10 to 20 in number, often broke as high as 300 tons of ore and re-

*Mine foreman, Mine No. 1, American Zinc Co., Mascot, Tenn.

presented two or three machine shifts. Some blocking-holing of slabs was necessary. Enough muck was drawn from the stope, which was underlaid with tracks, to allow sufficient headroom. At the extreme ends of the stope where the old back was high, cribbing was necessary, as can be seen in the flashlight illustrations.

Flume Without Side Braces*

In the construction of the City Trunk Line, by means of which the municipality of Los Angeles receives its apportionment of water from the Los Angeles Aqueduct,

FIG. 2. VIEW OF FERNANDO FLUME, LOS ANGELES WATER-WORKS

flume work is employed in the crossing of a shallow creek bed. The flume erected differs from the standard form of flume construction in that no outside struts or braces are employed.

The flume has a total length of 676 ft. and is designed to carry a flow of 20,000 miner's inches (approximately 258,000,000 gal. per 24 hr.) at the high velocity of 22 ft. per sec. The grade is 2.58 per cent. The allowance for n in Kutter's formula was 0.011. The structure is

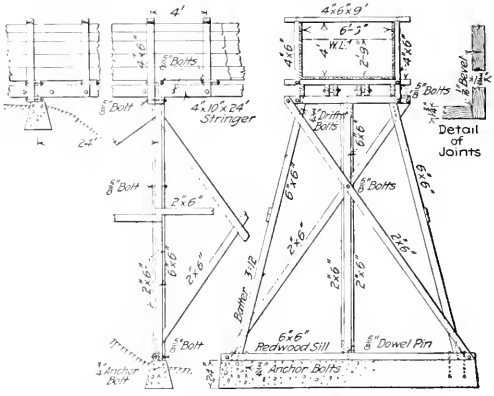

FIG. 1. DETAILS OF FERNANDO FLUME, LOS ANGELES WATER-WORKS

built on a tangent and carries the full flow of the aqueduct 18 ft. above the creek bottom.

The flume proper is built of 2-in. redwood plank, dressed on one side, calked with oakum, with inside di-

*An article by Burt A. Heinly, in "Engineering News," July 22, 1915.

mensions of 6½ ft. in width and 4 ft. in depth, with an allowance of 15 in. for freeboard.

Since the usual side struts were considered likely to loosen and weaken the structure, the side walls are held firm by bolting the outside posts to both the cap of the bent and the cross-tie under the flooring and by employing a 4x6-in. cross-tie doweled in at the top.

The bents are of selected Oregon pine, set 12 ft. apart, on concrete foundations, except over the stream bed, where there is a truss with the end bents placed 48 ft. apart to permit the passage of drift in winter freshets. The cost complete amounted to $7.50 per lin.ft.

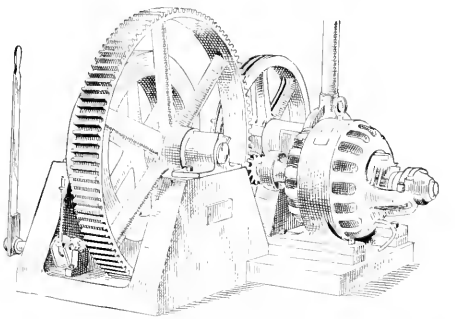
High Steam-Shovel Stripping Rate

A high daily record for stripping was made recently at the Locust Mountain Coal Co.'s Colliery at Shenandoah, Penn. A 70-C Bucyrus digging in a 15-ft. bank loaded 605 4-yd. dump cars, or approximately 2118 cu.yd. of material, in a 10-hr. day. During this period the shovel lost 105 min. for moving up and 50 min. waiting for cars, making the actual working time 7 hr. and 25 min. The material handled was from a face consisting of 5 ft. of rock and 10 ft. of clay. Three 22-ton locomotives were used, each pulling a train of seven 4-yd. Koppel cars. The labor around the shovel consisted of two men at the jackscrews and four in the pit, besides the regular shovel crew. The labor on the dump consisted of six men and one subforeman.—*Excavating Engineer.*

Handling Stock-Pile Cars

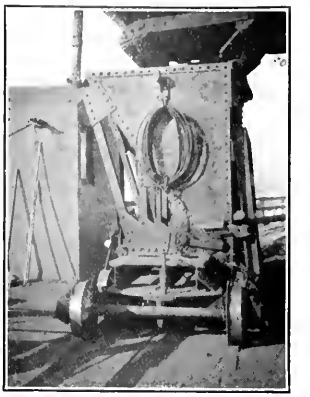
By F. H. Armstrong*

The tramcar used by the Penn Iron Mining Co. for stockpiling is shown in the accompanying illustration. It is a single-side dump car having a bottom at an angle to the horizontal of 56 deg. The door is hinged at the top and held closed by the catches at the ends of the car. In the illustration the door is held open by a block to show the catches.



HAULAGE UNIT INVOLVING WHITING-HOIST PRINCIPLE

The haulage plant for handling this car uses the principle of the Whiting hoist, the driving sheave having four grooves. There are three idler sheaves independent of one another and the rope is wound around these sheaves and drum. The ring on the driving sheave is in two parts, so that it can be replaced readily when the grooves wear to different diameters. The fact that the idlers are independent largely eliminates the differential strains that would be caused by grooves of different diameters. The motor driving the plant is reversible. A brake and an indicator give the operator complete control over his car. With this method it is not necessary to have anyone on the trestle with the car, in inclement weather or at other times, and "off-the-track" or a broken trestle does not endanger life. The tram plant can be set where most convenient and ropes run to the car. The indicator, brake and controller for the motor can be installed within easy reach of the tram man at his post near the chute.



TRAM CAR FOR STOCKPILING

A Simple Chain Ladder

By Clinton P. Bernard*

The use of chain ladders during shaft-sinking operations is compulsory in some states. Frequently the ladders will be found "hanging up in the shaft somewhere," because of carelessness or sloth on the part of the shaftmen. Chain ladders should always be within easy reach of the bottom, and especially so when not timbering close.

A simple and economical chain ladder, easy to repair when "shot up" is made by using ⅜-in. chain; the rungs being made by using $\frac{7}{16}$-in. bolts, passed through the links, and through a piece of ¾-in. pipe between the chains. The nut should be drawn up tight on the bolt to keep the pipe from turning. Rungs are usually spaced 12 to 14 in. apart and 12 in. wide between chains. For hanging to timbers, a square hook fitting over the timbers and attached to the two chains by a ring is sufficient, though often two hooks are used, one on each side of the ladder.

Such a ladder will weigh about 10 lb. and cost made up about $1 per foot.

Sewer Tile of Concrete

In the paper on "Sewer Tile of Concrete" in the *Journal* of July 31, p. 188, the outside form was made of 1¼-in. dressed-pine staves, instead of ¼-in., as stated in the article.

A Copper Discovery in Argentina is reported by U. S. Consul William Dawson, Jr., at Rosario. The deposit is [illegible] per-bearing pyrites and was found at a height of [illegible] ft. in the Planchon Pass between the Colorado and A[illegible] in the Argentine Province of Mendoza.

Details of Milling and Smelting

Making Use of Segregation in Electrolytic Tank

The facts that the various constituents of an electrolyte, both those which are essential and those accidentally introduced by corrosion of the anodes, tend to stratify or segregate rapidly in the tank is well known by electrolytic refiners, and a great deal of ingenuity has been lavished on the effort to prevent this. An invention has been patented by Francis R. Pyne and H. M. Green (U. S. pat. No. 1,118,398) in which this segregation is made use of, the electrolyte being drawn off at various levels.

In copper refining it is the common custom to withdraw a certain proportion of the electrolyte daily, treating it to get rid of the various elements introduced by the impurities in the anodes. The patentees state that these undesirable elements have a great tendency to concentrate in the upper portions of the electrolytes, and that if the circulation of the tank be kept up by withdrawing the electrolyte at two different levels, it is only necessary to treat a small portion drawn from the top in order to perform the same purifying action as would be attained by the treatment of a much larger portion of the electrolyte, in case the portion withdrawn were a fair sample of the total content of the tank.

The portion withdrawn on the lower level can of course be returned to the regular electrolyte circulation. This means then that a great saving is made by treating a small instead of a large amount in those tanks using insoluble anodes where the tank efficiency is low and producing a greater amount of copper in the regular electrolytic tank where the current efficiency is high. Apart from this, most of the copper produced in insoluble anode tanks is of inferior grade, which must be sold at a lower price than good electrolytic copper. If the amount thus produced in the insoluble anode tank can be cut down by withdrawing a stratified solution, there is a saving attained in this way also. The inventors state that the invention is not limited to copper refining, but may be applied to any electrolytic refining process.

Oil-Fired Settlers at El Paso

With the curtailment of the supply of lead ores at El Paso, Texas, it became impracticable to operate the Rhodes separator furnaces that had long been a distinctive feature of the El Paso Smelting Works. When the lead plant got down to a 2-furnace basis, the amount of fuel required for the separators was greater than it would have been had a larger volume of molten material been handled. H. F. Easter describes[1] the experiments that led to the substitution of an oil-fired settler capable of serving two furnaces, the slag and matte being first passed through the usual rectangular settling boxes to separate any lead that has left the furnaces. Circular oil-fired settlers were first tried but finally a magnesite-lined settler, approximately 10x20 ft. inside, was adopted.

At the El Paso Smelting Works, a change to any standard plan was impracticable, except at excessive cost. One serious difficulty was the lack of sufficient elevation in front of the blast furnaces, the space between them and the separators being comparatively level and only 4 ft. below the furnace tap holes. This was practically all made ground, having been built up of loose boulder slag, which made excavation difficult and dangerous on account of its tendency to ravel and cave. Another trouble was the lack of room for any arrangement of tracks such as are generally to be found in front of a line of modern blast furnaces.

It was decided therefore to proceed along somewhat original lines, and on July 25, 1914, there was put into operation in front of one furnace a round, oil-fired settler, 8 ft. in diameter. This was intended to serve merely as a second settler to remove the last traces of matte from the slag before going to the dump. For the main separation one of the old rectangular boxes, 3 ft. 4 in. by 6 ft. 4 in. by 2 ft. deep, was relied on, being placed between the round settler and the furnace. Results obtained from this settler were not particularly satisfactory as numerous particles of matte persisted in floating across the surface of the bath direct from intake to outlet. Also, the settler shortly began to fill up with a zinc mush that interfered seriously with proper settling. While the slag that was being run at the time contained only 4% of ZnO, there seemed to be present in the Huntington & Heberlein roast enough unaltered zinc sulphide to give trouble.

The furnace to which this settler was attached was blown out soon afterward and was replaced by another furnace, in front of which was a similar arrangement of box and round tank, except that in this case the latter was 10 ft. in diameter. The tank was set off center far enough to give the furnace tapper a chance to work, which made necessary a rather long curved spout from the box to the tank. The greatest trouble encountered was the lack of elevation, as the round settler was erected on the original level of the ground in front of the furnace and it was necessary to have both slag and matte taps high enough for the hand pots to get under them. It was thus necessary for the slag to flow a total distance of about 23 ft. with a drop of only 11 in. between the tap hole and the outlet from the settler. This of course caused trouble every time the slag happened to get thick and pasty. The first settler or box was easily removable, had a firebrick lining (magnesite was afterward used with great success) and measured 66 in. long, 28 in. wide, and 21 in. deep inside the lining. The round settler had a 9-in. lining of magnesite brick, both sides and bottom, and a 9-in. arched roof of fire-brick upon which rested at the edge of the tank, just over the slag outlet, a short brick stack with an iron pipe con-

[1] In a paper, entitled "Lead Smelting at El Paso," to be presented at the San Francisco meeting of the American Institute of Mining Engineers, September, 1915.

nection above. The oil burner was placed at the exact center of the roof and was directed straight down upon the surface of the bath. A small combustion chamber was later placed on the roof and proved successful in getting more efficient results from the oil.

It was thought that a baffle extending across the tank close to the inlet and partly immersed in the bath might compel the floating particles of matte to go down and join the main body of matte instead of going straight across and out with the slag. Accordingly, such a baffle constructed of brick was placed about 12 in. from the inside of the lining. This feature of the experiment was a complete failure and the floating specks of matte continued to pass out on the surface of the slag as before. These small particles, however, proved upon investigation not to involve so serious a loss as had been feared. Several hand pots of slag were set aside to cool and put through the small automatic sampler. The average results were: Silver, 0.65, metallic lead, 1.00, copper, 0.15%.

After starting off favorably, this new settler soon began to fill up with zinc mush. Some of this material had a specific gravity lower than that of the slag, while some of it appeared to be slightly heavier, the tendency as a whole being to form a layer between the slag and the matte. Various samples of this material were analyzed, a typical one being as follows: Insoluble 6.6, iron 19, lime 3.4, zinc 24.3, sulphur 21, lead 10, copper 4.6%. When this crust was broken up with a bar, it floated for a while at or near the surface in lumps resembling dry dross. This was not a new condition, having frequently been observed in the Rhodes separators. The only way to overcome it seemed to be to let the settler fill up with matte, thus forcing the mush to the top where it was skimmed off with rabbles through a hole cut for the purpose. This of course involved a considerable loss of matte and a large proportion of the slag made at this time had to be saved for resmelting. This condition of affairs was finally remedied by changing the charge so as to use less of the Huntington & Heberlein roaster product.

As already mentioned, the original idea with regard to this type of settler was to use it simply as a safeguard against letting any matte go to the dump. As much matte as possible was tapped directly from the box; it was found that this amounted to about 88% of the total matte produced. The shells from the hand pots, in which the slag was removed, were frequently sampled. They assayed so little higher than the regular slag samples that they were thrown away.

The comparative success attending the use of these round oil-fired settlers encouraged the installation of a somewhat similar but larger settler intended to serve two furnaces instead of one. The apparent advantages of this were the greater volume of leady copper matte that could be accumulated at one time, the certainty that one such settler would require less fuel oil than two of the earlier type, and some saving in labor.

This new settler is placed about 6 ft. forward of the line of the front crucible plates of the two furnaces and equidistant from them. It is 10 ft. inside by 20 ft. long, extending close enough to the edge of the train pit to make it easy to tap matte and slag into the cars below without the use of excessively long spouts. The whole structure is supported upon rails running crosswise and providing air spaces beneath the bottom pan. This feature has proved to be of considerable importance inasmuch as there is a constant seepage of lead through the bottom and the open air spaces arrest its progress downward into the foundation and facilitate its removal.

The ends of the settler are made slightly curved in order to give a stronger structure. The sides are braced with I-beams set upright and tied across the top with steel rods. The sides and ends have a lining of 9 in. of magnesite brick. A matte tap is provided on each side close to the front, and there is a single lead tap in the middle at the rear end. This lead tap is used every day, but little lead is obtained, as experience with the Rhodes separators indicated the inadvisability of maintaining a bath of lead in contact with the matte, and every effort is made to keep lead from getting into the large settler in the first place. The roof of the settler is sectional, being composed of a number of rail-bound firebrick arches that can easily be lifted off if necessary. The stack is situated at the rear end between the slag inlets from the two furnaces and over the lead tap. Two oil burners were installed, one playing downward through the roof at a point about 6 ft. back from the front, and one playing nearly horizontal through the front wall.

Between each furnace and the large settler is a removable rectangular box, 2 ft. 6 in. wide by 9 ft. 2 in. long, lined with 4½ in. of magnesite brick all around. The furnace is connected with the box and the box with the settler by short water-coil spouts. Each box is set at an angle of about 45° to the furnace, giving the tapper a clear field for his work.

As it is no longer necessary to provide for the use of hand pots under the slag and matte spouts, it has been possible to arrange the elevation of the various parts of the system to much better advantage than in the case of the round settlers. There is a difference of 20 in. between the tap hole of the furnace and the bottom of the slag outlet from the main settler, which greatly facilitates the handling of the spouts. There is a difference of 10 in. between the bottom of the inlet and the bottom of the slag outlet, which allows plenty of time for switching and changing slag cars after the outlet hole has been closed up. The normal depth of the bath in the settler is 25 in. with the slag outlet open, and it is customary to maintain about 10 to 12 in. of matte at all times, as this seems to assist materially in keeping the settler in good condition.

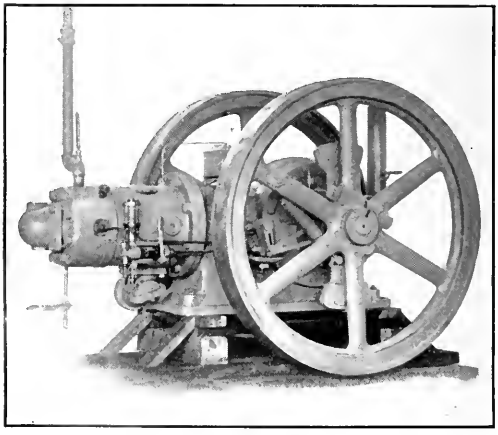
Although this settler was designed for operation with two furnaces, it was decided to try it out with only one, in order to see if it might be kept open under such circumstances. At the time of writing it has been in successful operation with one furnace for exactly one month, although the amount of fuel oil necessary to keep it in good condition is somewhat greater than was the case with the former round settlers. The larger settler requires about 7 bbl. of oil per day, whereas the others averaged about 4.5 to 5 bbl. However, with two furnaces running it is probable that less oil would be required.

Mining & Metallurgical Machinery

Fairbanks-Morse Internal-Combustion Engine

Fairbanks, Morse & Co. has placed upon the market an internal-combustion two-cycle engine designed to consume any grade of crude oil or distillate. No change in the engine is required in adapting it to different oils excepting a slight adjustment of the injection pump. The pronounced advantages of the two-cycle over the four-cycle system, especially in heavy service such as in pumping and in driving a loaded generator, induced the design of this semi-Diesel type-Y engine.

The crank case is closed and serves as an air chamber in which slight compression occurs on every outward stroke of the piston. This air is used for two purposes—as a scavenger of the combustion gases from the cylinder and to maintain pressure oil lubrication for every bearing and in the cylinder. The engine is valveless, the piston itself



FAIRBANKS-MORSE DIESEL ENGINE

covering and uncovering the ports. There are no cams, gears, carburetors, batteries, igniters, magnetos, spark-plugs or switches.

A complete cycle is as follows: Starting with the working stroke or when the piston is moving forward toward the crankshaft under the pressure of the gases produced by the burning mixture, effective work is done until the piston passes and uncovers the exhaust port in the wall of the cylinder and permits the larger part of the gases to escape under their residual pressure. Immediately thereafter, the piston uncovers the inlet port to admit compressed air from the crank case. This inrush of air sweeps out most of the inert gas remaining in the cylinder at the end of the stroke and leaves the cylinder filled with almost pure air at atmospheric pressure. As the piston returns on its inward stroke it covers both ports, thus entrapping the air and subjecting it to high compression. Just before dead-center is reached, the pump injects a very fine spray of the fuel into the combustion chamber, shown as a rounded development of the cylinder head in the illustration herewith. The walls of this chamber keep hot from the successive combustions, and as the engine turns over its center, the mixture ignites. The cycle is then completed.

When starting the cold engine, an ordinary kerosene torch is placed on the bracket below the combustion chamber until the metal is heated red. A few minutes suffices for this preliminary duty; then a few strokes given to the injection pump by hand and the turning over of the fly-wheel will start the engine into continuous operation. A feature is that the injection of oil is so regulated that the walls of the combustion chamber maintain an almost uniform temperature when running under light, heavy or variable loads. The governor varies the stroke of the injection pump with the demands for power on the engine.

The engine operates almost noiselessly. The inclosed crank case eliminates dust troubles in the bearings. The cylinder is water-jacketed. A very small amount of heated jacket water is conducted through an adjustable nozzle into the air passage leading to the cylinder, thus moistening the combustible charge and increasing its efficiency. The engine is carried in stock sizes from 10 to 75 hp., but is built to order for any capacity. The 25-hp. engine runs at 325 r.p.m., occupies floor-space 64x88 in. and weighs packed for shipment 5300 lb. Full particulars may be had from the Denver house of this company.

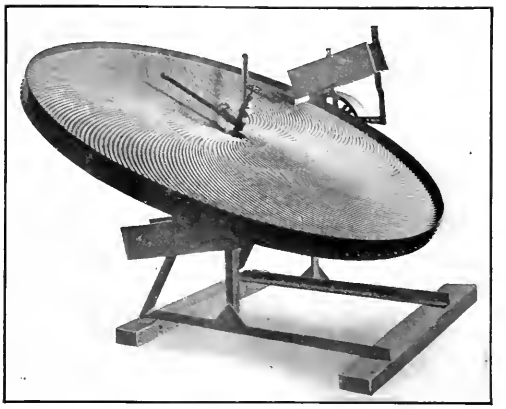
Concentrator and Classifier

The Rotary Concentrator & Classifier Co., 1215 Foster Building, Denver, is offering machines designed to do concentration, classification and separation in a new way. In the accompanying photograph is shown a top view of a 72-in. machine. It consists of a round shallow pan, built of California redwood, with a steel rim. The deck or bed is covered with linoleum, upon which are mounted many involute wooden riffles, the whole being supported upon a light but substantial steel frame. The pan may be quickly adjusted to any angle of slope and when in operation is revolved slowly by a cast-iron gear ring secured to the under side of the deck, the ring thus acting also as a stiffener. About ⅛ hp. is required for each unit.

Feed is delivered to the machine through the launder adjacent to the circumference of the pan, the direction of rotation being such as to carry the material upward. Dressing water admitted through perforations in the longer pipe shown, combined with the slope of the deck, washes the lighter or gangue particles toward the lower edge of the pan, the progress of such material being continually impeded by the many riffles that catch the particles of greater specific gravity. Rotation of the pan causes the concentrated heavier particles to tumble along

behind the riffles to feed the discharge-hole at the center, this spout being really the hollow shaft that drives the pan. Should any heavy particles wash over one or two riffles, they will be promptly caught by the succeeding ones and forced toward the concentrate discharge.

Near the center of the pan, a shorter pipe delivers water for completing the wash and driving the concentrate into its discharge pipe, and thus into the concentrate launder beneath. If the feed be coarse, say from 4 to 30 mesh, the riffles are made $\frac{1}{4}$ in. high; while for all finer feeds the riffles are but $\frac{1}{8}$ in. high. Thoroughness of concentration is brought to a maximum by adjustment of the quantity of water used and the slope of the deck; both of these adjustments are easily made while the machine is running. The manufacturers claim that fine sizing of the feed is not essential, since the principle of operation is more that of hand-panning or of differences in specific gravity than of sizes of particles. Ore must therefore be ground only so fine as to free crystals of differing minerals which it is desired to separate. On the other



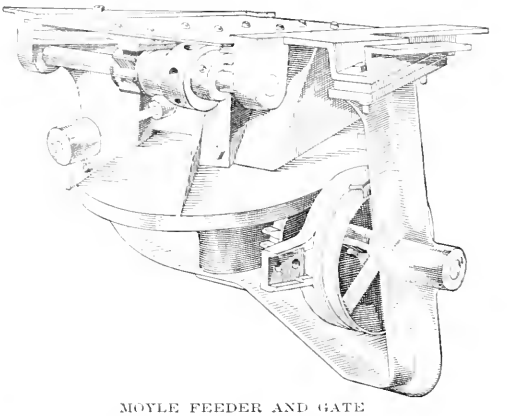
ROTARY CONCENTRATOR AND CLASSIFIER

hand, where the feed consists of a fairly uniform material ground to all sizes of particle, the machine can be readily adjusted in slope and quantity of wash water to act as a classifier to produce two general sizes. It will thus handle 25 to 100 tons per day, depending on the fineness of the grinding. Again, separation of concentrated minerals may be accomplished by suitable adjustments, this in practice being done on additional machines placed below the concentrating units. Another adaptation of the machine is for handling very fine material, such as slimes. When used for this purpose, however, there is a difference in the deck of the pan, which is made saucer shaped and is covered with canvas, which serves to hold the very fine, floaty, metallic minerals and to carry them to the upper zone, where they are rinsed into the riffles near the discharge.

The most recent adaptation of this machine is in amalgamation, a considerable quantity of mercury being charged into the pool that is maintained at the pan-floor margin. Without flouring in the least, a small amount of this mercury is picked up by the succeeding riffles and carried upward. Unless this mercury encounters free gold and forms amalgam, it will eventually roll over the riffles and collect again in the pool, but any amalgam formed will generally be forced upward and into the concentrate discharge. Suitable mercury traps are provided to obviate any losses at both points of discharge, and the machine is said to perform very good work.

Moyle Feeder and Bin Gate

A combined stamp-mill feeder and ore-bin gate is being offered by the E. H. Moyle Engineering & Equipment Co., Los Angeles, Calif. The feeder itself presents no new features except that it has a horizontal bin gate as one

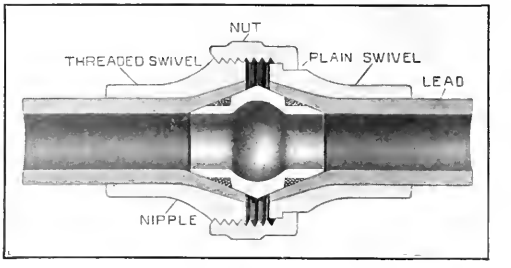


MOYLE FEEDER AND GATE

of its integral parts. The device is intended to be placed in the bottom of the ore bin, feeding directly thence to the mortar boxes. Motion is transmitted through a lever, much as in the case of the ordinary feeding devices.

Anderson Pipe Coupling

The Anderson coupling, put on the market by the Chapman Valve Manufacturing Co., Indian Orchard, Mass., is not a new piece of apparatus, but one which seems to have but lately invaded the metallurgical field.



ANDERSON PIPE COUPLING

This coupling was originally designed to eliminate the necessity of wiping or soldering a joint when using either lead or iron pipes.

An order for some couplings of unusual [illegible] to the company's tracing their further history. It was found that they had been put into service on the [illegible] lines of an experimental leaching plant, where they were giving satisfactory service.

Otto H. Hahn

Otto H. Hahn, one of the most distinguished American silver-lead smelters, died at Jena, on July 26, at the age of 70 years. Mr. Hahn had been in poor health for some time, and the news of his death did not therefore come unexpectedly.

Mr. Hahn was born at Appolta, in Thuringia, and was graduated from the Bergakademie at Clausthal in the Harz, and also studied at the University of Jena. Having completed his studies he came to the United States in 1863 and found employment with the firm of Adelberg & Raymond, one of the earliest firms of mining and metallurgical engineers in this country. Another member of the staff was Anton Eilers. The friendship among Hahn, Eilers and Raymond which then began was never broken. After completing some work for Adelberg & Raymond, especially in connection with some lead mines in the state of New York, Hahn decided to venture into the newly developing West, hoping to find a broader field for his activities. He went first to California and found

OTTO H. HAHN

some difficulty in occupying himself, but before long he fell in with C. A. Stetefeldt, and after working with him for a while in California, went to Austin, Nev., to take charge of Stetefeldt's assay office there. Later he moved to Virginia City, Nev., where he was engaged in assaying and mining for several years, and during this time was associated with Luckhardt, another of our early metallurgists.

When the great silver-lead deposits of Eureka were discovered, Hahn found his great opportunity. He went there about 1870, first being superintendent of the K. K. smelting works. He remained at Eureka for several years engaged in silver-lead smelting, and from there went to Salt Lake City, Utah, to assist Mr. Eilers in running the Germania works. Later he was associated with Mr. Eilers in silver-lead smelting at Leadville and Pueblo, Colo. In an interval, however, he was occupied in running the great smeltery and refinery at Argentine, Kan. During his active experience in the United States he was connected with a great many of the important smelting works. His experience extended also to foreign countries. Once he went to South Africa to erect and operate a lead smeltery there, and one of his latest professional engagements was in operating one of the works of the American Smelting & Refining Co. in Mexico.

About ten years ago Mr. Hahn retired from active practice and since then resided at Jena, Germany. During most of this time he acted as the regular correspondent of the *Engineering and Mining Journal* in Germany, and his valuable contributions have been widely appreciated among our readers. Mr. Hahn, during his long experience in the United States, became thoroughly Americanized and acquired the ability to write in English with a precise, pungent style. During the last year of his life, while sojourning in Germany, he was wont to express himself in no unmeasured terms respecting the backwardness of German metallurgists, especially the lead smelters, in many particulars.

Mr. Hahn made several important contributions to American literature. The first of these was "The Smelting of Argentiferous Lead Ores in Nevada, Utah and Montana," a paper in which he collaborated with Raymond and Eilers, and which was published in "Mineral Resources West of the Rocky Mountains for 1871." Another highly important monograph was on "The Smelting of Argentiferous Lead in the West," which was published in "Mineral Resources of the United States for 1882." A third comprehensive monograph on lead smelting was published in the "Transactions" of the Institution of Mining and Metallurgy, of which he was a member.

The name of Hahn is indelibly associated in the annals of American silver-lead smelting with those of Eilers, Arents, Raht, Billings, Schneider and others—that brilliant group of German-American metallurgists that did so much to develop this branch of metallurgy in the United States.

China Refuses a Monopoly to Standard Oil

Cable dispatches announce that the Chinese Government has declined a proposal of the Standard Oil Co. for a monopolistic concession containing the following provision:

> A joint company to be formed in which the Standard Oil Co. has a controlling interest, the company having the right to explore all China and register exclusive claims in selected localities; the company further to monopolize the refining and transportation of the total production of crude oil by whomsoever mined, while the Standard Oil Co. would have a monopoly of marketing the refined article for a given period.

It will be recalled that about a year ago the Chinese Government entered into a temporary agreement for the exploitation of oil fields in northern China in the provinces of Chihli and Shensi. There have been occasional reports of success in the exploration work, but the present cables state that the Chihli field is "commercially worthless and that in Shensi appears of doubtful value"; therefore a fresh proposal was made to the Chinese Government. No confirmation of the cabled reports could be secured at the local offices of the Standard Oil Co.

Chrome Iron Ore Production in the United States increased from 255 long tons in 1913 to 591 long tons in 1914, according to the Geological Survey.

Correspondence and Discussion

What the Dip Needle Can and Cannot Do

I have read with much interest the article by C. A. Cheney, Jr., on "What the Dip Needle Can and Cannot Do" in the *Journal* of July 31. Mr. Cheney has clearly stated, and for the most part correctly answered, some of the common misunderstandings with regard to the dip needle, but in so doing he has, I fear, put the emphasis in such a way that some of your readers will obtain an unfavorable impression of what is one of the most important methods of conducting preliminary exploration for iron ores.

The dip needle has been condemned by many mining men because of a false impression that it was supposed to be capable of locating ore. In the Lake Superior region the dip needle and its inseparable associate, the dial compass, are essentially instruments for the study of the geology in areas where rock outcrops are too few to indicate the character and structure of the formations. No actual orebody in the Lake Superior region has, so far as I am aware, ever been determined by magnetic means. But many ore bodies have been located by drilling directed according to intelligent use of magnetic observations. This is the history of exploration for iron ores the world over. These observations are bound to be of even greater importance in the future than in the past, as exploration extends away from the developed ranges into areas where the drift-cover more completely obscures the rocks.

Every user of the dip needle should be aware of the fact that any kind of rock, sedimentary, igneous or metamorphic may contain sufficient magnetite or magnetic sulphide to affect the magnetic needle. In so far as he is capable of analyzing his observations and determining from them what they indicate—to this degree is he capable of using the dip needle and dial compass.

The Wisconsin Geological Survey is making extensive magnetic surveys of the lands in the northern part of the state and has recently issued a report covering over 2,000,000 acres. In this area thousands of acres of land are clearly indicated as being worthy of further exploration with the drill. This report—Bulletin XLIV—contains a chapter of over 60 pages devoted to a comprehensive discussion of magnetic observations, in which both the theoretical and practical sides of the interpretation of such observations are discussed fully, and in language as non-technical as possible.

In the field work on which this report is based, it has been found possible to make fairly accurate determinations showing the depth of burial of the magnetic formation, its general character, dip, strike and thickness. Of course these features cannot be determined with all the accuracy desired but they serve most effectively to guide drilling in regions where outcrops are not available to give greater accuracy.

This chapter on magnetic observations is practically a small text book on the subject and anyone doing such work anywhere will be amply repaid by a careful study of its contents.

W. O. HOTCHKISS.

Madison, Wis., Aug. 10, 1915.

On Zinc Poisoning

I read with interest the comment on "Zinc Poisoning" in the *Journal* of Aug. 14, as it bears on an experience of ours. During the past year, we have experimented extensively with the distillation of zinc from ores and in some phases of the work used graphite crucible retorts discharging into the body of a cylindrical down-draft melting furnace fired by natural gas. This furnace was not connected to a flue, but discharged its waste products directly into a large room, fully 30 ft. high. The charge of zinc ore in the retort was approximately 10 lb., the ore containing about 48% zinc. The distillation would last from 8 to 12 hr. and at times the presence of finely divided zinc oxide in the room was very noticeable.

My assistant, who was present in the room the greater part of the time that distillation was actively proceeding, noted no ill effects during the day, but at about 10 o'clock at night was suddenly seized with lassitude, nausea, great weakness and severe chills, as well as a seeming loss of control of the joints. A fever probably accompanied these symptoms although no temperature measurement was taken to make certain of this. At about 4 o'clock in the morning the symptoms gradually disappeared and the next day he felt reasonably well, had a good appetite, but was still weak. He had three attacks of this kind, each occurring after such an experiment as described above.

The furnace temperature was as high as 1325° C. at the end of the distillation period. The zinc ore used in the experiments contained about 3% lead, and as lead is rather freely distilled at this high temperature and there was a relatively long time of distillation, some lead oxide was undoubtedly present in the air. The furnace previous to the zinc experiments had been used a number of times to melt copper, some of which had spilled on the inside lining of the furnace. The presence of this copper was plainly indicated by the characteristic flame colors at the discharge flue of the furnace, but the amount was small so that it seems hardly probable that the copper has any bearing on the case. Moreover, the furnace, after the contamination of its lining with copper, had been used for other purposes than zinc distillation and its use had produced no ill effects.

The symptoms experienced are essentially the same as those described for "brass shakes," and I believe that the case was one of zinc poisoning, the zinc oxide being the active agent. The question of the presence of lead complicates the case somewhat, but the symptoms are [illegible] from those ascribed to lead poisoning that it seems questionable whether lead was responsible.

Cleveland, Ohio, Aug. 18, 1915.

Editorials

Securities of the American Smelting & Refining Co.

The recent offering to the public of a large block of the A preferred stock of the American Smelters Securities Co. at a price upon which the expected dividends will yield 7.06%, with the further promise of a profit of $15 per share in from one to 32 years, according as the shares are drawn by lot for cancellation, prompts the inquiry why one of the premier securities of so solid a company should be available at so low a price. It is interesting therefore to examine the status of the several issues of this company and the American Smelting & Refining Co., the affairs of which are so closely interwoven. So intimate have they been indeed that for several years nothing but a consolidated financial statement has been issued to the shareholders of the A. S. & R. Co. and the public, but it appears nevertheless that the accounts of the American Smelters Securities Co. have been kept separately, for the banking house making the recent offering was able to publish a circular revealing the figures of that company alone.

The history of the two companies is something like this: After the A. S. & R. Co. had been a going concern for a number of years, its managers organized the A. S. S. Co. to acquire another group of smelteries and refineries. The money for this was supplied partly by the public and partly by the Guggenheim Exploration Co. The plants acquired were situated at Tacoma and Selby. Subsequently the Baltimore works were bought, the Federal and Garfield plants were built, and a group of lead mines in Missouri were purchased, the expansion of the company's interests being made chiefly out of its profits. The securities issued were: The A preferred stock, 6%, owned partly by the public and partly by the Exploration Co.; B preferred stock, 5%, owned by the public; and common stock, divided between the A. S. & R. Co. and the Exploration Co. For many years these companies carried this stock on their books at a merely nominal value. Each had received it as a bonus—the A. S. & R. Co. for guaranteeing the B preferred stock, and the Guggenheim Exploration Co. for supplying capital in consideration of the A preferred.

A few years ago the A. S. & R. Co. purchased from the Exploration Co. the A. S. S. Co.'s common stock that it held, paying $60 per share therefor. In doing this it used a large part of its cash surplus and also obtained money for this and other purposes by the issue to the public of $15,000,000 of 6% debenture bonds of the A. S. S. Co., convertible into common stock of the A. S. & R. Co. at par. This was a curious and complicated transaction, the nature of which has never been clear to anybody, we think, except the financiers who conducted it. One thing certain, however, was that the Guggenheim Exploration Co. realized a large amount of cash by virtue of it.

Lately there has been talk about the Guggenheim Exploration Co. going into liquidation. Whether or not there is any truth in that we do not know. Anyway, it was its holding of the A preferred stock that was recently offered to the public.

As well as we can determine the position of the several stock and bond issues of the two smelting companies, they are as follows, stated in the order of priority of claim upon earnings:

Issue	Amount	Rate	Mkt. price	Yield
1. Debenture bonds.....	$13,534,500	6	106	5.30
2. A. S. S. pfd. B.....	30,000,000	5	80½	6.21
3. A. S. & R. pfd.....	50,000,000	7	106	6.60
4. A. S. S. pfd. A.....	16,648,800	6	85	7.06
5. A. S. & R. common....	50,000,000	5	79	6.33
6. A. S. S. common.....	30,000,000	..	..	...

We arranged the above table before filling in the figures. When the latter was done it appeared that the standing of several securities in the market is just what they ought to be, dismissing, however, the common stock, which is the special speculative issue. The debenture bonds of the A. S. S. Co. are undoubtedly the supreme lien upon the property and business of both these smelting companies. Next in order we put the A. S. S. preferred B stock inasmuch as it is guaranteed by the A. S. & R. Co., and being issued prior to the debentures is manifestly a superior claim upon the earnings of the company. However, that claim would be exercised only if the A. S. S. Co. should fail to earn anything. The A. S. & R. Co.'s preferred stock, and the A. S. S. preferred A have claims only upon the earnings of the respective companies after all other claims have been satisfied. Similarly, as to the common stocks. Inasmuch as all of the A. S. S. common is owned by the A. S. & R. Co., its position does not matter.

The preferred stock of the A. S. & R. Co. does not appear to occupy the place it once held. However, it is due to remark that there have been no failures in the payment of dividends on any of these issues. All told, they represent an enormous capitalization of a very profitable business. Nevertheless, it would seem to be desirable to have a thorough consolidation of the interests of the two smelting companies that live and work together in the same family.

Mineral Export Taxes in South America

Is South America going to kill the golden goose of its mineral industry? Following the distressing financial situation resulting from the war conditions, these countries are looking about to see where they can increase their revenues, and in many instances have hit upon the mining industry as a special field for exploitation in this respect. The South American governments need more revenue but their people need more industries. Any drastic action inimical to new industries will be a costly piece of legislation, the bad effect of which will make itself felt in meager development of a country for years afterwards.

Peru is just now considering one of the most important features of mining legislation that has been before

it in over a decade. In November the period of 18 years fixed by law for the free exportation of mineral products will expire, and the possibility of increasing the Government's income from this source has been occupying the attention of the administration. The Consejo Superior de Mineria, which has the direction of matters pertaining to the mining industry, has made public the proposed bills designed to increase the country's revenue by taxing the mining industry in various ways. It is expected that the Sociadad Nacional de Minería will protest on behalf of the mining interests, not against the export tax in principle but against the magnitude of the tax proposed by the Consejo Superior de Minería. The mineral industry of Peru is already handicapped by the lack of railways. It is largely on this account that there has been comparatively little development of its mineral deposits during the 18 years of freedom from special taxation. It is hard to see how the development of the mineral resources will be stimulated by the imposition of an export tax, especially if that tax be made an onerous one.

Most of our South American neighbors are in need of capital for the development of their countries, and there is an excellent opportunity at this time for the entrance of mining capitalists into those countries. But capital will not flow in that direction if there appears to be evidence of an intention to increase the burdens of taxation to the point of discouragement. The great and rapid development of North America suggests that these countries would benefit more from the establishment of industries within their borders than from a high taxation of the limited development that would ensue with the latter policy. Equitable taxes will not be objected to by the mining industry, but if a hold-up policy be adopted these countries will not see the rapid development which they are on the verge of accomplishing.

*

Zinc Falling to Its Normal Price

The price for spelter has fallen a long way from 25c. per lb., but it is still at a high figure. Some producers talk as if they had been robbed of something rightfully belonging to them in that they can no longer sell their output at 20@25c. per lb. They forget that it is scarcely eight months ago that zinc was selling under 5c. per lb., and that a normal price for zinc—based upon averages for long periods, the cost of production, etc.—is regarded as being about 5@5½c. per lb.

There have been no recent developments to alter ideas respecting a normal price for zinc. The enhanced price of 1915 was due to temporary shortage arising from the isolation of the German and Belgian smelters. An acute situation developed, but it could and would be cured naturally with time, even if the war were to continue indefinitely. In other words, there had only to elapse sufficient time to enable the deficiency in smelting capacity to be made good. The rapidity with which this is being done is a matter of marvel among persons versed in the zinc industry. Six months ago no zinc expert would have admitted that it could be done so swiftly.

As has been pointed out repeatedly in the *Journal*, the scarcity of spelter was due wholly to temporary shortage of smelting capacity and in no degree to shortage of ore supply. On the contrary, the immensely swollen list of furnaces in this country has been supplied easily without drawing upon the ore supply of Australia and other countries to any considerable extent. The military consumption of spelter is very large, but the peaceful use of it has been greatly curtailed. As soon as ample smelting capacity is provided there is no reason why spelter should not be selling around 5c. per lb. again, even if the war continues.

The price for high-grade and superior intermediate spelter has not yet declined to so large an extent as in the cases of prime western and brass special. High-grade spelter, strictly speaking, is practically a monopoly of the New Jersey Zinc Co., which of course may charge for it whatever it sees fit. The superior intermediate spelter, on the other hand, may be made by the redistillation of common spelter, at an extra cost of a few cents per pound. Obviously, therefore, the price for such spelter must follow the price for common spelter.

The events in the spelter market of 1915 are ascribable to nothing short of commercial insanity. There will be adverse consequences from which the zinc industry will be years in recovering.

*

Buying of Metals for Ammunition

The buying of metals for ammunition is done now in a way very different from that of three months ago. Then the contractor found himself with engagements calling for large quantities of copper, spelter, etc., during the next six months. He went into the market to buy the whole lot at once, acting as if there were never going to be any more of these metals in the world. He went about this business with a beating of tom-toms and created among sellers the impression that about ten times as much metal was needed as was really the case. Let a large number of buyers start operations in such a way and nobody had to consult the seventh son of a seventh son to discern what was going to happen.

The ammunition contractor of today is more canny. A few months ago he bought spelter at 25c. per lb. for fear lest it might go to 50c. But it halted at 25c., then receded, and appears to be likely to recede some more. The buyer is once more thinking about the equilibrium of demand and supply and has come to the conclusion that the nature of the markets is still just the same as it used to be before the war. So he says to himself that although he is going to need some thousands of tons of copper and spelter during the coming six months he will take his time about buying it—there will be enough for everybody—and perhaps there will be some opportunities for the bargain hunter.

*

Kennecott as a Cheap Producer

The developments in the Copper River region of Alaska, including a long railway through a difficult country and the opening and equipment of the Bonanza mine, cost a great deal of money. The gossip used to be that it was well toward of $20,000,000. This was furnished by J. P. Morgan & Co. and M. Guggenheim's Sons, the [illegible] subsequently taking in Kuhn, Loeb & Co. Among [illegible] there was always considerable doubt respecting [illegible] out-

come of [illegible]'s investment considered as a whole, although of course it was recognized that either the mine or the railway could make a fine showing at the expense of the other.

According to a Boston paper the syndicate put from $25,000,000 to $30,000,000 into the enterprise and so far has received $7,500,000 in dividends from the Kennecott Mines Co. (Bonanza mine), and $10,000,000 from the sale of Kennecott bonds. The Copper River & Northwestern Ry., which necessitated the greater part of the capital expenditure, has paid nothing. Apparently therefore the Alaska venture has been conducted on the basis of a cheap mine and a dear railway. Kennecott is advertised as the cheapest producer of copper in the world, its average cost being said to be only about 5c. per lb. The contributory factors in arriving at such a cost are high-grade ore—some of it almost pure copper glance—and what is substantially the free use of a large amount of capital.

By the sale of Kennecott stock the syndicate will further recoup itself, it is to be supposed. This company has an issued capital of 120,000 shares, and there are 400,000 additional shares reserved for conversion of the bonds, a total of 1,120,000, which at $25 per share—the promotion price—represents a valuation of $28,000,000, or about what the syndicate is said to have put into the venture. It will be interesting to see how the public will make out in its investment in this mine of very rich ore, which probably lacks the elements of long life that the porphyry mines have.

BY THE WAY

Delays are usually expensive—but not always. Shortly after the great war began the price of copper declined to what was for many an unprofitable level; commercial conditions generally were so upset that companies which normally could produce profitably at this price were not at all certain whether a further decline during transport might not wipe out any profit, or even make a deficit. For months the German raiders roamed the oceans and between actual captures and rumors of captures and the stimulated European trade, it was exceedingly difficult for ocean shippers to secure "tonnage." Toward the close of the year a certain copper producer desired to make a shipment and wrote his agents in the United States to contract for ships. This was easier said than done. Each week as no boat appeared, the mine owner would write again to his agents urging action. As the price of copper rose, he began cabling frantically. Eventually ships were secured, and when settlement was made by the smelters it was found that, owing to the advance in the price of copper, the amount received was about $90,000 in excess of what it would have been if shipment had been made when first attempted.

The following reasons from *Engineering News*, showing why a contractor has a snap rather than the engineer, are apparently the outburst of a municipal engineer, but the miner and metallurgist will probably sympathize.

The question "Has the Engineer a Snap?" may be answered perhaps better after itemizing the expense and trouble which the engineer must undergo, some of which are as follows:

1. Expense of looking over the proposed work and closing the contract for employment.
2. Expense of making necessary investigations and surveys.
3. Expense of getting out report.
4. Expense of traveling and time in submitting report.
5. Expense of time in convincing clients and local "home-grown" or "native" engineers that the report, plans and specifications are correct, or rather trying to convince them.
6. Expense of defending plans, specifications and ideas against the "butting-in" engineer.
7. Expense of assisting clients to carry on a campaign of education against the onslaughts of the public.
8. Expense of getting out the final working plans, specifications and estimates.
9. Expense of attending letting of contracts for construction work and for purchasing of materials, machinery, etc., and assisting clients in getting legal contracts closed up.
10. Expense caused by having to defend plans and specifications against the "salesman-engineer," who has something to sell, and promoters of "blue-sky" schemes, whose pose as public benefactors and do everything that they possibly can to have the specifications drawn so that competition is eliminated. (These same fellows are always the first ones to howl if the specification is closed against their particular article, and I have noticed that their particular article is always the best.)
11. Expense of time in examining forms or bonds to be furnished by the contractors.
12. Expense of time in approving manufacturer's plans of machinery, details, etc.
13. Expense of time in getting contractor started on his work.
14. Expense of starting resident engineer out on the work.
15. Expense in straightening a hundred trivial matters as the work progresses. (The resident engineer can handle the situation, but clients always want the "main guy" on the ground in person.)
16. Expense of making final inspection and test of the work.
17. Expense of getting out complete record, plans and maps.
18. Expense of time in getting plant running in good shape.
19. Expense of time in getting what is coming to one of the "balance due."
20. Expense of taking a vacation to recuperate and nurse oneself back to health.

The poet of the Safety Bulletin of the Nevada Consolidated Copper Co. is often effective and euphonious. The following, with trifling emendations, is his latest effort:

SUMMER JOBS FOR COLLEGE STUDENTS

With the summer sun and sunshine come green and greener trees;
Come the college boys to work the while to earn tuition fees,
With a chance to hatch an egg or two of theories in mind,
In the old-time incubator of experience and grind.

As a mucker energetic in a deep-sunk copper mine,
With the wallop of an athlete he can always hit the line.
Though the strain comes on strange muscles he has never read about—
Though his hands are skinned and blistered, he is game and sticks it out.

Some will grab a job as millhand, pushing tailings down the race,
Greasing ore for oil flotation, chasing slimes all o'er the place;
Classifying tanks and tables, grinding mills and crushing rolls,
And the like familiar duties, leading up to cherished goals.

One may take a try at smelting, making effort to acquire
Metallurgical experience in the heat of furnace fire;
Eating smelting smoke and calcines, with sulphurous perfumes,
And absorbing useful knowledge with the flue dust he consumes.

Thus they learn through stress and striving, holding fast to purposed aim,
Fate will favor him most fairly who most squarely plays the game.
And as rocks o'er which it ripples wake the mountain stream to song,
So should knocks of toiling effort make for music for the strong.

PERSONALS

Walter Harvey Weed is in Newfoundland examining a property at Notre Dame Bay and expects to return to New York City about Sept. 1.

W. H. Aldridge started West last week to make a general inspection of the mining interests in his charge. He expected to be away for a month or two.

W. L. Wotherspoon, consulting mechanical and electrical engineer of the Canadian Mining & Exploration Co., Ltd., has returned to New York after a three month trip in the West and Alaska.

H. D. Pallister has resigned as assistant professor of mining at the School of Mines of the Pennsylvania State College to become professor of Geology and Mining at the School of Mines of the University of Texas, El Paso, Tex.

Howland Bancroft sailed from New Orleans on Aug. 11 on the United Fruit Co.'s steamer Turrialba for South America, where he expects to spend the next few months in and about Bolivia examining various tin properties.

J. P. Hutchins writes from a boat on the Volga River whereby he was returning from a journey to the Caucasus. He was en route to Samara, thence to Omsk, after that intending to go up the Irtish river to the Altai region.

A. L. Queneau who was gassed in the battle of Ypres and feared that he would lose his eyesight writes that his eyes are now well. At St. Omer, July 5, he received the Distinguish Conduct Medal from the hands of Prince Arthur of Connaught, and having been "Cité a l'orde de l'Armee" he received the Croix de Guerre on Aug. 2 from the French general. Mr. Queneau writes "Although I have received the decorations given to the heroes, I do not consider that I have fully earned them, considering the immense number of wonderful deeds performed by our comrades of the Infantry." Mr. Queneau is still with the British engineers.

OBITUARY

John T. Morris, former president of the Isaac Morris Iron Works, of Kensington, Penn., died at Bretton Woods, N. H., on Aug. 15, aged 67.

John Ulrich Mef, professor of chemistry at the University of Chicago, died suddenly on Aug. 13 at Carmel-by-the-Sea, Calif. He was born in Switzerland 53 years ago.

Willis B. Burns, ex-mayor of Syracuse and president of the Syracuse Malleable Iron Co., died in that city Aug. 15, at the age of 64. He was a native of Syracuse, and in 1886 was elected mayor, after having served a term as alderman.

D. Austin Brown died at New Haven, Conn., Aug. 11. He was connected with the asbestos industry of Quebec for many years, as manager of Bell's Asbestos Co., Ltd., then as president of the Asbestos Packing Co., and finally as district manager of the H. A. Johns Co., of New York.

INDUSTRIAL NEWS

The Burd High Compression Ring Co., of Rockford, Ill., announces the appointment of O. P. Hand as director of publicity.

At a meeting of the Board of Directors of the American Locomotive Co. held Aug. 17, J. O. Hobby, Jr., was appointed treasurer.

The firm of A. Milne & Co., dealer in steel and iron, will be continued by the surviving partners, Luther Little and James K. Hoyt, under the same firm name and at the present addresses.

The Pacific Tank & Pipe Co., which has grown in 15 years from a small manufacturing plant originally started at San Francisco, to a company with factories at Los Angeles, San Francisco, and Portland, Ore., has seen such a rapid increase of business in Portland that it has found it advantageous to incorporate a separate company to take over its Northwest business. It has therefore organized the National Pipe & Tank Co., and from Aug. 16 all business handled from Portland will be under the name of the National Tank & Pipe Co., an Oregon corporation. The plant is situated at Kenton Station, within the city limits of Portland, and occupies 12 acres of land served by rail and water.

TRADE CATALOGS

R. & J. Dick, Ltd., Passaic, N. J. Catalog. Balata Belting. 20 pp., illus., $3\frac{1}{2}$x6 inches.

A. M. Byers Co., Pittsburgh, Penn. Folder. Byers Black Pipe. 4 pp., illus.; 3x6 inches.

Lea-Courtney Co., Newark, N. J. Catalog H-2. Centrifugal pumps. Illustrated, 64 pp., 6x9 in.

American Pulverizer Co., E. St. Louis, Ill. Catalog No. 21 Pulverizers, air separators. Illustrated, 12 pp., $3\frac{1}{2}$x9 in.

Coppus Engineering & Equipment Co., Worcester, Mass. Catalog. Coppus turbo blower. Illustrated, 40 pp., 6x9 in.

The Cutler-Hammer Mfg. Co., Milwaukee, Wis. Loose Leaf Catalog. Electric-controlling devices. Illustrated, $4\frac{1}{2}$x$7\frac{1}{2}$ in.

Templeton, Kenly & Co., Ltd., 1020 S. Central Ave., Chicago, Ill. Bulletin Catalog 115. Simple jacks. 24 pp., illus.; 6x9 inches.

Allis-Chalmers Mfg. Co., Milwaukee, Wis. Bulletin No. 1093. Engine-type direct-current machines. Illustrated, 16 pp., 8x$10\frac{1}{2}$ in.

Chicago Pneumatic Tool Co., Fisher Building, Chicago, Ill. Bulletin No. 130. Lubrication of pneumatic tools. Illustrated, 4 pp., 6x9 in.

Emerson Pump & Valve Co., Alexandria, Va. Catalog. Steam pumps, foot-valve and quick-cleaning strainer. Illustrated, 80 pp., 6x9 in.

The Brown Hoisting Machinery Co., Cleveland, Ohio. Bulletin. Brownhoist Schnable patent drag-line bucket. 12 pp., illus., 6x9 inches.

The Globe Iron Roofing & Corrugating Co., Cincinnati, Ohio. Catalog H. Sheet-metal building materials. Illustrated, 166 pp., 6x9 in.

Burd High Compression Ring Co., Rockford, Ill. Directory of piston-ring sizes for engines, tractors, trucks, etc. Illustrated, 134 pp., $4\frac{1}{2}$x7 in.

The Titanium Alloy Mfg. Co., Niagara Falls, N. Y. Catalog. Titanium aluminum and other standard bronze castings. 32 pp., illus., $3\frac{1}{2}$x$8\frac{1}{2}$ inches.

Bausch & Lomb Optical Co., Rochester, N. Y. Catalog. Optical instruments for inspection and testing of materials. 36 pp., illus., $6\frac{1}{2}$x$9\frac{1}{2}$ inches.

W. N. Best, 11 Broadway, N. Y. Catalog. Oil and tar burning apparatus for marine, locomotive and stationary boilers. 32 pp., illus., 6x9 inches.

Armstrong Mfg. Co., Waterloo, Iowa. Catalog. Armstrong special blast-hole drills. 64 pp., illus.; $10\frac{1}{2}$x8 inches.

The steam-shovel mining has resulted in more attention being paid to blasting for the shovels and to the machines that drill the blast holes. Catalog B-1 describes the special blast-hole drilling machines developed by the Armstrong company. The machines are made for either electric or gasoline drive and are claimed to be much superior to the ordinary well-drilling machine and to the piston drill both in speed of drilling and cost per ton of rock broken. The special blast-hole drilling machines are manufactured both in the portable and traction type. The tractors are provided with two speeds so that they may negotiate steep grades readily. From 25 to 35% of lost time occasioned through the use of ordinary well-drilling machines is eliminated by the special blast-hole drill.

SOCIETIES

Mining Institute of Scotland—A general meeting of the Mining Institute of Scotland was held in the rooms of the Institute, 39 Elm Bank Crescent, Glasgow, Aug. 7, 1915, for election of members and discussion of papers previously read before the society, original contributions were read by [illegible] and Gillieaux on lining shafts with concrete Z-blocks, [illegible] Ferguson on the origin and development of [illegible] and metallurgy in the ancient empires of Chaldea, Assyria, Medea, and Persia.

NEW PATENTS

United States patent specifications listed below may be obtained from "The Engineering and Mining Journal" at 25c. each. British patents are supplied at 40c. each.

ABRASIVE—Electric-Furnace Abrasive and Method of Making the Same. Herbert T. Kalmus, Brookline, Mass., assignor to The Exolon Co., Cambridge, Mass. (U. S. No. 1,149,-064; Aug. 3, 1915.)

ALKALI AND ALUMINA—Treating Leucite-Rock for the Extraction of Alkali and Alumina Contained Therein. Elmer E. Dougherty, Bloomfield, N. J. (U. S. No. 1,148,156; July 27, 1915.)

ALKALIES—Process of Recovering Alkalies from Cement Kilns. Spencer B. Newberry, Baybridge, Ohio. (U. S. No. 1,150,295; Aug. 17, 1915.)

ALLOY—Noble Alloy (Cobalt, Chromium and Iron). Elwood Haynes, Kokomo, Ind. (U. S. No. 1,150,113; Aug. 17, 1915.)

ALLOYS of Platinum and Osmium. Fritz Zimmermann, Newark, N. J., assignor to Baker & Co., Inc. (U. S. No. 13,961; Aug. 10, 1915.)

ALUMINA—Method of Making Alumina. Herbert T. Kalmus, Walter L. Savell, and Kenneth B. Blake, Kington, Ont., Canada, assignors, by direct and mesne assignments, to The Exolon Co., Cambridge, Mass. (U. S. No. 1,148,092; July 27, 1915.)

ALUMINUM—Process of Plating Aluminum. Joseph A. Holl, New Britain, Conn. (U. S. No. 1,147,718; July 27, 1915.)

ALUMINUM CHLORIDE—Production of Aluminum Chloride. Franz von Kügelgen, Holcombs Rock, Va., and George O. Seward, East Orange, N. J., assignors to Virginia Laboratory Co., New York, N. Y. (U. S. No. 1,147,832; July 27, 1915.)

AMALGAMATOR. Charles O. Haskell, Los Angeles, Calif., assignor, by mesne assignments, to Centrifugal Machinery Co., Los Angeles, Calif. (U. S. No. 1,148,770; Aug. 3, 1915.)

AMALGAMATOR—Rotary Amalgamator and Concentrator. Lloyd C. Dewart, San Francisco, Calif. (U. S. No. 1,147,314; July 20, 1915.)

ANNEALING—Continuous Annealing Furnace. Frederick Ingraham and Daniel Lynch, Joliet, Ill., assignors to The American Steel & Wire Co., of New Jersey, Hoboken, N. J. (U. S. No. 1,147,731; July 27, 1915.)

CAGE—Automatic Cage Safety. John L. Clarkson, Gillespie, Ill. (U. S. No. 1,150,341; Aug. 17, 1915.)

CALCINING FURNACE. William R. Clymer, Cleveland, Ohio, assignor to National Carbon Co., Cleveland, Ohio. (U. S. No. 1,147,706; July 27, 1915.)

CAST IRON—Process of Treating Cast Iron to Remove Oxygen. Joseph E. Johnson, Jr., New York, N. Y. (U. S. No. 1,150,201; Aug. 17, 1915.)

CASTING METALS. Samuel Price Wetherill, Jr., Philadelphia, Penn., assignor to Wetherill Finished Castings Co., Philadelphia, Penn. (U. S. No. 1,150,318; Aug. 17, 1915.)

CONCENTRATION—Improved Apparatus for the Water Concentration of Ores or the Like. W. M. Martin, Redruth, Cornwall. (Brit. No. 2845 of 1915.)

CONCENTRATION—Improvements in or Relating to the Concentration of Ores. H. W. C. Annable, Egham, Surrey, Eng. (Brit. No. 15,962 of 1914.)

CONVEYOR—Reciprocating Conveyor or Screen. Bertram Norton, Dudley, England. (U. S. No. 1,146,947; July 20, 1915.)

COOLING ORE. William H. Hubbard, Jr., Salida, Colo., assignor to The Ohio & Colorado Smelting & Refining Co., Denver, Colo. (U. S. No. 1,149,264; Aug. 10, 1915.)

CORROSION—Composition for Coating Surfaces of Iron and Steel. Robert S. Perry, Cave Spring, Ga. (U. S. No. 1,147,971; July 27, 1915.)

CRUCIBLE-LIFTING MECHANISM. Thomas B. Barr, Bethlehem, and Franklin G. Hoyer, South Bethlehem, Penn. (U. S. No. 1,148,138; July 27, 1915.)

CRUSHER. August W. Warsen, New York, N. Y. (U. S. No. 1,148,315; July 27, 1915.)

CRUSHER. William H. Liber, Milwaukee, Wis., assignor, by mesne assignments, to Allis-Chalmers Manufacturing Co. (U. S. No. 1,149,146; Aug. 3, 1915.)

CRUSHING Keying Means for Crushing Rolls. Charles G. Buchanan, New York, N. Y. (U. S. No. 1,149,626; Aug. 10, 1915.)

CYANIDING APPARATUS. Frederick E. Carman, Jamaica, N. Y., assignor to Miriam E. Carman, Babylon, N. Y. (U. S. No. 1,146,783; July 20, 1915.)

DRILL. Pneumatic Drill. George H. Gilman, Claremont, N. H. Assignor to Sullivan Machinery Co., Claremont, N. H. (U. S. No. 1,150,357; Aug. 17, 1915.)

DRILL-ROD COUPLING. Euclid Jerome Lowe, Balboa, Canal Zone. (U. S. No. 1,148,977; Aug. 3, 1915.)

DRILLING—Improvements in Valve Gear for Rock Drilling and Like Machines. W. C. Stephens, Carn Brea, Cornwall. (Brit. No. 16,035 of 1914.)

DRILLS—Improvements in or Relating to Fluid-Operated Percussive Drills. Ingersoll-Rand Co., New York, N. Y. (Brit. No. 1274 of 1915.)

DRILLS—Improvements in Valves and Valve Gears for Percussive Rock Drills, Tools and the Like. G. H. T. Rayner, Sheffield, Eng. (Brit. No. 4004 of 1915.)

ELECTRIC FURNACE. John W. Brown, Lakewood, Ohio, assignor to National Carbon Co., Cleveland, Ohio. (U. S. No. 1,147,703; July 27, 1915.)

ELECTRIC-FURNACE REGULATOR. Ray Hill White, Niagara Falls, N. Y., assignor to Norton Co., Worcester, Mass. (U. S. No. 1,149,238; Aug. 10, 1915.)

ELECTRICAL FURNACE. William H. Hampton, New York, N. Y., assignor to The Conley Electric Furnace Co., Inc., Wilmington, Del. (U. S. No. 1,147,165; July 20, 1915.)

ELECTRICAL TREATMENT of Ores, Improvements in or Relating to the. R. W. Highfield, Oxford, Eng. (Brit. No. 6866 of 1914.)

FELDSPAR—Process of Treating Feldspar for Use as a Fertilizer. Charles William Drury, Kingston, Ont. (U. S. No. 1,150,815; Aug. 17, 1915.)

FILTER MEDIUM or Other Article of Manufacture. Ernest J. Sweetland, Montclair, N. J. (U. S. No. 1,147,279; July 20, 1915.)

FILTERING APPARATUS. William E. Holderman, Salt Lake City, Utah. (U. S. No. 1,150,369; Aug. 17, 1915.)

HAULING PLANT. Anton Godan, Kattowitz, Germany, assignor to the Firm of E. Nack's Nachfolger, Kattowitz, Germany. (U. S. No. 1,148,225; July 27, 1915.)

HOISTING ENGINES—Controlling Apparatus for Hoisting Engines. Clarence R. Welch, Pittsburgh, Penn. (U. S. Nos. 1,150,720; 1,150,721 and 1,150,722; Aug. 17, 1915.)

INGOT MOLDS—Adjustable Feeder for Standard Ingot Molds. Ernest J. Turner, Pittsburgh, and Bloomfield H. Howard, Aspinwall, Penn. (U. S. No. 1,149,228; Aug. 10, 1915.)

INGOTS—Treating Iron and Steel Ingots. Benjamin Talbot, Middlesbrough, England. (U. S. No. 1,150,401; Aug. 17, 1915.)

JIG. Guy H. Elmore, Swarthmore, Penn., assignor to William O. Elmore, Oneonta, N. Y. (U. S. No. 1,149,641; Aug. 10, 1915.)

LAMP—Miner's Lamp-Attachment Means. Frank A. Casteel, Washington, D. C., and Robert M. Mayfield, Kingwood, W. Va. (U. S. No. 1,148,889; Aug. 3, 1915.)

LEACHING—Ore-Leaching Apparatus. Murray C. Godbe, Salt Lake City, Utah. (U. S. No. 1,150,263; Aug. 17, 1915.)

LEACHING—Process for Leaching Ores or Minerals Containing Copper Carbonate. J. Erdos, Kolozsvar, Hungary. (Brit. No. 4658 of 1914.)

METAL RECOVERY—Process for the Recovery of Metals from Ore or Slags and Other Furnace Products. W. Troeller, Bad Homburg von der Hohe, Germany. (Brit. No. 7113 of 1914.)

METAL-SEPARATING APPARATUS. Charles O. Haskell, Los Angeles, Calif., assignor, by mesne assignments, to Centrifugal Machinery Co., Los Angeles, Calif. (U. S. No. 1,148,-771; Aug. 3, 1915.)

METALLURGICAL FURNACE. George Campbell Carson, Denver, Colo. (U. S. No. 1,149,495; Aug. 10, 1915.)

NITRIC ACID—Apparatus and Method for Producing Nitric Acid. Harry Dalton Rankin, Pittsburgh, Penn., assignor to Rankin Process Co., Phoenix, Ariz. (U. S. No. 1,150,786; Aug. 17, 1915.)

ORE TREATMENT—Apparatus for Treating Ores. William A. Hoffman, Hazleton, Penn. (U. S. No. 1,150,367; Aug. 17, 1915.)

PHOSPHATES—Method of Treating Phosphates. Charles N. Meriwether, Clarksville, Tenn. (U. S. No. 1,149,390; Aug. 10, 1915.)

PHOSPHORIC ACID—Process of Recovering High-Grade Phosphoric Acid. Frank S. Washburn, Nashville, Tenn. (U. S. No. 1,149,233; Aug. 10, 1915.)

PRECIPITATION—Feeding Apparatus for Feeding a Precipitant. Herbert C. Colburn, Victor, Colo. (U. S. Nos. 1,149,-426 and 1,149,427; Aug. 10, 1915.)

PYROMETER METHOD and Apparatus. Theodore W. Clark, Pittsburgh, Penn., assignor to Gibb Instrument Co., Pittsburgh, Penn. (U. S. No. 1,147,483; July 20, 1915.)

RADIUM—Portable Generator for Producing Radio-Activity in Varying Substances. Cassius R. Heberling and Albert H. Low, Denver, Colo., assignors to The Colorado Radium Products Co., Denver, Colo. (U. S. No. 1,149,829; Aug. 10, 1915.)

REDUCTION—Improvements in or Relating to the Reduction of Metallic Oxides and the Like. R. W. Highfield, Oxford, Eng. (Brit. No. 6865 of 1914.)

REFINING—Metallurgy of Copper. Lawrence Addicks, Perth Amboy, and Clarence L. Brower, Chrome, N. J. (U. S. No. 1,148,814; Aug. 3, 1915.)

RESPIRATORY APPARATUS—Mask, Helmet, or the Like for Use with Respiratory Apparatus. Alexander Bernhard Dräger, Lübeck, Germany. (U. S. No. 1,150,508; Aug. 17, 1915.)

ROASTING—Improvements in Ore-Roasting Furnaces. P. Picketty, Paris, France. (Brit. No. 149 of 1915.)

SEPARATOR. George Allen Fowler, Miami, Ariz., assignor to Crown Mill Equipment Co., Miami, Ariz. (U. S. No. 1,146,-931; July 20, 1915.)

SEPARATOR—Dry and Wet Ore Separator. Joseph Stanley, Geary, Okla. (U. S. No. 1,149,302; Aug. 10, 1915.)

SIZING APPARATUS—Harry W. Hardinge, New York, N. Y., assignor to Hardinge Conical Mill Co., New York, N. Y. (U. S. No. 1,149,826; Aug. 10, 1915.)

SLIME SEPARATOR and Classifier. Charles Allen, El Paso, Tex. (U. S. No. 1,147,356; July 20, 1915.)

SMOKE—Fume and Smoke Filter. Ernest H. Gagnon, Billings, Mont. (U. S. No. 1,148,508; Aug. 3, 1915.)

STEEL—Improvements in or Relating to the Manufacture of Steel by the Basic Open-Hearth Process. A. E. Davies, Bilston, Staffs., Eng. (Brit. No. 20,582 of 1914.)

ZINC—A Method of Treating Zinkiferous Ores with Sulphurous Acid. Erzverwertungs-Ges. m. b. h., Berlin, Germany. (Brit. No. 8197 of 1914.)

ZINC—Process for Recovering Zinc from Zinkiferous Materials. F. C. W. Timm, Hamburg, Germany. (Brit. No. 22,519 of 1913.)

ZINC OXIDE—Improvements Relating to the Reduction of Zinc Oxide. W. Buddeus, Charlottenberg, Germany. (Brit. No. 26,379 of 1913.)

Editorial Correspondence

SAN FRANCISCO—Aug. 18

State Oil and Gas Supervisor has been Appointed by State Mineralogist Hamilton. R. P. McLaughlin has the appointment. His duty is to carry out the provisions of the new law passed by the last legislature for protection of oil and gas wells from water infiltration. Mr. McLaughlin will appoint deputies to be stationed in the oil fields to collect the necessary engineering data, study local problems and advise operators. Mr. McLaughlin has had charge of the oil department of the State Mining Bureau during Mr. Hamilton's incumbency and is author of Bulletin 69, the most comprehensive and complete contribution to petroleum literature ever produced in the state. It was chiefly through Mr. McLaughlin's efforts that the oil bill became a law.

Smelter Fume Question in Redding-Kennett district is again being investigated. Dr. Charles Keane, state veterinarian and member of state smeltery-waste commission, is gathering information, and has sent out notices to farmers in 20 or more townships in Shasta county. This action is direct result of request by farmers for more time in which to present evidence. At recent hearing of state smeltery-waste commission, Mammoth Copper Mining Co. presented much evidence showing damage to vegetation since installation of bag house is very slight, if any; farmers claim they did not have notification in time to prepare evidence and collect witnesses. On account of Mammoth company's evidence, commission decided to reopen case, although it had previously reported to Governor Johnson that smelting-plant fumes were injurious to vegetation of county.

State Highway Labor will be performed for the first time by inmates of the state prison beginning in August. The last legislature under authority of what is known as the Convict Labor Law provided that convicts should be detailed for this work. The highway in Mendocino County to be thus constructed is 33 miles long between Cummings and the south fork of Eel River. In Humboldt County the highway will extend from Miranda to Barberville, a distance of 15 miles. Three camps will be worked on the system of 60 men to each camp. They will consist of three groups, the working crew, the cooking and camp tending crew, and the policing crew. It is said there will be no armed guards. The system will be under the general supervision of the State Highway Commission and the State Board of Prison Directors. Each camp will have a superintendent and foreman in direct charge; and only men who can be trusted, in the opinion of the authorities, will be assigned to employment in these camps. The Colorado modified honor system giving the men additional credits and other advantages will be followed. The work in these counties will be done by men from San Quentin prison.

First-Aid Contest Between California Teams will be held at the Panama Pacific Exposition on Sept. 22, in addition to or conjunction with the third annual field meet of the American Mines Safety Association and the U. S. Bureau of Mines to be held on Sept. 23 and 24. The California contest will be held under the direction of the California Metal Producers Association. The entire cost of this meet of California contestants will be paid out of current revenues of the association without recourse to assessment. This contest will be in first aid work only, while the national contest will be in both mine rescue work and first aid work. The association will provide for each member of each team entered on Sept. 22 a souvenir bronze medal and offers, to the team making the best record on that day, a silver trophy cup, for which annual contests will be had in the future. Each member of the winning team will receive a silver medal provided by the association. Entries for the contest on Sept. 22 must be in the hands of the secretary, Robert I. Kerr, 1109 Merchants National Bank Bldg., San Francisco, not later than Sept. 1, and the names of the members of each team must be in the hands of the secretary not later than Sept. 10. No substitutions will be allowed after the names of the members of the teams have been sent in. All teams competing in the California contest will be allowed also in the national contest on Sept. 23. Entries in this contest must be directed to the committee in charge of national events. It is probable that the same judges and recorders acting for the national events will also act for the California contest. There should be a great deal of interest attached to this California contest since the demonstrations given by the U. S. Bureau of Mines rescue car in various mining districts in the state have been attended by miners who were enthusiastic in the work and who realized the great benefit to follow a thorough knowledge of mine rescue and first aid work. In fact there has been a greater demand by the miners for this class of instruction than the Bureau of Mines has been able to meet.

Rumored Sale of the Zelia Mine on the east belt of the Mother Lode in Amador County has been printed in Amador papers and others in the state, not without some reason. But the sale has not been made. It might be a wise guess that the Zelia will go into the hands of one of the big operating companies and that the newspapers which printed the item first may claim the honor, but it is not a safe statement to make with due consideration of the rights of the operators who may be actually contemplating the purchase. Inquiry today at the office of the company reported to be the purchaser, brought the reply that they had also seen the item printed and that was all they knew about it. The Zelia mine after successful operation for 30 years closed down at the beginning of 1915 and there have been several efforts to sell it. Large bodies of low-grade ore have been explored below the old workings and sufficient development done by intended investors to prove that the Zelia is still a good low-grade mine. The necessity for an entire and complete new equipment, both mining and metallurgical, on the surface and underground will be necessary in order to operate the property by former methods. The owners have dismantled the entire surface equipment except the hoist at the old shaft. So that the mine is in readiness for renewed operation. But if the company which is said to be negotiating for the purchase at present should take the property over, it is quite likely that the mine may be worked from another direction and through another source, so that such new equipment would not be necessary.

SEATTLE—Aug. 17

Nome Mines Are Working Full Swing and outlook for the season is most favorable. The lateness of the season was a drawback for a time but lots of water is now at hand and sluicing is general even where dumps had to lie idle temporarily. The payroll is as large as in any of the last few preceding years.

The Drought Is Seriously Interfering with mining operations in the Fairbanks district and owing to lack of water some of the miners are running half shifts. The problem of the 8-hr. shift is still a live subject of interest, and owing to some of the workers refusing to accept a reduced wage scale for an 8-hr. shift, several plants remain idle and the output of gold for the season will be somewhat decreased. Interest is being enlivened by the building of a government road to the new Tolovana district.

Alaskan Gold, Copper and Silver shipped to Seattle in the first seven months of this year are valued at practically twice the total for the same period last year according to the statement of the collector of customs. So great has been the development in Alaska for the past two years and so huge are the plans now being carried out that it is figured by competent mining men that the years mineral output of the territory will be $24,000,000 in copper alone, and that by 1917 the gold production will be increased to considerably more than $80,000,000 and may possibly reach $100,000,000. Of this sum about $72,000,000 will come from the Juneau gold belt. The principal increases this year so far have been in copper and gold, and these are due to the fact that Cordova since last June has been shipping copper ore at the rate of approximately $2,000,000 a month, and the gold properties in the Juneau region, which began crushing last March, are now in good running order. Sufficient ore has been blocked out in the Kennecott and Jumbo copper mines from which the greater part of the production has come to keep the mines running for several years, and some of the gold mines at Juneau are arranging to double their capacity before the close of the year. Mining men figure that the value of the copper product this year will exceed that of the entire gold output of 1914 which fell a trifle short of $16,000,000 and that

this year will undoubtedly prove a record breaker in the production of silver also. The record for the first seven months of the year already has been badly shattered. Besides the additional gold that is being produced in the Juneau gold belt, several small mills are working in the Port Wells, Kenai, Knik and Fairbanks regions and more are being installed. All of the copper mines of Alaska, many of which were closed down at the beginning of the war because of the drop in the price of copper, are being opened up as rapidly as possible, and many of them are beginning to ship. Besides copper ore, a considerable amount of antimony ore is being shipped and a big increase in the production of tin is expected from the new dredges that have been installed this season. The production so far this year to be shipped through Seattle is about as follows: Copper ore, $5,758,000; gold and silver, $6,496,000; marble and gypsum, $96,000.

SALT LAKE CITY—Aug. 19

There Were Withdrawn during July 3760 acres of land in Utah, Colorado, Idaho, and Montana from all forms of entry, on account of possible value for power-site purposes. The Utah area includes 1800 acres along the Blacksmith Fork river in Cache County.

A Narrow-Gage Railroad for Alta is being exploited. Promoters of the contemplated railroad to connect Alta with the Wasatch terminal of the Salt Lake & Alta railway have been soliciting tonnage of ore for the proposed line provided it is built. There is an old narrow-gage roadbed part way up the cañon and it is said this might be used to great advantage.

Earnings in Utah are placed at $250 per capita on a population of 400,000, according to statistics, recently compiled. It is estimated that new wealth added to the state this year will be at least between $25,000,000 and $30,000,000, and that the mining industry will pay in excess of $10,000,000 in dividends. The figures are conservative, as indicated by the production and dividends during the first half of the year.

Suit Against the Ohio Copper Co. has been started by the Empire Trust Co., of New York to foreclose a mortgage, given to secure $2,000,000 worth of bonds issued by the Ohio Copper, and to determine the interests of other companies claiming certain rights to the properties securing the mortgage. The property will revert to the mortgage holders on Sept. 17, 1915. Three sections of the mill are now working, and treating between 2400 and 2500 tons of ore daily; and 225 men are employed by the General Exploration Co., lessees.

In the University of Utah Controversy the investigating committee of the American Association of University Professors has just returned a final verdict against President J. T. Kingsbury and the board of regents. The report is a book of 82 pages, constituting a scathing indictment of Doctor Kingsbury and the majority of the board of regents. It is signed by all of the seven members of the committee. These investigators conclude, after weighing all the evidence, that the dismissal of the four professors last spring was a grave injustice.

BUTTE—Aug. 19

That the Long Hoped-for Railroad between Radersburg and Three Forks is about to be constructed, is reported, and work on it will be begun within a week or two. Julius Rosholt, a North Dakota capitalist, it is said, will build the road with his own funds. Construction officers have been ordered by Mr. Rosholt to begin preliminary work. It is said that the Keating Gold Mining Co. has entered a contract with Rosholt to pay $1 a ton for all ore hauled over the road from the mine and to furnish a minimum tonnage.

Carrying Out One of the Provisions of the Compensation Law passed by the last legislature of Montana, the state accident board, consisting of A. E. Spriggs, chairman; William Keating, state auditor, and W. J. Swindlehurst, commissioner of labor and industry, is at present on a tour of inspection of the mines, mills and smelting plants in Butte and vicinity. On Aug. 12 the board took a trip through the Washoe smeltery at Anaconda which was most satisfactory, according to the members of the board. Everywhere in the big plant steps are being taken to safeguard the employees in every way, and the most modern equipment is being installed not only in the new departments, but in the older departments as well. The board, while in Butte, will also inspect the Timber Butte and Butte & Superior mills and the East Butte smeltery. "The compensation law is elective," said Mr. Spriggs, in speaking of the method in which it is worked out. "In the six weeks that it has been in operation 90% of the employers in Montana have accepted it—a remarkable fact when compared with other states where a large percentage of the employers had not complied with its provisions within a year." Although in Montana an employer is not compelled to accept the law and may not give his employees recourse to its benefits, he sacrifices his common law rights in court." State mine inspector, W. B. Orem, looks after the safety inspection of the mines in the regular course of his work; the coal mine inspector does the same for the coal mines; the grain inspector looks after the safety of the elevators; the state dairy inspector after the creameries, and the state boiler inspector, while looking after all boilers, inspects other machinery used in connection with boilers. This leaves practically only plants using electric power for the members of the board themselves. The system is working out very well and the members of the board are much gratified with the results to date. Since July 1, when the law went into effect 485 accidents have been reported, of which seven were fatal. Not more than 20% of the injured employees will receive compensation, most of them having been able to return to work within two weeks time.

HOUGHTON, MICH.—Aug. 24

The Annual Report of Wolverine which is now being received by shareholders in Houghton presents some particularly interesting figures to those who were certain that the company soon would be out of business. The cost of copper put on an eight-cent basis is commendable and particular credit is due to the fact that the content of copper was close to 18 pounds to the ton of rock which is quite different from the old time 24-lb. average. Wolverine shares are never active in the market but it must be remembered that Wolverine has comparatively no construction figures to worry about in the future and that it has considerable rich ore yet to take out. Instead of three or four years it is far more reasonable to figure that Wolverine is good for at least ten years on just the ore that can be figured on reasonably from present openings.

The Movement of Lake Superior Stockholders of Centennial to ask the management of the Osceola Consolidated to buy out their interests and have the Centennial retire completely as a separate corporate entity is growing rapidly and a meeting likely will be called in the near future. It is figured that 32% of the stock not owned by the Calumet & Hecla is owned by people of this district. The great majority of these people bought their stock at prices higher than the present market price of the stock. They believe too that the stock is worth a great deal more than the present market price, and that it is particularly valuable to the Osceola Consolidated, which organization is able to operate it through the South Kearsarge shaft. They figure that the stock value ought to be higher to the Osceola Consolidated than to themselves or to the Centennial as an individual organization. Their proposal, as far as it has gone, is exactly the same as that which the Tamarack outstanding shareholders are making to the Calumet & Hecla company and the shareholders here believe it to be more plausible, as the quality of their yet-to-be-mined rock is considerably higher than the Tamarack's development on the Osceola lode.

TORONTO—Aug. 21

Canadian Zinc Co. is the name of a new company with an authorized capital of $500,000, which will build an electric zinc-smelting furnace at Welland. The Weedon Mining Co., which has a lease on large lead-zinc deposits in Quebec, is behind the new venture.

To Insure a Domestic Supply of Zinc at reasonable prices suitable for use in the production of brass for shell and cartridge cases the Canadian Government has passed an Order-in-Council providing for bounties on refined zinc produced from Canadian ore. The order is a tentative one and provides for bounties on a sliding scale not exceeding 2c. per lb. for zinc containing not more than 2% of impurities. These bounties however will not be payable unless the standard price of zinc in London falls below £33 per ton, nor upon zinc produced during the progress of the war, or after July 31, 1917, or upon zinc contracted for by the Shell Committee at a price of 8c. per lb. or over. The total amount to be paid in bounties is not to exceed $400,000. Hitherto zinc ores have not been distilled in Canada, and owing to the high price of the refined metal and the uncertainty of being able to obtain supplies from abroad the Government has been impressed with the necessity of establishing Canadian smelteries. Canadian producers were reluctant to incur the heavy expense of intalling reduction works, unless insured against the drop in prices which is inevitable at the close of the war. The bounties were therefore decided on as a means of overcoming this difficulty. The Shell Committee is prepared to pay the refiner 8c. per lb. or more during the continuance of the war and the requirements at this price, coupled with the bounty in case of a sudden cessation of hostilities will guarantee smelters against loss. It is announced that the Shell Committee has already contracted for several thousand tons of zinc at reasonable rates, which will secure an adequate supply of brass for the manufacture of fixed ammunition, and further large orders for shells are anticipated.

The Mining News

ALASKA

SPEEL RIVER PROJECT (Juneau)—W. P. Lass has returned to Juneau after trip to San Francisco on business in connection with the power plant to be installed at Speel River.

KENNECOTT COPPER (Kennecott)—Reported that on 500 level, 60-ft. vein running 70% copper has been cut. Also reported that Kennecott stock will soon be listed on New York Stock Exchange and quarterly dividends inaugurated.

GRANITE GOLD (Valdez)—Is now crushing steadily and producing about $1000 per day. Plates return from $15 to $48 a ton. Seventy men are now employed and an orebody sufficiently large to keep the present plant busy about three years has been developed.

ANACONDA GROUP (Fairbanks)—J. H. Russell and his associates have sold this property for about $150,000 to be paid from workings; vendors getting 10% of gross output until they are fully paid. New owners who have not been announced will work ground with dredge next summer.

ARIZONA

Gila County

MIAMI (Miami)—In July produced 4,087,611 lb. of copper, largest month's production to date. Reported record low cost of 8.195c. per lb. made. Reported extraction during last 11 days of month, 79.26%. Mill heads average 2.24% copper.

NEW KEYSTONE (Miami)—At special meeting of stockholders will vote on proposed reduction of capital stock from 600,000 shares of $5 par to 39,797 shares at $1 par. Company holds in treasury 39,797 shares of Inspiration stock received for sale of its property to Inspiration. Distribution of Inspiration shares to New Keystone shareholders is contemplated.

Greenlee County

ARIZONA COPPER (Clifton)—Some of company's copper is now being refined electrolytically, owing to disparity in price of casting copper.

Mohave County

TOM REED (Oatman)—Has purchased 51% interest in Crown City group of claims for $200,000. This is reason given for passing of dividend.

BLACK RANGE (Oatman)—Shaft has been retimbered and 60-hp. hoist, 800-ft. compressor and other equipment installed. Shaft will be sunk an additional 150 ft. before any crosscutting will be done.

WHALE (Kingman)—Leviathian Mining Co. represented by J. H. Conway and Geo. H. Pudden, of St. Paul, has exercised its option on Whale molybdenum mines. Operations have been begun under direction of J. W. Cornelius.

BIG JIM (Oatman)—A 25-hp. Fairbanks Morse hoist has been ordered. Efforts for present will be concentrated on group adjoining Black Eagle belonging to Tom Reed company. Sam Warmbath is manager.

Santa Cruz County

BLAND (Alto)—This mine now shipping copper ore, carrying iron, also valuable for flux.

CALIFORNIA

Alameda County

MANGANESE DEPOSITS in Corral Hollow district reported leased to E. A. Wiltsee. Property is owned by McLaughlin Co. Several years ago coal was mined here and used for the manufacture of briquettes by mixing with oil. Manganese has been known to operators, but has never been practically developed. Development work is now said to be in progress. Wagon road will be built from mine to Western Pacific tracks in the vicinity of Carnegie.

Butte County

EXPOSITION (Mooretown)—F. C. Burroughs and A. Khorelius have finished installing new 2-stamp mill. High-grade quartz is reported.

FORBESTOWN CONSOLIDATED (Forbestown)—C. W. Reese has taken lease on property including Gold Bunk, operated 1887 to 1904, Golden Queen and Shakespeare. Operations just beginning.

Calaveras County

ROYAL CONSOLIDATED (Hodson)—Mill is crushing low-grade ore running from $4 to $5 per ton; 125 men on the pay roll.

COLUMBIA MINES (Angels Camp)—The 200-ft. shaft is to be deepened 50 ft. and new drifts started. Mine is equipped with 5-stamp mill; stamps weighing 1250 lb. each.

CALAVERAS COPPER (Copperopolis)—Reported that experiments with flotation process have been very satisfactory and that it has been decided to increase extraction and treatment of ore. Main plant is handling 125 tons per day and flotation unit 25 tons. New grinding machinery and increased flotation capacity will be provided.

Eldorado County

GEORGIA SLIDE (Georgetown)—Property reported to be under consideration by New York men under management of H. K. Montgomery. An option of bond and lease has been taken. Property includes large acreage and number of claims. Mines have been worked almost continuously since 1852 but in later years operators have not been successful in adapting metallurgical methods.

PLACER CLAIMS on middle fork of American River embracing river bed and bars and extending from Horse Shoe Bar, have been sold to L. C. Burpee, of Oakland, by John A. Britton, of San Francisco.

RYAN (Shingle Springs)—Arrangements made for installation of pump with capacity for raising water 300 ft. a distance of 3000 ft. from supply ditches. Machinery for new equipment has been assembled. Gravel will be put through sluice boxes. Gasoline engines will be used.

Humboldt County

GEM (Blue Lake)—Reported that mine has been sold for approximately $40,000 by Gus Perigot and George Teal. Property consists of old Schauber mine; original Gem mine aggregating 400 acres on the Trinity River at confluence of the south fork. Operation has been by hydraulicking. Four miles of flume for carrying water has been constructed. Schauber was one of famous Trinity River gold producers in early day. It was here that Horsehead nugget was found.

Kearn County

CAR LOAD OF ANTIMONY ORE from Poso Creek property, operated by O. H. F. Hansen, will be shipped to New York. Reported to be worth $185 per ton. Hansen owns claims also on Cedar and Caliente Creeks. Poso claims were located 30 years ago. Until recently price of ore was too low for profitable working, because of lack of transportation facilities.

Kings County

C. F. FRANCIS VS. WILLIAM GRAY—Case dismissed by stipulation of attorneys. Question of possession has been settled by litigants. Controversy is over possession of Kings quicksilver mines.

Nevada County

UNION HILL (Grass Valley)—Deepening of shaft to 1200-ft. point is contemplated. Recent reports state that new high-grade orebodies have been disclosed.

KENOSHA (Grass Valley)—Reported that New York men, represented by C. C. Levitt, of San Francisco, considering negotiations for purchase. Property has been idle for about four years and must be unwatered. There is a double pumping system at mine which can be readily put in operation. All machinery is in good condition. Property developed by 450-ft. shaft.

WILLOW VALLEY (San Francisco)—Permission granted by State Corporation Commission to issue 350,000 shares to W. E. Wright in exchange for the North Montana mine and an option to purchase for $64,000, five-eighths interest in the Montana mine; also to issue 400,000 shares to A. W. Hogo in exchange for remaining two-fifths interest; and to sell 250,000 shares at 25c. per share. Properties are in Willow Valley district. Charles W. Hornick, president of company.

Placer County

BARTON (Westville)—New air-lift has been installed. Recent test lowered water in mine 25 ft. in 24 hours. Mine was reopened by Hermine Operation Co., S. H. Brockunier, manager

DEWEY CONSOLIDATED (Iowa Hill)—Sacramento men recently undertook reopening of gravel deposits. Slope is being sunk to reach pay gravel and extensive development is expected.

DELLORSI GOLD MINING CO. (Dutch Flat)—New incorporation; capital stock $100,000, paid up. Directors are J. M. Dellorsi, J. T. Patrick, Fred C. Dill of Dutch Flat; Will McPatrick of Auburn; Toney Dellorsi, Forest Hill.

Plumas County

JAMISON (Johnsville)—Fifty men are employed under management of George Redstreake. Good ore is reported.

PLUMAS-EUREKA (Johnsville)—Cleaning out tunnel is in progress and it is reported that mine will be reopened. There has been talk of driving lower tunnel to orebodies which are said to persist below old working. Charles D. Etark, Jr. is superintendent.

DIVING FOR GOLD at Rich Bar will be undertaken by an organized company of nine men known as E. C. Lang Manufacturing Co. Claims are situated on Feather River at upper edge of bar. Large platform and derrick and 35-hp. donkey engine have been installed. Clamshell dredging bucket will be used to lift large boulders from bed of river and sand and gravel pump will handle sand and larger gravel. In deeper water below main plant, floating platform is installed for use of divers, A. B. Knapp and A. E. Johnson. They use regulation diving suits and alternate in shifts. Point where work is now going on, river is 30 ft. deep and current swift.

Shasta County

NOBLE ELECTRIC STEEL (Heroult)—State railroad commission has been asked to sanction lease to this company of Sacramento Valley & Eastern R.R., running from Pit to Bully Hill; lease to run until Dec. 31, 1918. This railroad was built by Bully Hill Copper Mining & Smelting Co. which discontinued operations five years ago on account of damage done to crops from its smelting plant. Since that time Noble Electric has been chief patron of railroad, and needs better service than railroad company can give. Agreement between the two companies fixes rental at $1 per year; steel company to bear all expenses of operation and upkeep, and to post bond of $10,000. Steel company to be allowed to terminate lease on 60 days' notice.

EMMA (Buckeye)—Shoot of good-grade ore opened recently. Plans called to drive long tunnel to explore this group.

OLIVE (Redding)—M. V. Collins has made preparations to add more stamps to stamp mill.

GLADSTONE (French Gulch)—Vertical shaft will reach depth of 250 ft. below lowest, or 1200 level, in August, at which depth it is expected vein will be cut on its dip.

SUMMIT (French Gulch)—Ore will be treated in Brunswick 5-stamp mill. Small-track incline tram being built from mine to mill; ore will be lowered in car, and car returned by hoist and cable.

RED TOP MINING CO. (Redding)—New incorporation organized by French and Spanish residents of Stockton. Capitalization, $25,000. Directors are Fermin Alustiza, Manuel Llano and Jose Dominguez. Company will operate Black Cloud and Red Top claims in Quartz Hill district, north of Redding.

Yuba County

YUKON GOLD (Hammonton)—Has acquired control of another dredging property, adjoining Yuba Consolidated, which contains, according to official estimates, approximately $4,000,000 gross. One of largest dredges ever constructed has been ordered and is scheduled to begin operation about end of year.

COLORADO

Boulder County

ROYAL GEM (Cardinal)—New Orleans capitalists have incorporated company to operate this Caribou hill group.

CARIMAN (Caribou)—Cyanide mill handles daily about 100 tons of stuff from old dumps of Caribou and Poorman mines. Recovery chiefly in silver. Both mines are being re-opened and developed, Caribou shaft being retimbered to 500 level, depth at which Boulder County adit will tap these workings.

Clear Creek County

HUDSON MILL (Idaho Springs)—Cyanidation has been abandoned in this custom plant and is superseded by flotation now in commercial operation a month. New equipment treats only tails from amalgamation and concentration.

LITTLE GIANT (Lawson)—Has few men engaged developing its large group of lode claims some of which were prominent for notable shipments in early days. Tabor adit is being driven to intersect Little Giant vein while Tabor vein itself is showing shoot of good ore.

WESTERN METALS (Georgetown)—Old company, organized to commercialize Madan dry-chlorination process in large mill erected here several years ago, languished for lack of capital but has been revived as the Colorado Metals Mining & Milling Co., with Prof. F. W. Traphagen as president. John L. Malm, inventor, will continue as metallurgist.

Lake County

WATERLOO (Leadville)—George Cramer, leaser, is shipping high-grade manganese ore.

FOREST CITY (Leadville)—Leasers, following vein in bottom level, struck shoot of silver-gold-lead-copper ore. Winze will be sunk in vein prospecting for large body.

MAYFLOWER (Silverton)—Winze being sunk from adit level follows galena shoot that, at 50 ft. depth, is 6 ft. thick. All ground broken is packed out on burros.

PENROSE (Leadville)—Station for first pair of pumps of Downtown Pumping Co. having been completed last week, pumps have been lowered and placed. Full duty will now be placed on equipment until depth for last pump station is reached.

VALLEY (Leadville)—Station for electric-driven air compressor is being cut at 1150 ft. from portal of adit, this bringing station at about 50 ft. from present breast that should be close to anticipated ore-bearing contact for which this bore was projected by Warren F. Page.

Ouray County

VALKYRIE (Ouray)—Leasers McDonald and Garrett have installed 2000-ft. pipeline to convey compressed air from plant at Mountain Top mine and will hereafter push development by use of machine drills.

San Juan County

SUNNYSIDE (Silverton)—Shipped 45 cars zinc concentrate in one train recently to smeltery at Blende. Huff electrostatic plant being enlarged to 2000-tons per month capacity.

THE SILVER CROWN MINING AND DEVELOPMENT CO. (Silverton)—This is a new incorporation which has been recently organized by James T. Burns for the purpose of operating the Lee mine on Grouse Mt. A long-term bond and lease has been secured on property which has been idle for several years. Recent exploration has disclosed a strong vein containing promising amounts of gold, silver and copper. Vigorous development will be started by new company.

San Miguel County

MATTERHORN (Ophir Loop)—Development work will be resumed on larger scale in this property on Yellow Mt.

CARIBEAU (Ophir)—J. C. Shortevant has installed two flotation machines next old Caribeau mill and will work over old tailing dumps and make tests on ore from mines.

Summit County

WELLINGTON MINES (Breckenridge)—Under management of R. M. Henderson, has been able to produce abundance of zinc-lead ore and to dispose of its high-grade concentrates under contract. Zinc concentrate goes to Empire Zinc Co. Between Dec. 1, 1914 and June 30, 1915, gross sales of concentrates—zinc and lead—amounted to $255,182. Total mining, milling and other expenses were $101,258, leaving net profits about $154,000.

BLUE BIRD (Independence). This property being developed vigorously by Franklin Leasing Co., under direction of Nelson Franklin, who is president. Forty to fifty men are employed in mining and development on the 19th and 20th levels, which have recently yielded several rich pockets of smelting ore. Careful sampling of the dumps is in progress with view of determining advisability of erecting mill for the treatment of old dumps, said to average above $4 a ton in gold.

Teller County

SPECIMEN (Victor)—Leaser McFarland has set up washers and screens on surface and is recovering, from mine dump, concentrate that sells for $50 per ton.

C. O. D. (Cripple Creek)—New heavy hoist being installed. Compressor will also be put in. Shaft will be sunk 500 ft. below present depth of 800 ft. Several sets of leasers shipping.

PORTLAND-INDEPENDENCE (Victor)—To tram ore from old adit on Portland ground into Independence mill, company is building large trestle. Dump material, as well as ore, will be treated.

VINDICATOR (Independence)—New shafthouse will be erected at No. 2 shaft to replace building destroyed by fire last spring. It will be equipped with new hoist and compressor.

MARY McKINNEY (Anaconda)—Plant was closed down two months ago for repairs to hoisting shaft and installation of electric-driven compressor and hoist that have now been tested and accepted. New drifts will be started from shaft at 1100 level.

ANNIE D. (Cripple Creek)—John A. Smith and Fred S. Cropper, pioneers in this district, upon learning of recent Tenderfoot Hill strikes, have returned from Waterloo, Iowa, and have bought this claim which they prospected years ago. They propose immediate development.

IDAHO

Cassia County

BELCHER (Albion)—First car of ore ever shipped from this property is at Salt Lake being sampled. Assays of ore show average about $16 in gold, 35% lead, 28 ounces silver and 2% copper.

Shoshone County

REINDEER QUEEN (Mullan)—Plans to erect milling plant of 150 ton capacity.

CONSTITUTION (Kellogg)—Teams are engaged in hauling zinc ore from mine to station on railway, distance of nine miles. One car-load has been shipped and another car is loading. Ore carrying 45 to 50% zinc is being taken from both tunnels for width of 6 to 8 ft. Eighteen men are employed and new messhouse and bunkhouse for 30 men are nearly finished. Charles van Horn is manager.

HIGHLAND-SURPRISE (Kellogg)—Satisfactory smelter contract having been negotiated and 100-ton mill having been renovated, Highland-Surprise mine, Pine Creek property credited with a past production of $100,000, is again on shipping basis. Fifteen men are employed in mine and there is said to be sufficient zinc ore developed to keep mill running at capacity for long period.

CASTLE ROCK (Wallace)—At stockholders' meeting Aug. 7, decided to levy small assessment to obtain funds for further development work. Mine is located on Placer Creek two miles from mouth. Contract for 200-ft. shaft has been let and driving of 50-ft. crosscut to vein is under way. Capacity of compressor, driven by water obtained from flume on Placer Creek, will be increased by addition of second nozzle.

SILVER CABLE (Mullan)—Workings of this company are all in Montana, although some of claims lie on Idaho side. Raise connecting upper and intermediate levels has been completed. Upper tunnel cut top of shoot of zinc ore and intermediate tunnel 92 ft. lower follows shoot for 300 ft.; ore is said to be of milling grade across width of 12 ft. For 70 ft. along drift there is a 3½-ft. streak of ore assaying 40% zinc, and it is planned to make shipments from this.

RAY-JEFFERSON (Wallace)—Recently announced plans of this company, which owns group of claims adjoining Interstate-Callahan on Nine Mile Creek, call for construction, at cost of $100,000, of thoroughly modern concentration plant of 250 tons daily capacity. Underground development during winter and electric-haulage system connecting mine with proposed mill will cost an additional $100,000. Heavy timbers and much of the equipment for the mill will be delivered this fall and preliminary work will begin during winter, so that actual construction work can start as soon as possible in the spring. It is hoped to have mill running by Aug. 1, 1916.

MICHIGAN

Copper

LAKE (Houghton)—Working force has been increased by 30 men. Manager Walker is getting things in shape for continued increase in tonnage.

SOUTH LAKE (Houghton)—Has increased its compressor capacity so that now has full crew on night shift as well as day shift.

ALLOUEZ (Allouez)—Is maintaining rock tonnage enough to keep more than two heads busy all of time. Increase recently has reached 1900 tons daily, which is close to 3-ton average in mill.

CHAMPION (Painesdale)—Experiment of shooting tailings from stamp mills into mine for filling where waste rock is scarce, is generally looked upon as successful. Champion rock recently has been of such good grade that there is small discard and larger shipments of sand could be used.

Iron

RICHMOND (Palmer)—Working force here has been added to lately. Mining is carried on by openpit method. About 150,000 tons will be shipped this year.

CASCADE (Cascade)—First train load of ore was shipped from this company's property on Aug. 21. Mine is now operating steadily and working force has been considerably increased. Shaft is 960 ft. in depth. It is lined with concrete from collar to sump. It is considered one of finest shafts on ranges.

MINNESOTA

Cuyuna Range

ROWLEY (Barrows)—Diversion run from Duluth to property of the Barrows Mining Co. on Sunday, Aug. 22, to permit stockholders to see progress being made. Shaft will be concrete one, with 29,000-lb. shoe.

Mesabi Range

CROSBY (Nashwauk)—Concentrating plant is rapidly nearing completion. Believed mine will be started when mill is ready. This will be third plant of its kind for Nashwauk.

BUTLER BROS. (Nashwauk)—Is operating Hawkins and Quinn-Harrison properties. Both mines have washing plants. About 60 cars of concentrates being shipped daily.

HELMER (Kinney)—Contract recently placed for electrification of entire mine. After an idleness of several years, mine will resume operations immediately upon completion of electrical installations.

MONROE (Chisholm)—Shaft 200 ft. in depth will soon be lined with concrete from top to bottom. Pump station at bottom is being repaired. Mine will be in good shape for getting out ore when all of improvements are finished.

SECTION 27 (Chisholm)—Shaft here is now down 200 ft. Pumps are now able to take care of all of water. Some trouble was experienced from this source short time ago. Timber shaft is down 90 ft. Hoisting engine is being installed. Boiler house, and change house will soon be started. Temporary boilers are now taking care of pumps.

Vermilion Range

B. M. PATTISON (Ely)—First shipment made from mine went forward Aug. 14, being 50 carloads. Entire stock pile has been sold.

MONTANA

Beaverhead County

BOSTON & MONTANA (Elkhorn)—Former Lieutenant Governor Allen, the chief promoter of company, who has just returned from east, reports that the New York banking firm of W. W. Cohen & Co. has become fiscal agents for company in East. Present plans call for continuation of development work at Elkhorn mines. Railroad project will be held in abeyance until fall. Main reason for waiting is on account of war conditions which have sent price of steel up and made it difficult to push plans through at present.

BANNACK GOLD (Bannack)—Excellent progress being made driving company's main tunnel near Bannack. Tunnel now in distance of 500 ft. being driven for contact between limestone and syenite, along which gold ore occurs. There is said to be at present blocked out in mine approximately 100,000 tons of milling ore that will average $10 per ton. Treatment tests have demonstrated that highest extraction, amounting to 96%, can be attained by straight cyaniding. It is intention of management practically to double present tonnage blocked out before taking steps toward building mill. Flume carrying water for power development to the extent of 150 or 200 hp. has been completed. Property consists of 13 patented claims. Grasshopper Creek traverses holdings of company and placer beds lying below claims have been worked for years by dredges and have produced in neighborhood of $12,000,000 in gold.

Broadwater County

BLACK FRIDAY (Radersburg)—With construction of proposed railroad into Radersburg district actually begun, attention is again being directed to development of this mine and adjoining properties, located in same group with Keating properties. Mine was closed down three years ago on account of litigation which has been settled since; ground in dispute having been secured by Black Friday company. Strike of rich gold ore was recently made by leasers on one of company's claims and preparations are being made by company for further development. Black Friday vein is about 2 ft. wide carrying mineral in foot- and hanging-wall streaks from $38 to $200 per ton.

Deer Lodge County

WASHOE REDUCTION WORKS (Anaconda)—Work on No. 9 reverberatory is going on at rapid pace. Waste gases from this furnace will fire two Stirling boilers, after which they will be carried to big stack through brick and steel flue. Steel work for this flue is now complete and brick work is under way. Steel stack will be 200 ft. high and self supporting. It will be 12 ft. in diameter. No. 4 converter of Great Falls type is being installed and is fourth of its kind to be put in building. In main reverberatory section are five furnaces using pulverized coal and three more of same type will complete this part of plant.

Lewis and Clark County

NORTHWESTERN METALS (Helena)—Involuntary bankruptcy proceedings were begun in Federal Court against this company, which proposed to refine ores by electrolytic and other processes and erected an expensive plant in Helena. Petitioning creditors are M. L. Hewett with a claim of $38,236; C. C. Titus with a claim of $8668, and the Helena Adjustment Company whose claim is $531. For some time the promoters of this enterprise were very enthusiastic about success of their processes but it seems that results of laboratory experiments failed to materialize when applied to operations on commercial scale.

Silver Bow County

BUTTE & LONDON COPPER (Butte)—After idleness of more than five years work will be resumed at company's property northeast of Meaderville. Situated outside confines of generally acknowledged mineral zone, company's engineers are satisfied that their exploration work will result in fixing new and enlarged mineral area for Butte. Shaft will be sunk from 1130 to 1830-ft. level and then crosscut of 1200 ft. made each way, north and south to cut vein which, it is believed, runs from Butte & Superior hill, directly on west, toward Columbia Gardens. Half a million dollars have already been spent on property. Splendid three-compartment shaft was sunk and up-to-date electric machinery installed. There are 20 men at work now on property. Crew will be increased to upward of 100 when driving of crosscuts begins. Point of interest is fact that should promising mineral be encountered in this section of Butte camp, it will indicate that ore bodies of the Anaconda hill may again be found to east of Silver Bow Creek. W. W. McDowell, of Butte, is president of company. He is backed by T. F. Cole and C. A. Congdon, Duluth financiers.

Silver Bow County

RAINBOW DEVELOPMENT (Butte)—All water has been pumped from shaft of Rainbow mine and company is prepared to do development and exploration work on large scale. Shaft was found to be in excellent condition. Pumping station was installed on 1000-ft. level, pumps having capacity to guarantee freedom of shaft from water.

TIP-TOMMY (Butte)—After nine months of idleness, during which shaft was allowed to fill with water, company's mine is ready for operations to be resumed. Everything was found in good condition and there will be no delay in general mining work. Three shifts have been put to work comprising same number of men employed before shut-down. Shipping of ore will begin at once. Later it is probable that shaft will be sunk to 2800-ft. level.

BUTTE & SUPERIOR (Butte)—According to company's report for quarter ending June 30, the work of sinking shaft has been completed to short distance below the 1700 ft. level. Ordinary routine development work resulted in blocking out new tonnage of an amount equivalent to that mined. It is expected that old tailings produced prior to this year will be worked over at favorable time and produce substantial profit. Additional ground acquired for disposition of tailings will permit of storing separately, tailings now being produced, so that earlier accumulations can be worked over when desired. Additional area will also provide ample tailings storage facilities for many years.

NEVADA

Elko County

BUNKER HILL (Bullion)—Frederick Davis, manager, leased old smeltery site to T. R. Moe and associates of San Francisco who will erect 50-ton smelting plant within next 90 days.

Humboldt County

FIRE SWEPT ROCHESTER shortly after midnight Aug. 15 and destroyed upper half of town. Little or no insurance was carried. Loss is heavy. Fire burned several hours. Rebuilding already underway.

Nye County

TONOPAH ORE PRODUCTION for week ended Aug. 14 amounted to 10,320 tons valued at $211,720 compared to 10,722 tons week previous. Producers were: Tonopah Belmont, 3529 tons; Tonopah Mining, 2800; Tonopah Extension, 1850; West End, 1002; Jim Butler, 1050; and miscellaneous leasers 89 tons.

Storey County

OPHIR (Virginia)—At Central tunnel 250 level winze cleaned out and compressed-air line for hoist and drills laid from C. & C. shaft to the tunnel.

JACKET-CROWN POINT-BELCHER (Gold Hill)—In joint incline Belcher ground 3 new sets of timbers installed below 1500 level. On 1300 level 90 tons of mill rock saved. Jacket mill received 1052 tons of dump rock.

CON VIRGINIA (Virginia)—In connection with Ophir and Comstock Pumping Association repairs to airways on 1600 and 1900 levels have been continued. Two compartment winze station on 2500 level cleaned out and enlarged. Hoist will be installed at this station and the winze equipped for hoisting from 2700 level.

MEXICAN, UNION, SIERRA NEVADA (Virginia)—Connections made on 2500 level, completing system of airways. Union saved 14 tons ore averaging $12.85 from air connections. Mexican vein widened 3 ft. Quartz assaying low. Mexican 2700 level west crosscut advanced 39 ft.; face in porphyry and stringers of quartz. Mexican mill crushed 123 tons. Mexican ore averaging $8.77 and 14 tons Union ore sampling $12.85.

Washoe County

GEORGE WINGFIELD (Reno)—Has purchased controlling interests in Boundary Red Mountain Gold Mining Co. in Mt. Bacon district, Washington, one mile from British Columbia boundary and 90 miles east of Vancouver and plans to erect 10-stamp mill, power plant, and install mining machinery.

TENNESSEE

Washington County

CLINCHFIELD PRODUCTS CORPORATION (Johnson City)—This Corporation of 100 William St., New York City is building $500,000 chemical plant at Johnson City for manufacture of lithophone and kindred products.

SOUTH DAKOTA

Lawrence County

GOLDEN REWARD (Deadwood)—Astoria roaster is at present outputting 50 to 60 tons daily which is shipped to cyanide mill at Deadwood for treatment. Results indicate 90% extraction on hard-blue, or unoxidized ores.

RATTLESNAKE JACK (Galena)—Fifty tons daily are being put through new mill which is one of most modern in Black Hills, containing 10 stamps, Hardinge 22-in. by 84-in. pebble mill, Dorr classifier, Trent cyaniding machinery, Merrill zinc-dust precipitating equipment. Amalgamating plates are installed, but have not been used since first clean-up. Plant is driven by electricity.

TROJAN (Trojan)—In preparation for thorough [illegible] improvements Holt-Dern roaster will be installed. Company believes that cyanide recovery on average ore can be increased to 90% by previously giving it a chloridizing roast. Under present methods oxidized ores yield 75% and about 85% of silver. Unoxidized ores are not worked when valuable enough they are smelted. Result is large quantities of ore are left in stopes.

UTAH

Beaver County

THERE IS MUCH ACTIVITY in the Star district near Milford, and more properties are shipping than in several years.

CEDAR-TALISMAN (Milford)—Shipments of zinc ore and of silver-lead ore are being made. Zinc is being mined from 225 and 1000 levels south of shaft. It occurs as bedded deposit lying under lead ore, and is from 18 in. to 4 ft. in thickness.

MAJESTIC (Milford)—Zinc ore has been opened at Harrington-Hickory mine 45 ft. on strike, and up to 10 ft. in thickness. A two-year contract for smelting copper ore from Old Hickory mine has been made.

LEONORA (Milford)—Better progress in development being made since installation of new machinery. Drifting is being done on 400 level, and three fissures between main shaft and limestone-monzonite contact will be prospected.

Juab County

TINTIC ORE SHIPMENTS for week ended Aug. 13 amounted to 171 cars estimated at 8550 tons valued at $210,000. There were 22 shippers.

YANKEE CONSOLIDATED (Eureka)—Discovery of ore made recently at surface in Humbug claim, and favorable reports continue to come in. Ore, which is lead running well in silver, is thought to be on east, or May Day ore zone.

MAY DAY (Eureka)—About 30 leasers are working, and making shipments of zinc ore amounting to 250 tons a month. Eighty tons recently shipped ran 31% zinc. Company is shipping 20 cars of lead-silver ore a month.

SCRANTON-LEHI (Eureka)—This property, which adjoins Scranton in North Tintic, is being developed through two tunnels. Vein material similar to that in Scranton has been cut in lower tunnel. This carries small amounts of zinc. Scranton has produced much high-grade ore from large lenses of zinkite.

Piute County

UTAH FERTILIZER & CHEMICAL CO. (Green River)—This company has been incorporated to work group of 15 alunite claims in Mount Baldy mining district south of Marysvale. Capitalization is $25,000, divided into shares of $5 each. Charles P. Tasker, who has been drilling for oil in southeastern Utah, is president.

Salt Lake County

TAR BABY (Salt Lake)—Twenty feet of low-grade ore has been cut in company's tunnel in Big Cottonwood.

UTAH COPPER (Bingham)—Average daily output during July was 28,000 tons of ore. Of this the D. & R. G. handled 9500 tons and Bingham & Garfield, 18,500 tons.

UTAH-APEX (Bingham)—New smelting contract or renewal has been made with A. S. & R. New flotation plant for treating fines from 250-ton mill is in operation.

WEST TOLEDO (Alta)—Cross-cut which is being driven for Toledo fissure is being advanced 3 ft. daily. Vein is expected to be cut in about 40 ft. Work is being done at two other points.

CARDIFF (Salt Lake)—New 150-hp. Laidlaw-Dunn-Gordon compressor has been ordered, and will be installed as soon as possible. This will be an electrically driven 17 and 10x14 feather-valve compressor, and is rated at 850 cu.ft. of free air per minute.

WASATCH MINES (Alta)—Car of ore has been shipped from No. 5 workings, and further ore is broken and ready for shipment. Silver-lead ore a foot thick has been cut in tunnel on Relief claim. This is under some zinc ore opened at surface. Leasers are making shipments from different parts of property.

COTTONWOOD-KING (Salt Lake)—This property, formerly Giles, in Big Cottonwood has opened 6 ft. of vein matter containing iron and manganese. Work is being done in middle tunnel, which is in 600 ft., and is following limestone-quartzite contact. S. S. Parry is general manager.

SOUTH HECLA (Alta)—Shipment of car a day is being made from Wedge fissure, and shipments will soon be started from Kate Hayes fissure in Quincy tunnel. It is thought that two cars daily will be shipped from this part of the ground. Fields & Claflin, leasers on Quincy tunnel, are opening good body of sand carbonate ore with some galena.

Summit County

PARK CITY ORE SHIPMENTS for week ended Aug. 14 amounted to 1752 tons valued at $76,000 compared with 2342 tons last week.

SILVER KING COALITION (Park City)—Work of installing new flotation section at mill is in progress. Concrete foundations are completed, and part of equipment, including tanks and cells, are on ground.

NEW YORK BONANZA (Park City)—Appraisers are looking over this company's property, now in bankruptcy. Appraisers are M. J. McGill, H. S. Townsend, and J. Fewson Smith.

KEYSTONE (Park City)—Work of cleaning up at this property in Thaynes Canon is being done. It is thought by stockholders that work will be resumed, or that property will be sold to Silver King Coalition.

Tooele County

COMPANIES NOW OPERATING AT OPHIR are Ophir Hill Consolidated, Cliff, Lion Hill Consolidated, Buffalo, Eureka-Ophir, and Montana Consolidated. Production of camp to date is placed at $20,945,000.

OPHIR MINES DEVELOPMENT (Ophir)—Articles of incorporation filed by this company, to develop McKinley group of patented claims adjoining Ophir Hill Consolidated owned by Senator W. A. Clark. Capitalization is $50,000. There are 500,000 shares of which 250,000 remain in treasury. A. K. Tiernan is president. Continuation of Ophir Hill Consolidated ore beds and fissures on south side of canon will be looked for.

WASHINGTON

King County

SEATTLE SMELTING CO. (Seattle)—W. D. Wood, consulting business manager of company, is quoted as stating plans are being made for erection of smelting plant at Anacortes, Wash., for treatment of antimony ore.

Spokane County

MAYFLOWER (Spokane)—Is operating prospect in Nine Mile district of Cœur d'Alenes, Idaho, and plans for installation of compressor and sinking equipment.

SILVERADO (Spokane)—Plans for installation of compressor equipment and electric power plant at its mine near Osborn, Idaho. C. D. Musen, Spokane, is secretary.

EMPIRE MOLYBDENITE MINING & MILLING CO. (Spokane)—First molybdenite mining company organized to operate in the Spokane district, property being in northern Idaho. Thomas A. LePage, president, declares that sufficient ore has been uncovered to warrant erection of mill.

Stevens County

NORTHPORT SMELTERY (Northport)—Men were put to work at Northport smelting plant Aug. 16 and more are to follow. Furnaces 1, 2, 3 and 4 are to be torn down and 5 and 6 are to be retained and used for treatment of copper ore. Lead furnaces are to be installed. Smeltery is to be operated in small way at first and later made as modern as possible, with electric power and mechanical handling devices.

CANADA

British Columbia

GRANBY CONSOLIDATED (Vancouver)—During fiscal year ended June 30 production amounted to 26,705,928 lb. of copper; 415,806 oz. of silver, and 32,126 oz. of gold. Of the total, 10,005,278 lb. came from Grand Forks smeltery and 16,700,650 lb. came from New Hidden Creek smeltery at Anyox. Despite low operating costs at Anyox, three months shutdown at Grand Forks last fall and other facts, made total cost per lb. reach 10½c.

Ontario

PRESTON EAST DOME (Porcupine)—Will be reopened.

VIPOND (Porcupine)—In July treated 3670 tons and recovered $30,000 bullion. Sinking has been started to 550 ft. level.

TOUGH OAKES (Kirkland Lake)—July production was $55,500 from a little over 2300 tons of ore. Mill capacity has been raised to 120 tons a day.

ZENITH ZINC (Nipigon Bay)—As result of the government policy of encouraging zinc refining in Canada this mine will shortly be re-opened.

NIPISSING (Cobalt)—In July produced silver to estimated net value of $180,000 and shipped bullion from Nipissing and custom ores to estimated net value of $262,616. High-grade mill treated 37 tons and the low-grade mill 6960 tons of ore.

HOLLINGER (Timmins)—Usual 4-weekly statement for period ending July 15 shows gross profits of $124,222 from treatment of 25,076 tons of ore of average value of $9.24. Working costs were $3.53 per ton milled.

DOME (Porcupine)—In July treated 28,300 tons and recovered $131,928, an average of $4.67 a ton. This represents a large increase in tonnage and value over preceding month, and constitutes record production since commencement of operations.

McINTYRE (Porcupine)—In July treated 94°6 tons averaging $7.89 and made recovery of 96%; total of $71,600. Total costs were $44,000 or $4.70 a ton. Net profits were $27,600. Owing to favorable developments underground, mill capacity will be increased to 400 tons a day.

STANDARD SMELTING & REFINING CO. (North Bay)—This company will establish plant up Niagara River from Chippawa, Ont., where it has secured works of British Canadian Smelting Co. with 20 acres of land. Large building is being erected. Company will treat nickel and cobalt ores.

DOME LAKE (Porcupine)—Will increase capital of company from $1,000,000 to $2,000,000. Of new capital, 100,000 shares will be offered to shareholders at 40c. to provide funds for equipment of mill with cyanide plant, and to carry on more extensive development. For week ending Aug. 4 mill produced $3100.

MEXICO

Chihuahua

CUSI (Cusihueriachic)—Has just completed experimental mill. Test run promises bright future.

Pachuca

SANTA GERTRUDIS (Pachuca)—In June crushed 14,066 tons of ore. Estimated profit £4860.

Sonora

BELLOTA (Nacozari)—J. V. Fryer and A. Martinet have recently purchased this property from A. Fuller and have been doing considerable work. Shaft 120-ft. has been sunk and 18 in. of $50 ore opened up in the bottom of shaft. Four cars have been shipped to smelters and two more will be shipped as soon as cars can be secured.

SOUTH AMERICA

Chile

ERADEN (Rancagua)—Record production in July, amounting to 1415 tons (2000 lb.) of copper; production for first 7 months of this year, 9064 tons.

CHILE COPPER (Chuquicamata)—By end of October it is expected that full mill equipment will be in operation with nominal daily capacity of 10,000 tons. Third unit of power plant is scheduled to start operations Sept. 1, and fourth unit Oct. 1. Favorable underground developments continuing; one drill hole down 1530 ft. continues in ore averaging 2.11% copper.

The Market Report

Metal Markets

NEW YORK—Aug. 25

During the last week copper, lead and zinc all became emphatically stronger, the price of copper rising about 1c. per lb., and the price for zinc rising nearly 2c. a lb.

Copper, Tin, Lead and Zinc

Copper—Up to Monday the market was very weak, there being sellers all the time at 16c., regular terms, and there were sufficient shadings on some business to bring the net cash price, basis New York, down to 15¾c. At this low level, considerable business was done both with domestic consumers and with foreign governments. It was particularly noteworthy that American consumers bought both for prompt and for September shipment, indicating that they had allowed their supplies to run low. This buying probably absorbed most of the cheap copper offered by the smaller producers, agencies, etc., and on Monday the market started upward. Early in the day about 15.85c., cash, New York, was accepted on some export business, but by the end of the day the market stood at 16.10, or 16¼c., regular terms. On Tuesday there were sales at 16¼c., regular terms, at the opening, but at the close the market stood at 16⅝c., regular terms, for nearby shipments, and 16¾c., regular terms, for futures. On Wednesday there were sellers at 16¾c., regular terms, at the opening, but the tone of the market was decidedly firmer, and before the end of the day 17c., regular terms, was realized.

The principal producers did not figure in the market this week, their price being 17½@18c., regular terms. At the close it looked as if buyers would have to go to them and pay their price, the copper for sale by outside producers having been so completely absorbed, and the upturn in the market having been so sharp.

In the European markets during the last week there was sharp competition from Australian and Japanese sellers who accepted prices that American producers did not care to accept. However, at the beginning of the week a large order was taken by an American producer at a relatively low price.

Our correspondent reports no copper was shipped through the port of Baltimore during the last week.

Copper Sheets are quoted at 23c. base, with the usual advance for cold rolled. Copper-wire market has been unsettled; prices at the mill range from 17⅜@18¼c. per lb.

Tin—The market sagged off a little and then rallied at the close in sympathy with the advances in the other metals. There was a steady demand but in the main the market was featureless.

Lead—The large orders that were accepted at low prices about 10 days ago apparently cleared the atmosphere, for on Aug. 19 there developed an increased demand, and the higher prices that were asked were willingly paid. Following this there was a steady improvement during the week, and a fairly large transaction of business. All of the cheap offerings of lead disappeared and the outside market rose to the level of the A. S. & R. Co. On Aug. 25 that company advanced its price to 4.60c.

Spelter—Late in the afternoon of Aug. 18, and on Aug. 19 there developed a rather important buying demand, in which some very large domestic consumers figured. Their orders were taken, however, at unchanged prices, viz., about 10c. per lb. On Saturday England commenced buying in this market and took a considerable tonnage at about 10½c. per lb. This lifted the market out of the doldrums and a further advance ensued on relatively small business. On Aug. 25 about 13c. was paid for round lots for September-October shipment, and there were some large inquiries in the market for October-November shipment.

The domestic buying in the early part of the week was largely from galvanizers, but it was by no means general, and there was a supposition that certain galvanizers were covering contracts for military purposes. Outside of such work, the galvanizing business sems to be still as nearly paralyzed as it ever was.

The high price for high-grade spelter is said to have been 40c. per lb. The company that produces that grade of spelter, strictly speaking, is now said to be offering it for delivery in 1916 at 20c. per lb.

The American Zinc & Chemical Co., at Langeloth, Penn., is now working on the construction of its second unit which will consist of four furnaces, each of about 900 retorts.

British papers report that the Swansea Vale zinc-smelting works at Llansamlet, Swansea, Wales, have been purchased by London interests, headed by R. Tilden Smith, who intend to enlarge the works and produce spelter at the rate of 25,000 tons per annum, against the present production of 5000 tons per annum.

We hear that the Munitions Ministry of the British Government is contemplating doing some zinc smelting on its own account.

Zinc Sheets have been actively inquired for, but few sales resulted. The base price for carload lots is $16 per 100 lb., f.o.b. Peru, Ill., less 8% discount.

DAILY PRICES OF METALS IN NEW YORK

Aug.	Sterling Exchange	Silver, Cts. per Oz.	Copper: Electrolytic, Cts. per Lb.	Tin: Spot, Cts per Lb.	Lead: New York, Cts. per Lb.	Lead: St. Louis, Cts. per Lb.	Zinc: St. Louis, Cts per Lb.
19	4 6675	47⅛	15 75 @15 85	34	4 40 @4.50	4 25 @4 30	9½ @10½
20	4 6775	47⅛	15.75 @15 85	33⅞	4 45 @4 50	4 30	9½ @10½

24	4 6550	47	16 10 @16 60	33½	4 50	4 30	11 @12
25	4 65125	46⅞	16 60 @16.85	34⅛	4 60	4 35 @4 45	11½ @13

The quotations herein are our appraisal of the average markets for copper, lead, spelter and tin based on wholesale contracts for the ordinary deliveries of the trade as made by producers and agencies; and represent, to the best of our judgment, the prevailing values of the metals, reduced to basis of New York, cash, except where St. Louis is given as the basing point. St. Louis and New York are normally quoted 0.17c. apart.

The quotations for electrolytic copper are for cakes, ingots and wirebars. Electrolytic copper is commonly sold at prices including delivery to the consumers and is subject to discounts, etc. The price quoted for copper on "regular terms" is the gross price including freight to the buyer's works and is subject to a discount for cash. The difference between the price delivered and the New York cash equivalent is at present about 0.20c. on domestic business. The price of electrolytic cathodes is 0.05 to 0.10c. below that of electrolytic. Quotations for lead represent wholesale transactions in the open market for good ordinary brands. Quotations for spelter are for ordinary Prime Western brands. Only the St. Louis price is herein quoted, St. Louis being the basing market. We quote the New York price at 17c. per 100 lb. above the St. Louis price.

Silver quotations are in cents per troy ounce of fine silver.

Some current freight rates on metals per 100 lb. are: St. Louis-New York, 17c.; St. Louis-Chicago, 6.3c.; St. Louis-Pittsburgh, 13.1c.

The above table gives the closing quotations on London M[illegible] All prices are in pounds sterling per ton of 2240 lb., except silver [illegible] per troy ounce of sterling silver, 0.925 fine. Copper quotat[illegible] copper, spot and three months, and for electrolytic, pric[illegible] subject to 3 per cent. discount. For convenience in comp[illegible] in pounds sterling per 2240 lb., with American prices in cen[illegible] following approximate ratios are given, reckoning exchange a[illegible] 3.21c.; £20 = 4.29c.; £50 = 0.43c.; £40 = 8.57c.; £60 = [illegible] ditions, £1 = 0.21½c.

The Am[illegible]mated Zinc Co. has been granted permission by the Aus[illegible]n authorities to ship the 57,000 tons of blende concentrate[illegible]ld to America and 6000 tons to Marseilles.

Zinc dus[illegible] quoted at 30c. per lb.

Gold, Silver and Platinum

Gold production of the Australian Commonwealth for the half-year ended June 30 is reported at $20,822,890; South Australia being estimated.

Silver—The market has ruled dull and quiet the last week with weaker tendency, closing in london at 22⅛ pence. The New York price has also been depressed by the fall in sterling exchange.

The United States Government bought 500,000 oz. of silver on Aug. 20 and is in the market for 500,000 oz. more on Aug. 27.

Platinum—The market is unsettled but with upward tendency. There were few sales, dealers not being inclined to make concessions. Prices ranged from $38 to $41 per oz. for small lots of refined platinum, and $47 for the 15% iridium alloy.

Other Metals

Aluminum—There is little activity owing to scarcity of the metal. Small lots are quoted nominally at 36@38c. per lb., New York.

Antimony—Notwithstanding that some important inquiries have been received, actual sales are scarce and the market is weak. Outside brands are quoted at 29@31c. per lb., and Cookson's at 45@48c.

Quicksilver—Trade has been quiet but has improved slightly. New York quotations for large orders are $91 per flask of 75 lb. and for smaller lots $90@93. San Francisco quotes $85 with market inactive. London quotations are £18 per flask for both first- and second-hand stocks.

Zinc and Lead Ore Markets

JOPLIN, MO.—Aug. 21

Blende, high price $72.50; base price per ton 60% zinc, premium ore, $70, medium, $65@57, lower grades down to $50; Calamine, base per ton 40% zinc $55@40; average, all grades of zinc, $67.31 per ton.

Lead, high price $53.50, base price $50@45 per ton of 80% metal content; average, all grades of lead, $50.46 per ton.

SHIPMENTS WEEK ENDED AUG. 21

	Blende	Calamine	Lead	Values
Totals this week..	10,221,360	787,300	1,925,970	$419,070
Totals this year..	364,956,730	29,764,560	56,223,510	$15,948,260

Blende value, the week, $351,990; 34 weeks, $13,803,170.

Calamine value, the week, $18,510; 34 weeks, $651,040.

Lead value, the week, $48,570; 34 weeks, $1,494,050.

The decline of $50 per ton for blende in five weeks, as unheard of as its miraculous advance, has engendered a depressing and apathetic feeling in producing circles. Manipulation is charged and dissatisfaction reigns, but so far the production has not been restricted. In fact the high prices failed to produce a marked increase at any time, the average of the year to date being only 5825 tons per week.

PLATTEVILLE, WIS.—Aug. 21

The base price paid this week for 60% zinc ore was $60-65 per ton. No sales of lead ore were reported.

SHIPMENTS, WEEK ENDED AUG. 21, 1915

	Zinc Ore, Lb.	Lead Ore, Lb.	Sulphur Ore, Lb.
Week	4,067,870	.....	707,440
Year	121,522,210	4,083,160	18,100,210

Shipped during week to separating plants, 4,297,140 lb. zinc ore.

Iron Trade Review

NEW YORK—Aug. 25

The steel market is undoubtedly quieter than it was a week ago, and considerably quieter than it was in July. There is really very little strictly new buying, while specifications on contracts, although at a very good rate, are not on the whole coming in as rapidly as in June and July. There are exceptions, wire products and sheets showing decidedly greater activity, both in new business and in specifications against contracts.

PITTSBURGH—Aug. 24

The slackening in general market activity is causing a little concern in some quarters as to the future of the steel market, particularly in view of the fact that the steel mills will be working better in September and October and will be able to turn out a larger tonnage, by 10 or 20%, than in July and August. There is decided encouragement in the fact that export demand has continued to grow uninterruptedly to date, while September normally shows a great deal more steel buying than August.

Steel prices continue to stiffen. The 1.35c. price on bars, plates and shapes, announced last week by the Carnegie and Illinois steel companies, is being more frequently quoted by other interests. Blue annealed sheets were advanced last Thursday from 1.35c. to 1.40c. by the American Sheet & Tin Plate Co., which today announced an advance in black sheets also, from 1.85c. to 1.90c., the advanced price in blue annealed having since become the market while the black-sheet advance is practically certain to be similarly effective.

Effective yesterday the American Steel & Wire Co. announced new prices on wire products, involving advances of $1 a ton in nails and $2 a ton in plain wire and painted barb wire, and reductions of $2 a ton in galvanized wire and galvanized barb wire, the extra for galvanizing being reduced from 80c. to 60c. per 100 lb. consequent upon the decline in spelter. The new prices are: Plain wire, 1.50c.; wire nails, $1.65; galvanized wire, 2.10c.; painted barb wire, 1.80c.; galvanized barb wire, 2.40c.

Pig Iron—Bessemer and basic pig iron have advanced 25c. and foundry and forge 50c. in the week. The sales have not been heavy but the furnaces were already well sold up and further advances are expected. The Valley Mold & Iron Co. announces it will blow in its Alice furnace at Sharpsville shortly, while Ella furnace of Pickands, Mather & Co., and Fannie and Claire of M. A. Hanna & Co., also in the Shenango valley, are being gotten ready for blast and the Shenango Furnace Co.'s No. 4 stack at Sharpsville has been blown in. With additional furnaces seeking orders prices may not rise as rapidly in the next two or three months as they have been rising in the past four or five weeks. We quote: Bessemer, $15.50; basic, $14.25@14.50; No. 2 foundry and malleable, $14@14.50, forge, $13.75@14.25, f.o.b. Valley furnaces, 95c. higher delivered Pittsburgh.

Ferromanganese—The market is quite unsettled. There is no regular quotation on imported ferromanganese, while domestic is offered on contract at $115, this price however being occasionally shaded, and the quotable market for spot and contract lies within the limits of $100 and $115, with not much activity.

Steel—There is considerable negotiating for billets and sheet bars in small lots, with few offerings and prices not well settled. A steel mill in this district has taken a contract to reduce 3000 tons of ingots to billets, a kind of business done only when steel is very scarce. The market is approximately $23 for billets and $24 for sheet bars, f.o.b. maker's mill, Youngstown, and about $1 higher delivered Pittsburgh. Rods are decidely stronger at $28, Pittsburgh.

Imports of ferromanganese at Baltimore for the week from Liverpool were 1079 tons.

Imports of manganese ore at Baltimore for the week from Brazil were 12,300 tons.

IRON ORE

Of the Lake ore shipped in July 6,161,730 tons, or 85.5%, went to Lake Erie ports.

Ore on Lake Erie docks Aug. 1 was 6,539,933 tons, or 89,720 tons less than on Aug. 1, 1914. As the receipts this year were greater by 3,616,673 tons than in 1914, this indicates an increase of over 3,700,000 tons in the movement from docks to furnaces.

Imports of iron ore at Baltimore for the week from Cuba amounted to 13,490 tons.

Chemicals

NEW YORK—Aug. 25

The market is firm though not active. Futures are stronger, especially in nitrate, and the position of some other chemicals is improving owing to conditions arising out of the constricted war market.

Arsenic—Prices are a little firmer, though not much business is being done. Carload lots are quoted 3⅜@3½c., and smaller orders 4c. per lb.

Copper Sulphate—Trade is fair but without change in prices, $7.25 per 100 lb. being asked for large lots and $7.50 for smaller parcels.

Nitrate of Soda—This market is stiffening, owing to buying of the Allies on the West Coast. Spot nitrate is 2.40c. per lb.; September forward, 2.42½c., and 1916 quotations have advanced to 2.45c.

Pyrites—Imports from Spain at Baltimore for the week ended Aug. 23 amounted to 17,076 tons.

VOLUME 100 SEPTEMBER 4, 1915 NUMBER 10

The Steel Headframe at No. 9 Shaft, Republic Mine, Vulcan, Mich.

By Floyd L. Burr*

SYNOPSIS—Old wooden headframe demolished and new steel headframe constructed and shaft kept from operation only seven weeks. New 100-ft. headframe designed for sheaves in tandem instead of parallel as usual; for unusual structure stresses; and uncommon method of hoisting and balancing. Total weight of steel 142,000 lb.; that cost erected, $8400.

In the earlier days of the Lake Superior mining region, when timber was a plentiful local product, almost all mine structures above and below the surface were of wood. Many of these structures have given excellent service but have now reached a state of advanced decay and must be replaced. In making replacement, attention is now usually directed toward a more durable material than wood, and this is especially true when a headframe is under consideration. The structure described in this article was erected for the Republic Iron Co., which at the time of construction was the owner of the property. It was operated under the same general management as the Penn Iron Mining Co.'s mines at Vulcan. The Republic mine has since been transferred to the Cleveland Cliffs Iron Co. No. 9 shaft of the Republic Mine is a rectangular timber-lined vertical shaft 6 ft. by 17 ft. 4 in. inside the timbers, having three compartments comprising a cageway at the north end, a skipway at the south end and a middle compartment used for pipeway, ladderway and balanceways—a very common type of shaft in this district.

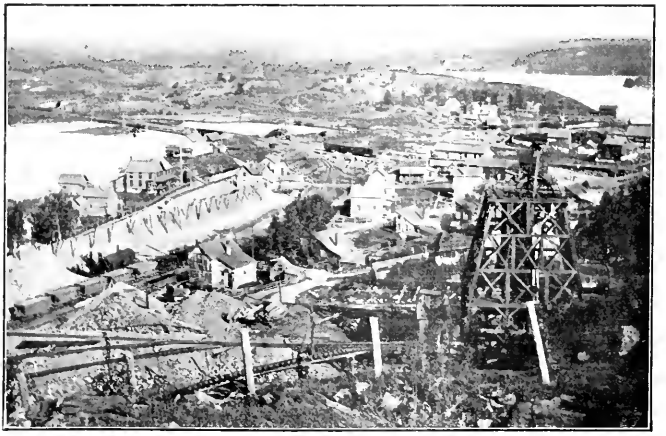

FIG. 8. VIEW AT REPUBLIC MINE, VULCAN, MICH., SHOWING OLD TIMBER HEADFRAME

This shaft had for 25 years been surmounted by a timber headframe having the form of a truncated pyramid 36 ft. square at the base, set upon a prismatic section; altogether about 60 ft. high. The long axis of the shaft has a general north-south direction. The headsheaves for the cage rope and skip rope lay in east-west vertical planes, the ropes leading from them down toward the east to an angle-sheave frame where the ropes were turned nearly at right angles, running thence in a southerly direction for about 1800 ft. to a second angle-sheave frame, from which they emerged in an easterly direction and entered the hoisting house.

This long and indirect route for the hoisting cables came about by reason of the use of the old No. 5 shaft hoisting drums for the then new No. 9 shaft. This solution of the problem of equipment for a new shaft is not unusual in the Lake Superior district. In addition to the two horizontal angles in the ropes, there were several slight vertical angles due to the profile of the ground over which the ropes ran. In the discussion preliminary to the design of a new headframe it was thought best to eliminate one of the two principal angle-sheave frames by letting the ropes run the 1800 ft. in a southerly direction directly from the headsheaves to the southernmost one of the two old frames. There were various other matters of rearrangement planned as an improvement over the original layout.

Regular Practice in Operation of Headgear

The common practice at the Vulcan and Republic mines is to dump the ore from the skip into a hopper or chute through which it slides by gravity into a transfer car operated by some form of rope haulage. This car carries

*Vulcan, Mich. Formerly structural engineer, Republic Iron Co.

the ore out to its destination, which may be either the stockpile or the shipping pocket where it is automatically dumped. The floor or platform upon which this car stands in the headframe is known as the landing floor. Where the neighboring ground surface is at about the same elevation as the shaft mouth, it is necessary in modern installations to have this landing floor about 40 ft. above the shaft collar in order to provide ample headroom for shipping pockets and stockpile trestles.

In the case of this shaft, a form of gravity haulage has been in use for some years. The tram tracks are placed on a strong down grade, varying from 2½ to 5%, leading out on the trestles to the stockpile dump, the wasterock dump, or the crushing plant dump, and the loaded transfer car is allowed to run out and be automatically emptied. On the way out, it is controlled by a rope attached to the car and to a drum at the headframe, and the empty car is pulled back up the slope to the headframe by this drum, actuated by the skip hoist through the medium of a driver pulley keyed to the shaft of the headsheave and a rope drive delivering power to a follower pulley on the same shaft with the drum. This drum may be clutched to the shaft at pleasure. One man attends to the landing of the skip and operation of the machinery and car.

On account of the elevation of the shaft above the railroad tracks, a height, for the landing level, of about 12 ft. above the collar is sufficient to furnish the down grade referred to and still leave sufficient headroom for the various dumps.

Besides the cage and skip there was a skip counter-balance running in the shaft and requiring provision in the headframe.

In order to make certain references farther along intelligible, it will be necessary to give here a little explanation about the system of skip counterbalancing[1] in use at this shaft. By this system an auxiliary rope runs from the bottom of the hoisting drum to an auxiliary drum, called the balance drum (see Fig. 3). From the other end of this balance drum another rope runs to and over the headsheave and down into the shaft, where it is attached to the balance weight that travels up and down the shaft between ordinary guides. This balance drum is made with varying radii, thus giving a varying-moment arm for the pull of the ropes. These radii are proportioned so that the dead weight of the skip and that portion of its rope which hangs in the shaft is, at all points in its downward and upward travel, very closely in balance with the weight of the counterbalance and that portion of its rope which hangs in the shaft. The balance drum usually takes the general form of a double cone. In this case, however, the shaft end of the drum is a spool, upon which a flat rope runs to the headsheave and counter-weight. Of course the varying diameter of the coil as the rope winds on or off furnishes the varying moment arm needed for the system. The other, or hoist portion of the drum, is of the usual form with sloping face.

When the skip (Kimberly type) goes into the dump in the headframe, it of course exerts less pull on its rope or "loses weight" by reason of its resting partly on the dump members of the headframe. With the perfect

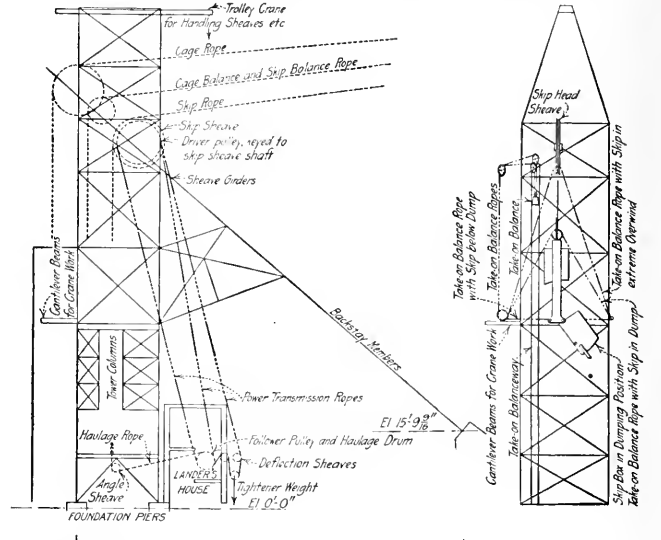

FIG. 2. GENERAL LAYOUT OF HEADFRAME, HOISTING ROPES AND BALANCING SYSTEM

counterbalancing just explained, this loss of weight is sufficient to prevent the emptied skip from moving out of the dump when it is started downward again into the shaft. It is therefore necessary to compensate for this loss of weight by taking on weight from another source—hence the "take-on balance."

This take-on balance is a weight of about 1500 lb. traveling in a balanceway built from the ground up into the headframe. It is attached to a rope, or a pair of ropes which are led over small headsheaves and around various deflecting sheaves and attached to a fixed support in such a way and at such an elevation as to lie horizontally across the center of the skipway ready to be engaged by wheels on the top of the skip frame just when the skip box begins to lose weight in entering the dump. It will be readily seen that by having the horizontal portion of these ropes of some length, the effect of the take-on

[1] A complete description of this system may be found in the "Proceedings of the American Institute of Mining Engineers," meeting of February, 1914, as part of a paper entitled "Use of Electricity at the Penn and Republic Iron Mines, Michigan," by William Kelly and E. H. Armstrong.

balance is gradually increased to correspond approximately with the gradually decreasing weight of the skip.

General Design of the Headframe

A survey disclosed the fact that the long or north-south center line of the shaft lay at an angle of only 11¼° from a straight line joining the shaft with the distant angle-sheave frame mentioned. Therefore it was decided that the center line of the headframe should be aligned parallel with the shaft, thus avoiding a slight obliqueness in the alignment of support of guides, dump, etc. The center of the two principal compartments lying thus so nearly in a common line to the distant angle-sheave frame, the two main sheaves would be very nearly in the same vertical plane and of course would be in tandem (see Fig. 4), instead of parallel arrangement as they had been in the old headframe and as they are in the majority of headframes. This tandem arrangement generally introduces a good deal of complication to the design of a headframe, and this case was no exception to the rule.

The site of the shaft is at the foot of a steep rocky slope which forms the north end of the bold and extensive jasper outcrop, so prominent a part of the distinctive geology and the remarkable scenery at Republic. The hoisting ropes were to lead directly to the brow of the bluff and, with the height of headframe required, this a long distance from the shaft, making it necessary to adopt the six-post type of headframe in which there are four vertical columns in the immediate region of the shaft, forming by themselves a complete tower against which is leaned, so to speak, the backstay portion of the frame. The backstay portion is to a large extent independent, being braced to the tower only in the upper portion of its height.

As a matter of fact these objects have not been attained with absolute perfection, since the pillow blocks for the sheaves are placed on the top flange of the girder struts, thus putting the center of the sheave about a foot from the plane of the center lines of the backstays instead of exactly in that plane.

Also the resultants from the four hoisting ropes do not all fall exactly in the same plane, since it was not convenient so to arrange matters on the hill that all the ropes from headsheaves to hill should be exactly in parallel planes. As a result of this lack of perfection the vertical tower portion of the frame does carry a slight compressive stress from the hoisting.

Detail Description of Design

The details of the design are shown in Figs. 5 and 6. It was thought best to gain the advantage of short girts, beams and diagonals by making the headframe narrow

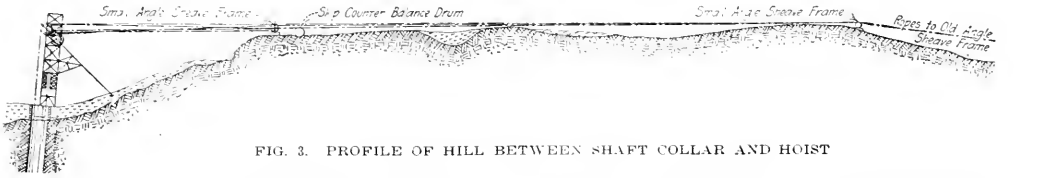

FIG. 3. PROFILE OF HILL BETWEEN SHAFT COLLAR AND HOIST

topographical relation made the ropes actually slope upward in leading away from the headsheaves—an unusual condition. This of course made the resultant of the rope stresses lie very flat. A glance at the profile sketch (Fig. 3) will make these features clear.

The shaft being a deep, important and permanent one, structural steel was chosen almost as a matter of course as the material for the headframe. In deciding upon the general form of the headframe and the location of its members, it was necessary to keep in mind the matters of support and clearance for four headsheaves with their hoisting cables; the take-on balanceway and its sheaves and ropes and fixed support for rope ends; the dump plates, hopper, platform, car, and track; the large rope drive, driver-pulley on the skip-sheave shaft and the rope-drive ropes; means for convenient handling of the headsheaves; suitable provision for handling miscellaneous loads on two sides of the headframe; and convenient floors, stairways, ladders and railings as means of reaching all vital parts.

In working out the design, it was considered desirable to have a structure wherein the principal stresses produced by the hoisting should be perfectly determinate and as far as practicable be confined to a few members through which they would be transmitted directly to the earth. These objects required the backstays to lie in the plane of the resultant for each and every rope, and called for the peculiar arrangement of sheaves whereby all four of them are located in the plane of backstays. Placing the backstays at such a flat slope forced their bases out and the tower portion short. This narrowness also allows teaming of supplies close to the east side of the shaft. To allow for plenty of clearance for the skip throughout its dumping operation and a possible overwind, and to provide clearance for the travel of the take-on ropes the west columns were placed 10 ft. from center line of shaft. This position was also found to furnish a good central support for the hopper, which is a heavy affair and subject to much stress by the impact due to the dumping of ore. The east columns were placed 7 ft. from the center line of the shaft to allow of suitable bearing for the column piers. This made a total width of 17 ft., which is little enough for the general stability of a structure of 100 ft. total height.

For a similar reason, the length of the tower portion was reduced to a minimum (16 ft.) that would still provide for stairways, landings and other minor but necessary features. To attain this object, the front of the tower was placed across the center compartment of the shaft, and the cageway was thus left outside the main structure. The near or south guide of the cageway was easily bracketed out from the north girts of the tower. The outer or north guide was not so readily supported since there must be clear space for the travel of the cage. Believing that about 50 ft. of clear cageway would be sufficient for safety, overwind possibilities and all traffic of handling long materials on or under the cage, its travel was stopped off at elevation 51 ft. by a triangular horizontal bracket reaching out to the north side of that compartment to furnish horizontal support for the

upper end of a vertical backing-beam to which the north guide is bolted. This beam was built up by riveting a 10-in. channel to one flange of a 10-in. I-beam.

The tower proper is surmounted by a trolley-beam crane from which all the sheaves can be readily handled. A trolley is provided and the web of the beam is also perforated at short intervals for the ready attachment of

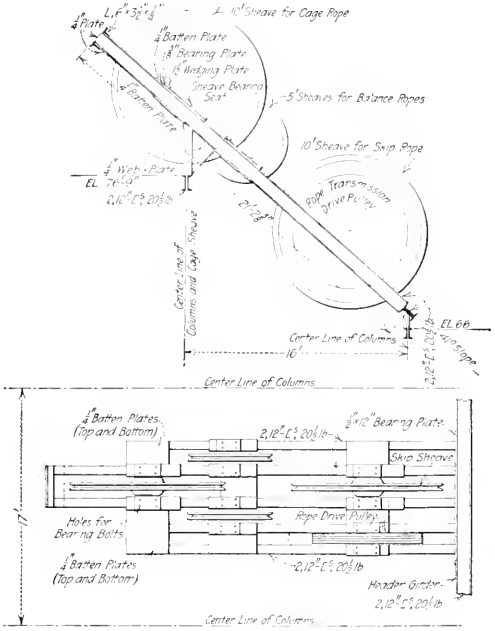

FIG. 4. DETAILS OF SHEAVE SUPPORTS

a clevis at any desired point along its length. This trolley-beam cantilevers out both to the north and to the south. The south end—extending over the backstays—is intended for a support for hoisting the sheaves from the ground. An open space is provided in the upper panel of the backstays through which the sheaves may pass while being hoisted. The north end, extending over the cageway, could with less facility be used in the same manner, but is intended only for general convenience in handling and temporarily storing sheaves or their bearings; thus one sheave could hang suspended from this north end while other sheaves are being handled on the main portion of the beam. The trolley beam is readily reached by means of two ladders, one on each side.

A comfortable stairway leads up from the ground to the top of the tower proper, the maximum slope of the stairs being about 50°. All floors or landings are of reinforced concrete built on "Multiplex Plates." All stairways and landings are well inclosed by riveted angle-steel railings. At several points these landings and stairways extend outside of the tower frame. Such an extension of the floor occurs at the base of each trolley ladder and provides a safe and convenient platform for entering or leaving the ladders.

No swinging jib crane is provided for general handling purposes. Instead there are at an elevation of 36 ft. 6 in. on the north and east sides of the structure, cantilevered beams provided with clevis holes from which tackle can be suspended to handle any material desired. One pair of these beams extends out from the skipway, while the others extend in front of the cageway on either side.

Provision is made for four headsheaves, but only three are installed—a 5-ft. sheave for the skip balance, a 10-ft. sheave for the cage, and a 10-ft. sheave for the skip. The fourth sheave will some time be put in to carry the cage-balance rope. Up to the present the cage has never been counterbalanced. The bearings of these sheaves all rest on a series of sheave girders set in the plane of the

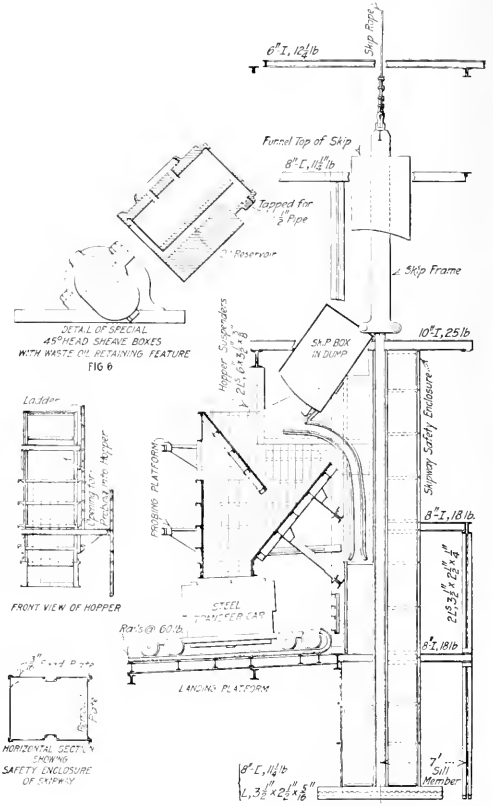

FIG. 5. SECTION THROUGH SKIPWAY AND DUMP
FIG. 6. DETAIL OF 45-DEG. HEAD-SHEAVE BOXES

backstays. These girders are of built-up eye-section, each being formed of two 12-in. 20½-lb. channels set ¼ in., back to back. The lower ends of these girders or girder-struts bear upon a cross girder of similar section which receives the hoisting stresses and through the medium of certain trusslike bracing delivers them to the backstay columns.

(To be concluded)

1914 Mineral Production of Western Australia

The mineral production of Western Australia in 1914 has been officially reported as follows, the items being given in long tons, except when otherwise stated, and in order of descending value: Gold, 1,232,977 oz.; coal, 319,210; lead ore, 3554; tin, ore and ingot, 363; copper ore, 3913; silver, 189,837 oz.; copper ingot, matte, etc., 183; pyritic ore, 9759; bismuth, 9; zinc, spelter, etc., 22; mica, 4. The total value of the mineral output for 1914 was £5,533,990, or $502,125 less than that of 1913.

Regulation of Oil and Gas Wells in California

By Lewis H. Eddy*

Protection of the natural resources of petroleum and gas in California against improper operation by producers is provided for in an act passed by the last Legislature and approved by the governor, known as Senate Bill No. 916, introduced by Senator Maddux. This act provides for state control under direction of the state mineralogist, creating a special branch of the State Mining Bureau known as the Department of Petroleum and Gas.

The work of the department will be performed by a state oil and gas supervisor appointed by the state mineralogist. The compensation of the state mineralogist for supervising the new department is $1100 per annum, in addition to his compensation of $3600 as state mineralogist. The compensation of the supervisor is $4500 per annum. The supervisor will appoint not more than four deputies, also clerical assistants, and he may employ an attorney. The deputy supervisors shall be competent engineers or geologists experienced in the development and production of petroleum. It shall be their duty to collect all necessary information regarding oil wells with a view of advising operators in the protection of wells from infiltration of water. Records and data shall be kept on file in the offices of the deputies and open to inspection of persons authorized by operators and the state officers and the board of arbitration. The records are not to be used as evidence except in such proceedings as are provided for.

The supervisor shall order such experimental or remedial work to protect wells as his judgment dictates. The well owner may within 10 days from service of the order file a statement and demand arbitration by a board of three members. Two members of the board shall be selected by owners of wells and they shall select the other member. They shall be paid for actual services at the rate of $10 for each day, not to exceed $30 each in the arbitration of any one case.

One-third of the owners or operators of wells within a radius of one mile may make written complaint, upon which the supervisor or deputy must make investigation of the well or wells complained of and order the work required to repair the damage. If the supervisor holds that such repair is not necessary, the complainants may demand arbitration.

In obedience to the order of the supervisor or the arbitration board, the owner of the well shall commence work in good faith within 30 days. If the work be not commenced within the time limit, the supervisor shall appoint agents to perform the work and the amount expended shall be a lien against the well or the land. The decision of the board of arbitration or supervisor may be reviewed by the Superior Court within 30 days.

It should be the duty of the owners of wells now drilled or that may be drilled to case such wells properly with metal casings, and to use every effort for protection in accordance with the most approved methods.

Before abandoning a petroleum or gas well the owner shall give written notice to the deputy supervisor of intention to abandon, 15 days before such proposed abandonment and shall furnish information of the condition of the well and proposed method of abandonment. The supervisor or deputy shall either approve or order such work as may be necessary before approval.

The owner of any well before commencing the work of drilling shall file with the supervisor or deputy written notice of intention, stating location, elevation and designation of the well, and estimates of depth at which oil or gas sands of formation should be encountered, and the point where water should be shut off. The owner shall keep a careful and accurate log of drilling, to be subject to inspection of the supervisor and his deputies, and the copy filed with the deputy, including additional work. Five days in advance of a test to shut off water in a well, a deputy supervisor shall be notified and be present at such test and record the result. If any test should be unsatisfactory, he shall so notify the owner. Producers of oil shall file with the supervisor once a month a sworn statement of the amount and gravity of the oil produced, and the number of wells being drilled, the number producing, idle or abandoned. Refusing to permit inspection or hindrance of such inspection will be deemed a misdemeanor. Operators of petroleum and gas wells shall pay annually to the state treasurer a charge at uniform rate per barrel of oil produced and amount of gas sold in the preceding calendar year. Owners of oil lands shall pay to the state treasurer an annual charge at a uniform rate per acre.

Estimates of amounts necessary to be assessed and collected from the owners of wells and land, for the maintenance of the department, shall be determined by the state mineralogist in conjunction with the state board of control. Notice of such assessment shall be published annually in newspapers in Fresno, Kern, Los Angeles, Orange, Ventura and Santa Barbara Counties. Assessments and charges constitute a lien upon all property of owners of wells or lands so assessed or charged. Action against the state treasurer may be brought by persons so assessed upon claims that the assessment is void. Collection of delinquent assessments will be prosecuted by the attorney-general.

The fir assessments under this law shall be levied on the first Monday in March of 1916 and based on the production of 1915, and are due and payable upon the first Monday in July following, and delinquent in six weeks thereafter. Action for delinquency shall be brought in the following May. The moneys will be expended under direction of the state mineralogist; $45,000 annually to be allowed for maintenance of the department; and all moneys in excess of this amount shall be available for repairs of wells made by the supervisor upon failure of the owner, and for costs of publication and its defense

*Associate editor, "Engineering and Mining Journal," San Francisco, Calif

of actions in court. Appropriation of $20,000 from the general fund of the state is made available for the immediate use of the department, to be returned to the general fund when collections equal $30,000. The act of Mar. 20, 1909, which had become practically obsolete, is repealed.

Iron and Steel Production of Canada in 1914

The iron and steel production of Canada in 1914, as collected and reported by the statistical bureau of the American Iron and Steel Association is given in Bulletin No. 5 of the association. The production of pig iron shows a heavy decrease, 30.5%, as compared with 1913, and is the smallest reported since 1909. The make for three years has been as follows:

	1912		1913		1914	
	Tons	%	Tons	%	Tons	%
Basic	489,799	53.6	558,524	55.0	331,456	46.9
Bessemer	228,742	25.2	227,662	22.4	184,053	26.1
Foundry	194,208	21.2	225,231	22.2	174,546	24.7
Other	129	...	3,701	0.4	16,117	2.3
Totals	912,878	100.0	1,015,118	100.0	705,972	100.0

The total production in 1914 included 690,880 tons made with coke as fuel and 15,092 tons with charcoal. Ontario furnished 503,214 and Nova Scotia 202,758 tons. Of the total for the year 515,527 tons were used by the makers for conversion into steel, and 190,445 tons were merchant iron, for sale. Deliveries from furnace were: Molten, 449,713; sand-cast pigs, 188,135; machine-cast, 68,106; direct castings, 18 tons.

The raw material used in 1914 was 1,358,184 tons of iron ore, cinder, etc.; 419,864 tons limestone; 910,887 tons coke; 883,625 bu. charcoal. The average consumption per long ton of iron made was 4309.4 lb. ore and 1332.2 lb. limestone. The coke furnaces consumed 2,611.4 lb. coke per ton of iron; the charcoal furnaces 105.5 bu. charcoal.

There are 22 blast furnaces in the Dominion, 11 being in Ontario, 8 in Nova Scotia and 3 in Quebec. Their total estimated capacity is 1,564,800 tons yearly. Five furnaces use charcoal as fuel, their average yearly capacity being 14,560 tons; 17 use coke, having a yearly capacity of 81,150 tons each.

Steel Production

The steel production of Canada for 15 years past has been as follows, in long tons:

1900	[illegible]	1905	403,449	1910	741,924
1901	[illegible]	1906	570,889	1911	790,871
1902	[illegible]	1907	616,754	1912	853,031
1903	181,514	1908	509,957	1913	1,042,503
1904	148,744	1909	678,751	1914	694,447

The sudden increases in 1902 and 1905 were due to the completion of new works. The make in 1914 was less than that of 1913 by 348,056 tons, or 33.4%; and was the smallest reported since 1909, five years previously.

Magnesite Discovered in British Columbia

Magnesite has been found in large quantities along the shore of Lake Atlin, in the northwestern part of British Columbia. Seven claims have been located by Vancouver parties, and plans are being made for working the deposits. This ore is shown by analysis to run as high as 98% in magnesium carbonate. The world's supply has so far come from California, Greece and Austria. On account of the war the latter source is cut off, and since this was the most important there is an extraordinary demand for the mineral which British Columbia will soon be in a position to supply. Magnesium salts are used in the arts, in medicines and in connection with the pulp industry of this province. This new discovery may prove to be of special importance, since the chief value of the spruce forests in British Columbia is in their paper-making possibilities, and the fact that magnesia necessary to the manufacture of a finished product is right at hand may result in greatly increasing the importance of the two industries.

Interstate-Callahan Zinc Makes Record Profits

Special Correspondence

Cœur d'Alene mine-earning records have been eclipsed by the Interstate-Callahan company, which owns and operates the Consolidated Interstate-Callahan mines, in the Nine Mile district. The net profit for the quarter ended June 30, 1915, was $1,126,114, according to the report of John A. Percival, secretary-treasurer.

The total ore extracted was 30,595 tons and the concentrates and shipping ore produced was 14,872 tons. Of the crude-ore shipments there were 68 tons averaging 21.05 oz. in silver and 44.60% lead, and 2834 tons averaging 19.74% zinc. The milling ore treated amounted to 27,235 tons, averaging 27.8% zinc, and the concentrates produced were 851 tons averaging 26.72 oz. in silver and 59.49% lead and 11,399 tons averaging 48.24% zinc.

The recovery of zinc values by sorting and milling was 78.28%, and the ratio of milling ore to total concentrates was 2.2:1. The mining costs were $3.07 per ton; milling costs were 67.2c.; and loading and shipping costs were $1.267, making the total cost of the ore mined $4.285 per ton.

The Interstate-Callahan company, of which John H. Robbers, Spokane, is president and general manager, inaugurated dividend payments last April, and $1,610,000 have since been disbursed to stockholders.

Gems and Precious Stones in the United States in 1914

The total value of the output of precious and semi-precious stones in the United States in 1914 is reported by the Geological Survey at $124,651. The demand for gems at the Panama-Pacific Exposition resulted in an increased production of turquoise and turquoise matrix, the production in 1914 being $13,370, as compared with $8075 in 1913. These gems have long been popular with the tourist trade in the West.

No discoveries of unusually fine deposits of gem minerals were made in 1914, but a few prospects for the less valuable gems were found. Among these were pink beryl in the quarry of the Maine Feldspar Co., on Mount Apatite, near Auburn, Me.; amazon stone, a variety of feldspar, near Lone Pine, Calif., White Plains, N. Y., and on the coast of Maine; sunstone in the Apache Indian Reservation of Arizona; and turquoise deposits in Lander and Eureka Counties, Nevada.

The Wisconsin Zinc District—III

By H. C. George*

SYNOPSIS—Milling practice of the Wisconsin zinc district is much like that of Joplin, Mo. The difference is in detail; but the Wisconsin mines do not concentrate on tables following the jigs. Jigs are usually of the Cooley type. Roasting and magnetic separation are practiced. Descriptions of all processes are given.

The milling practice of the Wisconsin zinc district is in a general way similar to that of the Joplin, Mo., lead and zinc district: that is, the ore is crushed and jigged. In details, however, the process is different. None of the average Wisconsin mines supplements jigging with the concentration of sands on tables. The usual mill consists of crusher, rolls, one or two jigs and the necessary trommels and elevators. Figs. 29 and 29A show a plan and flow sheet, and Fig. 30 an elevation of a typical Wisconsin zinc mill with steam power-plant, except for the use of a Wilfley table for sands.

The mills of the district are housed in frame buildings on concrete foundations. The cost of a mill with all machinery varies from $10,000 to $30,000, depending on its capacity and equipment. The usual practice of the district is to build the concentrating plant or mill adjoining the hoisting derrick and hopper, but frequently the ore is conveyed on the surface as much as half a mile from the shaft to the mill. In this case the hopper at the shaft feeds onto a belt conveyor, or into surface tram cars or aerial tram buckets or cars, which deliver the ore at the mill hopper.

After the ore is hoisted, it is delivered onto a grizzly above the hopper. The grizzly has the bars spaced from 4 to 6 in. apart. The oversize is either sorted by hand (the pieces containing ore being broken by sledge hammers to pass through the grizzly bars, and the waste rock loaded into cars and dumped on the surface outside the hopper) or it is all fed to a large crusher, which breaks all of the large pieces of rock and ore and discharges them into the hopper with the undersize. From the hopper, which usually has a capacity of 100 to 200 tons, the ore is fed directly into a 14-, 18- or 24-in. crusher of the Blake type, or onto a shaking screen. In the latter case the fine material passes through the shaking screen and goes direct to the dirt elevator, and the coarse material or oversize is fed to the crusher.

Material from the crusher runs down an inclined trough to the first roll crusher,

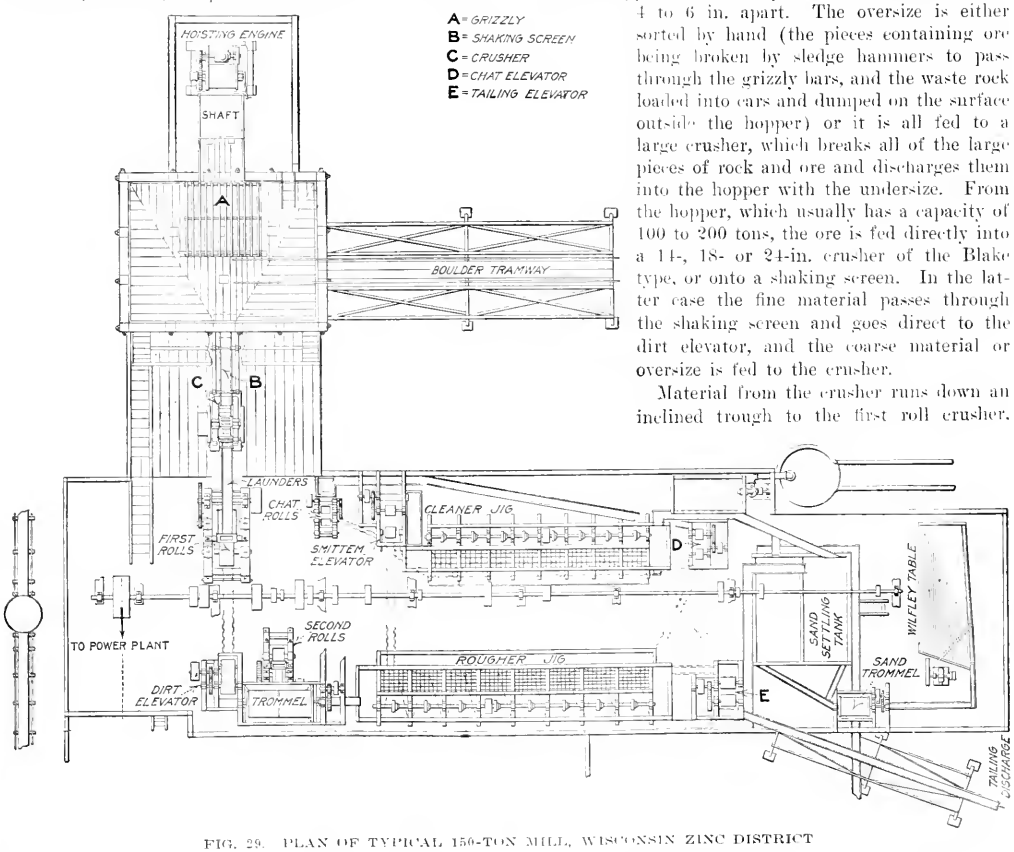

FIG. 29. PLAN OF TYPICAL 150-TON MILL, WISCONSIN ZINC DISTRICT

which is usually a 24-, 30-, 36- or 48-in. machine of the Cornish type. The crushed material from these rolls is carried in an inclined trough to the dirt elevator. The first elevator feeds into a trommel with ⅜-, ¼- or ⅝-in. perforations. The oversize from the trommel is fed to the second rolls, usually 24 or 30 in., of the Cornish type, and from these rolls it is returned to the dirt elevator and thence again to the crushers.

*Chief engineer, Wisconsin Zinc Co., Platteville, Wis.

The undersize product from the trommel is fed onto the rougher jig in a two-jig mill or onto the combined rougher and cleaner jig in a one-jig mill. Up to this point the process is the same in the one- and two-jig mills, but from this point the processes are different and will be treated separately.

One-Jig Mills

The jig, usually of the Cooley type, consists of 7, 8 or 9 cells, each cell generally having a 30x36-in. jigging surface. A common pitch from cell to cell in a jig having

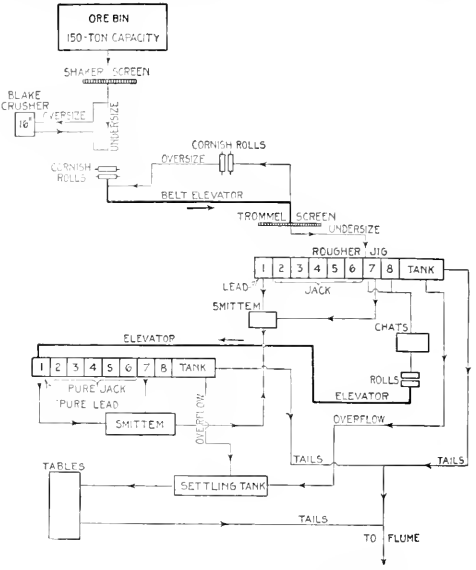

FIG. 29A. FLOW SHEET OF 150-TON MILL

30x36-in. cells is $1\frac{3}{4}$ in. per cell. The amount of water used in milling varies from 800 to 1200 gal. per min. The first cell is used for cleaning lead, and cells 3, 4 and 5 are used for cleaning zinc in the 7-cell jig, and cells 3, 4, 5, 6 and 7 are used for cleaning zinc in the 9-cell jig.

Mixed lead and zinc product from the second cell is either returned to the dirt elevator or the chat elevator. The product from the eighth and ninth cells in a 9-cell jig and from the sixth and seventh cells in a 7-cell jig is sent to the chat elevator. From the chat elevator the material is sent to the chat rolls, usually of the 24-in. Cornish type. The crushed material from the chat rolls is returned to the dirt elevator. In some one-jig mills there are no chat rolls, and in this case the chat material is fed to the second rolls with the oversize from the trommel.

Recrushing is necessary for this material in order to free the zinc and iron sulphides from the lead sulphides and from limestone. The material that passes over the lower end of the jig to the dewaterer carries from 4% to 6% metallic iron as iron sulphide and from 1% to 2% metallic zinc as zinc sulphide. This material is carried from the dewaterer at the end of the jig to the tailings elevator, from which it is discharged through a trough to the ground at some point near the mill. A common size for the sieves or grates on the first, second and third cells is usually a $\frac{1}{4}$-in. perforation; on the fourth and fifth cells, $\frac{1}{4}$-in. perforation, and on the sixth seventh, eighth and ninth cells, $\frac{3}{16}$-in. perforation. Fig. 29 shows the plan of a rougher and cleaner jig in a mill and Fig. 31 shows a vertical cross-section of a jig cell. In Fig. 31 *K* shows the sieve or grates, *L* is the hutch or part of the cell below the sieve; *M*, the spigot for drawing from the hutch; *N*, the spigot for drawing from the bed or the part above the sieve, and *P*, the jig-plunger compartment. In the one-jig mill, concentrates are drawn from the spigots *M* and *N* in the cells used for cleaning ore.

Two-Jig Mills

The two-jig mill process is practically the same as the one-jig mill process up to the point of the delivery of the undersize product to the jig. The two-jig mill has a rougher jig, with from 5 to 9 cells, usually with a 30x36-in. jigging surface on each cell, and the cleaner has from 5 to 7 cells of the same size. For convenience of description I will take the case where the rougher and the cleaner each has 7 cells. A common construction in the jigs of a two-jig mill of this type is for the sieves or grates in the first 5 cells of the rougher to have $\frac{1}{8}$-in. perforations and the sixth and seventh cells to have $\frac{1}{12}$-in. perforations, and the first three cells of the cleaner have $\frac{1}{16}$-in. perforations, and the last 4 cells $\frac{1}{12}$-in. perforations.

In the two-jig mill process, this product is fed to the rougher, which has from 5 to 9 cells, usually with a 30x36-in. jigging surface. The oversize or sieve product on the middle cells of the rougher is cleaned and drawn

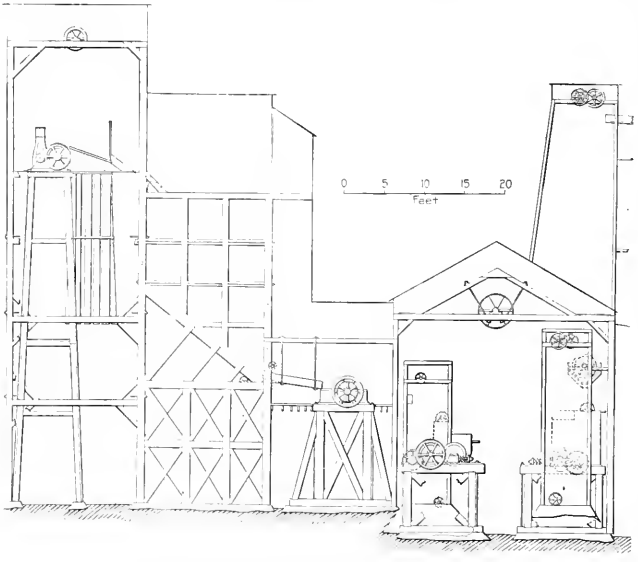

FIG. 30. END ELEVATION OF ZINC MILL

from the spigot *N* when the product is not chatty. When the ore is chatty it is drawn and taken to the chat elevator, and from there to the chat rolls, whence it is returned to the dirt elevator. Fig. 32 shows a flow sheet of a typical two-jig mill. In case the sands are not treated this product is run into the tailings elevator instead of to the sands elevator, as shown in Fig. 32.

The hutch product from the rougher, the "smittem," is carried to the "smittem" elevator and from there to the cleaner jig, where it is cleaned. The finished lead concentrate is drawn from the hutch of the first cell of the cleaner. The hutch or middling product from the hutch of the second cell is returned to the "smittem" elevator. The hutch product from the third, fourth, fifth and sixth cells is finished zinc concentrates. The hutch product from the seventh cell when not chatty is returned to the smittem elevator, but when chatty it is returned to the chats elevator. The material passing over the tailboard of the cleaner jig is sent to the tailings elevator, unless the sands are to be treated on a sands jig, and in that case it is taken to the same elevator, as shown in Fig. 32, or when the cleaner tailings contain much zinc they are returned to the dirt elevator or to the chats elevator. Jigging is done on three materials in the district—perforated sheet steel, jig grates and woven-wire screen cloth. The first of these is most commonly used, it being claimed that it has the advantage over grates in that no "dead beds" exist, because of the greater perforation area, which produces better and more uniform pulsations on the beds. This enables the ore to be cleaned better, and is especially advantageous in keeping down the lime and lead content of the zinc concentrates. It is also claimed that perforated metal (sheet steel) adapts itself better to a variable feed to the jig. Grates have the advantage over perforated sheet steel and woven-wire screens because the bed does not have to be cleaned so often with the grates.

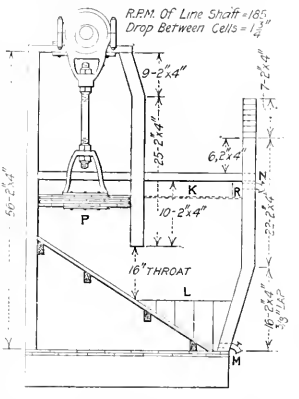

FIG. 31. CROSS-SECTION OF JIG

Concentrating Tables

Concentrating tables have been very little used in the Wisconsin zinc district. The Vinegar Hill Zinc Co. uses two Overstrom tables and one Ford table at the Wilkinson mine for concentrating marcasite sands. The Wilfley table has been successfully used at the Wallace mine at Highland, the Board of Trade mine at Cuba City, and the Avenue Top mine at Dubuque, Iowa. All of these mines have produced zinc concentrates from the jigs assaying better than 50% Zn.

The Wilfley table has been tried at a number of mines where the zinc concentrates from the jigs assayed from 30 to 45%; but because of the greater sliming of the marcasite much lower-grade zinc concentrates have been produced, and they have been difficult to market. On account of their fineness and the resulting dust losses they are not suitable to roast in the local calcining plants.

The classification of sands and the handling of the different products over different tables have been difficult on account of the small amount of ore handled daily in a Wisconsin mill, but this difficulty may be overcome with the larger mills being built in the district at the present time and the greater attention being given to the question of mill recovery.

Roasting or Calcining

A feature of the district is the roasting or calcining and magnetic separation of low-grade zinc ores. The Mineral Point Zinc Co. at Mineral Point, Wis., has a plant with five roasting kilns of the Mathey type. This plant uses Wetherill magnetic separators and has a capacity of about 300 tons of green or unroasted ore per week. The Wisconsin Zinc Co. has a plant with two roasting kilns of the Mathey type located at Platteville, Wis. This plant is equipped with Dings magnetic separators and has a capacity of about 250 tons of green ore per week.

The National Separating Co. has a plant with two roasting kilns of the Mathey type at Cuba City, Wis. This plant is equipped with Dings magnetic separators and has a capacity of about 300 tons of green ore per week. The

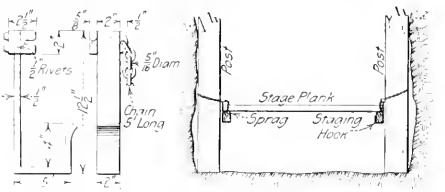

FIG. 32. FLOW SHEET OF ZINC TREATMENT

Campbell Magnetic Separating Co. has a plant with four roasting kilns of the Campbell type at Cuba City, Wis. This plant is equipped with Campbell separators and has a capacity of about 300 tons of green ore per week. During the past year this plant was leased by the Wisconsin Zinc Co. The Linden Zinc Co. has a plant with two roasting kilns of the Campbell type at Linden, Wis. This plant is equipped with Campbell magnetic separators and has a capacity of 150 tons of green ore per week. There are also several roasting plants of the Mathey type at different mines in the district and one custom roasting plant of this type near Galena, Ill., not operating.

The roasting or calcining process consists of heating the ore in the kiln by coal or oil fuel in an adjoining fire box. Coal is used in the Mathey roaster and oil is used in the Campbell roaster. The sulphur in the ore aids in the combustion. Only the outer crust of the fragments or particles of marcasite or pyrite are changed by the heat to a magnetic sulphide, which, after the ore is discharged from the kiln, cooled and fed to the magnetic-separating machines, is picked out of the feed of mixed zinc and iron sulphides by the magnets of the separating machines and discharged as a tailing product.

The feed to the roasting kiln usually assays from 20% to 40% metallic zinc. The finished ore from the magnetic separators assays from 58% to 61% metallic zinc. The tailings from the magnetic separators assay from 3% to 8% metallic zinc.

All of the companies named in the preceding page as operators of magnetic-separating plants buy ore running from 20% to 40% metallic zinc for their roasting plants, besides treating that from their own mines. In addition to these companies, a number of the zinc-smelting companies have buyers in the district. These buyers purchase high-grade ores from the mines and the roasted ore product from the separating plants.

The smelting companies that have ore buyers in the district are the Mineral Point Zinc Co., with a smeltery at DePue, Ill.; the Grasselli Chemical Co. with smelteries at Clarksburg, W. Va., and Meadow Brook, W. Va.; the Matthiessen & Hegeler Zinc Co., with a smeltery at La Salle, Ill.; the Illinois Zinc Co., with a smeltery at Peru, Ill.; the American Zinc & Chemical Co., with a smeltery at Langeloth, Penn., and the American Zinc Co. of Illinois, with a smeltery at Hillsboro, Ill. The Illinois Zinc Co. and Matthiessen & Hegeler Zinc Co. buy zinc concentrates low in lead, because much of their spelter product is rolled into sheet zinc. The Grasselli Chemical Co. buys zinc concentrates low in lead because it makes a high-grade spelter for the brass and bronze trade. The other smelting companies are not so particular about the lead content of the zinc concentrates because they make prime Western spelter for galvanizing purposes.

The buyers for the smelting companies purchase on a base of 60% metallic zinc contents in the zinc concentrates. They penalize $1 per unit of zinc below 60% and pay a premium of $1 per unit above 60%. Iron is penalized at the rate of $1 per unit over 1%; lime at 50c. per unit over 2%; and lead at $1 per unit over 1%. This scale of penalties and premiums usually applies to concentrates containing from 50% to 63% metallic zinc. For ores of a lower grade a different scale is used. Some ores are purchased on contract, based on the spelter market, a fixed or given smelting charge, and the metallic zinc content of the concentrates.

Three-fourths of the production of the district is made by five companies. The following list gives the principal operating mines of the district, their location and the name of the operating company:

The foregoing list contains only about half of the properties that have produced ore during the past year, and does not contain the names of any properties not equipped with a milling plant, but it does include the names of all of the big producers of the present time in the zinc district.

The mines of the district are widely scattered, few of them being nearer than a mile to any other mine. Prospecting is being carried on largely by the big companies, with good results. The production of the district grew from 19,000 tons of concentrates in 1904 to 130,000 tons in 1914. Taking into consideration the scattered nature of the ore deposits, the size of the district and the number of mines that have been found with a small amount of prospecting, it is safe to predict a steady growth, a long life, and a bright future for the Wisconsin zinc district.

United States Graphite Output

According to the Geological Survey, the production of natural graphite in 1914 in the United States amounted to 1336 short tons, valued at $324,118. Of this quantity, 1725 tons were amorphous, valued at $38,750, and 2611 tons were crystalline, valued at $285,368. The greatest part of the crystalline graphite—all the "flake" variety—was produced in New York, Pennsylvania and Alabama. A small quantity of crystalline graphite was produced in Montana. The entire output of natural graphite in 1914 showed an increase in value as compared with that of 1913, but a slight decrease in quantity.

Early History of Braden Mines*

SYNOPSIS—Traditions surrounding the Braden copper mines and the early Chilean operations are recounted by William Braden, who also tells of the modern exploitation, the difficulties of construction in a new country and how these difficulties were overcome.

The traditions of the Braden Copper Co.'s mines date from the 18th century, when a Spanish lieutenant (*teniente*) who was a fugitive from justice escaped to the snow-crowned Andes between Chile and the Argentine, where he camped at what afterwards became known as the Mineral Teniente. This man is said to have discovered there a vein of high-grade ore, and out of the proceeds of shipments of it, to have paid to the authorities a fine which freed him from further difficulties with the colonial government. Be this as it may, the first official records date from 1819, when the working of the mine was undertaken by Don Juan de Dios Correa, *conde de la Conquista*, and owner of the immense hacienda stretching from the coast range of the Chilean Andes to the Argentine boundary, within the limits of which the mines are situated. Don Juan de Dios exploited the mine until the '70s of the last century, transporting the ore on muleback to the coast for exportation.

The First Smelting Plant

Partners were taken into the enterprise about that time, and one of them, Don Federico Gana, a graduate of Freiberg, took charge. He drove what is now known as Teniente No. 1 adit, to tap the orebody which until then had been attacked only by irregular inclined workings from the surface. A shaft was sunk from this adit to a depth of over 100 m., and an underground *malacate* was installed. An inclined wooden chute carried the ore down the mountain to a sorting floor near the *lagunas* or small lakes at the foot of the hills; and a smelting plant was installed at Perales, about 15 miles distant, near the junction of the Coya and Cachapoal Rivers. In short, what was considered an uptodate and progressive exploitation was undertaken.

On account of the heavy snowfall at the mines, no work was done during the winter months beyond keeping the shaft dewatered and preparing the mine for the extraction of high-grade ore during the ensuing working season.

According to one version of the accounts referring to operations at this time the mine boss and miners, during one of the winters, stole about all of the tools and equipment that could be carried off; and the following spring the owners found the shaft full of water. Another version is to the effect that water was suddenly encountered and that miners in the lower workings had barely time to escape, so rapidly did the water rise. At all events money was then required to get the mine into a state of production. The money not being forthcoming, the mine was abandoned and the taxes left unpaid.

About 1897, Don Enrique Concha y Toro, an enterprising mine capitalist, sent a prospector to the district; and after taking up claims to cover some of the most promising croppings including the old Teniente mine, he proceeded to sort high-grade ore from the old stopes of the latter, and sell it.

Correa Heirs Bring Suit

Don Carlos Irarrázaval, who was married to Doña Nicolasa Correa, the heiress of Don Juan de Dios Correa, then brought suit in the interest of the Correa estate, to enjoin Don Enrique Concha y Toro. The difficulties between the parties were adjusted after some legal warfare, by an arrangement giving Don Enrique a third interest in the Teniente mine, and the sole proprietorship of all the other mining claims which he had taken up in the neighborhood.

The Correa heirs would invest no capital in the business; and Señor Concha y Toro, not caring to work for the benefit of others in the Teniente, in which his partners owned a two-thirds share, limited his operations to looking for ore in that part of the property of which he was sole owner. He thus explored the Capitana and Subteniente, but principally the Fortuna mines, where he executed underground workings covering an area of about 100x150 ft. and reaching a depth of 150 ft., always on the lookout for shipping ore. This he did not find, as all the copper was in fractures of, or disseminated through, diorite country which made up a 4% Cu ore, requiring concentration on a more or less important scale to be profitable.

Effort to Interest European Capital

An Italian mining engineer, Don Marco Chiapponi, was consulted under these circumstances, as to what could be done with the property, and he recommended the construction of a concentrating plant. As such an installation, with the necessary wagon road, power plant and other equipment, involved more capital than Señor Concha y Toro cared to invest in what was considered a low-grade mine, Chiapponi was entrusted with the sale of the property.

Signor Chiapponi sent about 25 tons of the ore to Europe for concentrating tests; and as these proved successful, the business was submitted to mining capitalists in France and England. Engineers were sent to examine the property; but they were apparently unable to grasp the magnitude of the proposition, which, moreover, was at that time a new one in its way; and they reported adversely on it.

Mr. Braden Inspects and Invests

About two years later, Signor Chiapponi proposed the business to William Braden, who after careful inspections, formed a favorable opinion of it, and interested his friend E. W. Nash—since deceased, then president of the American Smelting & Refining Co., and one of the most enterprising of mining and smelting men in the United States—in the organization of the Braden Copper Co. for the exploitation of the property with a cash capital of $625,000.

With this money it was proposed to open up and equip the mines; build a wagon road about 35 mi. long to connect them with Graneros, a station on the Chilean state railroad 1600 ft. above the level of the sea, or about 6000 ft. lower than the mines; erect a 250-ton concentrating

*Excerpts from an article by William Braden in "Teniente Topics," June, 1915.

mill; construct three aërial trams; install a hydro-electric plant of approximately 1000 hp.; and provide living quarters at the mine and mill camps.

Equipment Completed as Scheduled

In view of this undertaking being the first of its kind in the Chilean Andes, and of its being realized under many little-known conditions it was with satisfaction that the plant was completed, and concentration started in the month of June, 1906, within the time set for beginning exploitation.

The usual route for reaching the mines had formerly been by trail from Rancagua through the village of Machalí, about 45 mi. distant, passing through the Isla ranch along the south bank of the Coya River. There were no houses at the property other than a couple of "rucas"—small low huts, with walls of loose rock and roofs of loose sheets of corrugated iron held in place by the weight of judiciously-strewn boulders. . . . The wagon road from Graneros was concluded in 1905. During the winter months of that year—June, July and August—about 4000 tons of machinery and construction material had been accumulated at the freighting station, La Compañia, near Graneros, for transportation to the mine; and it certainly looked like a big task.

Several Chilean gentlemen hazarded the opinion that it would take three or four years to haul this material to the Cordillera; and when it was explained that the company proposed not only to haul the material, but finish the plant and start running it the following June, their expressions of incredulity verged on the borders of derision. By hustling, the company's expectations were, however, fulfilled. There were as many as 250 ox-carts at work at one time—which meant the employment of over 2000 animals. These carts were at work on the farms in the neighboring country; and it was possible to induce the cartmen to leave their congenial surroundings in the wheat fields and orchards of the low-lying plains, for the work of hauling heavy loads to the Cordillera, only by paying them what was considered a very high rate of freight—25 pesos, Chilean paper currency, equal at that time to about $7.50 per ton. As a matter of fact, they responded to the call promptly.

Securing Labor in a New Country

Advertisements were inserted in the newspapers, and placards posted throughout the agricultural districts inviting them to "Come one, come all!"

About 1000 Chilean laborers were employed in the construction work at the camp during the summer season of 1905-6, that is from September to May inclusive. During the first months there were no houses for them. When a group of laborers presented themselves for work they were given a few sheets of corrugated iron, and they promptly built themselves a *ruca*. Some groups of workmen cooked their own meals; but the company maintained kitchens in tents where most of the men took their meals.

The work was accomplished, and in fact was only possible, by a defiance of the customs of the country. These, including immoderate consumption of liquor and the observation of numerous feast days, besides Sundays, throughout the year, were supposed to constitute a necessary evil with which it would be impossible to cope. Nevertheless, the introduction of liquor into the camp was prohibited, and gradually it was practically suppressed. The men learned to work instead of "laying off" on all the feast days.

Labor Efficient Under Proper Handling

Labor, man for man, was cheaper than in the United States; and under efficient direction, the company got as much out of Chilean labor, dollar for dollar, as could be gotten from labor in North America. Throughout the construction period, work went on smoothly. The men were well handled by their chiefs, who were always "on the job" and who gave an example to the peons—of which the latter showed their appreciation—in punctuality, steadiness and perseverance.

The construction of the mill was intrusted to W. E. Bradley; the power plant was in the hands of C. E. Doolittle; the aërial trams were built by Thomas Graham; and the opening up of the mine was undertaken by Thomas M. Hamilton. The work in the mine was different from anything the men had ever seen before, and at first was undoubtedly hard on the miners; but Mr. Hamilton's example of tireless energy and his genial character alike appealed to the men, who recognized in him a leader and a friend. While exacting strict compliance with duty, he always lent an attentive ear to suggestions, complaints or other representations of the men; he redressed every just grievance to which his attention was called, and patiently gave them object lessons in the proper handling of tools and employment of explosives—through which they worked out their contracts to better advantage, and contentedly reaped a good pecuniary harvest.

No Fatal Accident During Construction

Although there was a certain amount of danger connected with the work, much of which was done on the steep slopes of high rugged mountains where pieces of heavy timber were handled for the tram towers and other work, in places where many people would think there was no foothold for a single man, there were no accidents attended with loss of life during the construction period.

The first death by accident in the camp took place shortly after construction was finished and concentration had begun. It happened in the portal of the old Teniente mine where a miner, despite the company's regulations and in a manner approved among natives pretty much all over the Andes, tried to thaw out 46 sticks of dynamite in a shovel nicely balanced over the flames of a bright fire in a brazier 2 ft. in diameter. Somehow or other miners there will do this sort of thing with impunity over and over again until they think it is the proper way to go about the business. On this occasion it was not done with impunity. Fortunately there was no one present except the miner who stood on one side of the shovel, and his assistant who stood on the other; and strange to say, although both were the same distance from the explosive only the assistant was killed, the other escaping unhurt, suffering merely from slight deafness for a few days.

Rivalry in Construction Operations

At the time the fever of construction activity was at its height, there was considerable rivalry among the chiefs, each one of whom vied with the others in strenuous effort to get his part of the work completed first. Incidentally amusing and sometimes also annoying accidents took place. One day, while a bench for the Teniente power flume was being blasted out of the solid rock on the hillside just above the proposed course for the aërial tram, the

flying rock completely wrecked three tram towers; and the disgusted tram-construction superintendent, who had been congratulating himself on the rapid progress he had been making, could not be convinced that the shot had not been fired especially to knock down the towers and retard his work.

It was with difficulty that about 50 men were induced to "invernar" or pass the winter of 1905 in the mountains. The thing was accomplished, however; and before the following winter set in there were bunkhouses and living quarters for several hundred men. As an incentive to the laborers to stick to their work steadily, every man who worked from May to September was presented gratis with a number in a lottery, which was started in the camp, with prizes from 100 to 500 pesos, besides a few "consolation" prizes. This system was successfully used for several years to insure a full complement of workmen.

While the construction work was going ahead, at the camp and for some time after, the railroad to connect the mines with the state railroad at Rancagua was being surveyed, and the grade built almost as fast as it was surveyed. The work was at first under the direction of W. Titus, but was afterward taken over by George E. Montandon, who, in the rocky regions of the Cordillera, had to overcome many difficulties. The road rose from 480 m. above the sea at Rancagua, to its first proposed terminal station at the camp, 2016 m., with maximum grades of 4.5%, and curvatures rendered necessary by the topography of the country, which made the road 70 km. long, although the distance in a straight line between terminals was only 34 km.

Elk City and Dixie Mining Districts, Idaho

EDITORIAL CORRESPONDENCE

The Black Pine Mining Co. has completed its small mill for treating the ores from its property. At present the mill is not in operation, all efforts being centered upon advancing the tunnel which is to cut the oreshoot, rich on the surface, at a depth of about 275 ft. The mill has five stamps, with mortar block and timbering completed for an additional five. Plates and concentrators are provided, and the output will consist of bullion and concentrates. Power is supplied by a 120-hp. water turbine, supplied by a flume carrying water from the American River.

The Buster mine, near Elk City, is still shut down. The condition of the vein at 400-ft. depth is not considered satisfactory, and the principal owners, Bradley and MacKenzie, have decided not to carry out further explorations. Conditions are not good in the district and not much work is being done.

The Elk City Dredging Co. has been reorganized and operations are being continued on what is considered a satisfactory basis. The dredge has been rebuilt, the ladder having been lengthened so as to enable it to reach bedrock. The gravel is said to contain about 50c. per cu.yd. At the Col. Sellers mine, L. Basketh is operating in a small way, extracting high-grade ore from stringers. This ore is being roasted without crushing, which results in a mixed product, the largest pieces of which are about 1 in. in diameter. The material is cyanided, in this condition, by leaching. A 10-stamp mill is being built to handle the lower-grade ore. Amalgamation and cyanidation will be the process.

In the adjoining Dixie district there are no notable developments. No continuous operations are being carried on, although some ore is being milled at intervals and there is some development in progress.

Willow Creek and Broad Pass, Alaska

SPECIAL CORRESPONDENCE

The Willow Creek region, already known as one of the most prominent free-gold mining districts of Alaska, bids fair to become of even greater importance this year than heretofore owing to the recent discovery of several additional bodies of high-grade ore. A cleanup made early in July by the Gold Bullion Co. resulted in the shipment of over $16,000 in bullion said to run over $19 per ounce. The Alaska Free Gold Milling Co., which operates in the same district, expects to clean up $250,000 before cold weather terminates milling operations for the season. A portion of this amount, however, will be obtained by cyaniding the tailings. The Independence Mining Co., which at present operates but a small mill, has recently uncovered some excellent ore and will probably increase the capacity of its plant. An encouraging discovery made upon the Mabel group of claims has revealed the presence of richer ore than had hitherto been found upon this property. From a discovery prospect in the same district a couple of men working by crude methods on a small scale have been taking out $30 per day.

The Broad Pass region, owing to the lack of transportation and the fact that it is not a placer- but a quartz-mining country, has not hitherto been exploited to the extent that its merits warrant. The new railroad will pass directly through the heart of the district, which in addition to gold-bearing ore has deposits of excellent coal. Transportation being assured, it is believed that the coming year will witness a thorough prospecting of the entire region.

Du Pont Co. Doubles Capital

A plan for the sale of the E. I. du Pont de Nemours Powder Co. to a new company, to be known as E. I. du Pont de Nemours & Co., has been arranged by the directors and will be put in effect when approved by two-thirds of the stockholders. The purchase price is to be $120,000,000, of which $1,484,100 will be in cash, $59,661,700 in debenture stock and $58,854,200 in common stock.

The authorized capitalization of the old company was $60,000,000, of which $16,113,807 in preferred stock and $29,428,708 in common stock was outstanding, a total of $45,542,515. Besides this there were bond obligations amounting to $16,922,000.

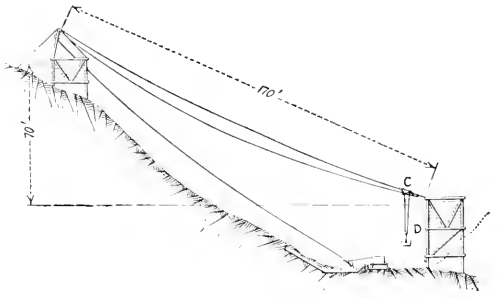
Potash Supply may come from the Philippines, according to a letter published in the "Daily Commerce Reports" of the Department of Commerce. It has been found that the ash of the seaweed collected on the shore of Manila Bay in Tondo yields 15% of potash. This discovery has aroused considerable interest, owing to the war-time scarcity of potash. No data are available to show just the amount of seaweed available, but it is known in a general way that it is abundant. Explorations and further exploitation will be conducted by the Government.

Details of Practical Mining

Alaskan Ore-Hoisting Rig

By Walter Swaren*

An interesting arrangement for reducing the attendance in conjunction with hoisting equipment at an Alaskan gravel mine is shown by the accompanying sketch. The particular work to be done by this installation was transmitting gravel from an ore bin—to which it was trammed from an open cut—to a breaker 70 ft. higher than the ore bin and on the opposite side of the cañon from the open cut. Several similar rigs have been put in operation for hoisting from a shallow shaft, a tripod being erected over the mouth of the shaft to take the strain of the cable of both hoisting and conveying. The installation here shown is designed to carry a load of 1500 lb. at a maximum speed of 400 ft. per min., although its normal speed is usually 200 ft. per min. The track cable is ⅞ in. and the



ORE-HOISTING RIG

hoisting rope ⅜ in. diameter. Two buckets are provided; while one is being loaded at the ore bin, the second is being hoisted.

The operation is as follows: The bucket *D* being loaded, the hoist hook is fastened in place. The traveler *C*, by a special locking arrangement, is held in position at the lower end of the track rope until the block carrying the bucket *D* has been hoisted vertically to the carrier. When the bucket is pulled to the carrier it is automatically caught by means of a trigger arrangement which releases the catch holding the traveler *C* at the lower end of the rope; the hoist continuing to run, draws the carrier *C* carrying the bucket up the track rope. A long loop of chain is attached to the uphill side. When the bucket has reached the upper ore bin this chain catches on a post or projecting beam and automatically dumps the bucket.

After dumping, by slacking off on the winch at the foot of the hill, the empty bucket drops to the lower end of the cable where the carrier engages the catch, and the bucket is released and dropped vertically into the ore bin or the mouth of the shaft, as the case may be. The first bucket, being released from the hook, the second bucket is attached, and the cycle of operation is repeated.

Turbines vs. Engines in Units of Small Capacities*

The term "units of small capacity" is here intended to include turbines and engines of less than 500-hp. capacity, including auxiliary units in large plants or central stations.

There are certain definite fields where the small turbine is of conceded superiority, and other fields wherein the engine must hold sway. The desirability of the one as compared with the other is largely determined by the following factors, which govern the adaptability, cost and economy of the equipment to be installed:

1. Speed conditions and limitations, involving consideration of maximum or minimum permissible speed, and whether the driven apparatus is of the constant- or variable-speed class, or such as requires uniform angular velocity in rotation.

2. Steam pressure and temperature conditions, involving consideration of initial and final pressures and superheat.

3. Power capacity of apparatus.

4. Relative space requirements of turbine and engine units, involving consideration of available room, character of power-house construction and cost of foundation or other supporting structure.

5. Use of application, if any, of the exhaust steam for feed-water heating, steam heating or industrial purposes.

6. Available cooling-water supply, if the turbine or engine is to run condensing, involving also consideration of the temperature of the water and whether it must be artificially cooled and recirculated.

7. Operating conditions, including consideration of attendance, oiling, starting and stopping, vibration, noise, etc.

8. Relative cost of complete installations, including the necessary foundations, piping and condenser equipment, if any.

Summarizing, the fields of usefulness of the turbine and engine may be briefly stated to be as follows:

For condensing service, turbines are best adapted to: Direct-connected 60-cycle generators in all sizes, 25-cycle generators above 1000-kw. capacity; direct-current generators in sizes up to 1000-kw. capacity, including exciter units of all sizes; centrifugal pumping machinery operating under substantially constant head and quantity conditions, and at moderately high head, say from 100 ft. up, depending upon the size of the unit; fans and blowers for delivering air at pressures from 1½-in. water column to 30 lb. per sq.in.

For noncondensing service turbines are applicable for all the above purposes, in those cases wherein steam economy is not the prime factor or where the exhaust steam can be completely utilized, and particularly where oil-free exhaust steam is desirable or essential.

*From a paper read by J. S. Barstow before a joint meeting of the A. S. M. E. and A. I. E. E. at the Engineers' Club, Philadelphia.

Still another field for the turbine is in geared units operating either condensing or noncondensing for all the aforementioned applications, and in addition, many others which would otherwise fall in the category of the steam engine, on account of the relatively slow speed of the apparatus to be driven.

For noncondensing service, engines are applicable for: Electric-generators of all classes excepting exciter sets of small capacity, unless belted from the main engine; centrifugal pumping machinery, operating under variable head and quantity conditions and at relatively low heads, say up to 100 ft., depending on the capacity of the unit; pumps and compressors for delivering water or gases in relatively small quantities and at relatively high pressures—in the case of pumps at pressures above 100 lb. per sq.in. and in the case of compressors at pressures from 1 lb. per sq.in. and above; fans and blowers (including induced-draft fans) for handling air in variable quantities and at relatively low pressures, say not over 5-in. water column; lineshafts of mills where the driven apparatus is closely grouped; and all apparatus requiring reversal in direction of rotation, as in hoisting engines and engines for traction purposes.

For condensing service the engine is adapted to the purposes cited, particularly where the condensing-water supply is limited, and must be recooled and recirculated.

Power for Driving an Aerial Rope Tramway*

When an aërial tramway has to be driven by power, the amount necessary is obtained from the following formula, the result being in foot-pounds per minute:

$$Power = [(W_1 + W_2 \times \mu_1 \times \frac{N}{2} \times V) + (w \times 2L \times \mu_2 \times V) \times (2R \times V) + F] + or - \textit{theoretical power}$$

Where

W_1 = Weight of full carrier;
W_2 = Weight of empty carrier;
μ_1 = Coefficient of friction for cars;
N = Total number of cars on line;
V = Velocity in ft. per min. of cars;
w = Weight per ft. of traction rope;
L = Length of line in feet;
μ_2 = Coefficient of friction for traction rope;
R = Number of supporting pulleys;
F = Power required for station friction.

The first four factors give the power necessary to overcome friction, and the theoretical power required or developed depends upon whether the loads are ascending or descending. The factor for station friction varies greatly for different lines and is solely a matter of experience, although 0.02 of the total weight of the moving parts in the station, multiplied by the speed, may be taken as a good mean.

When the line is of considerable length and consists of several sections, it often happens that one section is developing power while another needs power; in which case the latter may derive from the former the whole or part of the power it requires. Should an excess of power be developed over the whole line, it may be utilized in various ways, such as driving dynamos, pumping, etc.

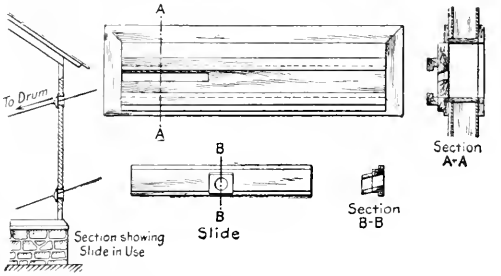
*Abstract from article in the "Engineer," London, July 23, 1915.

Sliding Board for Hoisting Ropes

By D. E. Charlton*

The slide board shown in the accompanying illustrations possesses two advantages over the usual method used on hoisting ropes at the point where the rope passes out of the engine house and onto the idlers before reaching the head sheave. Regular practice is to have a rectangular opening in the engine house at this point, through which the rope passes. This opening varies in length and width, but in nearly all cases is of sufficient size to admit considerable air. This in the summer months may be a desirable feature, but is not so in the winter. There is also a tendency on the part of the rope to have a certain amount of play, particularly in a vertical direction, and the use of such a device does not permit this at this point. The device may be placed on the original opening, as shown in the illustration, or may be built to suit any particular opening.

It consists of a 1¾-in. pine board, cut to fit the opening and toenailed into it, and slotted as shown—either on one side or the other, depending on whether it is for the lower or the upper rope. Below this a 1-in. strip of the same length is fastened to the frame of the opening,



DETAILS OF SLIDING-BOARD FOR HOISTING ROPE

so that along with the board already mentioned it forms a base to which the guides for the slide are fastened. These are of oak.

The slide, as shown in the lower elevation, is also of oak and made so that it moves along the guides with perfect freedom. The projecting piece is fastened to the main part of the slide. The inclined hole should be of sufficient size to permit of but slight play in the rope. The slide may be made entire or of two parts.

Packs, Sand Filling and Solid Pillars†

The substitution of packs and sand filling for isolated small solid pillars is gradually becoming general in the mines of the Rand. In describing the big subsidence at the Village Main Reef, attention was drawn to the fact that it was the solid ground which was affected by the rock movement. The only explanation seemed to be that the hanging-wall had slowly subsided onto the packed sand until no further movement was possible. As that subsidence must have also included the area held up by the

*Mining engineer, Virginia, Minn.

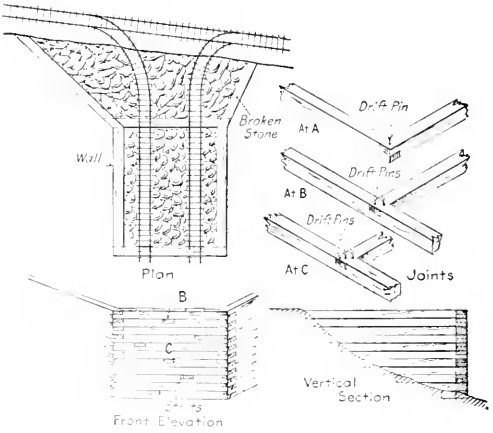
†Abstract from the "South African Mining Journal," July 10, 1915.

solid-rock pillar, it was clear that the latter had reached a state of acute compression and was disturbed by general movement of the underlying strata. This was sufficient to burst away the sides of the pillar, filling the drifts with débris and damaging the shaft timbers. The interesting feature of that occurrence was the fact that the area which could reasonably have been regarded as the safest and strongest became under the circumstances the weakest and most dangerous. An inspection of the immediate neighborhood of the shaft immediately after the occurrence revealed the fact that the workings and drifts in the sand-filled area were quite unaffected, no disturbance of the filling being detected. The result of that unusual accident was to detract considerably from the value of solid pillars unless they cover an excessive superficial area. Sand filling appears to be more effective, as it presents a slightly elastic resistance, allowing the strata to subside gradually without hurting the continuity of the hanging walls. The contrast to this is the solid pillar with its puncturing effect.

A Log Retaining-Wall

By Frederick W. Foote*

At a property with which I was recently connected, a railroad grade on the side of a steep mountain connected with an incline down the mountain. To allow room for the turning of the cars at right angles to the direction of the track by means of a short radius curve, it was necessary to build out the ground. This was done by constructing a timber retaining-wall which was filled with broken rock removed from the grade.



LOG RETAINING-WALL

The logs for this wall were hewn by contract requiring two sides to be flat and the faces to be at least 2 ft. wide. The contractor received 25c. a running foot for his labor. After the logs were cut and measured, the lumbermen were hired by day labor to "snake" them into piles by use of a portable boiler and hoist situated upon the railroad grade. A mast and boom were then rigged in the center of the proposed wall. The trenches were laid out and dug to bedrock (4 to 5 ft.) in benches not over 3 ft. high. Where bedrock was over 6 ft. below the surface, the trench was only dug 6 ft. deep and broken stone used as a filling. The logs were then tarred on their flat sides and put in position by means of the mast and boom. Guide ropes on the ends of the log assisted in this operation. Holes were drilled along the top of the log every 5 ft. with an air-auger and home-made drift pins of ⅞-in. round iron were used to fasten each log to the next one below it. Logs were placed at right angles to the walls in toward the ground about every other tier, and were securely fastened to the main structure with drift pins. They were usually placed horizontally and served as binders when they were later covered with loose rock. They were placed in the wing walls as well as the front wall.

In this manner the wall was raised some 30 ft. A slight batter was given the walls which required about 6000 running feet of timber. The walls A were built similarly, as foundations for the ore bins. The incline cars ran under this ore bin.

*University, Va.

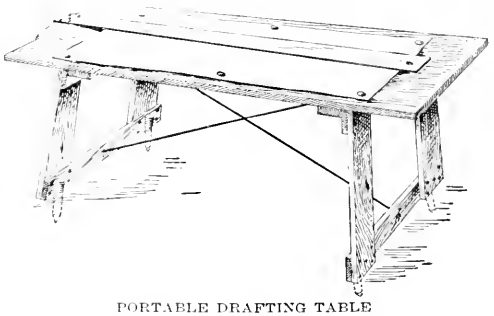
Drafting Table for Fieldwork

By Clinton P. Bernard*

A solid, steady drafting table, for use in fieldwork, that will take but little room in the wagon when moving camp and that may be set up on any kind of ground in two or three minutes, is a very desirable addition to an engineer's camping outfit.

The table described here I first saw used on a railroad outfit in the Southwest, and it was so satisfactory that I have used it several times since.

Two cleats 2 in. thick are screwed to the bottom of the drafting board or table, a suitable distance apart. The supports are made of 1x4-in. or 1x6-in. lumber as desired. Strong wires are fastened both at the top and at the bottom of one support and are passed through holes in the bottom and the top of the opposite support.



PORTABLE DRAFTING TABLE

When setting up the table, stakes are driven in the ground 18 to 24 in. farther apart than the cleats on the board, so as to give a decided slant to the supports. The table is placed upon the supports, the wires stretched tight and held by winding around a nail, and the table is ready.

If the wires be stretched tight the table will be steady and firm and stand better than one supported by horses. The use of stakes may be avoided by using two spreaders of proper length between the bottoms of the supports.

Details of Milling and Smelting

Flotation Testing Machine

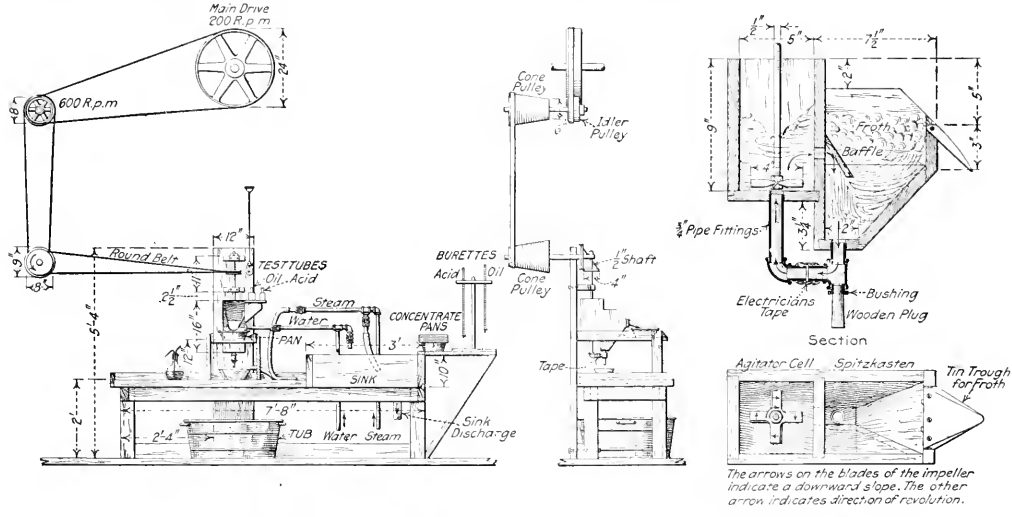
By Ralph W. Smith*

In designing a testing machine, it is well first to consider the character of work required of it, in order to arrange for flexibility in the desired directions. In flotation testing, there are so many influencing factors and their combinations, that must be varied in the testing work, that it is best to state these factors so that their relation to one another can be better appreciated. The variable factors are as follows: (1) Kind of oil; (2) amount of oil; (3) whether or not acid is to be used; (4) amount of acid (if used); (5) temperature of pulp; (6) length of time of agitation of pulp; (7) peripheral speed of impeller; (8) consistency of pulp; (9) effect of adding oil or acid first to the original pulp; (10) effect of retreatment of froth.

Not only must all of these factors be varied, but their combinations must also be varied and this must be done systematically. The testing machine described in this article was designed to afford ample opportunity to vary any or all of the essential factors, and furthermore to allow the operator to make the necessary changes with the minimum trouble and loss of time. There are many other advantages in using a testing machine of this design, but attention is drawn to these as they are outlined. The design and reason for certain arrangements are as follows:

This machine comprises a single closed-circuit cell, which exactly reproduces the proportions of a single cell of a large commercial multi-cell machine. This design has two advantages: By reproducing these proportions, the same physical conditions are imposed on the pulp as would be imposed on it in the commercial machine; the froth concentrates can be removed continuously from this cell, conditions in a commercial machine being thus exactly reproduced.

To be able to duplicate commercial conditions means much in testing. To explain this, consider the work done by a large machine. It usually comprises from 8 to 11 cells (of which this testing-machine cell is an exact duplicate in regard to proportions). These cells are connected in series, so that the pulp passes from one cell to the next and so on until it has passed through all of the cells and is discharged as tailings. This number of cells is used so as to gain the desired length of time of agitation, since a single particle of ore can be considered subjected to treatment so long as it remains in the machine. Thus, the number of cells is one factor in determining the time period of the passage of a single particle of pulp through the machine.



CLOSED-CIRCUIT, SINGLE-CELL, MINERALS-SEPARATION-TYPE FLOTATION TESTING MACHINE

Each cell can be considered a separate unit and each cell usually does its own particular kind of work. In most flotation practice, the first cell not only floats the greatest tonnage but also the highest grade of concentrates. It is nearly always found that the tonnage and assay per cell decrease as the pulp advances through the machine. The last one or two cells usually make a small tonnage of dirty concentrates. From this it can be seen that there is a practical limit to the time of agitation beyond which it is useless to go. When the final set of commercial operating conditions to be used has been determined upon from the testing work, there will be included among these conditions the speed and length of

*1845 Grant Ave., Denver, Colo.

time of agitation. Therefore it is imperative that the testing operator be able to determine these factors.

The second advantage of this design of testing machine—duplicating commercial operating conditions—depends on the fact that exact and reliable data can be obtained concerning the kind of work each cell would do in a commercial machine. This is because of the arrangement for continuous froth removal. With the closed-circuit cell as shown in the sketch the sulphide particles theoretically will become oiled in the agitator cell and ultimately be drawn over into the relatively quiescent spitzkasten. Here, the flotation phenomenon will manifest itself and the oiled mineral will rise to the surface. Not all of the sulphide minerals will rise instantly. Some particles may make the circuit from the agitator to the spitzkasten many times before they become incorporated in the froth. The most easily oiled mineral will float first, and the effect of the different gradations of this case of being oiled is to form the froth slowly and continuously for some time. The froth that forms first is usually the heaviest and thickest. The eye can easily tell when the practical end point has been reached, since at that point, the froth appears thin and lean.

In testing machines of other design, there is no quiet pool in which to allow the froth to rise, but the froth forms directly over the swiftly swirling pulp in the agitator cell. In order to separate the concentrates from the tailings the impeller is stopped and a thin partition is inserted between the froth and the pulp. Thus, the froth is formed under unfavorable conditions and removed in an unscientific manner. There are several ways in which results can easily be "salted," high or low, in this type of machine. Furthermore, it does not duplicate commercial conditions.

The testing machine with the arrangement for continuous froth removal will furnish data relative to the kind of work that each cell of a commercial machine would do under the same conditions, as follows:

Assume the total length of time of agitation, or, total length of time during which froth is removed, to be 5 min. Then, the total froth formed and removed during the first, second, third, fourth and fifth minutes respectively, should be gathered in separate pans, weighed and assayed separately. The information contained in this data will indicate exactly the relative quantity and quality of concentrates which would be formed in the respective cells of a commercial machine, under the same conditions.

This constitutes the most important single advantage of this design. Ease of operation and handiness should be added to this, but these last two can be better appreciated after one has run some tests in the machine. Now as to the design in particular. In order to be able to determine the best speed of agitation, it is necessary that we have several speeds readily available when the testing work is being done.

In the sketches, it will be noticed that the method of drive is by cone pulleys and belts. A much neater and equally satisfactory drive is a small vertically mounted, electric motor, connected with a rheostat in order to obtain various speeds. But in many cases, the absence of available current for such a connection, makes this installation undesirable or even impossible. Since testing work of this character is often carried on in an operating mill, the most convenient method of drive depends upon the kind of power in the mill. If electric power be available or be used in the mill, the motor drive should be used. The machine under discussion was designed to be used in a mill where steam power is used, and other conditions did not seem to advise the motor drive.

The sketch explains itself. The weight of the shaft, impeller and pulley is supported by the set collar, shown on the upper end of the vertical shaft. One set collar only is used, so that the shaft can be lifted and changes or adjustments made in the impeller. The impeller shown on the end of the vertical shaft may be cut from a piece of $\frac{1}{16}$-in. sheet iron. The arms are bent in a direction similar to the blades on an electric fan. However, further attention should be given the bending of these arms. The direction of revolution of the vertical shaft should be traced out from the pulleys and belts, and the arms on the impeller should be twisted so that the revolving impeller will pull the pulp through the feed pipe directly underneath it. It is this lifting action which causes the efficient circulation of the pulp, which must be in the direction of the arrows in the cell sketch. The impeller can be fastened to the end of the vertical shaft by threading the end and using a nut above and below the impeller. The threaded portion of the shaft which might stick out of the impeller should be sawed off flush with the nut. This is done so that the impeller may be brought as close to the bottom of the agitator cell as desired. When in place the impeller should clear the floor of the agitator by $\frac{1}{4}$ in.

A convenient and satisfactory method of connecting the pipe fittings under the cell is by means of electrician's tape. An ordinary pipe union should not be used because there is a shoulder on it which necessitates the spreading of the parts shown, when the connection is made. The tape will not leak. When a test is being made, the tee at the base of the flotation cell is closed with a bushing into which has been driven a wooden plug. This arrangement has the advantage of leaving no chamber above it in which the pulp can settle. If a valve be used, it can at best only be connected by a close nipple, and this will leave a small chamber above the valve gate, into which some of the pulp will settle during the test, and receive no treatment. Results will therefore be inaccurate.

The water should be connected close to the bottom of the agitator cell, so as to wash the agitator out after each test and supply water conveniently for further tests. The steam should not be piped to the machine, since the steam will create a great disturbance if introduced into the cold pulp, if the pulp is relatively quiet. A much more satisfactory way is to connect it to a short length of hose as shown. When the pulp is to be heated the impeller should be running and the end of the hose should be pushed under the surface of the pulp in the agitator cell. If the steam is turned on under these conditions, the rapidly swirling pulp will cause the steam to enter silently, and the rise in temperature can be well observed in the front or spitzkasten. The particular charges of oil and acid, which are to be used in a test, should be placed at some convenient place as shown.

The cross-section of the cell shows its proportions, how it is constructed and the flow of the pulp. There are usually enough pulleys, shafting, lumber and belting around a mill, so that it is not necessary to order anything for this machine except the cone pulleys. An ordinary millwright or carpenter can construct the whole. If results are systematically sought and the machine properly attended, accurate and valuable results can be obtained from a machine of this design.

Lead and Zinc Movement

There have been such remarkable changes in the movement of lead and zinc during the past year that it is of special interest just now to give the figures of the Department of Commerce for the fiscal year ended June 30, which covers approximately a year of war conditions.

Imports and Exports of Lead

The imports and exports of lead for June and the fiscal year are reported as follows in short tons:

	June		Fiscal Year	
Imports:	1914	1915	1913-1914	1914-1915
Lead, metallic	1	2	118	405
Lead, ore and base bullion	2,521	2,537	30,093	41,230
Total imports	2,522	2,539	30,211	41,635
Exports:				
Domestic lead, exports		5,401		86,512
Foreign lead, re-exports	976	1,912	23,768	29,929
Total exports	976	7,313	23,768	116,441

The imports of lead in ore and base bullion in 1914-15 included 38,080 tons from Mexico and 1672 tons from Chile. The imports from Mexico were almost double those of the preceding year.

Imports and Exports of Zinc

Imports and exports of zinc in metallic form for June and the fiscal year ended June 30 are reported as follows, in short tons:

	June		Fiscal Year	
Imports:	1914	1915	1913-1914	1914-1915
Blocks, pigs, etc.	35	163	1,073	862
Exports:				
Domestic	269	9,470	1,998	128,345
Foreign (re-exports)		1,286	140	11,116
Total	269	10,756	2,138	139,561

The comparison here is between a normal year and a year of war conditions, the effect of which is shown by the extraordinary increase of exports.

The imports and exports of secondary zinc products are given as follows, in short tons:

	June		Fiscal Year	
Imports:	1914	1915	1913-1914	1914-1915
Zinc dust	174	24	2,404	1,439
Exports:				
Zinc dust		21	66	275
Zinc dross		562	286	5,181

The exports of zinc dust were all reëxports of foreign material.

The movement of zinc ores for June and the fiscal year was as follows:

	June		Fiscal Year	
	1914	1915	1913-1914	1914-1915
Exports, tons, contents not given	1,431		14,294	3,345
Imports, tons	2,136	19,175	18,280	79,814
Zinc contents, lb.	1,399,921	15,121,176	14,484,802	66,649,820

In 1913-14 reëxports of foreign ore having zinc contents of 1,184,629 lb. were made. In 1914-15 no such reëxports are given in the returns.

Lake Shipping Conditions

For the first time since 1907 iron-ore shippers are now canvassing the vessel owners and offering ore-carrying contracts. In fact, several instances have been noted where carriers have refused contracts, preferring to take wild cargoes until later. Vesselmen complain that the present season has been an unprofitable one because of low rates. They say that in the past, when a dull season wound up with a rush, as at present, it indicated a prosperous year to follow, hence their reluctance to contract until the rush is at its height. The ship owners could take more ore if it were not for the fact that they anticipate only a moderate coal movement up the lakes this fall. At the present rates on ore it is only profitable to carry coal one way and ore the other. Grain is another factor counteracting against the ore trade. Brokers are bidding 2½c. for boats for grain at Duluth or Fort William for Lake Erie ports. This rate is theoretically equivalent to 93½c. on ore, and in actual practice about 75c., as against the nominal iron-ore rate of 50c.

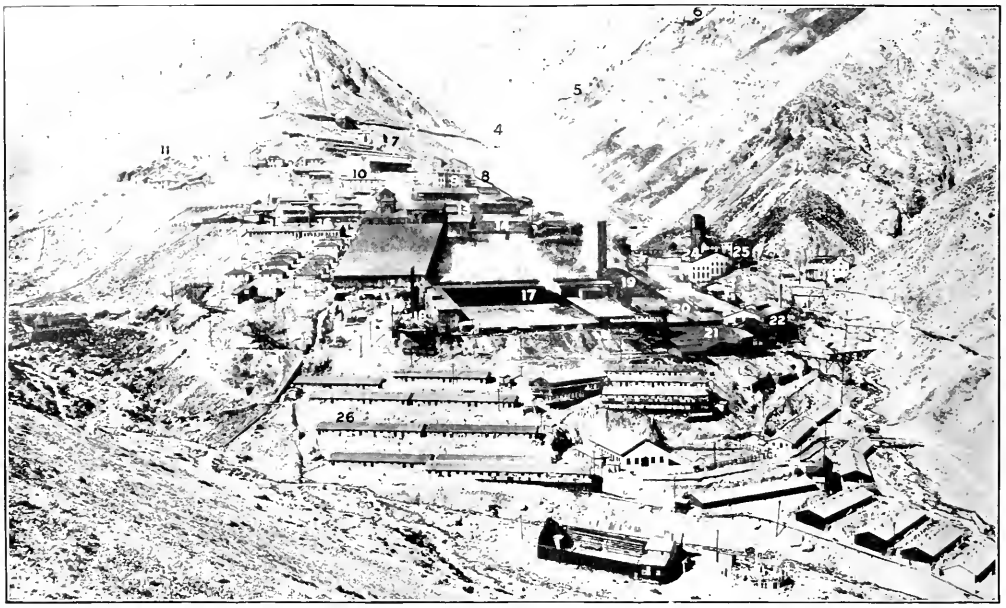
Vannoy H. Manning

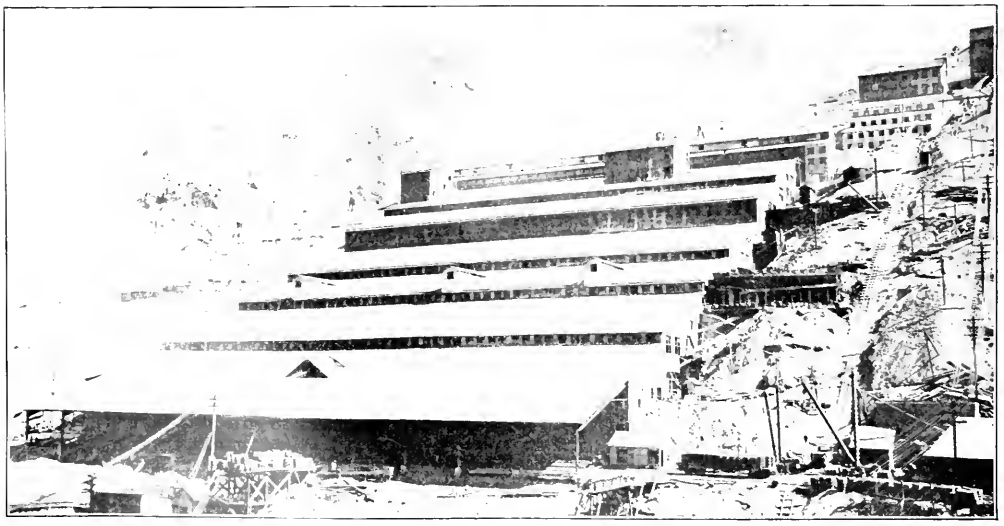
Vannoy H. Manning, the new Director of the Bureau of Mines, was born at Horn Lake Depot, Miss., Dec. 15, 1861. For more than 20 years he has been engaged in technical and scientific work in the Department of the Interior. From 1885 to 1910, as civil engineer with the United States Geological Survey, he was engaged in topographic mapping in nearly every state of the Union. When the Bureau of Mines was established in 1910, Mr. Manning was appointed to an administrative position in it by Secretary Ballinger, and on Jan. 1, 1911, was made Assistant Director; he has been Acting Director of the bureau in immediate charge of its work

VANNOY H. MANNING

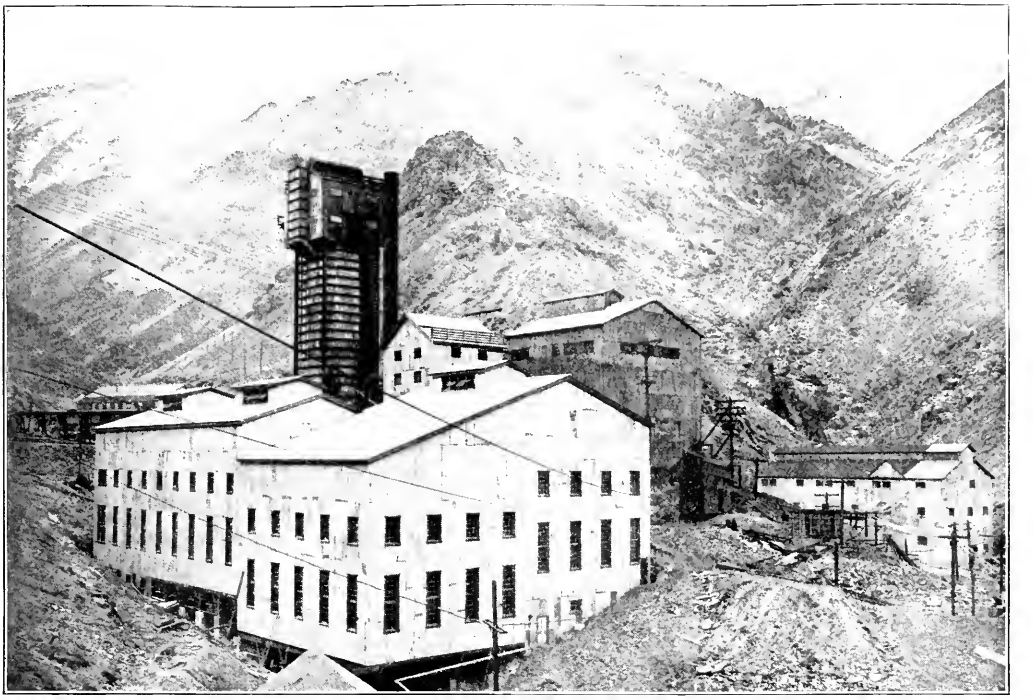
since Jan. 1, 1914, at which time Doctor Holmes, on account of illness, had to relinquish active work. During his service with the bureau Mr. Manning has had charge of methods relating to appointments, expenditures and the conduct of investigations, loyally supporting Dr. Holmes in every effort to make the bureau of greater service to the public, and by handling a mass of detail enabling Dr. Holmes to give attention to matters of policy and to the coördination of the work of the bureau with that of other Government and private institutions or establishments seeking to increase safety and efficiency in the mining, quarrying and metallurgical industries. Since June 1, 1914, Mr. Manning has had charge of all the technological investigations being conducted by the bureau, of the operation of its mine-rescue cars and stations, and of the educational work of safety and health that the bureau is doing in the mining and metallurgical districts of the United States.

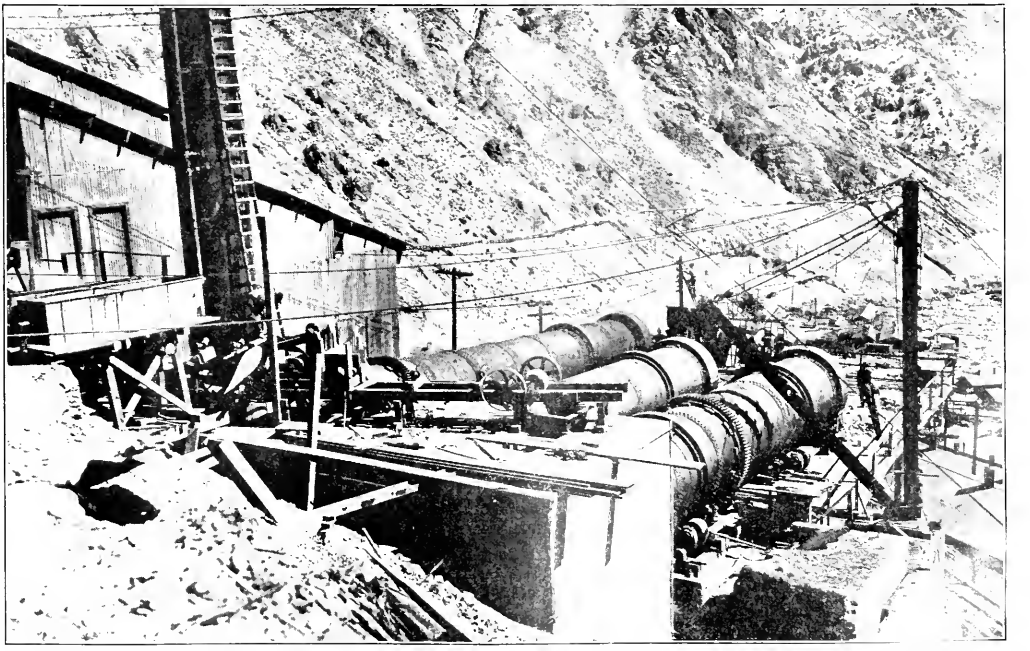
Braden Works, Sewell, Chile





The upper view shows the Braden Copper Co.'s reduction works at Sewell, Chile. The name of the town was formerly Molino, but was changed to Sewell on March 1, 1915, in memory of the late president, Barton Sewell. The mines are about 1½ miles up Teniente Cañon at the right. The chief features of interest in Sewell are: 1, penstock and high-pressure water line; 2, coarse-ore bins; 3, electric railroad to mine; 4, 5, 6, adits of Teniente mine; 7, crushing plant; 8, mill; 9, staff house; 10, main office; 11, American townsite; 12, store and warehouse; 13, mechanical shops; 14, foundry; 15, laundry; 16, laboratory; 17, smeltery charge bins; 18, nodulizing cylinders; 19, dust chambers; 20, blast-furnace building; 21, converter plant; 22, electrolytic building; 23, leaching plant; 24, sulphuric-acid plant; 25, roasting plant; 26, native quarters and town. Farther up the hill is the staff house, a modern hospital has been provided. The lower illustration is a closer view of the mill, which employs both gravity and flotation concentration.





The upper view shows the sulphuric-acid plant which supplies acid for the flotation process and for [illegible]ching experiments. The lower view shows the nodulizing cylinders in which the flotation concentrates are agglomerated to make them suitable for blast-furnace charging.

Manganiferous Iron Ores of the Cuyuna Range

By Edward P. McCarty*

SYNOPSIS—Orebodies occur lens-shaped averaging 300 ft. wide on the North Range and 125 ft. on the South Range. North Range ores are manganiferous, the South Range ores are not. Ores are of secondary origin. A small tonnage is low in phosphorus. A large tonnage is high-phosphorus and can now only be used in mixtures to make pig iron. Beneficiation is difficult and mechanical washing and concentrating tests thus far show only indifferent results. Magnetic separation would reduce phosphorus but could not separate iron and manganese.

The iron and manganese orebodies of the Cuyuna range, Minnesota, are irregular in form though usually lens-shaped. Both iron and manganese occur within the same lens. These lenses may be broad, narrow, single or double, and often parallel, separated by lean ore material or barren rock. They stand at steep dips.

As to size great variation is to be noted. The ore-bearing formation without doubt is continuous for many miles, but the length of a single lens is not great. The lenses of ore have a tendency to overlap. A rapid change in the formation may cause the pinching out of a lens. Irregularities in the shape of the lens may make it appear as though the lens had pinched out. This may be due to the pitching trough. Underground development alone will show actual conditions. On the North Range the greatest width of lens does not exceed in all probability 500 ft. The average will be much less, not exceeding 200 ft. On the South Range 125 ft. is nearer the maximum width with an average of about 50 ft. It is not likely that commercial ore will be found extending to a great depth since ore concentration has taken place from the top down. Perhaps 150 ft. deep for the North Range and 300 ft. deep for the South Range would be a fair estimate for the average depth of merchantable ore, having in mind the iron ore rather than the manganiferous ore.

The Cuyuna iron ores are mostly hydrated hematites of a red, brown, and black color, and in some cases earthy in character. The ores show high loss on ignition. This is owing to the driving off of the water of crystallization and the decomposition of carbonates that may be present. Such ores smelt readily. Some of the ores are true hematites, especially the North Range deposits. The brown and black ores are characteristic of the South Range and are somewhat magnetic.

Manganiferous Ores of the North Range

The North Range contains areas of highly manganiferous ores so far lacking in the South Range. The iron content of this ore averages about 55%. On the South Range it is almost an invariable rule that the highest percentage of iron is found in the ore near the surface and the iron content decreases with increased depth. This is also true, to a certain extent, on the North Range. Siliceous material is present in considerable quantities. Where the iron runs high the silica runs low and vice versa. With increased depth the silica rapidly increases until the ore becomes too lean to be merchantable. The average phosphorus content is high, about 0.30%. Present developments show a bessemer iron orebody in only one 80-acre tract. The alumina averages well for merchantable ore, although the ores are slaty in places; little or no paint rock occurs. The manganese presents an interesting phase relative to the ores of the district.

On the North Range there exist orebodies carrying 25% manganese for part of a drill hole while the rest of the hole may show little or no manganese. Many drill holes average from 6 to 15% manganese, while a short distance from the hole the orebody shows very little manganese. As a rule it follows the iron in a high percentage near the surface, decreasing with depth. In the general run of bodies the manganese will be less than 1%. In certain cases development shows a higher percentage of manganese than that indicated by drill holes. As usual with manganese minerals the ore formation is spotty.

The moisture content of the ores varies from 6 to 14% with an average of about 12%. The shape of the orebodies and their relation to the adjacent rocks exclude the idea of their being contemporaneous with the enclosing rock. Their occurrence near the erosion surface indicates a secondary development in the nature of a concentration by meteoric waters. Iron carbonate was undoubtedly present in the original iron-bearing rocks. The Cuyuna orebodies therefore may contain some iron carbonate where the weathering has been incomplete.

The manganiferous ores of the Cuyuna Range may be classified into: (1) Low-phosphorus manganiferous iron ore, and (2) high-phosphorus manganiferous iron ore.

The first class is made up of a small tonnage of manganiferous ore low in phosphorus; that is, an ore which is sufficiently high in manganese and of a character suitable for the manufacture of spiegeleisen—the alloy used for recarburizing in the bessemer process and to some slight extent in the open hearth. Such ore is found in one of the operating mines and to a small extent elsewhere. The analysis is variable, but may be taken at: Iron 44.25%; phosphorus .036%; manganese 10.50%; silica 18.25%; moisture 9.55%. Its tonnage, however, is small. The layers containing this low-phosphorus manganiferous iron ore will ultimately run into stringers of material containing so much phosphorus as to cause the orebody to pass into the high-phosphorus manganiferous iron ore.

High-Phosphorus Ores

The second class consists of a considerable tonnage of high-phosphorus manganiferous iron ore. It is difficult to give to this class an average grade, but the table on the following page gives some representative analyses.

*Professor of mining, University of Minnesota

It is at once apparent that such ores would have their only use in mixture with other ores in the manufacture of pig iron, where the regular mixture does not carry sufficient manganese. The present tendency of steel makers is to increase the manganese charge in their ores. The presence of 1% manganese is desirable in basic iron on account of the beneficial effects which this element has with respect to sulphur. Many ores do not contain sufficient manganese to make an iron containing as high as 1%. The ores carrying from 15 to 16% manganese

ANALYSES BY PER CENT., DRY WEIGHT

Iron	Phosphorus	Manganese	Silica	Alumina
46.85	0.239	6.84	4.80	3.66
48.39	0.314	7.02	6.07	2.35
40.85	0.273	15.24	3.21	2.91
38.74	0.262	16.23	3.21	2.91
51.16	0.288	6.61	6.07	2.35

could be used in making spiegeleisen, if the phosphorus percentage was not so high. Spiegeleisen must contain less than $\frac{1}{10}$ of 1% in phosphorus. If these ores were smelted directly without any previous treatment, the resulting product would be a high-phosphorus spiegeleisen, varying in manganese from about 10%, for the low-manganese ores, to about 22% for the higher-manganese ores.

In the smelting of manganiferous iron ores, it is found that about three-fourths of the manganese will go into the metal and one-fourth into the slag. All the phosphorus, unfortunately, will remain with the metal. Owing to the high phosphorus of these ores they are unsuitable for spiegeleisen, and on account of the phosphorus content, they would naturally be graded as foundry ores, except that the high manganese precludes the use of such ores for foundry purposes.

Unmerchantable Low-Grade Ores

Owing to the low iron content these ores are not of merchantable grade at this time, even if the phosphorus and the manganese were in such percentages as to admit of their use as foundry ores or steel-making ores; such ores could not be used in a furnace on a basis of 100% of the charge on account of excess manganese.

According to Ledubur, an ore of the following composition is smelted in the Queen Mary steel plant in Germany: Iron oxide 39.30%; manganese 10.48%; silica 21.92%; alumina 11.84%; lime 0.27%; magnesia 1.19%; sulphur 0.01%; phosphorus 0.68%; loss on ignition 9.00%. This ore is a siderite containing high alumina and was, for the most part originally limonite, ultimately decomposed into a siderite. Little of such ore, however, has been utilized. It is to be noted that the composition of this ore is much like that covered in this class found on the Cuyuna Range. It is not to be confounded under any conditions with the class of ores called in the trade "manganese ores." Such manganese ores contain from 10 to 52% in manganese. Phosphorus analyzes from .01 to .05%. The iron percentage varies from 2 to 14. Manganese ore with percentages such as these is marketed in various parts of the world. It is to be noted that the percentage of phosphorus is low and the percentage of manganese high.

In England an iron carbonate is used. It is usually roasted before smelting. A typical analysis is as follows: Iron oxide 36.14%; manganese 1.12%; silica 10.17%; alumina 4.80%; lime 0.16%; magnesia 0.94%; sulphur 0.04%; phosphorus 0.33%; moisture 2.52%. From the above analysis it is at once seen that the phosphorus is practically the same as that carried by the Cuyuna Range ore, but the iron is in the form of a siderite and in no wise directly comparable with the Cuyuna ore.

Problem of Beneficiation

Since the high phosphorus manganiferous ore cannot be smelted and treated at a profit without prior beneficiation, the question at once arises, How may such beneficiation be done? By beneficiation is meant the increasing of the iron and manganese content or the purifying of the mass by the removal of the phosphorus, silica, sulphur, etc. Beneficiation along metallurgical lines does not offer an inviting field. Hence resort must be had to some mechanical treatment of the ore. Such ore might be screen-sized, classified, washed in a log washer, jigged, treated on reciprocating tables or magnetically concentrated. Tests made so far have shown only indifferent results.

Magnetic concentration might aid in reducing the phosphorus content, but cannot separate iron and manganese. The phosphorus may exist in an iron ore, or manganiferous iron ore, as on the Cuyuna Range, in the form of several minerals, principally apatite ($CaFCl.Ca_4P_2O_{12}$) and vivianite ($Fe_3P_2O_{8}.8H_2O$). In New York, operating on a magnetic ore—note the Cuyuna ore is a hematite—by fine grinding and magnetically concentrating the product, commercial apatite is formed as a byproduct and a nonbessemer ore rendered bessemer. In the Cuyuna ores the phosphorus exists in the form of apatite in part only, crystals of apatite have been found, but the percentage of phosphorus is greatly in excess of that carried by the apatite. It is a fair assumption that much of the phosphorus is in the form of vivianite or similar minerals. When thus combined, the iron and phosphorus cannot be separated magnetically.

Present indications are not favorable to beneficiating Cuyuna ore by magnetic concentration alone.

Tonnages Developed

The tonnages and grade of high-phosphorus manganiferous ore so far developed on the Cuyuna Range is as follows:

ANALYSES BY PER CENT., DRY WEIGHT

Tons	Iron	Phosphorus	Manganese	Iron and Manganese
123,771	54.65	0.179	1.22	55.87
3,122,031	56.38	0.159	1.36	57.74
720,488	53.69	0.258	3.53	57.22
644,750	50.85	0.350	4.98	55.83
713,490	48.15	0.236	5.90	54.05
468,566	47.27	0.058	9.19	56.46
948,802	46.46	0.236	10.99	57.45
1,939,417	42.57	0.226	11.30	53.87
408,878	39.27	0.090	15.45	54.72
183,716	43.26	0.156	15.96	59.22
100,000	30.82	0.070	21.93	52.75

The total as shown above amounts to 9,373,909 tons of such ore. Without question further drilling will increase this tonnage, but the fact remains that the general character of such ore has been established and the value, whether materially increased or not, is practically settled. Many erroneous statements have been made at different times relative to these manganiferous ores, and until recently a correct knowledge of them had not been acquired.

Nothing has been said about ferromanganese which was of such interest a few months since. There is no ore on the Cuyuna Range from which ferromanganese may be manufactured. A small tonnage of spiegeleisen can be produced.

It should be borne in mind that the consumption of ferromanganese is increasing in the United States, as the making of openhearth steel increases, while the use of spiegeleisen is decreasing as its principal role is that of a recarburizing agent in the bessemer process of steel manufacture.

The Minnesota School of Mines Experiment Station has in press a bulletin entitled "Preliminary Concentration Tests on Cuyuna Ores." This publication takes up the treatment of the ores with considerable detail and deals especially with log washing and jigging tests. A chapter is devoted to the manganiferous ores.

Draining a Swamp by Air Lifts

SPECIAL CORRESPONDENCE

At the American mine, Diorite, Mich., J. R. Thompson, manager and part owner, has devised a novel method for removing the water from a large swamp which lies above some of the mine's ore deposits. The swamp is about 2 mi. in length and 1 mi. in width, containing a great deal of water, and it was feared that if it ever came into the workings in large quantities it would cause trouble. To get rid of the water was considered quite a problem, but Mr. Thompson did some figuring and believed that he could solve it. He had a diamond-drill company put down several holes in the swamp, to find how close the ledge was to surface, which would give some idea of the amount of water that the swamp held. The drills showed that the ledge varied from about 70 to 125 ft. below surface. On top there was about 10 ft. of black muck, with quicksand and gravel below. The diamond-drill firm was asked to put down several 8-in. holes to the gravel, but its engineer stated that the task would be too great, as the quicksand would cause difficulties. Mr. Thompson then undertook the work himself, putting down the first pipe a distance of 76 ft. in three days after the tripod was rigged up. The pipe was not touched with a hammer. It was sunk by turning, forcing air down the inside at the same time. When the pipe was bottomed in the gravel the air caused the water to shoot to surface. This pipe is now producing about 1000 gal. per min. Since that time five more pipes have been put down, some of them reaching a depth of over 100 ft. One went through the gravel, being put down deeper than any of the others, and no water is now flowing from it. An attempt was made to blast it off higher up, but without success. One of the other pipes is also inactive. The four that are now working are sending about 5000 gal. per min. to surface. Two of the pipes are 10 in. in diameter, but they do not give any better results than the 8-in. pipes. This system of an air-lift has lowered the water level in that huge swamp over 20 ft. during the short time that it has been in operation. When most of the water is out, a drift will be extended from the 140-ft. level of the mine and a 3500-gal. centrifugal pump installed to care for any water that comes into the swamp later on. The method is very cheap, as the pipes need no attention after they get in operation. Some idea of the force of the water can be gained from the fact that granite rocks weighing as much as 85 lb. were brought to surface through one of the pipes. The water coming from below runs into a ditch that was made by using dynamite and forms quite a sizable stream. The principal of the air-lift is quite old, but we do not know that it has ever been applied to this kind of work before.

Bureau of Mines Suggested Regulations for Mines

A publication of considerable interest to the metal-mining districts of the United States has just been issued by the Bureau of Mines, under the title, "Rules and Regulations for Metal Mines." It is to be known as Bulletin 55 and the authors are W. R. Ingalls, J. Parke Channing, James Douglas, James R. Finlay, and John Hays Hammond.

The above committee was originally appointed at a meeting of the American Mining Congress at Denver, Colo., in November, 1906, and its object was the drafting of a modern law governing quarrying and metalliferous mining which could be recommended to the several states for adoption, in the hope that the passage of such a uniform law by the mining states would tend to lower the number of fatal and serious accidents.

When the committee took up its work, it found that Colorado, Missouri, Montana and New York were the only states that had enacted mining laws of broad scope applicable to other than coal mines. California, Arizona, Idaho, Kansas, Michigan, Minnesota, Nevada, New Mexico, North Carolina, Oregon, South Dakota, Tennessee, Utah, Washington, and Wyoming were found to have statutes pertaining to metalliferous mining, but with few and incomplete safety provisions.

This committee of the American Mining Congress did considerable work along this line and made a number of reports. In April, 1911, Dr. Joseph A. Holmes, Director of the Bureau of Mines, invited the committee to serve as a committee of that bureau with the idea of preparing a final draft of a law, and this invitation was accepted.

Starting with a composite of existing laws, the committee by successive stages endeavored to work out a general law that would embody the best mining thought of the day, be in accord with approved modern mining practices, and yet at the same time be effective and practical in operation, not merely a collection of rules and regulations to be disregarded or enforced at will. The committee in discussing its report says:

"We have found that a great deal of interest and attention among mine operators has been awakened by our advocacy of improved means for promoting safety in mining. However, we are under no illusion that our recommendations will be immediately and generally adopted. We consider our work to be especially of educational character rather than anything else. It will be useful in three main ways, we think, as follows:

"1. As a basis for State legislation.

"2. As a basis for private systems of inspection.

"3. As a collection of simple rules for the guidance of everybody engaged in mining.

"Since the publication of our first report several States have adopted new mining laws and amended their old ones. In this connection our code has served some purpose; for example, in the drafting of the laws that now stand on the books of the states of Nevada and Arizona. We do not expect that any state will at once adopt all of our recommendations, especially those that are essentially of legal character. We offer them as what we think ought to be and hope some day will be.

"Since our first publication, furthermore, most of the mining companies of consequence have adopted inspection systems or have at least framed codes of safety rules, which have been based to a large extent on our code, notably so in the case of the Cleveland-Cliffs Iron Co. This tendency, in fact, has become one of the most important phases in the national movement for 'Safety First.' This is the gratifying consummation that we had in mind. Unquestionably, also, the widespread adoption of state laws providing compensation for injured workmen has helped the safety movement by making accident prevention worth while.

"We consider, however, that the chief usefulness of the code of rules that we have formulated will be to small operators, who frequently engage in unsafe practices without knowing that they are unsafe or without thinking about the matter at all. There is a reasonable hope that our report will be of educational value to all mining operators.

"The act that we have drafted may be regarded from two angles—from the legal and from the technical. With respect to the latter we have had in mind the conditions and practice of mining existing and prevailing in the several parts of the United States. In our treatment of the matter from the legal standpoint, in which we have had the advice of good lawyers, we have refused to clothe the inspector of mines with the optional powers that are given to him under the laws of many of the British colonies, and also we have refused to convey to him the sweeping power that is given to health inspectors in some of our own states.

"The code of mining rules that has been finally drafted by the committee is the coördination of the experiences, opinions, and suggestions of a great many men who have been associated with the committee in an advisory capacity and as directly employed aids. The former have included many engineers actively engaged in practice, members of professional societies, and members of the bar; the latter have included members of the regular staff of the Bureau of Mines and of the personal staffs of members of the committee. The committee has sought to obtain many points of view and to summarize many experiences. The draft that has been prepared is not offered as the last word upon this subject. There are many phases of this subject with which the committee has been unable to deal thoroughly. Thus the committee confesses its inability to formulate at the present time adequate rules covering the important subject of ventilation of mines. Similarly there are many practices in opencut mining, by steam shovels, etc., regarding which the committee has felt unable to formulate rules. We feel, however, that the rules so far as prescribed may advantageously be applied to open mining whether it be simple quarrying or the extraction of metalliferous mineral, as well as to underground mining."

Lake Superior Mining Institute

The twentieth annual meeting of the Lake Superior Mining Institute will be held on Sept. 6, 7 and 8, 1915, assembling at Ishpeming, Mich.

A first-aid contest will be held Monday morning, Sept. 6. In the afternoon automobiles will be taken for a trip over the range, visiting the following mines: Norrie Group, Newport, Colby and Wakefield. The Wakefield is the new property opened by the M. A. Hanna Co. and is described in a paper by W. C. Hart. Stops will also be made at other mines en route. A business session will be held at the New Central High School at 7:45 p.m. Trains will leave for the Cuyuna at 11 p.m., arriving at Crosby, Minn., at 7:30 a.m. Breakfast will be served on the dining cars from 6 a.m. Cars will be provided to take the party to the following mines: Croft, Thompson, Armour No. 1 and No. 2, Kennedy, Pennington, Mahnomen, Mille Lacs, Iron Mountain, Sultana and Hill Crest. This is the first visit of the Institute to the Cuyuna Range. Another business session will be held in the evening, and trains will leave for Minneapolis at 11 p.m.

On Wednesday the party will be met at the train by a special committee of the Minneapolis Civic and Commerce Association. Automobiles will be provided for a visit to the Minnesota School of Mines. Luncheon will be served at the Minnikahda Club at 1 p.m. and after luncheon the party will visit the State Fair.

Following is a partial list of papers to be presented during the meeting: "Sheet-Ground Mining in the Joplin District, Missouri," by Edwin Higgins, mining engineer, Bureau of Mines, Ironwood, Mich.; "Rock-Drifting in the Morris-Lloyd Mine, Marquette Range," by J. E. Hayden, mining engineer, Ishpeming, Mich.; "Sinking of the Woodbury Shaft at the Newport Mine, Gogebic Range," by J. M. Broan, mining engineer, Ironwood, Mich.; "Mining Methods on the Gogebic Range," by Messrs. Oscar Olson, Frank Blackwell, O. M. Schaus, Committee; "A Survey of the Developments and Operations in the Cuyuna Iron Ore District of Minnesota," by Carl Zapffe, geologist, Brainerd, Minn.; "The Mining School of the Cleveland-Cliffs Iron Co.," by C. S. Stevenson, director, educational department, Ishpeming, Mich.; "Grouting at the Francis Mine Shaft of the Cleveland-Cliffs Iron Co.," by John R. Reigart, assistant superintendent, Princeton, Mich.; "New Stock-Pile Trestle, Colby Iron Mining Co.," by G. S. Barber, superintendent, Bessemer, Mich.; "Opening of the Wakefield Mine," by W. C. Hart, superintendent, Wakefield, Mich.; "The Use of Gunite in a Steel Shaft and in an Underground Pump-House on the Gogebic Range," by Steven Royce, general engineer, Hurley, Wis.

Cuyuna Range Tonnage for 1915

BRAINERD CORRESPONDENCE

Under present expectations the Cuyuna Range will ship 1,075,000 tons in the 1915 season. This estimate is based on announced ore sales and other definite factors. Of this tonnage the Soo Line will haul fully 80%, the remainder going via the Northern Pacific. Detailed tabulation is as follows:

	Expected Tonnage	Maximum
*Armour No. 1	75,000	75,000
*Armour No. 2	200,000	250,000
Adams	.....	.....
Barrows	.....	.....
Brainerd-Cuyuna	.....	2,000
Croft	.....	.....
Cuyuna-Mille Lacs	40,000	50,000
Cuyuna-Duluth	.....	10,000
Hill Crest	.....	.....
*Iron Mountain	10,000	10,000
†Kennedy	200,000	225,000
Mahnomen	.....	10,000
*Meacham	.....	.....
*Pennington	100,000	100,000
*Rowe	200,000	300,000
Rowley	.....	.....
Sultana	.....	2,000
*Thompson	200,000	200,000
Wilcox	50,000	60,000
	1,075,000	1,294,000

*Ships via Soo Line. †One-half tonnage to the Soo and one-half to the Northern Pacific. The remainder ship via Northern Pacific or are not tied up.

Electrical Power for the Cuyuna Range

BRAINERD CORRESPONDENCE

The Cuyuna Range is supplied with hydro-electric power by the Cuyuna Range Power Co., whose power plant is located on the Crow Wing River southwest of Brainerd. A large proportion of the underground pumping is done electrically, although operators have found it necessary to safeguard themselves by the installation of auxiliary steam pumping plants. The Wilcox mine, at Woodrow on the South Range, has perhaps the best equipment in this respect. Here the pumping facilities consist of one 1200-gal. two-stage electric station pump (100-hp. motor), one 800-gal. four-stage electric sinking pump (65-hp. motor) as an auxiliary, and a small electric pump for boiler feed, etc. A like capacity of simple and compound, noncondensing steam pumps is carried for emergency purposes only. Air for drilling is compressed by a 100-hp. electrically driven machine. The remainder of the plant is steam, two 150-

hp. boilers furnishing power for hoisting and for operating the auxiliary pumps. At the Rowe mine, Riverton, electrically operated pumps have served admirably in furnishing water for the hydraulicking operations, which are now practically completed.

English and Canadian Tough Oakes Companies

SPECIAL CORRESPONDENCE

The Tough Oakes Co. in Kirkland Lake, which has received so much publicity on account of the financial mazes through which its promoters have carried it, is again in the limelight because of an endeavor to have the English company liquidated.

There are two companies of the same name, one English and the other Canadian, the former having contracted to purchase the stock of the Canadian company through the agency of the Kirkland Lake Proprietary, which is also an English company. The Proprietary and the English Tough Oakes were promoted by the same people, and in the process of transferring the stock a substantial commission was obtained by the Proprietary company.

The English Tough Oakes Co. sold stock to the extent of £200,000, and of this amount only £15,000 was paid to the Canadian company. The balance of £155,000 was practically all loaned to several companies in which the promoters of the English company and the Proprietary held control, and the stock of these various companies was given as security for the loans. After the war broke out it was impossible for the English company to realize on any of these securities—some of which did not have anything very substantial behind them—so that the contracts with the Canadian company could not be carried out. A petition was presented in the English courts asking for the winding up of the English Tough Oakes Co., and this petition was supported by holders of 20,500 shares, while those opposing the petition represented 155,000 shares.

The judge ordered the petition to stand over pending the hearings of the actions in the Kings Bench Division, and also ordered the company to use its best endeavors to collect the moneys owing.

College Teams in a National First-Aid Meet

In view of the great interest manifested by first-aid teams from mining colleges in the third annual joint field meet to be held in San Francisco, Sept. 23 and 24, by the United States Bureau of Mines, the American Mine Safety Association and the California Metal Producers' Association, the rules committee has withdrawn the restrictions against the participation of such teams in the meet.

The ruling previously made that only teams from bona-fide mining, smelting and milling companies should be admitted to the interstate contests of Sept. 24, hereby restricting teams from mining colleges to participation in the demonstrations of Sept. 23, has been modified to provide that such teams and teams from state departments or other institutions interested in safety in mining, but not concerned in mine operation, may compete among themselves on the 24th for a special prize for the most proficient team from an educational institution.

Freeman's Appeal Wins New Trial

The United States Circuit Court of Appeals handed down a decision reversing the judgment of the trial court in the case of Albert Freeman, who, with Julian Hawthorne and Dr. William J. Morton, was convicted of using the mails in a scheme to defraud investors in mining stocks, and sentenced to serve a term of five years' imprisonment in the Atlanta penitentiary. In reversing the judgment the Appellate Court orders a new trial for Freeman.

Hawthorne and Doctor Morton did not appeal, and since the trial they have served their sentences.

The appeal was granted on the ground that two different judges could not hear the same case. While the trial of Freeman, Hawthorne, and Doctor Morton was under way in the Criminal Branch of the Federal District Court, Judge Charles M. Hough, who was presiding, was taken suddenly ill, and then, in accordance with a stipulation entered into by District Attorney Marshall for the Government and counsel for the defendants, the trial was continued and finished before Judge Julius M. Mayer.

Later, on a motion, irregularities concerning the jury were brought to Judge Mayer's notice.

Freeman was convicted in March, 1912, and in asking for a new trial asserted that one of the trial jurors was disqualified because as a Grand Juror he had previously investigated the Hawthorne Silver & Iron Mining enterprises. Freeman further asserted that three of his witnesses were intimidated and threatened with prosecution if they crossed the Canadian border to swear to the accuracy of their reports which were used in the sale of mining stock.

Gold and Silver Production in 1914

The revised statement of the Director of the Mint shows that the production of gold and silver in the United States during 1914 was actually considerably in excess of the preliminary estimate published last January. The production of the precious metals in 1914 therefore compares with that of 1913 as follows:

	1913	1914	Changes
Gold, value	$88,884,400	$94,531,800	I. $5,647,400
Silver, fine oz.	66,807,500	72,455,100	I. 5,653,600

The corrected totals exceed the earlier estimate for 1914 by $1,708,300 gold and 4,525,400 oz. fine silver. The approximate value of the silver produced in 1914 was $39,713,365, at the average price of the year.

Bureau of Mines Car Schedule

The Bureau of Mines Denver Car No. 2, J. H. East in charge, will follow the following schedule for the next 10 days:

	Arrive	Leave
Bisbee, Ariz.	Sept. 5	Sept. 7
Clifton, Ariz.	Sept. 7	Sept. 9
Globe, Ariz.	Sept. 9	Sept. 11
Los Angeles, Calif.	Sept. 12	Sept. 13
San Francisco, Calif.	Sept. 14	.....

The Shawinigan Electro-Products Co., Baltimore, Md., will erect a plant for the manufacture of calcium carbide, according to report.

Editorials

Mining-Stock Brokers

The spirit of speculation that has once more overtaken our people is naturally developing an activity in the mining-stock exchanges of New York and the interior, or the semblance of such. Already there are reports of scandals and of operations that are attracting the attention of the authorities. The latter should be on the alert, else the work they did in cleaning up the criminal dirt that accumulated during the boom of 1906-7 and soon afterward will be undone.

Now let us have a clear understanding of what the conditions are. Almost all branches of business are speculative, mining being so neither more nor less than any other. Utah Copper Co., for example, exemplifies an enterprise in which millions of money were expended in developing a huge deposit of copper ore. During the development period there was speculation as to how large the ore deposit would prove, whether the estimates of grade would be verified, whether unforeseen difficulties in the extraction and beneficiation of the ore would crop out, etc. There were violent controversies over some of those matters. After the lapse of nearly 10 years the disputes have disappeared, the position of Utah has been established, investment in its shares has come to be regarded as safer than investment in New York City real estate. Yet there is still speculation in them. The market for copper, the policy of the management, the possibilities of progress in the arts of mining and metallurgy—all constitute factors that affect value and afford opportunity for speculation than which nothing is more legitimate.

Another kind of speculation in mining is equally legitimate and is indeed the mainstay of the mining industry. This is the venturing of capital in looking for mines, in making mines. In this the chances for loss are greatest and conversely the chances for big returns are correspondingly large. Such speculation is usually undertaken privately by a small group of persons, or by a larger group through the medium of an exploration company. The public is seldom invited to participate, nor should it be, and there is no need for the listing of stock upon an exchange. When a mine has been brought to some degree of success its shares become more and more distributed. Private trading is followed naturally by public trading on the curb, and finally the stock goes upon the New York Stock Exchange, the great market of the country.

To this legitimate business in mining the so-called "business" on the minor exchanges bears about the same relation that the betting ring of a race course does to a trading place for commodities. The prime function of those exchanges is the gambling in things that do not mean anything, in pieces of paper, in mere names. Almost everywhere in the United States the faro bank, the roulette wheel, the pool room have been exterminated. The managers of the "mining-stock exchanges" say that they are doing "business," their dealers and lookouts and cappers call themselves brokers and the police are impotent against them. Recently the brokers of the exchange in Salt Lake City suspended a regular session in order to congregate in the so-called Gold Room of the Commercial Club in order to do honor to a notorious exponent of the black art who was warmly welcomed and feasted, for was he not going to foster a boom in Alta stocks? Try to imagine the brokers of the New York Stock Exchange doing that. In fact nearly all of these stock exchanges of the interior are cheap, contemptible. We are disposed to have most respect for the San Francisco exchange merely for the reason that there is no pretense that the dealing in Comstock shares is anything but gambling. A considerable portion of the population of San Francisco wants to gamble and the authorities are willing to permit them to do so under the guise of doing business, although they will not permit ordinary gambling. Moreover, the San Francisco brokers, satisfied with their regular clientele, make no attempt to inveigle unwary widows living in Vermont.

Reports from the West are to the effect that "mining brokers everywhere who have the best interests of the mining industry at heart are taking an active part in the proposed organization of a National Mining Brokers Association." When the prospectus gets to us we shall like to ask *when* did the "mining brokers" anywhere *ever* have the "best interests of the mining industry at heart"?

*

Democracy and Inefficiency

"The pioneer democrat had the backwoods and the Indian to fight. He won. He thought very well of himself in consequence. So his brains went raw. Raw, ready brains sufficed for his needs and emergencies. With an ax, a gun, a vote and some patent medicine, he survived. This greatly reinforced his initial generalization that 'one man was as good as another.' Very despotic was this son of liberty in his backwoods. His notion of liberty was that everybody was *free to agree with him.*

"Before we came into the world, the times were filled with phrases. Our birthday was celebrated by a phrase: All men are created equal. Into the Declaration of Independence Jefferson, a slaveholder, wrote this and all the signers signed it; and thus phrases and falsehood were made bone of our bone and flesh of our flesh. They essayed to reconcile equality and slavery by explaining that negroes were not exactly men.

"But you cannot continue to swallow a contradiction like slavery and equality for very long, without important results to your mental integrity. You never can substitute rhetoric for reality without important results to your brain. You cannot fight trained armies with rhetoric; and so the English burned Washington. The War of 1812, however, taught nothing to our phrase-mongers in Congress and elsewhere. We continued to be the 'land of the free,' and to boast about our 'glorious institutions and destiny.' We spoke of Europe's 'effete despotisms'; we said, 'Uncle Sam had a farm for everybody'; and our public orators from Jefferson to Bryan continued to build commonwealths with hot air.

"The cherishing the equality and slavery lie, and thus nourishing our Optimistic Fallacy with phrases which our easy success in the backwoods seemed to validate, we acquired our instinct to look away from any reality that fell short of squaring with the Optimistic Fallacy, any truth that refused to combine agreeably with it. From all such unpleasant facts, political and social, all facts that grated on the Optimistic Fallacy, we turned our eyes so quickly and so hard, that our national sincerity ended by acquiring a perpetual squint. Slavery was abolished—we know at what cost—but the four years' struggle of true national conscience, while it exalted a generation forever, could not undo the work of the 60 or 70 preceding years; the squint went on, it had become chronic. In great things, as in small, we hid behind phrases; changing the *words* satisfied us just as well as if we had thereby changed the *facts*. For instance, 'first' and 'second' class couldn't be painted on railroad cars; all passengers, being Americans, were equal; it would be 'un-American'; but paint 'Pullman' on a car, and everybody was satisfied.

"Under a great shock we see straight. If clumsily, still we are struggling for social justice. Our business honesty has improved. Perhaps we shall be cured of our squint without a surgical operation. Perhaps Uncle Sam may escape the fall he seems to be riding for; but if this is to be the case, we must see straight and keep ourselves right-minded on small as well as great occasions."

The foregoing paragraphs are composed from sentences selected and strung together from an article by Owen Wister in the *Atlantic Monthly* for June, 1915. They seem to us to reflect sharply the failing from which the welfare of our country has suffered more than is commonly comprehended. To such ideas as are therein exposed are traceable our muddling in military affairs; for example, in the Spanish-American War; our incompetency and waste that are most glaringly displayed in our municipal government, our ridiculous inefficiency in running our post office, and the harassing of our railways and great industrial corporations. Only exceptionally have we collectively done any great work well—the building of the Panama Canal being the brightest example—and when that has happened it has been for the reason that we have turned it over to an expert and kept our hands off. Probably if the Post-Office Department were turned over to Colonel Goethals in a similar way he would soon renovate it and run it as a well-organized business.

In our private and corporate affairs we have suffered largely from the same kind of inefficiency, although we have had such wonderfully rich resources to deal with that the results of disgraceful blundering have been dwarfed by the big returns that often have come in spite of ourselves. In late years we have begun to emancipate ourselves—at least our leaders have. A new spirit has pervaded us. Yet it has aroused the opposition of a large part of the people who would have us stick to the wastefulness of the corner-store retailer who must be protected in the competition which meant the survival only of the fittest. The labor leaders have consistently opposed everything savoring of scientific management.

In mining we have had similar experiences. The backwoodsmen operated lead mines in Missouri and Wisconsin, pick in one hand, rifle in the other, made something out of them and acquired the theory that anybody could run a mine—a theory that obtained until very recently. In many districts the ores sticking out among the grass roots were so rich and so easily won that indeed anybody could run such a mine, whether most advantageously or not is another matter. But since we have had recourse to the deposits of low-grade ore, involving engineering as a necessity, there has been another story.

The shock produced by the outbreak of the Great War has opened the eyes of America to many of its inefficiencies, has brushed away many false ideas. The hunters of the money devil who wanted to have the stock exchanges and commodity exchanges closed for being gambling hells saw them closed and the business of the country halted thereby, and having gained their wish voiced no opposition when they reopened. The trust-baiters ceased from blatherskiting and rejoiced over the efficiency that the great corporations exhibited in holding up the shattered props of our industries and later in reaching out into the foreign markets. But most impressive of all has been the lessons that Germany has been teaching the world, not only in warfare but also in peaceful sciences and arts. We shiver at the thoughts of what would happen if America had to match her ingenuity and power against the German kind of efficiency and organization.

New Director of U. S. B. M.

The appointment of Vannoy H. Manning to the directorship of the Bureau of Mines comes as a great relief from the apprehensions of what might have been. No longer have we to dread the shadow of the walking-delegate or of any of the friends of Brother Wilson, who presides over the Labor Department.

The leadership of the United States Bureau of Mines demands administrative ability above anything else. Our ideal for the directorship is a mining engineer of attainment and professional recognition, and administrative ability. But, alas! that ideal, like most ideals, is extraordinarily difficult of realization.

Mr. Manning is not a mining engineer, but he possesses executive ability. During the long illness of Doctor Holmes, when he was acting director, he won golden words of praise, not only for his administration, but also for his fine loyalty to his incapacitated chief and the ingenuous effacement of himself. It is always a good sign when a man's assistants support his promotion and work for it. Mr. Manning was the choice of the U. S. B. M. staff.

The *Journal* joins not only in the congratulations to Mr. Manning, but also to the President for making so good an appointment and to the mining industry for having a good man put at the head of the bureau that is so directly concerned with the welfare of all miners.

Inspiration Notes

The Inspiration engineers are working out some highly interesting problems, both in mining and metallurgy. The mill is now treating about 2700 tons of ore per day, and it is expected that it will be doing about 7000 tons by Nov. 1. After that everything depends upon getting the mine ready to deliver the enormous quantity of 14,000 tons of ore per day. That tonnage is indeed exceeded by far at Bingham, but that is a steam-shovel operation. Inspiration is going to hoist it through two shafts, 105 ft. apart. We may be in error, but we think that the achievement of this will be unprecedented. That it will be done there is no doubt. It is only a question of time.

In the Miami smeltery the Anaconda metallurgists, under the direction of Doctor Ricketts, have also cut loose from all precedents. Here is the first modern plant with no dust chambers. The Cottrell system is the substitute. The reverberatory furnaces—oil fired—are working upon an exceptionally rich charge—33% copper. They make more than 100 tons of copper per furnace per day, which is as much copper as there is slag. The slag runs 12 to 14% in alumina. In the flotation concentrates there appears to be an enrichment of alumina.

The Miami smelting plant was put in operation without a hitch. This is the modern American way of doing things, and especially is it the way of the Anaconda metallurgists. The report is becoming so common that it will soon cease to attract any attention. Nevertheless the feat, although often repeated, reflects great credit upon the engineers who perform it.

⁂

It is said that spelter will be made from calamine at Donora, Penn., as early as Oct. 1. If that be done the engineers of the Steel Corporation will surpass all previous records in zinc-smelting construction. However, they have every incentive to be swift, and every facility is being given them. Construction work is being carried on by night as well as by day, and it is said that this job has precedence among all of those that the Steel Corporation has in hand.

BY THE WAY

In the opinion of a British officer, the best soldier is the miner. He is strong in the back, used to cramped positions, familiar with danger and explosions, and is said to put two and two together much quicker than men from other trades. This has been recognized by the Canadian military authorities, who have sent out a special appeal to all the mining camps for men for the proposed pioneer battalion.

⁂

Alta and Emma Copper on the curb had their prices more than cut in half on Aug. 25. From 86c. the day before Alta was driven down to 30, closing at 42, and Emma from 88 vanished to 28, with a comeback to 43. This disaster, according to curb market gossip, was a heavy thrust at George Graham Rice. According to the New York *Sun*, Emma and Alta have been his two favorite mediums of speculation for some time. Since his return to the curb it has been common rumor that a group of sharpshooters as clever in their way as Rice once was in his have been gunning for him. The Aug. 25 drive was said to be their great coup. The stocks came back the following day with a modest degree of recuperative power, closing five or six points higher than on the day before, after bad breaks during the day. George Graham Rice at the close of the day smilingly reported that there was nothing in the stories that the gunners had hurt him, and to prove his triumph readily exhibited a fat bank roll with several bills of high denomination. The fall in the stocks, it was said, was a drive by the loan brokers. Other Curb Market experts attribute it to Rice himself, who is an old hand in such operations.

The late Jacob Langeloth, who at the time of his death, Aug. 14, 1914, was identified with many important mining enterprises, besides being chairman of the Board of Directors of the American Metal Co., left, as part of his $5,000,000 estate, the following securities, according to the appraisal of the state controller just published: 1300 shares in the American Metal Co., appraised at $1,201,000; 2000 shares of the F. W. Woolworth Co., preferred, $224,000; 2000 shares of the common stock of the same corporation, $168,000; 2350 shares of the Studebaker Corporation preferred, $190,350; 2520 shares of the common stock of the same company, $70,560; 600 shares of the Metallbank und Metallurgische Gesellschaft, $186,000; 11,400 shares of the Miami Copper Co., $171,000; 2430 shares of the Granby Consolidated Mining, Smelting and Power Co., $162,810; 1500 shares of the Nichols Copper Co., $135,000; and 750 shares of Sears, Roebuck & Co., common, $109,040, and 300 shares of the preferred stock of the same concern, $36,000. The bond holdings of the estate included: Philippine Island Government, $50,000; the Nichols Copper Co., $175,000; Mexican Petroleum Co., $55,500; and the State of New York, $26,750.

⁂

August Mining Dividends

Dividends disbursed in August, 1915, by 23 United States mining companies making public reports amount to $3,637,387, as compared with $1,830,362 in August, 1914. Industrial and holding companies allied to mining paid $18,191,785 as compared with $11,617,745 a year ago, although it might be claimed that Amalgamated $3.77

distribution was a return of capital rather than a dividend. Canadian and Mexican companies paid $799,989, as compared with $563,506 a year ago.

The totals for the first eight months of the year are as follows: Mining companies, $40,691,163, as against $42,410,582 in 1914; metallurgical and holding companies, $54,825,758, as against $56,167,506 in 1914; Canadian and Mexican mines, $5,297,340, as against $12,064,368 in 1914. The accompanying table shows details of the month's payments.

Correspondence and Discussion

Transactions of the International Engineering Congress

The International Engineering Congress is a serious effort on the part of the five societies under whose auspices it is conducted to give to the profession and the world at large something of real professional value in the shape of a clear statement of present practice in all branches of engineering in the different countries of the world. The work of securing, editing and publishing the *Transactions* of the congress is enormous and is being performed purely as a labor of love. The officers and members of the committee of management representing the five societies guarantee the expense, and the price of the publications has been fixed just high enough to cover the actual cost of clerical work, printing and binding, on an assumption of membership which before the outbreak of the European war, was extremely conservative.

While the war and the resultant conditions, even in neutral countries, have greatly reduced the anticipated enrollment of members, they have not resulted in a proportionate reduction in either the quality or the quantity of the material offered for publication in the *Transactions*. Sufficient papers have already been received to assure the success of the congress and the value of the *Transactions;* but in order that the congress should be the greatest possible benefit to the profession, it is essential that it should enroll the greatest possible number of members.

W. A. CATTELL.

San Francisco, Calif., Aug. 19, 1915.

Fineness of Crushing for Assaying

To Mr. Nason's request for data on the differences in assay value produced by variation in the fineness to which the ore is crushed I give one example that may be of value when correlated with other examples.

Some years ago in assaying a large number of samples I found that the first "batch," run in duplicate, did not check. I give the results on one sample that is typical for the group. The ore was quartz, containing free gold about 1 oz. of silver and 5% to 10% of sulphides. On this ore the duty of a 1000-lb. stamp, taking 1½-in. feed and crushing to 20-mesh, was four tons. For assaying, the pulp was crushed to 100% through 100-mesh and 50% through 150-mesh. Results for the sample were: First run—original, $18.60; check, $22.10. Second run—original, $21.90; check, $19.20.

The ore was then crushed to 100% through 150-mesh and about 70% through 200-mesh and assayed with the following results: Original, $20.35; check, $20.40.

It is my opinion that the variation in results was owing to error in sampling a pulp that had not been crushed to a uniform size. While the fact that the last set of assays checks does not prove that the results are correct, if we consider that the average of the first four is very nearly the same value, and that a commercial assayer obtained substantially the same result, it seems reasonable to suppose that the true value was obtained.

Although I am not an expert assayer—my assaying for the last six years having been confined to the assaying of samples taken in the examination of mines, and my opinion is therefore to be weighed accordingly—it has been my experience that coarse crushing gives variable, but not necessarily low results. I have never found that fine crushing decreases the assay value. If the pulp sample is of reasonable size, I believe that the steel worn off the crusher will be relatively small in amount and therefore negligible.

G. A. JOSLIN.

Los Angeles, Calif., Aug. 20, 1915.

NEW PATENTS

United States patent specifications listed below may be obtained from "The Engineering and Mining Journal" at 25c. each. British patents are supplied at 40c. each.

AMALGAMATOR. Elmer W. Hoffman, Tulsa, Okla. (U. S. No. 1,150,191; Aug. 17, 1915.)

BLAST FURNACE—Water-Cooled Valve. Luther L. Knox, Avalon, Penn., assignor to Knox Pressed & Welded Steel Co., Pittsburgh, Penn. (U. S. No. 1,151,193; Aug. 24, 1915.)

BLAST-FURNACE CONSTRUCTION. Luther L. Knox, Avalon, Penn., assignor to Knox Pressed & Welded Steel Co., Pittsburgh, Penn. (U. S. No. 1,151,192; Aug. 24, 1915.)

CAR—Cinder or Hot-Metal Car. Edgar A. Weimer, Lebanon, Penn. (U. S. No. 1,151,312; Aug. 24, 1915.)

CLASSIFIER. Albert E. Vandercook, Alameda, Calif., assignor to California Macvan Co., San Francisco, Calif. (U. S. No. 1,151,137; Aug. 24, 1915.)

CONCENTRATING TABLE. Robert Hunter, Spokane, Wash. (U. S. No. 1,151,466; Aug. 24, 1915.)

CRUSHER MANTLE. Ray C. Newhouse, Milwaukee, Wis., assignor to Allis-Chalmers Manufacturing Co., Milwaukee, Wis. (U. S. No. 1,151,119; Aug. 24, 1915.)

DRILLS—Valve for Percussive Tools. William Clement, Phillipsburg, N. J., assignor to Ingersoll-Rand Co., New York, N. Y. (U. S. No. 13,959, reissue; Aug. 10, 1915.)

ELECTRIC DEPOSITION of Metals by Fusion. Arthur Percy Strohmenger, Westminster, London, England, assignor to Slaughter & Co., Ltd., London, Eng. (U. S. No. 13,970; Aug. 24, 1915.)

ELECTRIC FURNACE. James G. Marshall, Niagara Falls, N. Y., assignor to Union Carbide Co., New York, N. Y. (U. S. No. 1,149,202; Aug. 10, 1915.)

ELECTROLYTES—Process for Regenerating Electrolytes. Oliver Curtis Martin and Frederick Jaeger, Perth Amboy, N. J. (U. S. No. 1,140,522; Aug. 3, 1915.)

FELDSPAR—Treatment of Feldspar, Leucite, and the Like. Franz A. Rody and Harvey M. Burkey, Newark, N. J. (U. S. Nos. 1,151,498 and 1,151,533; Aug. 24, 1915.)

LEACHING—Device for Treating Ores. James Alexander Fleming, Globe, Ariz. (U. S. No. 1,150,669; Aug. 17, 1915.)

LEACHING—Recovery of Cuprous Sulphide from Ores and the Like. Raymond F. Bacon, Pittsburgh, Penn., assignor to Metals Research Co., New York, N. Y. (U. S. Nos. 1,151,234 and 1,151,235; Aug. 24, 1915.)

MINE-CAR COUPLING. William Towers, Christopher, Ill., assignor of forty-five one-hundredths to Roy Lockridge, Christopher, Ill. (U. S. No. 1,150,980; Aug. 24, 1915.)

MINING MACHINE. Edward O'Toole, Gary, W. Va. (U. S. No. 1,151,383; Aug. 24, 1915.)

MIXING APPARATUS. Ralph Baggaley, Pittsburgh, Penn. (U. S. No. 1,151,332; Aug. 24, 1915.)

ORE TREATMENT—Method of Treating Metalliferous Materials with Nitric Acid, and Recovering Solvents Used. Harry D. Rankin, Crafton, Penn., assignor, by mesne assignments, to Rankin Process Co., Phœnix, Ariz. (U. S. No. 1,150,787; Aug. 17, 1915.)

PHOSPHATE—Apparatus for Making Ammonium Phosphate. Frank S. Washburn, Nashville, Tenn. (U. S. No. 1,151,074; Aug. 24, 1915.)

ROASTING—Mechanical Ore-Roasting and Like Furnace. John Harris, Sheffield, England. (U. S. No. 1,149,754; Aug. 10, 1915.)

PERSONALS

George Watkin Evans, of Seattle, Wash., in Alaska on professional business.

A. Charles Meagher, recently with H. Kenyon Burch at Miami, Ariz., has returned to San Francisco.

H. W. Hardinge, president of the Hardinge Conical Mill Co., is visiting the mining districts of northern Ontario.

Leo Von Rosenberg has returned to New York from Cripple Creek, Colo., where he made examinations of several properties.

K. Freitag is now at Lower Rochester, Nev., where he is constructing a 100-ton cyanide mill for the Nevada Packard Mines.

Hon. Edward Brown, of the Manitoba Government, has gone to make an examination of the Herb Lake gold field in northern Manitoba.

W. R. Parker and J. P. Watson, directors of the Mining Corporation of Canada, have been inspecting the company's properties in Cobalt.

P. G. Spilsbury, manager of the Aguacate Mines, is returning to San Mateo, Costa Rica, after a visit of several months in the United States.

E. S. Dickinson, formerly assistant professor of mining at the University of Kansas, has taken a position on the mining staff of the Canadian Copper Co. at Copper Cliff, Ont.

A. O. Baer, assistant superintendent of the blast furnace plant of the Illinois Steel Co. at South Chicago, has been appointed superintendent of blast furnaces for the Minnesota Steel Co., Duluth.

As a memorial to the late Dr. Joseph A. Holmes, Director of the Bureau of Mines, the Colorado School of Mines has established the Joseph A. Holmes Professorship of Safety and Efficiency Engineering.

L. D. Adams, of Oakland, Calif., and C. H. Maxey, of Rutherford, N. J., are two of the incorporators of the Zinc Company, Ltd., of Sherbrooke, Quebec, organized to establish zinc-smelting works and refinery.

H. G. Palsgrove, formerly manager of the Dolores mine and also of La Dura in Mexico, has accepted the position of general superintendent for the Aguacate Mines and will sail for Costa Rica early in September from New Orleans.

Charles E. Duncan has been appointed superintendent of the rolling mills and axle plant of the Cambria Steel Co., Johnstown, Penn., to succeed J. C. Fox, resigned. Mr. Duncan has been identified with the Lake Superior Consolidated Steel Co., Sault Ste. Marie.

Charles Camsell, of the Canadian Geological Survey, who was commissioned to make an investigation into alleged silver discoveries in the Lake Athabasca region, reports that nothing of economic value has been found there. Some nickel ore was found to occur, but not in commercial quantities.

E. A. Cappelen Smith is expected to arrive in New York about Sept. 10, returning from the successful starting of the leaching plant at Chuquicamata, for which he was the consulting metallurgist. While in Chile he also inspected the reduction works of the Braden Copper Co. at Sewell.

Horatio C. Ray will return to his duties as professor in the School of Mines of the University of Pittsburgh after spending his summer doing experimental flotation work with the Butte & Superior Copper Co. at Butte, Mont. On his way home Professor Ray will examine properties in Oregon and Colorado, besides visiting the Exposition at San Francisco.

OBITUARY

H. S. Bion, assistant superintendent of the Geological Survey of India, died at Calcutta on June 6.

Herbert Kynaston, director of the Geological Survey of the Union of South Africa, died at Pretoria, on June 28, aged 46 years.

Henry Richards, of Dover, N. J., for many years known as a mining engineer and manufacturer, died Mar. 26 last. He was a member of the American Institute of Mining Engineers.

Matthew Doyle, discoverer of the 85 Mine at Lordsburg, Grant County, N. M., a well-known Southwestern prospector, died in an El Paso, Tex., hospital Aug. 19. Mr. Doyle was born in Scotland 73 years ago and came to America at the age of 30 years, being employed in coal mines in Pennsylvania. He later moved to Colorado and thence to New Mexico, where he operated mines and prospected new territory. He had accumulated considerable property. The remains were interred in Evergreen Cemetery, El Paso.

Dr. Herbert Gray Torrey died at his home at Stirling, N. J., Aug. 29, aged 74 years. He was born in New York, being a son of Dr. John G. Torrey, for some time professor in Columbia College and the first head of the New York Assay Office. Herbert Torrey graduated from the College of the City of New York in 1860 and later from the College of Physicians and Surgeons. He entered the New York Assay Office and on his father's death succeeded him as chief assayer, holding that position for 39 years, until 1910, when he resigned. He had since acted as consulting metallurgical engineer. He was considered a high authority and during his service at the assay office was constantly consulted on metallurgical questions. He was a member of the American Institute of Mining Engineers and of the Society of the Cincinnati.

Max Hebgen, of Butte, Mont., vice-president and general manager of the Montana Power Co., died at the Presbyterian Hospital Aug. 24. Mr. Hebgen was recognized as a leading electrical engineer and had been prominently identified with several of the largest power projects in this country. He was born in Beaver Dam, Wis., in 1869; went to Butte in 1889, and up to the time of his death had been a resident of that city. In Butte he was associated with W. A. Clark as superintendent of the old Butte Electric Light Co. He was continuously in the employ of that company and associated concerns until the final organization of the Montana Power Co., of which he was vice-president, general manager and director. Mr. Hebgen was the active engineering and directing head of all development work of the Montana Power Co. and the concerns it succeeded. He had a large part in the organization of that company, one of the largest concerns of its kind in the world, which, upon completion of plants now under construction, will develop and market 225,000 hp. Mr. Hebgen's illness, which last June forced him to undergo treatment at the Chicago hospital, dated from an attack of pneumonia contracted more than a year ago on an inspection trip to the Thompson Falls power plant. From this illness he never completely recovered. He leaves a widow and a son 13 years old.

SOCIETIES

Lake Superior Mining Institute—About 300 members and guests of the institute will assemble at Ironwood on Labor Day, Sept. 6, for the 20th annual meeting. One day will be spent on the Gogebic range, where the second annual first-aid meet will take place in the forenoon. Edwin Higgins, engineer in the Lake Superior district for the Bureau of Mines, will be in charge. Dr. A. F. Knoefel, president of the American Mine Safety Association, will be the chief judge, assisted by six physicians from outside the district. Teams have been entered by the following companies from the different ranges: Oliver Iron Mining Co., Mesabi; Montreal Mining Co., Gogebic; Odanah Mining Co., Gogebic; Verona Iron Co., Menominee; Oliver Iron Mining Co., Gogebic; Judson Mining Co., Menominee; Castile Mining Co., Gogebic; Colby Mining Co., Gogebic; Republic Iron & Steel Co., Mesabi; Newport Mining Co., Gogebic; Pickands, Mather & Co., Mesabi; Republic Iron & Steel Co., Marquette; Cleveland-Cliffs Iron Co., two teams, Marquette. In the afternoon automobiles will transport the party to the Newport, Woodbury, Palms-Anvil, Wakefield, Norrie and Colby mines. In the evening a business session will be held.

INDUSTRIAL NEWS

Business growth has caused the Western Electric Co. to give up its old quarters at Portland, Oregon. Since 1910 the Company has been located on Fifth Street, but has now moved into a new two-story brick and concrete building which has been made ready for it at East Ash and Union Streets.

The General Naval Stores Co., 175 Front St., New York City, has taken up the sale of flotation oils as a specialty branch of its business. Recently the company has introduced a number of new oils for this purpose, including coal-tar oils, wood creosotes, etc. It is the intention to provide ... oils for various ores, and a laboratory is maintained for this purpose, in which to test and match oils.

Editorial Correspondence

SAN FRANCISCO—Aug. 25

Total Production of California Petroleum in July was 7,738,643 bbl., an increase over the June production of 294,686 bbl. Shipments did not maintain the lead over production in July, which was the encouraging feature in the June operations. The July shipments amounted to 7,643,049 bbl., being 95,908 bbl. less than the production. Still this is not a discouraging figure. The total stocks at Aug. 1 were 59,650,219 bbl.

Committees for the National Mine Rescue and first-aid meet to be held at the Exposition, September 23 and 24, have been practically completed since making some necessary changes. Robert I. Kerr, secretary of the Metal Producers Association, is made chairman of the committee on recording and is also on the executive committee. Albert Burch resigned as chairman of the executive committee and George W. Metcalfe, manager of the Mammoth Copper Mining Co., has been elected in his place. Mr. Burch will remain on the committee. It is understood that D. C. Botting, commissioner of the Washington Coal Operators Association, has been appointed to the chairmanship of the committee to judge mine rescue work, R. Y. Williams having found it impossible to act. James Bagley, mine inspector of Washington, and Thomas Graham, chief mine inspector of British Columbia, have also been appointed to this committee. Dudley Michell, one of Mr. Graham's assistants, will probably be appointed to the committee on judging mine rescue. H. M. Wilson, formerly of the Bureau of Mines, continues to act as chairman of the board of managers.

Panama-Pacific Convention will be held in San Francisco Sept. 16 to 18 by the American Society of Mechanical Engineers, the American Institute of Electrical Engineers, the American Society of Civil Engineers, and the American Institute of Mining Engineers. The International Engineering Congress, which has been organized by these four societies and by the Society of Naval Architects and Marine Engineers, will be held from Sept. 20 to 25. A comprehensive program of technical sessions, inspection trips and other interesting features has been arranged for the benefit of those attending this general gathering of the engineering profession. A special train will leave New York on Sept. 9 arriving in San Francisco on Sept. 15, with stopovers at Niagara Falls, Colorado Springs and the Grand Cañon. A special train will also leave New Orleans on Sept. 12, arriving at San Francisco on Sept. 15. There will be no return special train service, but a choice of several routes is offered. Representative Canadian committees of the British Institution of Civil Engineers, the Canadian Society of Civil Engineers and the American Society of Civil Engineers have invited those attending the congress to return through Canada, inspecting en route the engineering works within convenient distance of the main line of transportation through the provinces of British Columbia and Alberta. The installations visited will include the water-power development of the British Columbia Electric Railway Co., the Western Canada Power Co., the Calgary Power Co. and a number of large irrigation projects in Alberta.

Dancing on the Deck of a Gold Dredge is the novel method employed by the Feather River Gold Dredging Co. to celebrate the completion of the hull of a new dredge being constructed at Sumpter, Ore. The dredge has 7½-cu.ft. buckets and is of the California type of elevator dredge. The framing of the hull was started on June 6 and the laying of the deck completed on June 30. The Yuba Construction Co., the builders of the dredge, invited the people of Sumpter, Baker and Columbia aboard the boat for a dance on the night of June 30. The deck was temporarily housed in all round with canvas 8 ft. high. The main truss posts, stay rods and similar parts were concealed with evergreens and 155 electric lights were arranged for lighting and ornamental effect. On shore a tent was erected off the stern of the boat, having a covered passage between the tent and the boat, and fitted up as a ladies' cloak room. Refreshments were served in the construction camp dining room. Aboard the boat, punch was served, and the Sumpter orchestra, providing the dancing music, was installed in the space between the main gantry posts; the posts being concealed by evergreens. The well hole was planked over so that the dancers could make complete and uninterrupted round of the deck. There were 125 couples in the grand march. The Yuba Construction Co. has always been noted for its fair treatment of employees in construction camps and in regions like this it has never been difficult to obtain sufficient labor where the character of labor necessary is usually scarce. The novelty of the dance aboard the dredge attracted the entire country. The entertainment was presided over by Paul E. Morse, construction superintendent, and his wife and daughter.

DENVER—Aug. 26

Contract to Furnish 5000 Tons of Steel Rails for the main line of the government railroad inland from Seward, Alaska, has been made by Colorado Fuel & Iron Co.

Elktou Consolidated Gold Mining Co. passed its quarterly dividend, due this month. With promised drainage benefits from the renewed pushing of the Roosevelt tunnel, the directors deemed it well to prepare for extensive exploration of the mine at new depths.

Suit Has Been Brought by the El Paso Consolidated Gold Mining Co. against the Katinka Gold Mining Co. and the Progressive Mining & Leasing Co., both Cripple Creek concerns, for $10,000 alleged damages through wrongful removal of ore from the plaintiff's Ajax vein. Injunction is asked to restrain defendants from further trespass.

Colorado Gold Mining & Smelting Co., a corporation formerly operating mines and a smeltery in the Alma district, Park County, lost a foreclosure suit brought by the International Trust Co. of Denver. Judgment in the sum of $727,223 was declared for the plaintiff. Among the mines involved are the Atlantic and the Pacific.

President Zang, of the Vindicator, in sending out checks to cover dividends to stockholders for the last quarter, enclosed a circular letter concerning the company's financial affairs and the physical condition of the properties. Describing the Golden Cycle mine, he says: "The main orebody opened on the 18th level within two weeks shows an excellent grade of ore. Drifting is in progress with good values showing. In reaching this ore, a new orebody was encountered in a vein hitherto barren and it has been developed for over 180 ft. carrying average values of from $30 to $40 per ton. Two new orebodies have been opened on the 17th level. Sinking the shaft an additional 250 ft. from the 1900 level has begun." Of the Vindicator mine, he says: "Development on the 18 level has opened a large volume of ore in four different veins. Development during the coming quarter will undoubtedly add a considerable amount to the reserves."

Tungsten Ore has been reaching record prices in the Boulder County district. For a long time the standard price was $6 per unit for 60% WO_3 ore or concentrate. At times, during the past year, better prices have been announced and inducements offered miners to produce lower grades. Recently, demands for metallic tungsten in Eastern markets have exceeded the miners' ability to supply the raw materials. This was but natural in view of long refusals of dominating purchasing companies to buy any but rich materials. Now, purchasers have become liberal and have announced their eagerness to take any grade of tungsten ore from 3% upward, together with their readiness to pay $15 per unit irrespective of grade. Concentration of the ores is very simple. With the implied confessions on the part of purchasers, miners have given special study to the market and have concluded that, even yet, they are not "getting a square deal." With tungsten metal selling at $2 per lb., they feel that they should receive more than 75c. and, owing to the limited production, they are in position to insist on still better terms. Prediction is made that the price may jump to $20 per unit—$1 per lb.—any day.

BUTTE—Aug. 26

Butte Mines and Mills Now Employ 14,000 Men, according to reports recently received by State Mine Inspector W. B. Orem from 46 operating mines in and around Butte—10,597 under ground; 2820 on the surface; and 402 in mills. The Anaconda company has the greatest number of employees, 9865. It is working 30 mines, and the number employed averages more than 300 men to each mine. The Anaconda mine proper has the largest number of men employed, 750 under ground and 59 on the surface, a total of 809. Companies

other than the Anaconda, and the number of men employed, are as follows: North Butte, 848 men; Rainbow Development, 18 men; Butte & London, 14 men; Davis-Daly, 105 men; Butte & Superior, 1360 men; Butte-Alex Scott, 122 men; East Butte, 665 men; Butte-Ballaklava, 98 men; Atlantic Mines, 59 men; Pilot-Butte, 77 men; Tuolumne, 10 men; Elm Orlu, 260 men; Timber Butte mill, 134 men; Butte-Great Falls, 15 men; Bullwhacker, 25 men; Butte-Duluth, 3 men.

SALT LAKE CITY—Aug. 26

The United States Smelting Co. is increasing its roasting capacity at Midvale, by the addition of two Dwight & Lloyd roasters. This will make six, with the four at present in use. The installation will be completed in 10 days. There are 750 men on the payroll.

Investigations of Geologic and Topographic Conditions, and of water resources are to be undertaken in Utah by the U. S. Geological Survey at the request of Reed Smoot, senator from this state. The work contemplated includes general geological studies with reference to the ore deposits in the Oquirrh Range; a reconnaisance of the phosphate deposits of the Uinta Mountains; general investigation of the geology and ore deposits of the state; the completion of the Wellington-Sunnyside folio. Water investigations will be continued in coöperation with the state, and will include measurement of stream flow at 131 gage stations.

The Utah Power & Light Co. started its new power plant at Oneida on the Bear River, 17 miles northeast of Preston, Idaho, Aug. 13. The plant includes a 10,000-kw. water-wheel-driven generator, furnishing current at 6600 volts, transformers to step the voltage up to 130,000 volts, etc. This is delivered into the main line which runs to the terminal transformer station near Salt Lake City. From here it is stepped down to 44,000 volts and distributed over nine lines radiating to Bingham, Garfield, Salt Lake and other valley points. The new plant started up without a hitch and is in successful operation. It is one of several units or plants which will be added from time to time as more power is required. The company's property in Idaho has been assessed at $3,000,000 this year as compared to $2,700,000 the year previous.

SEATTLE—Aug. 24

Late Reports From Broad Pass, nick-named the "Rand of Alaska," are very encouraging. The Guggenheims have taken a number of options which late developments would indicate they intend exercising. About 50 miners and prospectors are now in the country either working on locations or prospecting for new lodes. Two towns, Colorado City and Wellsville, have been established at the mouth of Colorado River and a combined roadhouse and store has been built at Indian Creek. The area on which oreshoots have been exposed is about 10 miles in length and 300 ft. in width.

Small Stamp Mills Being Installed in many parts of Alaska show the substantial way in which a large number of properties are being developed. These mines are being made to pay their own way through the extraction of their own ore and there is no doubt in the minds of those who are in closest touch with Alaskan affairs that the small stamp mills which are becoming more and more numerous are already having an important bearing on the development of the territory. The investments run from $15,000 to $20,000 while the plant is capable of expansion through the simple process of adding stamps as they may be needed. Much is expected of the quartz in Fairbanks though it is conceded that were another Treadwell located there at this time it could not be operated on account of the exorbitant freight charges. In the experience of mining operators it takes about 10 years for a placer camp to turn over to a quartz camp after the rich placers are worked out, and while the district will produce millions from placers yet the cream has been taken out of the camp. The coming of another stamp mill means considerable better results to those who are now operating the mines, but it is confidently expected that it will be at least several years before Fairbanks is a full-fledged quartz camp of any proportions.

JOPLIN—Aug. 28

A New Zinc Smeltery to treat Joplin lead and zinc ores is being built at Kusa, a new town five miles east of Henryette, Okla., by George E. Nicholson and associates. Three blocks are expected to be in operation about Sept. 15, and additional blocks will be completed as quickly as possible until 10 are in operation. The Missouri, Oklahoma & Gulf R.R. has made a very low rate on zinc ore from Joplin to Kusa. The smelting company is said to have secured a natural-gas supply which will fulfill all their needs for at least 20 years.

HOUGHTON, MICH.—Aug. 28

The Stock of Copper which was accumulating on the docks here, much to the worry of some local people, has been moved. Several vessels came along and when they left the copper stock had vanished.

ISHPEMING, MICH.—Aug. 31

The Lake Superior & Ishpeming R.R., which handles most of the ore on the Marquette range, is operating to capacity. The mines are calling for cars but are unable to get all they want. The road placed an order for 500 steel cars in the spring but they have not been delivered as yet. When they are put in service about 300 old wooden cars will be scrapped. Ore is going out at a rapid rate, but all that is now in stock will not be moved. However, the outlook for the coming winter is very bright.

DULUTH—Aug. 28

At the New Minnesota Steel Plant the blast-furnace department is now being stocked with limestone and coal preparatory to the initial operations several months hence. There are 50,000 tons of limestone and over 100,000 tons of coal now in stock and more arriving regularly. At present this material is unloaded at the Missabe ore docks, in Duluth, and transported to the steel plant by train. It is understood to be a part of the general scheme later to procure the deepening and straightening of the channel up the St. Louis River to the steel plant, which channel is now navigable only by small craft. Following this, raw material will be docked directly at the furnaces, obviating the intermediate handling expense. The City of Duluth plans a monster demonstration to mark the inauguration of operations at the plant. The details have not yet been worked out.

BRAINERD, MINN.—Aug. 28

Labor Conditions on the Minnesota Ranges are unusual. Two months ago $1 a day and board secured an abundance of labor in the Duluth market. Orders for men at $2.50 are now going unfilled, although this is partially due to the Dakota harvesting season. Difficulty is experienced in securing large crews, due to European situation. Austrians will not work with Slavs and Italians, and the labor market is picked so bare that it is impossible to secure large crews of any one nationality.

HIBBING, MICH.—Aug. 28

The State Attorney General Has Overruled request of Mayor V. L. Power, of Hibbing, that the mining companies in the village of Hibbing be enjoined from removing any ore from their properties until their delinquent taxes have been paid. Efforts of the municipal authorities to collect the $750,000 delinquent taxes from the mining companies have thus far proved unavailing, and the matter is now in the courts. The operating companies, claiming gross extravagance on the part of the village officials, have declined to pay their taxes until they shall have been reduced to figures commensurate with the needs of the community.

TORONTO—Aug. 28

The Canadian Mining & Exploration Co. has issued a circular to the shareholders showing the investments and cash on hand as of Aug. 19, 1915. The statement shows investments in bonds to the amount of $2,185,763; demand loans secured, $50,000, and cash on hand $249,824, or a total of $2,485,587. This amount at the present market value of the securities shows a decrease in assets of $14,412 as compared with the prices at which the securities were bought. The accrued interest is not, however, taken into consideration.

Much Excitement Has Been Caused in mining circles by an extraordinarily rich find of gold on the Leyson-Dobie claims in Munro Township, about 11 miles east of Matheson. These claims have been operated by the Dominion Reduction Co. for about two months and their output during that period is estimated at upwards of $500,000. The shaft is down about 90 ft. on a 2-ft. vein which is stated to yield ore so rich that it is impossible to drill it and it has to be cut with chisels. Two specimens weighing together over 200 lb. and running from 2000 to 3000 oz. to the ton have been shipped to Toronto to be shown at the Canadian National Exhibition now in progress. It is stated that about a ton of this ore is now sacked and under guard at the mine. The present owners maintained strict secrecy as to the value of the mine until they had bought up a number of other claims in the district. Since the news became public there has been a great rush of prospectors into the neighborhood. Thomas W. Gibson, Deputy Minister of Mines, states that there is no doubt that a very rich and important strike has been made

The Mining News

ALASKA

CLIFF GOLD (Valdez)—A new lead, richer and bigger than any before found on these claims has just been uncovered above old workings and traced for several hundred feet. It is 22 in. wide and carries free gold.

HOBEN-DAVIS, SULLIVAN-CASSIDY HOLDINGS (Hope) on Bear Creek have been purchased by Chas. E. Herron, who will install hydraulic plant to work the ground. Herron dredge on Six-Mile Creek near Sunrise is proving very successful and good season is predicted.

KENNECOTT (Cordova)—Bonanza and Jumbo have been shipping $2,000,000 worth copper a month since last June. It is announced that same production will be made during Winter and in order to handle this Copper River & N. W. Ry. has placed orders for considerable more equipment.

GRANITE (Valdez)—With new machinery in full operation company took out $25,000 during July and this will be greatly increased during August and September as much low-grade ore was run through mill past month. Work of developing mine continues and much underground work has been done, blocking out enough ore to run mill for three years.

LANDLOCK BAY (Landlock)—W. A. Dickey, president of company, reports that about $30,000 worth of copper ore has been shipped from property this season so far and development work is being pushed as rapidly as possible. Company has also taken out considerable ore on Mason and Gleason claims near by but will not ship until after snow flies.

ARIZONA

Cochise County

PRIMOS CHEMICAL (Russelville)—Installing plant consisting of rolls, concentrator, jigs, etc., for treating ore from Stein and Boericke claims. Owen T. Smith is manager.

CALIFORNIA

Amador County

KENNEDY (Jackson)—Iron pipe line which for number of years has delivered water from reservoir to north shaft is to be displaced by wooden pipe line. This will be of modern construction, built of 2-in. staves held with iron bands. Change from iron to wood probably due to present high cost of iron.

McFADDEN (Jackson)—John McFadden reported to have made important strike near Aqueduct, of good quartz measuring 12 in. wide at depth of 30 ft. Property produced in early days; ore being worked in arastres. McFadden has installed gasoline engine for prospecting.

Butte County

ORO FINO (Magalia)—Big bed of gravel carrying high gold reported. Property owned by Robbers Roost Mining Co.

EUREKA (Magalia)—High-grade ore reported being shipped by Richards, MacDowell & Whitlock. Property situated on Magalia Ridge near Mineral Slide.

NATOMAS (Oroville)—Practical tests to determine mineral carried in tailings in Oroville field in Feather River district will be made at Thermalito. Where contents will warrant, redredging will be considered. Method will be first undertaken at Folsom by new No. 4 boat that is being rebuilt after design which will make possible replacing of ground with soil on top so that land will be reclaimed for agriculture.

Eldorado County

LYMAN S. SNYDER AND CHARLES S. WRIGHT have taken purchase options on 160 acres of gravel claims between Hanks Exchange and Pleasant Valley. Development will start immediately. Property lies south of old Fort Jim gravel mines.

GEORGIA SLIDE (Georgetown)—Reconstruction of 10-stamp mill in progress. Large dump of ore will be worked.

RYAN (Shingle Springs)—Greenwater & Death Valley Copper Co., formerly operating in Inyo County and having also interests at Dale, San Bernardino County, has taken over this gold mine. Development is in progress with John McGee, formerly of Dale, as superintendent.

G. W. HOLLIWAY, of Granite, is preparing for development of an antimony claim in Greenhorn district. Miles H. Martin is also developing an antimony claim on Greenhorn Mountain and reports high-grade ore.

OLD MILL (Caliente)—M. Elliott, Fred Ramey and Joseph and Sebastian Aspurren own property. Ore is being sorted and packed out to county road. Reported that purchase option has been taken by Eastern men. It is stated that some of so called low-grade ore will run 55% antimony.

Shasta County

BALAKLALA (Coram)—Mining operations will be resumed at once. Ten-year contract with Mammoth Copper Mining Co. to smelt ore signed recently. Production to start will be 250 to 300 tons daily, and may be increased later.

GREEN HORN (Tower House)—New oreshoot struck recently in crosscut tunnel at 133 ft. from portal. Drifting under way. Connection with No. 3 level, where shipping-grade ore is opened, will be made. Development work being pushed; crew of 25 men employed. Seven cars ore shipped to Mammoth smelting plant recently with satisfactory results. In addition to shipping-grade ore, 900 tons milling-grade ore stored in bins; milling tests will be made to determine best method of treatment. Property nine miles west of Tower House.

Trinity County

GEM MINE (Eureka)—This placer mine, together with old Schauber property, total of 400 acres, has been sold for consideration stated to be $40,000. Mine is situated on Trinity River, opposite south fork. Considerable gold production made here in past, hydraulic work being done each winter; water supplied through four-mile flume. Some platinum found here in addition to gold.

Tuolumne County

TARANTULA (Jamestown)—Henry T. Gage, former governor of California, has consummated deal for purchase of this property from United Gold Mining & Milling Co. of Paris. Mine is situated near Eagle-Shawmut. Gage also owns Jones mine adjoining Tarantula and will work two in conjunction.

APP (Jamestown)—Interest is attached to visit of W. J. Loring of Bewick, Moreing & Co. He was accompanied by Albert Burch and J. H. Bell of the Plymouth Consolidated. Their visit included Dutch-Sweaney. Reopening of the App mine through Dutch-Sweaney would be more economical than independently from surface. This fact lends color to the conjecture that there is probability of two properties being taken over by Bewick, Moreing & Co. Dutch-Sweaney was recently taken over by interests operating Melones mine in Calaveras County.

COLORADO

Boulder County

MINES AT RICO shipped 72 carloads of ore during July, Rico-Wellington Mining Co. led with 55 cars of copper, lead and iron ores; the Rico Consolidated Mining Co. shipped 15 cars of copper ore to Garfield, Utah. District is busier than for several years past.

Hinsdale County

GOLDEN FLEECE (Lake City)—Foundations are being laid for mill below dump of No. 3 adit. Treatment will be concentration, slimes over canvas tables and cyanidation of tails.

Lake County

ZINC-CARBONATE OREBODIES have been discovered in the Mosquito Range near Weston Pass, about 12 miles, in an air line, southeast of Leadville.

GARBUTT (Leadville)—John Cortellini is replacing his original lot of mining machinery with heavier installation adequate to handle mine's new requirements. Steam, piped from Ibex boilers, will drive double-drum, first-motion hoist and new 15-drill compressor. He contemplates erecting 200-ton mill to handle low-grade gold ore, a million tons of which he estimates as developed.

YAK (Leadville)—Persistent rumor is to effect that this company has purchased Aladdin Group, of 122 acres, intersected at about six miles in tunnel. Deal is by bond for $800,000 running four years. If option to purchase be not exercised within that period, lease will continue additional 6 years. Development of this ground, well to east of main portion of this district, will be watched with interest.

Ouray County

MOUNTAIN KING (Red Mt.)—Vein of lead-silver-copper ore, 17 ft. thick, has been opened by leasers.

REVENUE (Ouray)—St. John Mining Co., Ltd., of London, Eng., has acquired this large tunnel project and will push further work as soon as war conditions will permit.

CAMP BIRD (Ouray)—During second quarter of 1915 mill stamped 7626 tons. Bullion and concentrate sales amounted to $187,992. Costs of mining, development, milling, shipment, smelting, and marketing products totaled $78,720. This figure does not cover expenses of maintaining foreign offices.

San Juan County

IOWA-TIGER (Silverton)—Flotation machinery is being installed

HAMLET (Howardsville)—After idleness of seven years, mill was put into service Aug. 15. Machinery has been considerably altered while mine has been developed and put into shape to keep mill supplied.

Teller County

BLUE FLAG (Cripple Creek)—At annual meeting held recently it was decided to sink main shaft 300 ft. below its present depth of 1100 ft.

AJAX (Victor)—Mill being repaired and altered in preparation for resumption. Mackay lease has opened shoot of high-grade ore.

INDEPENDENCE (Victor)—Gault lease, 400 level, has opened shoot of $20 ore. Thomas B. Crowe, metallurgist of Portland company, is remodeling mill and fitting it to handle ores from both these large groups of property. He does not expect to have mill ready for service before beginning of 1916. When it is in operation, no ores will require up-hill transportation from mines or dumps as is the case with the present Portland mill.

IDAHO

Shoshone County

CALEDONIA (Kellogg)—It is planned to maintain 3c. dividends rest of year. Raise is being driven from lower level to cut downward extension of ore-shoot. This will give additional depth of 500 ft. and is expected to double ore-reserve.

SUCCESS (Wallace)—New orebodies recently found are expected to lead to large increase of reserves. Crosscut on 1200-ft. level has penetrated 6 ft. of clean shipping ore that is estimated to average about 70% lead. Same oreshoot on 1100 was three times as wide but much lower grade. New shoot on 860 level shows 7 ft. of shipping ore.

INTERSTATE-CALLAHAN (Wallace)—At an annual meeting of stockholders at Duluth, Aug. 16, two seis of officers were elected. Roberts-Sussman interests, which have been in control during past year, elected J. A. Percival, former secretary, to presidency, while Callahan-Boutin contingent elected P. H. Nelson president. Attorneys for eastern investors secured temporary restraining order from courts enjoining James Callahan from voting 170,000 shares held by Callahan Mining Co. on ground that this was an Idaho corporation and therefore not entitled to vote at meeting held in Minnesota. With this block of stock disposed of they elected their own officers, who proceeded with transaction of other business, including declaration of quarterly dividend of 50c. a share. Compromise between two factions is unlikely and fight will undoubtedly be carried to courts.

MICHIGAN

Iron

EUREKA (Ramsey)—New 2000-ft. electrically driven compressor has been purchased for this property.

JONES & LAUGHLIN (Wakefield)—This company has started drilling on eastern extension of Gogebic range. Several drills will be worked all winter.

WICKWIRE (Iron River)—About 150,000 tons will be shipped from Homer mine this season. All of stockpile and everything that is being hoisted will be shipped.

BRISTOL (Crystal Falls)—Contract has been let for electrically driven compressor. Current will be purchased from Peninsular Power Co., which is to extend its line to Crystal Falls.

BALKAN (Alpha)—Draglines which have been stripping here are now getting out some ore. This is being pulled from pit in dump cars and taken to surface and loaded into railway cars. Draglines are working better than expected in this ore. Shaft is now concreted from top to bottom; work was finished this week. This mine will be big shipper next season.

CLEVELAND-CLIFFS IRON (North Lake)—Work of stripping overburden from orebody found on Sec. 6 was started by contractors this week. Temporary track from main line of railway was laid in fast time. Only 75,000 cu.yd. are to be moved and this will not take long. No ore will be shipped from there this year. Ore will be mined by milling method. There is only about 30 ft. of sand over ore and it would not be possible to take it out from Morris-Lloyd workings. There are over 200,000 tons in this deposit.

MINNESOTA

Cuyuna Range

BRAINERD-CUYUNA (Brainerd)—Company prepared to ship at least one cargo before close of season, although product has not as yet been sold. Pumps handling about 1600 gals.

IRON MOUNTAIN (Manganese)—Mine working to capacity, and all production being shipped. Third drift now being opened. Town of Manganese, dependent solely on this operation, is now crowded, all houses rented and many being built

Mesabi Range

FAYAL (Eveleth)—One shovel loading from stockpile Shovel in pit loads ore part time and is used part time loading paint rock.

SCHLEY (Gilbert)—Schley and Elba mines in need of more miners. Operations being extended every week. Large shipments of ore to be made before navigation closes.

LEONARD-BURT (Chisholm)—This pit mine has resumed operations. One hundred men given work the first day. One shovel working two shifts. The property was idle four years.

OLIVER IRON (Coleraine)—Mesabi road broke record for hauling ore from Oliver mines here this week. With only one shift working, 881 cars were sent out in one day. Thirteen trains left mines.

MISSABE MOUNTAIN (Virginia)—One shovel at work in pit and another at stockpile Mine was idle several years. Ore that is being moved from the surface stood at mine for almost five years.

OLIVER IRON (Chisholm)—Company's new operation in Sec. 27, 58-20, which has not yet been given name, is progressing rapidly. Main hoisting shaft is down 230 ft. and timber shaft 125 ft. Large volume of water being encountered, but no more than was anticipated. Surface equipment, power plant, etc., well under way.

MACE (Nashwauk)—Butler Bros., stripping contractors, are trying out new type of Bucyrus steam shovel in removing overburden from Mace No. 2 property. Shovel has heretofore been used mainly for coal loading in Pennsylvania fields. Besides being of extra large size, machine has boom of sufficient length so that overburden may be removed from deposit without necessity of laying tracks into pit, unless depth be too great.

Vermillion

PIONEER (Ely)—Night shift of 200 men added to crew.

McCOMBER (Ely)—Two 150-hp. boilers and other surface equipment being installed. Railroad spur 1¼ miles long has been surveyed. Shaft somewhat over 100 ft. deep; drifting in progress. Ore thus far encountered is similar to usual Vermilion Range product

MONTANA

Silver Bow County

EMMA MINE (Butte)—Under an agreement with Butte Copper & Zinc Co., owner of Emma mine, Anaconda is going ahead with development of property, at Colorado and Silver Streets in heart of Butte. Is now installing machinery preparatory to unwatering shaft and is building fence around property

DAVIS-DALY (Butte)—Company has cut another vein in southwest crosscut on 2500 level of Colorado mine. Whether new vein is Hesperus vein, for which company has been driving, is not yet known. It is reported that crosscut had cut into vein about 11 ft., all in good commercial ore Entire width of vein has not yet been ascertained.

LEXINGTON (Butte)—About 400 men are at work on this mine of Anaconda company, preparing same for reopening. Repairs and retimbering in shaft have reached below 600 ft. level close to water level, which is still about 1000 ft. deep in shaft. New engine house has been erected and old buildings on property have been repaired for use.

BUTTE & LONDON (Butte)—Reopened Aug. 5 with a force of 20 men. Present work is in hands of T. F. Cole and associates of Rainbow Development Co. which has a contract for development work outlined and will take stock in company for remuneration. Working force will be increased and it is expected that 45 men will be on payroll within short period.

BUTTE & SUPERIOR (Butte)—On Aug. 20 company filed in federal court its monthly statement of ore treated by oil-flotation process in month of July, in compliance with order of court made in November, 1913. According to statement, oil-flotation plant handled 41,547 tons of ore, recovering 9843 tons of concentrates. Cost of flotation per ton was $2.95; value of concentrates per ton was $75.76.

ANACONDA (Butte)—On fulfillment of management plans, will have a capacity for producing 300,000,000 lb. of copper a year. In addition sulphuric acid and spelter will be turned out in quantities not yet fully determined. A one-ton experimental plant has been completed for purpose of devising method for profitably treating zinc ores. Three sections of concentrator have been remodeled and remaining five will be altered in rotation to conform with those already changed. Nominal capacity of each unit will be 2000 tons per day. One will always be kept in reserve so that probable capacity of plant will be close to 15,000 tons from seven operating sections. New copper refinery at Great Falls will be completed, it is expected, by Jan. 1, 1916. It will have monthly capacity of from 10,000,000 to 15,000,000 lb. of copper, against 5,000,000 lb. from old plant Existing Great Falls refinery will be scrapped

NEVADA

Storey County

COMSTOCK PUMPING ASSOCIATION (Virginia City)—Cleaning out east crosscut from Ophir-Mexican winze on 2700 level and preparing to install electric hoist at Ophir shaft.

MEXICAN (Virginia City)—West crosscut on 2700 level from winze station passed through 15 ft. of quartz and vein matter of low assay. Six-foot east crosscut shows quartz formation with streaks sampling to $25 per ton.

JACKET-CROWN POINT-BELCHER (Gold Hill)—Mill received 979 tons dump rock and shipped bar of bullion to smeltery. Timbering and general repairs continued.

OPHIR (Virginia City)—Development begun at top and bottom of vein 7 ft. wide. Samples assay from $3.75 to $22.75 per ton. Central tunnel development continues; 440 cars of ore saved from stopes and drifts; 326 tons milled.

UNION CON. (Virginia City)—On 2500 level, 65 ft. south of old Sierra Nevada incline station, 6 cars taken out in sampling, averaged $23.85 per ton. North drift in quartz 7 to 12 ft. wide; last 14 cars extracted sampled $17.55 per ton.

NEW MEXICO

Grant County

OCTO (Lordsburg)—Company has completed erection of headframe at Lee's Peak mine and will proceed with shaft sinking on contract. Bids have not yet been opened.

MEEKER MINING CO. (Silver City)—Company has just been incorporated by Z. D. White, J. A. Peterson and Adam Esplane. Will operate mines and mill at Pinos Altos.

JOHNNY BULL (Steins)—Mine has been taken over under lease by John Moffitt of El Paso, Tex. In same camp James Coil has made rich discovery of high-grade copper-gold ore north of Steins.

85 MINE (Lordsburg)—Company has put two diamond drills to work exploring ground below 450-ft. level. Smith and Travers, of Ontario, in charge of drilling. Caterpillar tractors formerly on 85 Mine ore haul have moved to Safford, Ariz., and will haul from Graham Mountains.

HOP CAÑON (Kelly)—Company is doing development work and getting into paying ore. Operations in district are encouraging.

Socorro County

ROSEDALE MINING & MILLING CO. (Rosedale)—Property will be sold, to satisfy judgment for $75,613, at Socorro County court house on Sept. 7.

Taos County

BUFFALO-NEW MEXICO (Red River)—Two shifts employed in sinking Silver King shaft at rate of 4 ft. per day. Shaft is now down 170 ft. and will be sunk to 300-ft. point before Nov. 1. Twenty feet of milling ore exposed in crosscut at 100 ft. level, 9 ft. averaging $15 per ton gold and silver, and 5 ft. averaging $19.90.

MEMPHIS-RED RIVER (Red River)—Upper tunnel on Memphis claim has been driven distance of [illegible] ft. on [illegible] ft. of ore averaging $30. Breast of intermediate tunnel has reached a point 200 ft. from portal. Vein at [illegible] 2.5 ft.; assays approximate those in tunnel No. 1. The [illegible] tunnels recently connected by 120-ft. raise.

PENNSYLVANIA

Lebanon County

LACKAWANNA STEEL (Lebanon)—Will erect benzol plant at Lebanon where it has two blast furnaces and byproduct coke plant. Estimated output of plant is 1600 gal. a day. It is reported that contract has been closed for sale of its 1916 output.

Potter County

NEW JERSEY ZINC (Millport)—Construction of extensive addition to zinc-oxide plant is now under way, and it is contemplated to complete it by end of November.

UTAH

Beaver County

LEONORA (Milford)—Recently ore was opened on 400 level on east-west fissure, and drifting is being done for intersection with north-south fissure. Machine drills are being used. These are part of the new equipment recently installed, including a three-drill compressor and hoist, both electrically driven.

Juab County

TINTIC MILLING (Silver City)—Excavating for mill has been completed, and concrete work is receiving attention.

SCOTIA (Tintic Junction)—Cave 180 ft. long, showing some mineralization, has been opened at this property, which is being worked under bond and lease by Chief Consolidated.

GEMINI (Eureka)—Pumping plant is keeping 1650 and lower levels of this property and the Ridge & Valley unwatered. Good tonnage was shipped by company and by leasers in July.

MAMMOTH (Mammoth)—Copper ore carrying gold and silver is being shipped. Five cars of low grade from mill dump southeast of Silver City were shipped week ended Aug. 13.

BULLION BECK (Eureka)—Zinc ore is being mined in four places by lessees, who are making shipments. Anderson-Goodwin lease is jigging 10 tons of ore daily from dumps and making a lead-silver concentrate.

UNCLE SAM (Eureka)—Work has been started to try and find extension of new orebody or ore zone just opened in Yankee property adjoining. Uncle Sam and Yankee each own part of original Humbug claim in which strike was made. Two ore shoots have previously been opened in this ground.

EAGLE & BLUE BELL (Eureka)—Ore has been opened from winze sunk 82 ft. below 1700 or deepest level. Drift 60 ft. south of winze cut full face shipping ore. It is proposed to drift from 1700 level to newly acquired Victoria property, which can be reached in 900 ft., and 600 feet, deeper than present Victoria workings.

YANKEE (Eureka)—Sinking is being done on new strike and 5 ft. of silver-lead ore has been opened. Raising for ore bed from tunnel 175 ft. lower will be done. Strike is in western part of Humbug claim and is apparently an entirely new orebody. Twenty-four leasers are mining zinc ore and are making shipments.

MAY DAY (Eureka)—Seven cars of high-grade silver-lead ore have been mined since recent dividend of 3c. a share, or $24,000, was declared. Some of this ore runs $70 to $80 a ton and gross value of seven cars is approximately equal to the dividend. Developments in western part of property have been particularly encouraging.

Salt Lake County

MICHIGAN-UTAH (Alta)—Tramway is now working and taking ore from City Rocks lease down to Tanner's Flat.

WASATCH MINES (Alta)—Projected drainage tunnel to be driven 400 ft. deeper than old Columbus Consolidated workings, is to be started soon. Length will be 5000 ft., of which 3000 ft. is to be in mineralized ground.

PRINCE (Little Cottonwood Lake)—Work of driving main tunnel is progressing. Hoisting works will probably be installed when power line to Cardiff is completed. Objective point of tunnel is ore-bearing fissure, which has been opened on surface by trenching.

Summit County

JOHN THE BAPTIST CONSOLIDATED (Park City)—Fissure has been cut on 450 level on footwall line. Five feet of oxidized vein material showing ore is being followed on main level. Small shipments running well in silver and lead have recently been made.

NEW QUINCY (Park City)—This company, formerly Thompson-Quincy Consolidated Mining Co. has been reorganized to provide funds for carrying forward development. An assessment of 5c. a share has been levied, delinquent Sept. 2. Development has been opened. The property lies between the Daly West and Daly-Judge. W. Mont Ferry is president.

WILLIAMS DEVELOPMENT CO. (Salt Lake)—F. T. Williams, president of this company, which for several years has leased upper levels of Daly West in Park City, has taken 3-year lease and bond on old Miller property in American Fork Cañon. Ike Wadley has property under lease at present, and sub-lease has been given to him to Williams company, which has been working about 10 men for the past two months. New lease and bond begins Nov. 1.

Utah County

MINERAL FLAT (American Fork)—Leasers are working at this property, and have ore ready for shipment.

MILLER HILL (American Fork)—Wadley lease has several teams hauling ore. Lead-carbonates have been opened in three places on Wyoming claim.

DUTCHMAN (American Fork)—Tunnel is being driven by Wild brothers to cut vein at greater depth. This reached ore at 200 ft. Shipments will be resumed.

WISCONSIN

Zinc-Lead District

AN INCREASED OUTPUT OF HIGH-GRADE ZINC ORE will result from many additions being made in roasting capacity. There are now in operation the National and Campbell plants, at Cuba City, the Empire and Homestead, at Platteville, the Linden Zinc, at Linden, and that of the Mineral Point Zinc Co., at Mineral Point. The old Enterprise roaster, at Platteville, has been overhauled by Kistler & Stephens and will be in operation soon; Utt & Thorne Co. will start up the Benton roaster, at Benton, recently purchased by it; the Wisconsin Zinc Co. is repairing the Joplin plant, at Galena, and is rushing to completion the new $100,000 roasting equipment at New Diggings.

LONGHENRY (Benton)—Longhenry Brothers are erecting small milling plant on Spensley land adjacent to the Fox mine.

POLLARD & SANE (Linden)—High-grade sheets of jack have been penetrated by shaft on Gillam land just ahead of the Ross mine at Linden.

VINEGAR HILL ZINC (Platteville)—This company has proved up and verified drill-hole results obtained on this tract adjoining Champion mine, at New Diggings, and has begun shaft sinking.

KING SOLOMON (Platteville)—Local company has opened up good body of high-grade zinc ore in shaft and crosscut in this abandoned property seven miles south west of Platteville.

CRUSON (Platteville)—Stephens & Kistler will start at once to sink shaft and construct milling plant two miles south of Platteville. Rich cuttings were found in number of drill holes ahead of old mine workings which were abandoned four years ago.

CANADA

Manitoba

GOLD PAN (Gold Lake)—This property recently taken over by Boston and St. Paul capitalists is showing rich ore in new workings. A 4-ft. vein, showing free gold, has been struck at depth of 15 ft.

Ontario

BELLELLEN (South Lorraine)—Will resume operations.

TECK-HUGHES (Kirkland Lake)—Buffalo after sampling this mine has declined to purchase.

IMPERIAL (Porcupine)—Has cut promising vein on the 100-ft. level. This property has just been re-opened.

JUPITER (Porcupine)—Meeting has been called for Sept. 8 to reach decision with regard to offers made for property.

MINING CORPORATION (Cobalt)—For four weeks ending July 20 milled 10,257 tons from which net profit was £10,171.

CONIAGAS (Cobalt)—Will install small cyanide plant to treat concentrates which assay about 100 oz. and were formerly sent to smeltery.

NIPISSING (Cobalt)—The hoist room at shaft No. 64 was struck by lightning and burned down on Aug. 25, causing loss of $2000, covered by insurance.

CROWN-RESERVE (Cobalt)—The directors have decided to discontinue dividends for time, owing to disappointing results from draining of Kerr Lake and low price of silver.

NORTH DOME (Porcupine)—Timiskaming of Cobalt, which has a controlling interest in this property, has commenced diamond-drilling; results of which will determine its future policy.

DOME LAKE (Porcupine)—Ore averaging from $18 to $20 per ton is now being taken from 400 level. Oreshoot is 3 ft. in width and has been developed for about 30 ft. in length, vein being still good in face.

COBALT LAKE (Cobalt)—An oreshoot developed at 380 level shows 26 in. of high grade. In one week's development 36 tons of ore, which it is estimated will yield net profits of $35,000, have been extracted.

CONIAGAS (Cobalt)—The erection of a small cyanide mill is in progress, which is expected to be in running order in two months. Slime tailing will be re-treated over canvas and precipitate obtained refined at Thorold smeltery.

CITY OF COBALT (Cobalt)—System of veins has been developed under center of town of Cobalt at 200 and 300 levels. Vein 5 in. wide of high-grade ore has been opened up and numerous small veins in wall rock of drifts are undergoing development with satisfactory results.

WEST DOME (Porcupine)—Shareholders on Aug. 20 ratified re-organization plan submitted by directorate which involves formation of a new company, "West Dome Consolidated Mines," capitalized at $3,000,000. Two-thirds of stock will be issued to old shareholders in proportion of two shares of new for every three of old stock.

MEXICO

Sonora

EL TIGRE (Ysabel)—Several tons of precipitates have been brought out and shipped to Selby, which is first shipment made for several months.

SANTA ROSA (Cabullona)—H. F. Brown who is operating property has encountered vein, about 12 in. wide, of oxide ore running about 30% copper.

MINA MEXICO (Tonichi)—This property has practically closed down and it will be some time before work is resumed. Has been unable to operate smeltery for lack of coke, as Southern Pacific which ran to mine, has about been abandoned on account of troubles south of Hermosillo.

The Market Report

Metal Markets

NEW YORK—Sept. 1

The markets for copper, lead and zinc were excited and rather chaotic during the last week, there being in each case a sharp rise at the beginning of the week which was followed by a decline, especially sharp in the case of copper.

Copper, Tin, Lead and Zinc

Copper—At the close of our last week of record, sales of copper at 16.85c., basis New York, had been made. On Thursday the market opened with sales at 16⅞c., and closed with sales at 17⅜c., or about 18c., regular terms. Thus, the market had come to the asking price of the principal producers, a large business being done on the way up. However, the market never became firmly established at 18c., regular terms, there being sales on Friday and Saturday all the way from 17½@18c., regular terms. Some of the principal producers even appeared to be willing to accept business at small concessions; moreover, none of them was averse to taking business for export at prices ranging from £87, c.i.f. London, to £84½, c.i.f. London, which at current rates of exchange figure out ½ to ¾c. below the New York price. By Monday the domestic demand for copper had about petered out and the smaller producers and agencies promptly cut prices and continued to do so on Tuesday and Wednesday, during which part of the week business was very light indeed.

What appears to have happened in the market is something like this: It has been recognized for a long time that there was potentially a large demand. At the latter part of the previous week this began to exhibit itself, and the buying for prompt delivery indicated that the stocks of manufacturers were low. A very large volume of business developed on Thursday, and sellers, misreading the signs, raised their prices too sharply. This frightened and disgusted many manufacturers who were interested in contracting for copper but were under no immediate pressure to do so, and went home saying they would await developments.

The business transacted during our last week of record is estimated at 30 to 40 million pounds, which was probably about equally divided between domestic and foreign orders. A highly encouraging feature of the domestic business was the buying of considerable quantities of copper by wire-drawers, who are not supposed to have any connection whatever with military contracts.

Copper Sheets are quoted about 23c. per lb. for hot rolled and 24c. for cold rolled, with usual extras. Wire prices are unsettled; quotations may be put at 18.50@19c. per lb. at mill.

Copper Exports from the United States in June are reported by the Department of Commerce as follows: Pigs, ingots and bars, 36,739,762 lb.; plates and sheets, 3,554,055; rods and wire, 8,559,324; scrap and old, 1,238,845; total, 50,091,986 lb. Exports for the fiscal year ended June 30 were 677,303,822 lb. In addition 5026 tons ore and matte were exported in June. Imports for June were 24,773,059 lb. metallic copper and 8,387,583 lb. in ore and matte; 33,160,642 lb. in all. The imports for the fiscal year ended June 30 were 152,443,247 lb. copper and 99,967,985 lb. in ore and matte; 252,411,232 lb. in all.

Tin—The tin market was dull and a little easier, chiefly on account of the drop in sterling exchange. The statistics for August are good. The tin committee of the New York Metal Exchange has issued a circular explaining how the British Consular guarantees should be complied with.

Lead—On Aug. 26 the A. S. & R. Co. raised its price to 4.70c., but before it did so, other producers had sold largely at 4.60c. and 4.65c., a big tonnage being placed especially with ammunition contractors. On Aug. 27 the A. S. & R. Co. raised its price to 4.90c., following sales by outsiders at 4.80c. On Saturday and Monday outsiders, not to be outdone again, became more reserved and succeeded in realizing 5c. on some moderate tonnages, especially for deliveries during the last quarter of the year. The demand then faded away, however, and at the close the lead market was showing a weaker tone. Reports from corroders and sheet and pipe manufacturers are not very good. The demand of last week was chiefly from the makers of ammunition.

Spelter—On Aug. 26-28 the principal consumer bought a large quantity of spelter at a sharp advance in price, especially as between Aug. 27 and 28. This buying, together with other orders, created confused and excited conditions similar to what prevailed when spelter was 10c. higher. Spelter was bought and sold in round lots for the same delivery in the same office at a difference of 1c. per lb. in price, within 10 minutes. The large demand having been filled, buyers became conspicuous by their absence, and sellers immediately exhibited once more their desire to get spelter off their hands, with the natural result that the price began to sag off again. Business last week was chiefly for delivery during the last quarter of the year. However, some considerable sales were made for delivery during the first quarter of 1916. This business was taken at a large discount from current quotations. A trifling amount of prompt business was done at fancy prices.

DAILY PRICES OF METALS IN NEW YORK

			Copper	Tin	Lead		Zinc
Aug Sept	Sterling Exchange	Silver, Cts. per Oz.	Electrolytic, Cts. per Lb.	Spot, Cts. per Lb.	New York, Cts. per Lb.	St. Louis, Cts. per Lb.	St. Louis, Cts. per Lb.

The quotations herein are our appraisal of the average markets for copper, lead, spelter and tin based on wholesale contracts for the ordinary deliveries of the trade as made by producers and agencies; and represent, to the best of our judgment, the prevailing values of the metals, reduced to basis of New York, cash, except where St. Louis is given as the basing point. St. Louis and New York are normally quoted 0.17c. apart.

The quotations for electrolytic copper are for cakes, ingots and wirebars. Electrolytic copper is commonly sold at prices including delivery to the consumers and is subject to discounts, etc. The price quoted for copper on "regular terms" is the gross price including freight to the buyer's works and is subject to a discount for cash. The difference between the price delivered and the New York cash equivalent is at present about 0.20c. on domestic business. The price of electrolytic cathodes is 0.05 to 0.10c. below that of electrolytic. Quotations for lead represent wholesale transactions in the open market for good ordinary brands. Quotations for spelter are for ordinary Prime Western brands. Only the St. Louis price is herein quoted, St. Louis being the basing market. We quote the New York price at 17c. per 100 lb. above the St. Louis price.

Silver quotations are in cents per troy ounce of fine silver.

Some current freight rates on metals per 100 lb. are: St. Louis-New York, 17c.; St. Louis-Chicago, 6.3c.; St. Louis-Pittsburgh, 13.1c.

LONDON

		Copper				Tin		Lead		Zinc	
		Standard		Electrolytic							
Aug Sept	Silver	Spot	3 Mos.	£ per Ton	Cts. per Lb.	Spot	3 Mos	£ per Ton	Cts. per Lb.	£ per Ton	Cts per Lb.

31	23	68½	67¼	84½	17 32	150½	152	22⅛	4 58	72	14 76
1	23 1/16	67¼	69	84½	17 07	150½	153	22 5/16	4 51	72	14 77

The above table gives the closing quotations on London Metal Exchange. All prices are in pounds sterling per ton of 2240 lb., except silver which is in pence per troy ounce of sterling silver, 0.925 fine. Copper quotations are for standard copper, spot and three months, and for electrolytic, price for the latter being subject to 5 per cent. discount. For convenience in comparison of London prices, in pounds sterling per 2240 lb., with American prices in cents per pound the following approximate ratios are given, reckoning exchange at 4.86: £1 = 3.21c.; £20 = 4.29c.; £30 = 6.43c.; £40 = 8.57c.; £60 = 12.85c. For amounts, £1 = 0.21c.

The American business of Beer, Sondheimer & Co. has been incorporated under the laws of the State of New York as Beer, Sondheimer & Co., Inc., with B. Elkan, president, and O. Frohnknecht, as vice-president.

Brass special spelter was reported sold on Sept. 1 at 17.40c. per pound.

Zinc Sheets—Business has been on a considerable scale. The base price for carload lots is unchanged at $16 per 100 lb. f.o.b. Peru, Ill., less 8% discount.

Other Metals

NEW YORK—Sept. 1

Aluminum—Supplies are still rather low and demand is steady. Quotations are 35@37c. per lb. for No. 1 ingots, New York.

Antimony—Sales are rather slow, though there are some large inquiries reported on the market. Ordinary brands are quoted 29@31c. per lb., while 45@48c. per lb. is named for Cookson's.

Nickel—Prices are steady and unchanged at 40@50c. per lb., according to size and terms of order. A premium of 3c. per lb. is charged for electrolytic.

Quicksilver—Trade has been fair. New York quotations are $89 per flask of 75 lb. for large lots; $90 per flask for smaller orders. San Francisco reports by telegraph $87.50@90 per flask, with market firm, but active; $95 was paid early in the week. London price remains £18 per flask, the same price being quoted by second hands.

Gold, Silver and Platinum

Gold—Another very large shipment of gold has been received at New York from London. Notwithstanding this sterling exchange has again fallen to a point lower than ever before reported, being about 7% below par.

Platinum—The market is still rather unsettled, but is inclined to be stronger. There is no quotable change, however. Dealers ask $39@41 per oz. for refined platinum, and $45@48 for hard metal, according to grade.

Silver—The market has ruled steady the past week with upward tendency in London due to limited supplies. Market closes steady at 23 $\frac{5}{16}$d.; the New York price has been seriously affected by the fall in sterling exchange from $4.65 to $4.51 during the week.

Zinc and Lead Ore Markets

PLATTEVILLE, WIS.—Aug. 28

The base price paid this week for 60% zinc ore was $65@75 per ton. The base price paid for 80% lead ore was $50 per ton.

SHIPMENTS, WEEK ENDED AUG. 28

	Zinc Ore, Lb.	Lead Ore, Lb.	Sulphur Ore, Lb.
Week	3,754,230	380,000	628,500
Year	125,276,440	4,463,160	18,728,710

Shipped during week to separating plants, 4,823,900 lb. zinc ore.

JOPLIN, MO.—Aug. 28

Blende, high price $87.50; base price per ton of 60% zinc, premium ore, $86; medium, $85@80; lower grades down to $75, and early purchases at $70. Calamine, base per ton 40% zinc, $70@[illegible]; average, all grades of zinc, $74.67 per ton. Lead, high price [illegible]; base price $45 per ton of 80% metal content; average all grades of lead, $44.95 per ton.

SHIPMENTS WEEK ENDED AUG. 28

	Blende	Calamine	Lead	Values
Totals this week	[illegible]	457,020	1,993,150	$429,050
Totals this year	[illegible]	30,221,580	58,216,880	16,377,310

Blende value, the week, [illegible]74,700; eight months, $14,177,870.
Calamine value, the week, $8550; eight months, $660,590.
Lead value, the week, [illegible]; eight months, $1,538,850.

A few cars of zinc ore were picked up early in the week around $70 base, but week-end purchases were largely above $80 for all grades sought. The American Metal Co. has been a very active purchasing agent for four weeks, and reports have been received here that this company has purchased all available ore in Wisconsin. The upward market is welcomed heartily, and producers are greatly encouraged with hopes of a further advance, at least in premium ores.

Iron Trade Review

NEW YORK—Sept. 1

Increased and increasing activity is manifest everywhere in the iron and steel trades. Mills are full and are beginning to fall behind on deliveries in a way that has not been seen for more than a year. Increased home orders are helping the munition or export orders to fill up the mills.

Pig iron markets are showing much strength and gains everywhere. Orders are coming in and prices are advancing steadily. The blowing in of additional furnaces has checked the advance to some extent, but the higher prices already made are being generally held, especially on Southern iron.

PITTSBURGH—Aug. 31

The booking of actual shipping orders in the steel trade in August has covered fully as large a tonnage as in July, while the export bookings have been heavier. The domestic business has been confined largely to specifications on old contracts, on which the buyers had a decided advantage as compared with prices currently quoted. The mills have no difficulty in finding business enough to operate at capacity, and are indeed falling behind in deliveries in nearly all lines, in some cases because the finishing departments are crowded and in other cases because the crude steel is scarce.

It is the general expectation that strictly new buying in steel products will be much heavier in September than it has been in August and in some quarters an actual famine in steel is predicted. It is understood that the railroads are considering the steel situation very carefully, realizing the possibility of not being able to secure deliveries desired in 1916, and at satisfactory prices, if they do not buy in time. The situation as to rails is particularly interesting, as so many rail mills are now rolling large steel rounds for shrapnel.

A part of the demand for steel in the past two or three months has been due to the desire of jobbers and manufacturing consumers to replenish their stocks, which had naturally been reduced to a very low level when mill deliveries were prompt. This extra demand of course is only temporary, and it may require a greater increase in general industrial activity than is now generally apprehended to maintain pressure upon the steel mills for steel.

Steel prices have continued to strengthen. The 1.30c. quotation on bars has disappeared, making the market 1.35c., while structural shapes and plates are trending to the same level. Blue annealed sheets have advanced $2 a ton to 1.50c., while black sheets are firmer.

Pig Iron—The American Steel Foundries has bought 10,000 tons basic iron from two middle interests for delivery to Sharon and Alliance over the balance of the year, on the basis of $14.50 at Valley furnaces, firmly establishing the market at this advanced figure and disposing some sellers to quote $14.75 or $15. A sale of 3000 tons of bessemer has been made at $15.50, Valley, for export early in September. The odd lots of malleable and foundry that were available at $14 at furnace have disappeared and the market is firm at $14.50 for this year's delivery, with $15 asked for the first half of next year. There remain very considerable stocks of basic iron, held largely in middle hands and there is some comment on the facility with which pig iron prices have been advancing when the sales have been light. The Jones & Laughlin Steel Co. recently bought 25,000 tons of basic iron from E. W. Mudge & Co., at a price below the present market. We quote: Bessemer, $15.50; basic, malleable and No. 2 foundry, $14.50@15; forge, $14.25@14.75, f.o.b. Valley furnaces, 95c. higher delivered Pittsburgh.

COKE

Coal and Coke Tonnage of Pennsylvania R.R. lines east of Pittsburgh and Erie, seven months ended July 31, in short tons:

	1914	1915	Changes
Anthracite	6,241,171	6,076,487	D. 164,684
Bituminous	25,739,730	23,929,923	D. 1,809,807
Coke	6,039,016	6,090,263	I. 51,247
Totals	38,019,917	36,096,673	D. 1,923,244

The total decrease this year was 5.1%. The July tonnage was 5,412,510 tons, showing a gain of 122,929 tons over last year.

Chemicals

NEW YORK—Sept. 1

Conditions in the general market show no special changes from last week, the position being rather strong.

Arsenic—Business is moderate but the market is firm. Prices are about $3.50 per 100 lb. for carload lots, and up to $4 per 100 lb. for smaller parcels.

Copper Sulphate—Trade is fair but without change in prices, $7.25 per 100 lb. being asked for large lots and $7.50 for smaller parcels.

Nitrate of Soda—The market is rather stiff, conditions remaining unchanged. September deliveries are quoted at 2.42½c. per lb.; while 2.45c. is named for futures.

Pyrites—Imports at Baltimore for the week included 4094 tons pyrites from Huelva, Spain.

The Mining Index

This index is a convenient reference to the current literature of mining and metallurgy published in all of the important periodicals of the world. We will furnish a copy of any article (if in print) in the original language for the price quoted. Where no price is quoted, the cost is unknown, inasmuch as the papers must be ordered from the publishers, there will be some delay for foreign papers. Remittance must be sent with order. Coupons are furnished at the following prices: 20c. each, six for $1, 33 for $5, and 100 for $15. When remittances are made in even dollars, we will return the excess over an order in coupons, if so requested.

COPPER

1698—CHILE—Bosquejo del Estado Actual de la Industria Minera del Cobre en el Estranjero i en Chile. J. G. Matta. (Bol. Soc. Nac. de Mineria. Mar. and Apr., 1915; 20 pp., illus.) To be continued.

1699—EFFICIENCY ENGINEERING in the Copper Country. P. B. McDonald. (Min. and Sci. Press, July 24, 1915; 1½ pp.) 20c.

1700—HYDRO-ELECTROLYTIC TREATMENT of Copper Ores. Robert Rhea Goodrich. (Am. Electrochem. Soc., Apr. 18, 1914; 127 pp., illus.)

1701—LEACHING—Roasting and Leaching Concentrator Slimes Tailings. Lawrence Addicks. (Bull. A. I. M. E., Aug., 1915, 13⅓2 pp., illus.) 40c.

1702—NEW MEXICO—Tyrone District, Grant County, New Mexico. Clifford C. Blood. (Min. and Eng. Wld., Aug. 21, 1915; 2¾ pp., illus.) 20c.

1703—ORE TREATMENT—Ueber die Verarbeitung kupferarmer, kieselsaure reicher, Kalk und Magnesia enthaltender Kupfererze. Binder. (Chem.-Ztg., May 15, 1915; ½ p.) On the treatment of copper ores poor in copper, but rich in silica which contain also lime and magnesia.

1704—REFINING—The Sources of Impurities in Cathode Copper. Lawrence Addicks. (Advance copy, Proc. Am. Electrochem. Soc., Oct., 1914; 11 pp., illus.)

1705—SLAG-SETTLER—Granby Tapered Settler. Frank E. Lathe. (Eng. and Min. Journ., Aug. 14, 1915, ½ p., illus.) 20c.

1706—SLAGS—Metal Loss in Copper Slags. Frank E. Lathe. (Eng. and Min. Journ., Aug. 7, 14 and 21, 1915; 11¾ pp., illus.) 60c.

GOLD AND SILVER—GEOLOGY

1707—KALGOORLIE—The Geology of Kalgoorlie. C. O. G. Larcombe. (Min. and Sci. Press, Aug. 14, 1915; 8 pp., illus.) 20c.

1708—ONTARIO—The Ordovician Rocks of Lake Timiskaming. M. Y. Williams. (Can. Dept. of Mines, Geol. Surv., Museum Bull. No. 17; 9 pp.)

GOLD DREDGING, PLACER MINING, ETC.

1709—ALASKA—Bagley Scraper for Gravel Mines in Alaska. Lewis H. Eddy. (Eng. and Min. Journ., Aug. 14, 1915; 1½ pp., illus.) 20c.

1710—CANADA—Rocker and Grizzly Mining on the North Saskatchewan. J. A. Macdonald. (Eng. and Min. Journ., July 31, 1915, 1¼ pp., illus.) 20c.

1711—OREGON—Hydraulicking at Waldo, Ore. W. H. Wright. (Eng. and Min. Journ., Aug. 7, 1915; 3¾ pp., illus.) 20c.

1712—SIBERIA—The Gold Mines of the Lena. C. W. Purington. (Min. Mag., June, 1915; 9½ pp., illus.) 60c.

1713—THAWING METHODS at Fairbanks. Hubert I. Ellis. (Eng. and Min. Journ., July 3, 1915; 5¼ pp., illus.) 20c.

GOLD AND SILVER—CYANIDING

1714—CALIFORNIA—Amador Consolidated Milling Plant, Amador City. (Min. and Sci. Press, T. S. O'Brien. (Eng. and Min. Journ., Aug. 14, 1915, 2½ pp., illus.) 20c.

1715—COLORADO—Cyanidation of Low-Grade Sulphide Ores in Colorado—II. H. C. Fairnelee. (Met. and Chem. Eng., Aug., 1915, 3 pp., illus.) Continuation of article previously indexed. 40c.

1716—COSTS—An Example of Low Working Costs at Corinthian North Mine, West Australia. V. F. Stanley Low (Proc. Australian Inst. of Min. Engrs., No. 18, 1915; 9½ pp., illus.)

1717—ELECTRICITY—An Alternating-Current Rectifier for Metallurgical Laboratories. Paul W. Avery and Angel O. Ulloa. (Mex. Min. Journ., July, 1915; 1 p., illus.) 20c.

1718—MEXICO—La Lucha Cyanide Mill. T. E. Pratt. (Mex. Min. Journ., May, 1915; 2½ pp., illus.) 20c.

1719—MONTANA—Piegan-Gloster Cyanide Mill. Alexander McLaren. (Eng. and Min. Journ., July 31, 1915; 3½ p., illus.) 20c.

1720—NEVADA—The Tonopah Plant of the Belmont Milling Co. A. B. Jones. (Bull. A. I. M. E., Aug. 1915; 27½ pp., illus.) 40c.

1721—PRECIPITATION—Gold Precipitation on Paper. Douglas Lay. (Eng. and Min. Journ., Aug. 14, 1915; 1½ pp.) 20c.

1722—SLIME AGITATION and Solution Replacement Methods at the West End Mill, Tonopah, Nev. Jay A. Carpenter. (Bull. A. I. M. E., Aug., 1915; 13 pp., illus.) 40c.

1723—SOLUTION—The Precipitating Action of Carbon in Contact with Auriferous Cyanide Solutions. W. R. Feldtmann. (Bull. 130, I. M. M., July 22, 1915; 2 pp.) Further contributed remarks on paper previously indexed.

1724—SOLUTIONS—Notes on the Practical Testing of Working Cyanide Solutions. Edward H. Croghan. (Journ. Chem., Met. and Min. Soc. of S. A., May, 1915; 2 pp.) Discussion on paper previously indexed.

1725—TUBE MILLING—The Theory of Tube Milling. H. A. White. (Journ. Chem., Met. and Min. Soc. of So. Afr., May, 1915. 3¼ p.) Discussion of paper previously indexed.

GOLD AND SILVER—GENERAL

1726—ALASKA—Gold, Silver and Copper in Alaska in 1914. Alfred H. Brooks. (Mineral Resources of the U. S., 1914, Pt. I, 19 pp.)

1727—AMALGAMATION—Recovery of Mercury from Amalgamation Tailing, Buffalo Mines, Cobalt. E. B. Thornhill. (Bull. A. I. M. E., Aug., 1915; 4½ pp., illus.)

1728—AMALGAMATION TESTS. W. J. Sharwood. (Bull. A. I. M. E., Aug., 1915; 12 pp.) 40c.

1729—ARIZONA—The Oatman District, Ariz. Howard D. Smith. (Min. and Sci. Press, July 31, 1915; 3½ pp., illus.) 20c.

1730—CHILE—Gold Mining in Chile. E. David Pope. (Min. Mag., July, 1915; 4 pp., illus.) Details regarding operations of Las Yacas company. 40c.

1731—CRUSHING—The Position of the Tube-Mill. Algernon Del Mar. (Min. and Sci. Press, July 24, 1915; 1¾ pp., illus.) 20c.

1732—CUPELLATION—A Rule Governing Cupellation Losses. W. J. Sharwood. (Bull. A. I. M. E., Aug., 1915; 5 pp., illus.) 40c.

1733—DUTCH GUIANA—Gold Industry in Dutch Guiana, Its Past and Present. J. B. Percival. (Min. and Eng. Wld., Aug. 14, 1915; 2½ pp., illus.) 20c.

1734—FLOTATION in a Mexican Mill. (Min. and Sci. Press, July 24, 1915, 5 pp., illus.) 20c.

1735—MEXICO—Early Mining History of Pachuca. Morrill B. Spaulding. (Mex. Min. Journ., May, 1915; 2¾ pp., illus.) 20c.

1736—QUEENSLAND—Charters Towers Goldfield. J. H. Reid. (Queensland Gov't Min. Journ., July 15, 1915; 1⅝ pp., illus.) 40c.

1737—RAND—Some Features in the Mining Problems of the Eastern Witwatersrand Area. W. G. Holford. (Bull. 130, I. M. M., July 22, 1915; 6 pp.) Author's reply to discussion.

1738—RAND—Mining Conditions on the Witwatersrand. W. L. Honnold. (Advance copy, A. I. M. E., Sept., 1915; 21 pp., illus.) 40c.

1739—RAND—Mining on the Witwatersrand. (Eng. and Min. Journ., Aug. 21, 1915; 2¼ pp., illus.) Conditions and prospects of the principal mines at the present time. 20c.

1740—SILVER EXTRACTION—Lead Acetate and Zinc Salts in Silver Extraction. Charles R. Morris. (Eng. and Min. Journ., July 31, 1915; 1 p.) 20c.

1741—WASTE RECOVERY—Treatment of Waste Material Containing Silver. R. J. Marsh. (Metal Ind., Aug., 1915; 4 pp.) Preparation for treatment of the waste materials produced in factories manufacturing silver goods. 20c.

1742—WESTERN AUSTRALIA—The Future of Mining in this State. C. A. Macleod. (Monthly Journ., Chamber of Mines of W. Aust., May 31, 1915; 3 pp.)

1743—YUKON—Silver Discovery in the Yukon (Galena Creek). D. Saunders. (Min. and Sci. Press, July 24, 1915; ½ p.) 20c

IRON ORE DEPOSITS, MINING, ETC.

1744—MESABI RANGE—Orebodies of the Mesabi Range. J. F. Wolff. (Eng. and Min. Journ., July 31 and Aug. 7, 1915; 13 pp., illus.) Conclusion of article previously indexed. 40c.

1745—MINNESOTA—The General Extent, Value, Assessment and Taxation of Iron Ore in Minnesota. (Reprint of Chapters VI and VII of the Fourth Biennial Report, Minn. Tax Comm., 1914; 75 pp., illus.)

1746—PROSPECTING—What the Dip Needle Can and Cannot Do. C. A. Cheney, Jr. (Eng. and Min. Journ., July 31, 1915; 1½ pp.) 20c.

1747—SIGNALING—Automatic Signal System Used in Stockpiling Iron Ore. John F. Murphy. (Eng. and Min. Journ., Aug. 7, 1915; ¾ p., illus.) 20c.

1748—SOUTH AFRICA—Occurrence of Iron Ores in the Cape Province. Alex L. Du Toit. (So. Afr. Eng., July, 1915; 6 p., illus.) 40c.

IRON AND STEEL METALLURGY

1749—BLAST-FURNACE PLANT AUXILIARIES and General Arrangement. J. E. Johnson, Jr. (Met. and Chem. Eng., Aug., 1915; 4¾ pp., illus.) Conclusion of article previously indexed. 40c

1750—BLOWING ENGINES—Gas-Blowing Engines at the Steelton Plant of the Pennsylvania Steel Co. (Met. and Chem. Eng., Aug., 1915; 3¼ pp., illus.) 40c.

1751—CASTINGS—How to Make Good Steel Castings. John Howe Hall. (Iron Tr. Rev., July 29, 1915; 5½ pp., illus.) Paper before Am. Foundrymen's Asssn. 20c.

1752—CORROSION—Metal Spray Processes. John Calder. (Iron and Coal Tr. Rev., July 30, 1915; 1¼ pp., illus.) From a paper before New York section, Am. Soc. Mechan. Engrs. 40c.

1753—ELECTRIC FURNACE—The Thermal Efficiency of the Electric Furnace. (Proc. Engrs.' Soc. W. Penn, July, 1915; 21½ pp., illus.)

1754—ELECTRIC IRON-ORE SMELTING in Sweden. (Engineering, Aug. 6, 1915; 2¼ pp., illus.) 40c.

1755—FERRO-ALLOYS—Electric Furnace Melting of Ferro-Alloys. R. S. Wile. (Advance copy, Am. Electrochem. Soc., Sept., 1915; 8 pp.)

1756—FERRO-CHROME—Zur Analyse des Ferrochroms. Schilling. (Chem.-Ztg., June 19, 1915; ½ p.) Concerning the analysis of ferro-chrome. 40c.

1757—HEATING FURNACE—A New Ingot-Heating Furnace. (Engineer, Aug. 13, 1915; 2¾ pp., illus.) Describes Ionides system of gaseous heating. 40c.

1758—PROPERTIES—Some Suggestions Regarding the Determination of the Properties of Steel. A. N. Mitinsky. (Bull. A. I. M. E., Aug., 1915; 9 pp., illus.) 40c.

1759—SOUND STEEL—The Commercial Production of Sound, Homogeneous Steel Ingots and Blooms. Emil Gathmann. (Advance copy, A. I. M. E., Sept., 1915; 8 pp., illus.) 40c.

1760—TIN PLATE—How Tin Plate Is Made in Germany. W. Kramer. (Iron Tr. Rev., Aug. 19, 1915; 2 pp., illus.) Reprinted from "Stahl u. Eisen." 20c.

1761—VANADIUM—Tests of Vanadium Iron Castings. (Iron Tr. Rev., July 29, 1915; 2 pp., illus.) Details of investigation at Lafayette College to determine characteristics of castings made from vanadium pig iron, with varying amounts of scrap. 20c.

LEAD AND ZINC

1762—CHURN DRILLING in Wisconsin Lead-Zinc District. E. J. De Wilde. (Min. and Eng. Wld., July 31, 1915; 1 p.) 20c.

1763—CONCENTRATION—Concentrazione per via Secca dei Minerali di Zinco. (Rassegna Mineraria, July 16, 1915; 1¾ pp.) 40c.

1764—ELPCTRIC FURNACE—The Thermal Efficiency of the Electric Furnace. Woolsey McA. Johnson. (Proc. Eng. Soc. W. Penn., July, 1915; 21½ pp., illus.)

1765—JOPLIN and the Spelter Boom. Otto Ruhl. (Min. and Sci. Press, Aug. 7, 1915; 2 pp., illus.) 20c.

1766—MARKET CONDITIONS—The Case of Spelter. (Correspondence and Discussion.) (Eng. and Min. Journ., Aug. 7, 1915; ¾ p.) 20c.

1767—METALLURGY—Notes on the Metallurgy of Zinc. E. H. Leslie. (Min. and Sci. Press, July 31, 1915; 5 pp., illus.) 20c.

1768—SMELTING—The Advantages of High-Lime Slags in the Smelting of Lead Ores. S. E. Bretherton. (Bull. A. I. M. E., Aug., 1915; 4 pp.) 40c

1769—TENNESSEE—Geological Anatomy of a Tennessee Zinc Mine. Frank L. Nason. (Eng. and Min. Journ., Aug. 14, 1915; 3 pp., illus.) 20c.

1770—WASTE of Zinc. S. E. Bretherton. (Min. and Sci. Press, July 24, 1915; 1¼ pp.) 20c.

1771—WISCONSIN—Wisconsin Zinc District—I H C. George. (Eng. and Min. Journ., Aug. 21, 1915; 5¼ pp., illus.)

OTHER METALS

1772—ANTIMONY—The Wah Chang Mines, China. H T. Liang. (Min. and Sci Press, July 10, 1915; 2 pp., illus.) 20c.

1773—ANTIMONY PRODUCTION of the World. (Eng. and Min. Journ., Aug. 14, 1915; 1¼ pp.) Excerpts from an article in "Engineering," July 9, 1915, with editorial comments and additions. 20c.

1774—NICKEL—Ontario Nickel Commission. (Can. Min. Journ., Aug. 1, 1915; 2 pp., illus.) Notes on the personnel. 20c.

1775—PLATINUM ASSAYING at the Boss Mine. Frank A. Crampton. (Min. and Sci. Press, Aug. 14, 1915; 2 pp.) 20c.

1776—RADIO-ACTIVE MINERALS in South Africa. R. N. Kotze. (So. Afr. Min. Journ., July 10, 1915; 1 p.) Discussion of a paper by W. A. Rogers before Geological Society, July, 1915. 40c.

1777—RADIOACTIVITY—Neuere Forschunger auf dem Gebiete der Radioaktivitit in den Jahren 1913 und 1914. F. Henrich. (Zeit. f. angew. Chem., June 22 and 29, 1915; 10½ pp., illus.)

1778—TIN—Separation of Wolfram from Tin. M. T. Taylor. (Min. Mag., June, 1915; 1½ pp.) 40c.

1779—Tin—The Physical Condition of Cassiterite in Cornish Mill Products. J. J. Beringer. (Bull. 130, I. M. M., July 22, 1915; 3 pp.) Further ecntributed remarks on paper previously indexed

1780—TIN—The Potosi Tin-Mining District, Bolivia. Francis Church Lincoln. (Min. and Sci. Press, July 24, 1915; 3 pp., illus.) 20c.

1781—TIN—Mining Conditions in Bolivia. Francis Church Lincoln. (Mex. Min. Journ., Mar., 1915; 6 pp., illus.) 20c.

1782—TUNGSTEN—Wolfram Mining in Burma. (Min. Journ., July 24, 1915; 3½ pp.) 40c.

1783—VANADIUM: Its Chemical and Metallurgical Technology. F. M. Turner, Jr. (Can. Min. Journ., Aug. 1, 1915; 4¾ pp.) 20c.

1784—VANADIUM—Metallurgy at the Primos Chemical Co.'s Plant. (Min. and Eng. Wld., July 17, 1915; 1 p.) 20c.

NONMETALLIC MINERALS

1786—BARYTES—The Production of Barytes in 1914; with a note on Strontium Ore and Salts. James M. Hill. (Mineral Resources of the U. S., Pt. II; U. S. Geol Surv., 1915; 6 pp.)

1787—DIAMONDS—The Economic Resources of German South-West Africa. (Bull. Imperial Inst., Apr.-June, 1915; 27 pp., illus.) General article, 3 pages of which are devoted to diamonds.

1788—FLUORSPAR—The Production of Fluorspar in 1914; with a note on Cryolite. Ernest F. Burchard. (Mineral Resources of the U. S., 1914, Pt. II; 9 pp.)

1789—PHOSPHATE ROCK in Johnson County, Tenn. Joel H. Watkins. (Min. and Eng. Wld., Aug. 7, 1915; 1¾ pp., illus.) 20c.

1790—POTASH DEPOSITS in Chile. Severo Salcedo. (Eng. and Min. Journ., Aug. 7, 1915; 1 p.) 20c.

1791—POTASH SITUATION, The. Samuel H. Dolbear. (Met. and Chem. Eng., Aug., 1915; 1½ p.) 40c.

1792—SALT—Notes on Sea-Salt Manufacture in North China. (Far Eastern Rev., June, 1915; 5 pp., illus.) 40c.

1793—SULPHUR—Sui Metodi d'Analisi degli Zolfi. M. G Levi. (Rassegna Mineraria, July 16, 1915; 6¼ pp., illus.) Continuation of article previously indexed. 40c.

1794—TALC AND SOAPSTONE—The Production of Talc and Soapstone in 1914. J. S. Diller. (Mineral Resources of the U. S., 1914, Pt. II; 7 pp.)

PETROLEUM AND NATURAL GAS

1795—OIL SHALES of Newfoundland. J. W. McGrath. (Can. Min. Journ., Aug. 15, 1915; ¾ p.) 20c.

1796—OKLAHOMA—The Influence of the Cushing Pool in the Oil Industry. Roswell H. Johnson and L. G. Huntley. (Proc. Eng. Soc. W. Penn., July, 1915; 29 pp.

The Engineering and Mining Journal

ONE OF THE FIVE ENGINEERING WEEKLIES

VOLUME 100 SEPTEMBER 11, 1915 NUMBER 11

A Trip Through Bolivia

By Stanley C. Bullock*

SYNOPSIS—The general manager of a Chilean mine visits the alti plano of Bolivia, inspecting some of the leading tin-mining operations. His notes and the data about the train and hotel accommodations should be useful to engineers who contemplate traveling in this South American country.

The Bolivian frontier is crossed a few kilometers after leaving Ollague, the last station on the Chilean section of the Antofagasta & Bolivia Ry. The distance from Antofagasta by rail is roughly 440 km., and the time required by the express train is 18 hr. At the time of writing—March, 1915—only one express was being run weekly, reaching Ollague on Sunday, but, as the intention was to go first to Potosí, it was necessary to take a slow train in order to make the connection at Rio Mulato, from which place the train leaves only once a week — on Saturday. Ollague therefore was left on Thursday at 3 p.m. (La Paz time), and Uyuni, at which place the train stopped, was reached the same night at 8:30 p.m. The hotel here—the Uyuni—is good for the size of the place, and the charges reasonable—bed, dinner, breakfast and attendance costing 5 bolivianos (1 boliviano = 15d. = $0.30, March, 1915).

ORURO, THE COMMERCIAL CAPITAL OF BOLIVIA

Ollague to Uyuni—Uninteresting Tableland

From Ollague to Uyuni the country is most uninteresting, being comparatively a level plain 12,000 ft. high, with little or no vegetation and very saline in character; mirages of water are seen continually along the route. There are a few mines on a branch line from Uyuni to Huanchaca, but these were not visited, since work was said to have been much curtailed and my time was limited.

The next stage of the journey started at 8 a.m. on Friday morning, and Rio Mulato, where it was necessary to stop until the next morning, was reached at 11:30 a.m. The country between Uyuni and Rio Mulato is a little more fertile than the previous section; llamas and donkeys were grazing along the line, and in places the ground had been tilled and barley grown.

There is a river at Rio Mulato, from which the place presumably gains its name, but were it not for the junction to Potosí, it would be of no importance. The hotel here is poor, and since there is no competition it has little inducement to improve. The prices are comparatively high, the charge made being 6 bolivianos per diem, though the food is not good.

The train for Potosí left at 8:30 a.m.; the fare was 14 bolivianos, the same as from Ollague to Rio Mulato. The railway gage from Rio Mulato to Potosí is 1 m. and though the main line from Antofagasta is being changed to this also, the alteration has not yet been completed. From Rio Mulato the line starts to ascend, reaching an altitude of 16,000 ft. and then descends to Potosí, which is about 14,000 ft. above sea level. The country passed through is attractive, well-watered, and cultivated on the mountainsides. Hundreds of llamas and donkeys can be seen grazing, while occasionally a bunch of vicuñas is visible fairly close to the railway line.

The only point of mining interest is the concentration plant of the Porco Tin Mines, Ltd., in course of erection at Agua Castilla, which is about 7 hr. from Rio Mulato. The mill is right at the railway, while the mine is connected to it by an aërial tramway. As the train, however, only stopped a few minutes, there was no opportunity of looking over the mill which is said to be one of the most uptodate in Bolivia, the plant including stamps, sand and slime tables and Hardinge mill for regrinding.

The train should have arrived at Potosí at 4:30 p.m., but owing to various delays on the line, was more than an hour late. On arriving a coach conveyed the passengers up to the main part of the town, which is about 1½ mi. from the station. The hotel was safely reached, though the state of the roads and the united efforts of the driver and his mules at times made this appear in the light of

*General manager, Poderosa Mining Co., Ltd., Mina Poderosa, Collahuasi, Antofagasta, Chile.

an impossible undertaking. The Hotel Splendide had previously been recommended as the best in the town, and here the food and attendance were good and the charges reasonable—5 bolivianos per day.

The next day—Sunday—was spent in looking over the town, which is most interesting, being one of the oldest in Bolivia. There are three principal mining companies in operation here, controlled respectively by English, French and Bolivian capital.

The English company is situated highest up the valley, but at the time was only working in a restricted manner. The plant is badly arranged for economical working and a new one is under consideration. The ore is partly sulphide containing about 10% tin, and is also rich in silver. It is first broken to about 1 in. and then crushed to 1 mm. in a ball mill from which it passes to a classifier feeding a jig, four tables and a Deister slimer. The concentrates average about 20% Sn, the seconds 10% Sn and are retreated. The tailings average 2.5% and go to storage dumps for future retreatment. The concentrates are calcined in hand-rabbled furnaces of the reverberatory type, fired by a small amount of *taquia* (llama dung). After calcining, the silver and any copper in the ore is leached out and the calcined concentrate is treated on four Wilfley tables, where concentrates are obtained running about 55% Sn, the tailings assaying about 2%. Power is obtained from two water turbines, each capable of transmitting 60 hp. Wages at present average about 2.50 bolivianos per day of 12 hr., while before the war they were from 4 to 5 bolivianos.

The French company is operating lower down the valley and is close to the railway station. The ore is brought to the plant by an aerial tramway, 3 km. in length, and contains about 15% Sn. It is crushed in rolls to 2 mm. and the silver and copper leached out. It is then passed over jigs and tables, the concentrates from which are calcined in hand-rabbled furnaces. After calcination the concentrates are further reduced to 1 mm. in rolls, the product from which is classified and passed to jigs and Wilfley tables. The first concentrates run about 60% Sn; these are shipped. The second assay about 30% Sn and are smelted to about 9?% Sn, while the third product contains about 10% Sn, and is crushed by stamps. From the stamps the pulp runs to more Wilfley tables, from which the first two products have the same destination as the previous concentrates, while the third product is reground in a Huntington mill. The feed to this mill assays about 5% Sn and the discharge runs to a classifier feeding more Wilfley tables and a Humboldt slimer. These tables make four products, the third assaying about 2% Sn and being retreated, while the tailings run about 0.5% Sn and are stored for future retreatment. Any oxidized ore mined is smelted with the low-grade concentrates, the tin for shipment assaying about 9?% tin.

The plant is run partly by water power and partly by a gas engine driving a generator. The workmen here in a great many cases work for 24 hr. on end for which they are paid 5 bolivianos against 8 to 9 bolivianos before the war. Living here is cheap as meat, fruit and vegetables are obtained from the neighboring villages. Some of the prices ruling in March were: Meat 30 centavos per lb., eggs 50 centavos per doz., oranges and bananas 10 for 20 to 30 centavos, grapes, peaches and figs 20 centavos per lb. Onions, beets, cabbages, lettuce, etc., were correspondingly cheap.

STREET SCENES IN BOLIVIA'S PRINCIPAL CITIES—ORURO, POTOSI AND LA PAZ

Potosí was left on Tuesday morning at 7:30 a.m. and Rio Mulato was reached about 5 p.m. the train being half an hour late. A dining car is attached to this train, the charge being 3 bolivianos for lunch and 50 centavos for tea, both of which meals are excellent. Tickets can be obtained direct from Potosí to Oruro, the fare being 24 to 40 bolivianos; the journey is broken at Rio Mulato for the night.

The Oruro train leaves Rio Mulato at 11:30 a.m. and does not reach its destination until 6:30 p.m. and as there is no dining car, due to some contract with a refreshment room at a small station en route where the food is not attractive, it is advisable to obtain provisions before leaving Rio Mulato. The country between Rio Mulato and Oruro is well watered and cultivated. Llamas and donkeys are seen in great numbers along the route.

At Challapata, the Llallagua company ships most of its products and this is, therefore, an important town. The company is controlled by Chileans and owns one of the largest and most profitable mines in Bolivia. Some of the ore is rich enough to be shipped straight from the mine. The company has a concentration plant for the poorer grades, but this was not visited.

The next station of importance is Machacamarca, from which Señor Patiño has built a branch line of 1-m. gage that runs up to his mines which adjoin those of the Llallagua company. These mines are the most productive in Bolivia. At Machacamarca there is a branch line to the Oruro company's mill which was seen at a later date.

The best hotel at Oruro is the Quintanal; the charge was only 5 bolivianos per head and the accommodation most comfortable. The most important mines here belong to the Oruro Mining Co. and, by the courtesy of the manager the main workings were visited.

Oruro Ore Treated at Machacamarca

The tin ore being extracted from the chief mine runs from 2 to 3% Sn and the present workings are 300 m. deep from shaft collar, this being about 50 m. above the railway. There are seven levels, the ore being hoisted by a vertical shaft, which at present only goes to the third level, but this will eventually be continued to surface. Now the ore is trammed from the shaft to an inclined shaft which hauls to the surface. It is then crushed, passed over picking belt and trammed to loading station of a ropeway that carries it to another crusher station with small trommel, reducing the ore to 1 in. and automatically loading railway trucks for transit to the company's concentrating plant at Machacamarca.

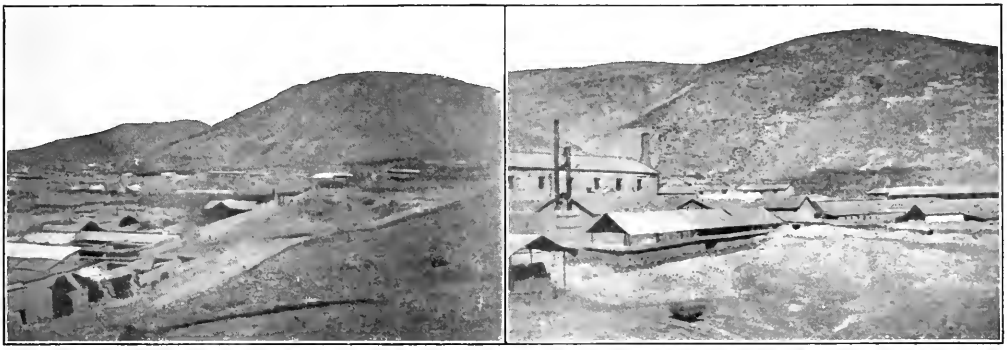
Jackhamer drills are in operation in the mine. The air pressure at surface is 80 lb. per sq.in., the air being supplied by an Ingersoll-Rand compressor driven by motor. The atmospheric pressure here is about 9½ lb. per sq.in., the altitude being roughly 14,000 ft. above sea level. Timber is not much used. When mine supports are necessary stone walls are built wherever possible. Little water is encountered and it is taken out by bailing. Electric power is used for hoisting, lighting, and other power purposes, the generator being direct coupled to Sulzer oil engines, which are entirely satisfactory. The power plant has a capacity of 250 hp., but only 100 hp. is at present being used.

The aërial tramway which connects another mine belonging to the same company was supplied by Messrs. Pohling, of Cologne, the hauling-rope system with fixed cable being used. That the war has been in many ways beneficial to Bolivia is well exemplified by this mine. Before the war it was necessary to mix the poorer ores from the Oruro mine with the richer ores from the company's mine across the hill, in order to make a profit at the mill. Now, on account of reduction in wages and various other general economies the company has been forced to make, it can operate on the low-grade ores alone at a profit. The miners earn about 3 bolivianos per day against 5 to 6 bolivianos previously.

Oruro a Gay City

Oruro is a gay city and the chief commercial center of Bolivia. The band plays every Thursday and Sunday, when the plaza is an interesting spectacle, everyone promenading, exchanging greetings and inspecting costumes. There is a native market where meat, fruit and vegetables can be obtained cheaply, though they are a little dearer than at Potosi.

Oruro was left at 8:30 a.m. and La Paz reached about 5 p.m., a change of trains being necessary at Viacha, where another company runs to La Paz. Just before reaching La Paz the steam locomotive is taken off and an electric one takes the train down the 1000-ft. hill into the city. The journey from Oruro to La Paz is interesting, and a good dining car is attached to the train.



SAN JOSE MILL ON THE OUTSKIRTS OF ORURO

The railway runs on a plateau between ranges of hills, and the whole plateau is more or less cultivated, while herds of llamas and donkeys are continually seen and occasionally a small troop of vicuñas is visible.

La Paz is the center of government but there is little other business done there. The principal factories are for the manufacture of Bolivian beer, which is doubtless due to the flow of excellent water through the valley. The chief hotel is the Guibert, but the prices are higher and the rooms less comfortable than those at Oruro.

The charges here were 7 bolivianos per day in spite of the fact that there is a plentiful supply of vegetables and fruit in the neighborhood. La Paz is probably one of the prettiest places to visit in Bolivia, but is of little interest from a mining point of view. The nearest mines of any consequence are those of the Corocoro United Copper Mines, the ore being chiefly native copper finely disseminated in a sandstone gangue. They are about 100 km. from La Paz, but I did not have time to visit them. Electric trams are running in La Paz and a long trip can be made down the valley to a place called San Jorge. La Paz was left at [illegible] p.m. for

the down to Oruro, which was reached at 9 p.m. the same day.

Having received an invitation to see the concentration plant of the Oruro Mining Co. at Machacamarca, this was done on Saturday in company of the manager. The ore as it comes from the mines is crushed to pass in two 16x36-in. crushing rolls, the oversize from the first being returned by means of a trommel to the second. It is then passed to calcining furnaces, rabbled by hand, the silver and copper leached out and the calcined ore passed through grinding pans, which, in turn, deliver to classifiers, feeding tables, vanners and Deister slimer. From these, 60% concentrates are obtained and this product is brought up to 65% by hand.

The oxidized ore is treated in another section of the mill, stamps being the crushing machine, the pulp from which flows to a Richards-Janney classifier, the different spigots feeding tables and vanners, the concentrates from which run about 50% Sn.

McDougal Furnace Volatilizes Silver

A new sulphide mill is being erected equipped with Hardinge mill, thickeners, Deister concentrators and slimers, the plant having a capacity of from 80 to 100 tons per day, and the concentrates are expected to assay from 67 to 68% Sn. Edwards roasting furnaces are also to be tried, as the labor cost on the present furnaces is excessive. A McDougal furnace has been tried, and although successful on straight tin ores, the losses are high where silver is also contained. This furnace, therefore, is not at present in use. The plant is run by gas engine, though the present management would prefer oil engines, direct coupled to generators, were a new plant contemplated. The new mill when completed should be one of the most uptodate and economical in Bolivia.

Labor is plentiful. During working hours, the natives are continually chewing the leaves of the coca plant, from which the well-known drug cocaine is extracted. This habit has descended from the days of the ancient Incas, and is supposed to satisfy all pangs of hunger as well as supplying the eaters with remarkable powers of endurance.

The fuel chiefly used is yareta and taquia. Yareta is a resinous moss of a fibrous nature found locally. The Indians collect and bring in these fuels from varying distances and the price varies accordingly from 60 centavos to 1 boliviano per Spanish quintal—100 lb. These fuels are worth about one-third their weight in coal as regards calorific powers.

Oruro was left on Monday morning at 7:45 a.m. and at 6 p.m. Uyuni was reached, where it was necessary to stay for the night as the train went no farther that day. Next morning Uyuni was left at 7:30 a.m. and Ollague reached at 1 p.m., and then on through Chile to the coast at Antofagasta.

The total trip lasted for practically three weeks at a cost of approximately $100 per head, including all expenses. Bolivia is undoubtedly a country well worthy of further development from a mining standpoint, and with the decreased cost and wages now obtaining, together with uptodate power plants, mining and milling machinery, there should be a profitable return on carefully expended capital, provided the prospects of any mining enterprise embarked upon are thoroughly gone into by a reliable mining engineer, well acquainted with the country and the people.

Anaconda and the Unions

Special Correspondence

On the occasion of their picnic at Anaconda a few days ago C. F. Kelley, vice-president and managing director of the Anaconda Copper Mining Co., addressed the members of the Mill and Smeltermen's Union and took occasion to paint in proper color the labor disturber, the soap-box agitator and the demagogue who fatten on honest labor; commended the honest leader of labor, and spoke of the necessity of reciprocal relations.

"It is my opinion that the greatest mistake that can be made is to view this relationship exclusively from the standpoint of one side or the other," he said. "The relation, together with its duties, is reciprocal, and inasmuch as there may be abuses and grievances on the part of one, so there may, and have been, on the part of the other. Unlimited and unrestricted power is the greatest cause of the abuse of power. Men are human, no matter in what capacity they act, and what may create injustice and oppression in one capacity will do so in another. There is no distinction in injustice, whether it be practiced by a corporation, an individual, or a labor union, nor should it be more excusable in one instance than in another.

"No single institution created by man is perfect. Corporations, inasmuch as they are governed by individuals, possess the same frailties and incur the same mistakes as men. Much has been said in criticism of the Anaconda company, and much of that criticism has been unfounded. One thing can be asserted as a fact—that throughout its entire industrial career it has been characterized by an unfailing spirit of fairness to its employees.

"I feel that I have an extraordinary right to make that statement, for its policy in this respect I have known from the time when I was employed by it in the humblest capacity until charged with more or less responsibility for its action. That such a policy of fairness will characterize its future conduct I have no doubt, and whatever may be said by the demagogues, I trust that the feeling of mutual confidence which has been built up will continue to prevail. Such a foundation furnishes a more satisfactory assurance that mutual obligations will be fulfilled than can the words of any written contract characterized by the distrust of the parties to it."

Tin Smelting at Pittsburgh

The Standard Smelting Co., Pittsburgh, has been organized with a capital of $100,000, and has installed in the works formerly occupied by the R. D. Nuttall Co. two Wile electric furnaces for smelting Bolivian tin concentrates, says *Iron Age* of Aug. 26, 1915. Another furnace of the same type is now being installed. The works will then have a capacity for smelting 20 tons of concentrates every 24 hr., from which it is expected to recover 12 to 14 tons of tin. The company expects to sell the greater part of its tin output to consumers in the Pittsburgh district. The incorporators of the Standard Smelting Co. are H. S. Glenn, C. E. Glenn, C. R. Buchheit and R. S. Wile.

Swiss Prohibition of Exports—The Swiss Federal Council has issued a decree extending the embargo on contraband articles to tubes made of the following metals or their alloys: Copper, lead, zinc, tin and nickel.

Ore Dressing at Clausthal

By E. Mackay Heriot*

SYNOPSIS—In describing the operation of concentrating lead and zinc ores at Clausthal, emphasis is placed upon the satisfactory results secured through the use of old-fashioned machinery, much of which can be built at any mine. Harz jigs and buddles are used, as are also spitzkasten and other well-known types. The ore and the treatment system are described.

Many years ago when I was a student at Clausthal I took the opportunity of working through a practical course at the state concentrator. The plant was a large one and in every way uptodate, employing 450 men and boys. It had the ordinary rockbreakers and rolls and 176 stamps for fine crushing. There were a number of jigs and Harz buddles for the ore concentration. The capacity was about 270 metric tons of crude ore in 10 hr.

A New Concentrator Erected in 1905

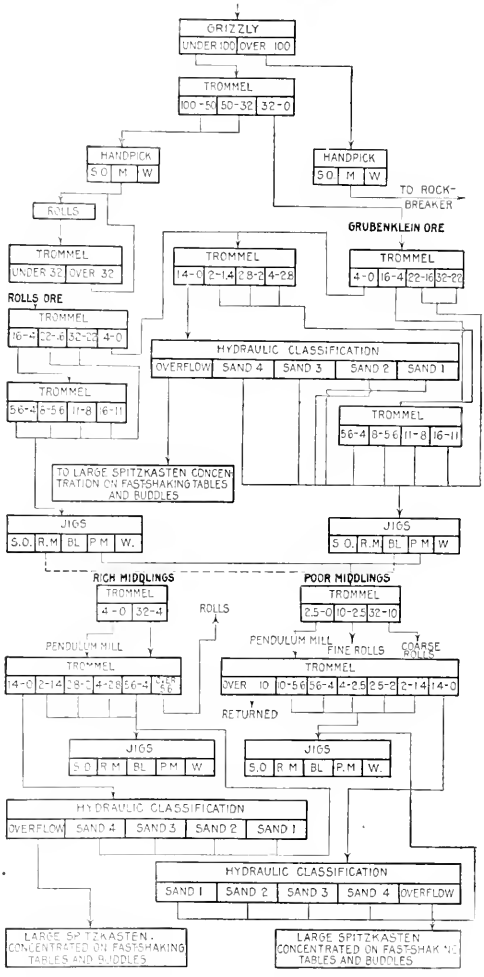
This installation was completely scrapped in 1905 and a new concentrator erected by the Humboldt firm. It takes up less room than the former one, employs only 250 men and boys and has a capacity of 360 metric tons of crude ore per 10-hr. day. It is in every sense of the word a model plant, as is proved by the results achieved, and anyone interested in this class of dressing would do well to visit it. In this model plant there are 96 Harz jigs working. The old type of spitzkasten has taken the place of patent hydraulic classifiers. There are 14 specially constructed Harz buddles for concentrating the finest slimes. Since the installation was laid down many improvements have been carried out.

In these days, when it is thought by many that a modern dressing plant must have some special patented system or a combination of systems, it is a pleasure to see the old-fashioned apparatus doing such excellent work and holding its own so easily. There is one particular reason why one should be pleased, and that is because jigs, spitzkasten and buddles can be made at almost any mine with the help of a local foundry. I do not mean to suggest that a concentrator should in all cases be made locally, especially if the plant be a large one. There are firms who can carry out the very best arrangements. However, it often happens that a mine cannot afford to put up a large plant at the outset, but could, with the aid of a good dressing expert, rig up a reasonably good installation. It often happens that after a small plant has been put up one sees the mistakes and in the construction of the large plant these mistakes are guarded against. I shall refer later on in some detail to the old-fashioned apparatus, and hope that the notes I give will have a practical value.

Composition of the Clausthal Ore

The ore treated at the Clausthal plant is of an ordinary kind. The minerals are galena, blende and copper pyrite in small quantities. An average analysis is: 4.17 to 7.83% PbS; 10.51 to 20.95% ZnS; and in some cases, 0.23% $CuFeS_2$.

The gangue is composed of calcspar, quartz, graywacke, thonschiefer and, in the Rosenhofer district, spathic iron ore in small quantities. The composition of the ores is much the same, but the structure shows considerable variations. At the Unterer Burgstaedter Revier con-



FLOWSHEET, CLAUSTHAL ORE-DRESSING WORKS

centrates of 11-mm. size can be obtained, whereas at the Rosenhof, 4 mm. is the largest. On this account the ores are not mixed, but held apart in large reserve bins.

The plant consists of two parallel installations. From the bins on the ground floor the ore is hoisted by an electrically driven lift to the top story of the main

*Mining engineer, Rio Tinto, Huelva, Spain.

building. Each truck passes over a self-registering weighing machine and is dumped on a grizzly with bars 100 mm. apart. All material over 100 mm. is hand-picked. The middlings are broken in a crusher and hoisted again to the grizzly. Stuff under 100 mm. falls into a bin, from which it is mechanically fed into a trommel, which classifies 100-50, 50-32 and 32-0 mm. sizes. The first two are hand-picked on revolving tables. The middlings, called rolls ore, are crushed in rolls. The 32-0 mm. size is called *grubenklein* (fines). It is richer than the rolls ore and is therefore treated separately. The *grubenklein* is classified by trommels into sizes 22-16, 16-11, 11-8,

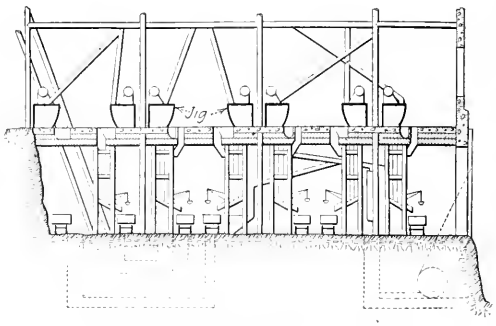


FIG. 1 JIGS AND CONCENTRATE BINS

8-5.6, 5.6-4, 4-2.8, 2.8-2, 2-1.4, 1.4-0. The last-named size passes on to a sand spitzkasten; all the former are treated on Harz jigs. The middlings are divided into two classes, rich middlings and poor middlings, and each is treated separately. The overflow of the sand spitzkasten passes on to a large spitzkasten system. This material is concentrated on fast-shaking tables and Harz buddles.

Treatment of Rich and Poor Middlings

The "poor middlings" referred to are sorted in trommels. The size above 10 mm. goes to the coarse rolls and 10-2.8 to the fine rolls. Material under 2.8 is crushed in *pendelmühlen*, whence it goes to sand spitzkasten. These products are jigged. The overflow of the sand spitzkasten goes to a large spitzkasten system.

The "rich middlings" contain a considerable amount of ore that is really clean, therefore the sizes from 4-1.4 mm. are jigged again. The middlings from this process, together with the larger sizes, are crushed in the mills, but the 2.8-0 is ground in a *pendelmühle*, whence it flows into a sand spitzkasten. These products are treated similarly to those of the "poor middlings," but of course separately.

The blende ores are soft and are therefore not suitable to stamps, as too much powder would be the result; thus material under 2.8 mm. crushed in *pendelmühlen*, using 1-mm. screens. This mill is an improved Huntington type. Its capacity, working through a 1-mm. screen, is 1600 kg. per hr. The mill ring lasts for from about 3500 to 4000 tons.

As regards the rolls, I noticed that the application of a corundum wheel kept the shells in order. The corundum wheel is driven by a belt and does not disturb the working of the rolls. The milling is all done on one floor, but the rockbreakers are on a different level. Each machine has its foundation separate from that of the building.

The jigs are the well-known Harz machines and are built of wood. Material of 22-11 mm. is dressed on 3-compartment jigs, 11-2.8 on 4-compartment jigs and 2.8-1.4 and sand on 5-compartment jigs. The jigs are placed in one large room. There are 96 of them, and here I observed a great improvement which cannot be too strongly recommended. The jigged products are run into small deposits in the floor and emptied from time to time into bins which lie alongside. The tops of these bins are on a level with the ground floor of the hall. On the floor below, the bins are emptied into trucks. All the bins are arranged in neat parallel lines. The jig hall is clean from end to end—there is no water and no sand about the place. One man can attend several machines, as he has very little to do except control the working and move the material one or two feet from hole to hole. The jig room is shown in Fig. 1.

I think in many cases where Harz jigs have not been found practical it is because they have not been properly operated. An expert hand is required to control these machines. So much depends on the class and height of the bed, the height of the bridge, the number and length of strokes, amount of fresh water, etc. With so many items to look after, one can make any number of combinations which may prove disastrous. On the other hand, by small alterations, great advantages may be gained. I give a case in point. The jigs in the old plant were

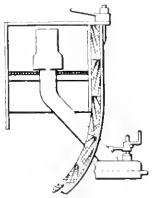

FIG. 2

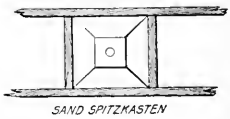

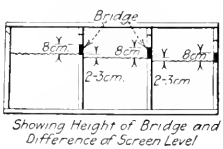

FIG. 3

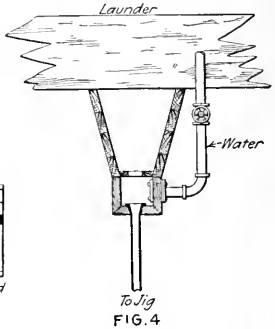

FIG. 4

FIGS. 2 TO 4. DETAILS OF CLASSIFYING APPARATUS

so constructed that the bridge between the screens was 10 cm. high. In the new plant the bridges are 8 cm. high. By this alteration the capacity has been increased 64%, or from 600 to 986 kg. per hour. Each machine uses about 1½ hp.

Details as to Work of the Clausthal Jigs

I now propose to give some detail of the jigs working in the Clausthal installation. The screens are 0.85 m. long by 0.48 m. broad. Sizes from 8 mm. to sand No.

4 are concentrated through a bed. In a four-compartment jig the first product is lead concentrate; the second, rich middlings; the third, blende concentrate; the fourth, poor middlings, and the overflow, in most cases waste.

DATA OF THE CLAUSTHAL JIGS

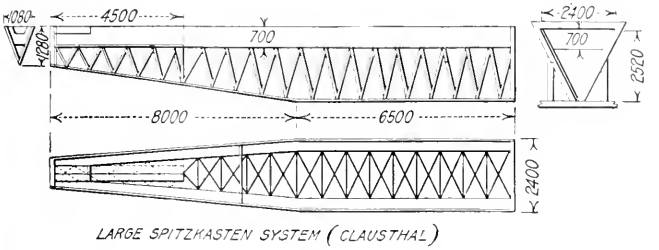
Size of Material, Mm.	Number of Strokes per Min.	Length of Stroke, Mm.
22–16	120	46
16–11	140	30
11–8	160	30
8–5.6	180	25
5.6–4	200	20
4–2.8	220	15
2.8–2	240	13
2–1.4	260	8
Sand No. 1	280	5
Sand No. 2	300	5
Sand No. 3	300	5
Sand No. 4	300	5

Another interesting item is the size of hole in the jig screen. Some examples are shown in the accompanying table.

SIZES OF HOLES IN JIG SCREENS

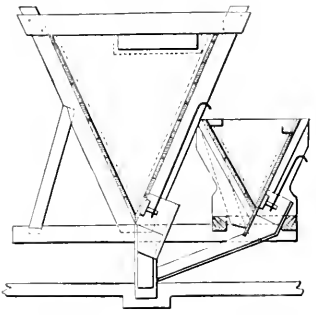
Size of Material, Mm.	Diameter of Hole in Screen, Mm.
Sand	1
1–4	2–3
2–8	3–4
8–11	2
11–16	4
16–22	4
22–32	8

It must be here stated that all material over 8 mm. is not concentrated through the screen, but worked on the Rohraustrag system—that is to say, the concentrates



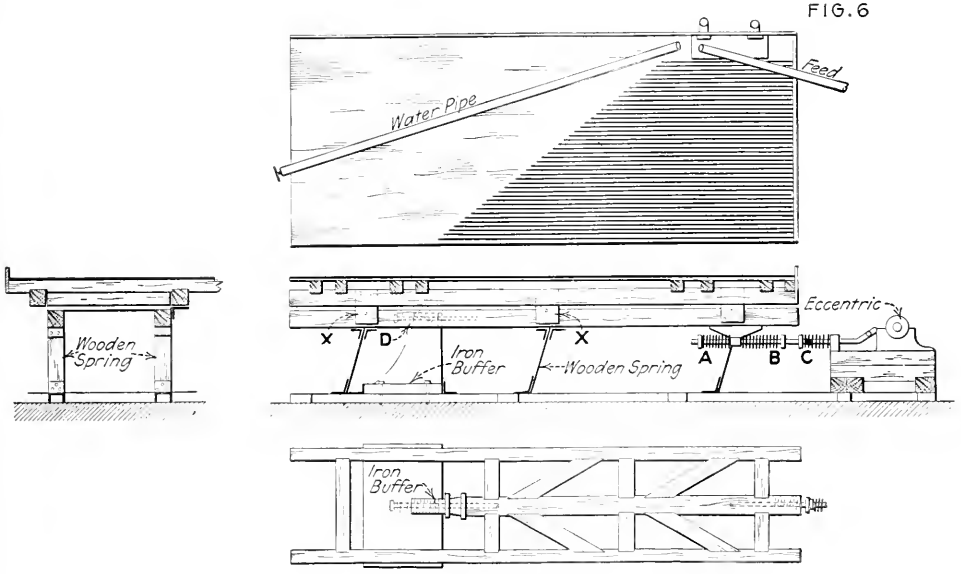
LARGE SPITZKASTEN SYSTEM (CLAUSTHAL)

FIG. 5



SPITZKASTEN AND VORSPITZKASTEN

FIG. 6



SHAKING TABLE AS USED AT CLAUSTHAL

FIG. 7

FIGS. 5 TO 7. DETAILS OF CONCENTRATING MACHINERY

In the poor-middlings department the bed of the first compartment is galena; the second and third, galena and blende; the fourth, blende with gangue. In the rich-middlings department the third and fourth are blende, but otherwise the same as previously mentioned.

are extracted from the top of the screen through a pipe. An outline of this method is illustrated in Fig. 2.

As has been already stated, the height of the bridge is an important factor in the working of a jig; so is also the difference of level from screen to screen. In general

the bridge is 8 cm. high and the difference of screen level 2 [illegible] as shown in Fig. 3.

The present iron hydraulic classifiers that were originally used have been removed and the ordinary rising-current spitzkasten put in their places. They are arranged in sets of four and their products are concentrated on jigs. There has been much argument about working spitzkasten products on jigs, but even where six of these are placed together the result has been in every way good. It is well known that any material under 1 mm. cannot be successfully sorted in a trommel. I will not argue the point as to whether the rising current should enter the spitzkasten at the bottom or side. Here it is at the side, and Fig. 4 shows a sketch of one drawn to scale.

The Spitzkasten System

The overflow from the sand spitzkasten is led to a large spitzkasten system. The spitzkasten are placed in two rows of 19 each, with a platform all around. The width of the first is 1030 mm., and it is 1280 mm. high. For the first 8 m. the machines grow larger and larger, but during the last 6500 mm. the size is the same, namely, 2400 broad and 2500 mm. high, as shown in Fig. 5. Most of the products of the spitzkasten are concentrated on fast-shaking tables, but the very finest are treated on Harz buddles.

The large spitzkasten are fitted with so-called vorspitzkasten. These are smaller ones placed in front and serve to take off the superfluous water before the concentration takes place.

The vorspitzkasten is 1300 mm. high by 1750 mm. broad, and 1100 mm. long. The drawing, Fig. 6, shows the system. From the excellent work the tables do there is no doubt that this method is well worth copying.

Humboldt Fast-Shaking Tables

The fast-shaking tables, of which there are 39 in use, are of an improved Humboldt model. The improvement was made by Mr. Northdurft, the plant manager, and has increased the capacity from 200 to 500 kg. of crude fines per table per hr. The working results are excellent. The supervision can be carried out by boys and the repair costs are practically nil. The table works any class of slimes except the finest. The amount of water used per minute is about 45 liters and the machine makes 360 r.p.m. Each revolution gives the table a backward and forward movement by aid of an eccentric on the driving shaft. When the table is moved toward the machine, three steel springs are tightened, and then let loose in the opposite direction with a jerk. The eccentric rod is not joined to the table but to a central beam. The further end of this beam fits into an iron buffer. By altering the tension of the springs *A* and *B* (Fig. 7) the shake movement can be modified at will. The incline from the vertical given to the wooden springs—six in number—depends on the fineness of the material to be worked, but it varies from 5 to 10 mm. By the aid of the three plates marked *N* and the hinges *E*, the slope of the table can be regulated. Several sketches of this table are given, because I think the results it has achieved make it worthy of being better known.

The Harz buddles are practically the same as those used in days gone by. The construction will be seen from Fig. 8. The face is cement and rests on wood. There

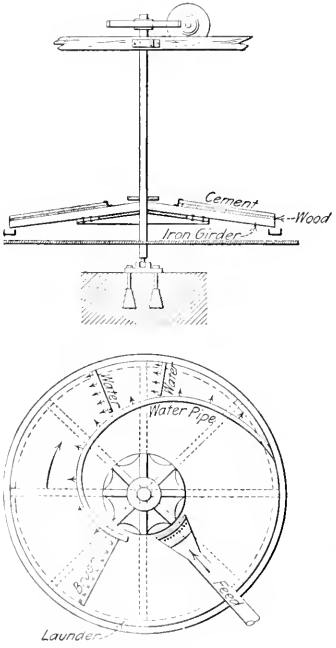


FIG. 8. MODERN ROUNDHEAD BUDDLE

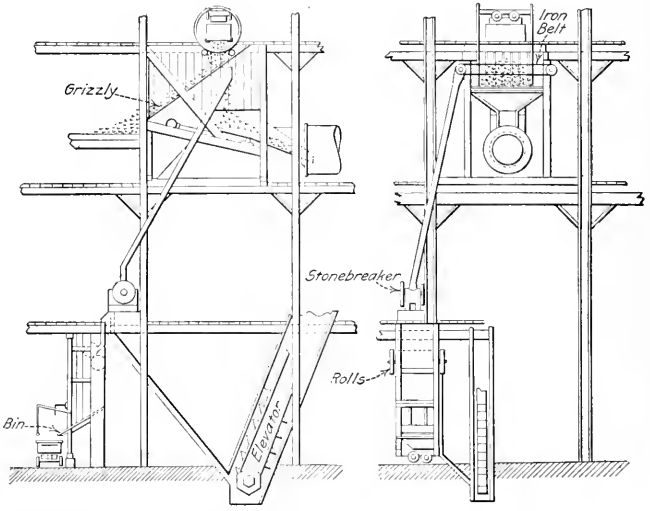

FIG. 9. CLAUSTHAL SAMPLING PLANT

are eight iron bearers or girders. The diameter is 5 m. and the incline of the face varies between 1.10 and 1.15. It makes about 0.6 r.p.m. The whole plant as it works today gives satisfaction; 76.56% of the lead is saved and 81.54% of the zinc. The lead is concentrated to 73% and the zinc to 54.60%. The marketable lead ores have 3% of zinc and the marketable zinc ores 2% of lead.

Electrically driven pumps are employed to pump back the water after it has been cleared in large tanks. Two cu.m. of fresh water is used per minute. The total power used in the dressing plant is 688 hp. Like other modern installations, the Clausthal plant has a mechanical sampler. This was erected in 1911. Under the 100-mm. grizzly, where the crude ore from the mine is first treated, there is an endless belt. This takes about 20 kg. from each truckload and passes it down a pipe into a small crusher, which breaks it to 16 mm. This crushed material falls in equal parts into two launders. One part is returned to the floors by aid of an elevator, while the other part is crushed in a small mill and falls into a bin. After each shift the bin is emptied and the sample reduced to 1 kg. A monthly average sample of this material is analyzed. It is taken into consideration that the material over 100 mm. does not enter the sample. The plant uses 7 hp. In Fig. 9 is shown a sketch of the sampler.

At the Silbernal mine, near Grund, the middlings from the wet concentrator are being treated by the Murex magnetic method. This is a combination of the oil-flotation and magnetic processes. It has been described by Messrs. Achenen and Jungst in their book on ore dressing. Grund lies about five miles from Clausthal. The ores contain a considerable amount of heavy spar. The material under 3-4 mm. is mixed with water to a thin pulp. To this is added a composition of magnetite, paraffin oil, goudron and colophonium. The whole mixture is deposited in a cylinder, 1240 mm. in diameter and 2780 mm. long, which is revolved at the rate of 50 r.p.m. The cylinder contains 150 kg. of steel pieces of 4-6 mm. diameter and 150 kg. of pebbles (10-15 mm.), which serve to mix the oil and ore more intimately. The mixture flows from the cylinder through a 2x4 mm. screen on to a shaking table which has a magnet at the bottom end. The magnet lifts the magnetite and with it the oil and galena. The heavy spar and gangue remain on the table.

It is interesting to note that the difficulty of clearing the water of slimes has to a great extent been overcome at Clausthal and Lautenthal by adding magnesium chloride to the water. At Lautenthal a 7% magnesium-chloride solution is used, one liter in 10 min. for every 3 cu.m. per min. slime water. The amount of insoluble matter in one liter was reduced from 0.35 to 0.14 by this method.

Civilian Engineers to Aid Army

Plans for having immediately available for the nation's service in time of war associations or societies of engineers, bridge builders, electricians, telegraphers and other trained experts in civil life, are being worked out at the Army War College in connection with the general reorganization scheme now being studied.

Secretary Garrison said on Aug. 30 that he had received suggestions from the American Institute of Mining Engineers, the Electrical, the Civil and the Mechanical Engineers that the organizations might be of use to supplement the army engineer corps, should the need arise. William Barclay Parsons, of New York, and Elmer L. Corthell, of Massachusetts, representing many engineering societies, called upon the secretary on Aug. 30 to tender formally the services of the organizations.

Mr. Garrison obtained from them written suggestions as to ways in which the engineers in civil life could be useful, and the whole matter was turned over to the War College for the framing of a definite plan. The War College will submit a detailed report on the scheme, which probably will be included in the Secretary's report to Congress this winter.

Montana Power Construction Progress

Special Correspondence

John D. Ryan, president, and officials of the Montana Power Co., which is owned by interests closely allied with the Anaconda Copper, have made an inspection of the different power plants of the company. The party arrived at Great Falls in time to see water turned over the big dam built across the Missouri River by the power company, the dam having just been completed. The company is practically ready to furnish the energy to the St. Paul R.R. for its electrified system, the contract calling for the delivery of the power by Oct. 15; but the company could have delivered it Sept. 1. The transmission line between Great Falls and Anaconda was connected a few days ago, and the work on the line to Two Dot is going on satisfactorily.

The big power dam at Great Falls is 1340 ft. long and its construction required 216,000 cu.yd. of concrete, to make which 1,000,000 sacks of cement was used. Three million feet of lumber, board measure, was used, and 6,000,000 lb. of reinforcing steel and 1,250,000 brick went into the structure. In all, 11,000 carloads of material went into the river to make the dam.

At Thompson Falls, in the western part of the state, work on the power plant is making rapid progress and will be in full running order by next winter. Two of the six units are already generating power. "When completed we expect to produce with our six units at Thompson Falls 50,000 hp.," said Mr. Ryan. "The main use of the electricity will be of course that of supplying the new electric system of the St. Paul R.R. Then we will supply the Cœur d'Alene mines, which we are already doing in part. We are, however, still in the market with our power, since we will have a great deal to spare." The Montana Power Co. owns practically all the important power plants and light plants in Montana, and under the plans of Mr. Ryan, the late John G. Morony, and the company's efficient managing expert, the late Max Hebgen, the power system in the state is being developed to a point where it will be second only to mining in industrial importance. It is already supplying power and light to Butte and all the Butte mines.

At a Conference of Representatives of the Russian Gold-Mining Industry on May 7 it was decided to address a petition to the government for the establishment of a concern to manufacture cyanide of potassium.

The Steel Headframe at No. 9 Shaft, Republic Mine, Vulcan, Mich.—II

By Floyd L. Burr*

SYNOPSIS—Continuation of description of a modern steel headframe. Details of steel work and foundation taken up in this section. Complete costs of erection are given.

The height of the structure depended upon the necessary elevation of the skipsheave, and this was fixed by considering the elevation of the extreme top of the skip at its "full dump" position and allowing for about 12 ft. overwind. The position of the top of the skip depended of course upon the horizontal east-west position of the inadequate in capacity and height, so the design of a larger and improved type of skip in use at one of the shafts at Vulcan was adopted as the basis of design for the headframe and the old skip was reconstructed to fit the new dump.

The elevation of the skipsheave, as determined by the conditions previously outlined, was 73 ft. The cagesheave was about 10 ft. higher. Allowing for plenty of headroom for tackle and handling of sheaves brought the lower flange of the trolley-beam crane up to an elevation of about 97 ft. The ladders extend up to an elevation of about 102 ft.

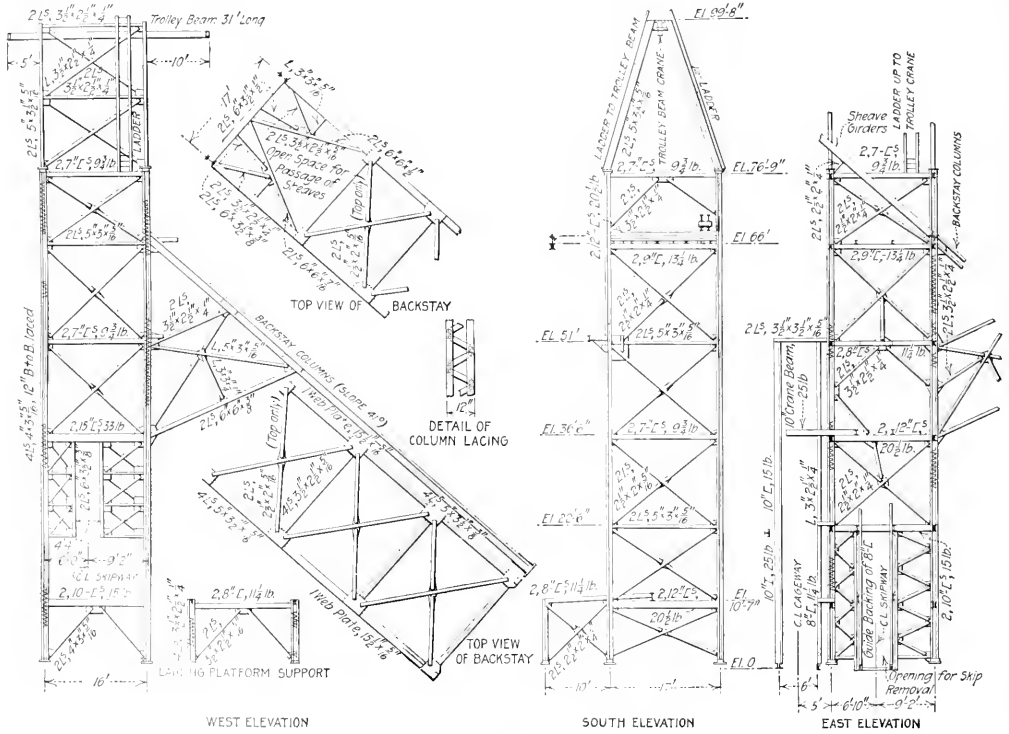

FIG. 7. DETAILS OF STEEL HEADFRAME REPLACING WOODEN STRUCTURE AT VULCAN, MICH.

car (or the discharge from the hopper); the height of the car; the necessary steepness of slope for the bottom of the hopper or chute; the profile of the dumping guides; the necessary steepness of slope for the bottom of the skip box in "full dump"; and the height of the frame and other features of design of the skip.

It was thought that the old skip, which was and is yet in use, might at some time in the future prove

The dump hopper or chute was given careful consideration and required a large quantity of steel. Its construction is of $\frac{7}{16}$-in. steel plates stiffened by 6-in. 8-lb. channels and provided with lining or wearing plates of hard steel $\frac{3}{4}$ in. and $\frac{1}{2}$ in. thick. These plates are in narrow units to promote economy in replacement when worn out. Two small platforms are supported at the outer end where a workman may stand with tools to reach into the chute in case large chunks of ore should choke the opening. The opening is so ample, however,

*Vulcan, Mich. Formerly structural engineer, Republic Iron Co.

that such choking should seldom occur. The platforms are reached by means of ladders from the landing floor. The lower portion of this chute is made so that it may be readily removed to allow for a larger and higher car in case such a car should be needed in the future. The weight of this hopper or chute and its live load is supported largely by suspension from the heavy girt-girder just above. This girt is made up of two 15-in. channels and the suspenders are each two angles 6x3½x⅜ in. attached to the web of the girt by means of gusset plates. The whole affair is thoroughly braced.

The wooden guides of the cageway and skipway are attached to vertical supporting members consisting of an 8-in. channel with an angle riveted to its web for stiffening in the plane normal to the web.

A clear opening about 20 ft. in height is left in the lower panel on the east side opposite the skipway to allow handling the skip in and out.

To avoid danger on the ground around the shaft from falling chunks of ore as well as the usual dangers of an open shaft, the skipway is inclosed for about 36 ft. of its height in a sort of box made of $\frac{3}{16}$-in. steel plate. The lower 20 ft. of plate on the east side is removable for taking the skip in or out.

To furnish necessary clearance for the take-on ropes the diagonal braces were replaced by knee braces in the middle panel on the east side. The take-on balance guides consist of two 6-in. I-beams standing on the south side of the tower and tied to the various girts. They reach from the ground up to an elevation of about 70 ft., where small headsheaves are located. From these sheaves the ropes lead horizontally in a diagonal direction over to small vertical sheaves. Going over these sheaves they descend vertically to elevation about 37 ft. where they pass under vertical sheaves and cross horizontally over the center of the skipway to their fixed-end support on the west side of the headframe. The sheaves mentioned are supported by various cantilevered beams.

The large headsheaves are supported upon a series of girders made up each of two 12-in. 20½-lb. channels, ¼ in., back to back. All the girders are in the one inclined plane, are laterally tied together and braced by plates riveted to the top and bottom flanges. These plates extend across wherever they may do so without interference with the sheave wheel or ropes.

It should be mentioned that an error was made in the calculations whereby insufficient allowance for eccentricity was given and consequently these sheave girder struts as designed were too light and weak, and do not possess the same liberal factor of safety that the rest of the headframe has.

For the support of the bearings, plates are riveted to the top and bottom flanges of the girders and the usual bolts pass through the pillow-block casting and through the two plates, thus clamping the bearing to the girder. For the purpose of resisting the principal stress, which is of course longitudinal or parallel to the girders, other plates are riveted on the top of the upper plate, forming by their edges an end bearing for the castings. Of course the riveting of these plates had to be calculated to resist maximum stresses. An open space of about 1½ in. was left at each end of the bearing casting to be filled up by steel wedges for adjusting purposes.

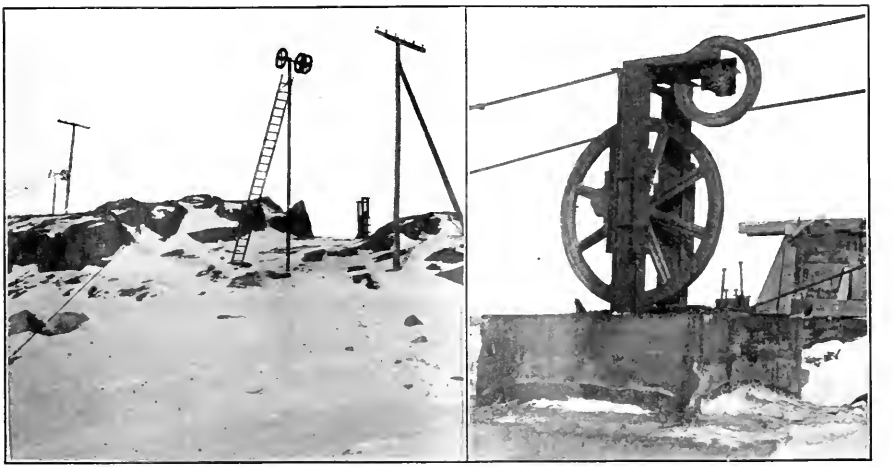

FIG. 5. ANGLE-SHEAVES AND IDLER PULLEY SUPPORTS

The bearings of the sheaves are 45° angle boxes of a special design (see Fig. 6). They are peculiar in that they are so designed as to retain all excess oil and deliver it through a hole tapped for 1½-in. gas pipe into whatever receptacle is desired. This feature was suggested by our experience with other headframes where all the upper portion of the structure is fairly drenched with oil that has dripped and blown away from the sheave bearings.

The trolley crane consists of two 12-in., 20½-lb. channels rigidly suspended from the framework by plates riveted between the two webs.

The power transmission ropes lead down through the south side of the tower portion of the headframe to a small concrete structure which contains and supports the haulage machinery. One man, called the lander, exercises the necessary supervision incident to receiving the skip loads of ore and operates the haulage drum. The operating floor of the lander's house is at the same level as the landing floor and is in immediate proximity to it.

This building rests upon the ground and in its lower story is a small space where the timber lander may go to keep warm or to avoid the weather. A stove in this lower room heats the whole building.

The building is constructed with a reinforced-concrete frame and floors cast monolithically, with hollow or air-spaced cement-plaster-on-metal-lath curtain walls. Plenty of large steel-sash windows admit light and ventilation and enable the lander to see in daytime the various points of destination of the transfer car. The machinery is provided with an indicator dial, however, so that sight of the car is not essential for its operation.

Loads and Stresses

In the design of the various parts of the structure for strength, the backstays and their bracing were given first place in view of their carrying the greater part of the hoisting stresses. In general the idea was to produce with consistent economy a structure of ample strength to withstand safely such extreme conditions as might reasonably be expected. Steel was used freely in the backstay members, lavishly in the dump-hopper region and rather sparingly in the four vertical columns and diagonal bracing.

The skip, which was and is yet in use, was of about three tons capacity and was handled by a 1⅛-in. hoisting rope. It was thought possible that at some future time a larger skip, possessed of some weight-adding and height-increasing improvement features, might be wanted and so the headframe was designed to provide for such a condition.

Accordingly, the backstays were designed to withstand the stress produced by the breaking of any one of the four ropes while the other three ropes were carrying their working loads. For the skip and for the cage there was assumed a 1¼-in., 6-strand 19-wire "extra strong cast steel" rope of 116,000 lb. ultimate strength; for each of the two balances, skip balance and cage balance, a ⅞-in. similar quality rope of 60,000 lb. ultimate strength. A maximum working load of 27,000 lb. was assumed for the skip made up as follows: Empty skip 8000 lb., load of ore 12,000 lb., weight of rope 7000 lb. The working load for the balances were taken each as 12,000 lb. The ultimate strength of the ropes was taken as 104,000 and 56,000 lb. net after reduction for bending stresses.

The resultant loads from the four ropes were found to be: 137,000 lb. for breaking the 1¼-in. rope; 74,000 lb. for breaking the ⅞-in. rope; 36,000 lb. for working load on the 1¼-in. rope, and 16,000 lb. of working load on the ⅞-in. rope. For the severest conditions arising from the possible combinations of these stresses there was allowed for the purpose of design a stress of 121,000 lb. for the east and 84,000 lb. for the west column.

No allowance was made in the columns for wind stresses. The following was taken for the basis of design: Allowable per square inch compressive stress 16,000 lb. $-70\ \frac{l}{r}$, allowable tensile stress 16,000 lb; maximum $\frac{l}{r} = 100$ for primary compression members and 140 for secondary compression members.

In determining upon the section for these columns, consideration was given to the fact of the long unsupported (in vertical plane) span which would put some bending load upon the columns because of their own dead weight. To give them stiffness in the vertical plane, the plate and angle section was chosen and a depth of 16 in. allowed. They are made up of a $\frac{5}{16}$x16-in. web plate and four 5x3½-in. angles. The thickness of these angles was made $\frac{5}{16}$ in. for the west column and ⅜ in. for the east column. In order to give lateral support and stiffness to both flanges of these columns, latticed angle girts were used. On account of the prime importance of this backstay portion of the structure, the minimum thickness of material was limited to $\frac{5}{16}$ in. The bracing in the upper panel was designed to transfer the sheave-girder stress to the two columns, thus largely relieving the lateral girder from bending stress.

The design of the vertical tower portion of the headframe involved the dead weight of the structure itself, including the considerable weight of the concrete floors, loaded car, the non-measurable but serious pounding effects of ore dumping, the wind load, and various minor loads. From the combination of these various loads, the four vertical columns were designed to resist at their lower ends each a load of about 90,000 lb.

It was recognized that the operations of the hoisting, dumping of the skip and running the transfer car would tend to produce much jar or vibration—particularly the dumping. The effect of this might be very pronounced on account of the small width of the structure. It was accordingly decided to introduce a considerable amount of vibration-absorbing mass by inclosing the lower 40 ft. of the length of the columns in prisms of concrete. No computation was attempted for this feature, but the prisms were made as large in section as available space would permit, being cast 30 in. square; 36 yd. of concrete was required. Lengths of old wire rope were stretched up in each, near the faces, to act as longitudinal reinforcement.

In view of the incidental reinforcing effect of these prisms the section of structural steel for these columns was made rather light and consisted of four angles 4x3x$\frac{5}{16}$-in. latticed 12 in., back to back with 2¼x$\frac{5}{16}$-in. bars.

Many of the girts act also as girders and were designed for their local load conditions. The other girts were designed to suit the specification by which the value of l/r must not exceed 140, the stresses to be resisted being usually too small to require so large a section.

Foundation

The foundation conditions for the structure were good. Solid rock ledge came nearly to surface at the site of the backstay piers. Excavation of loose material was made and some holes drilled down into the rock. Into these holes were anchored some steel rods reaching up into the pier. Four 1¼-in. anchor bolts, bearing against a suitable anchorage grill near the bottom of the pier, attach the base plate of the column firmly to the pier. These piers were made 4 ft. square at the top, with vertical sides and front faces, and with back sloping at about 40° with the horizontal slightly flatter than the columns. These two piers were cast after the erection of the steel structure. It was intended to cast them in preparation for erection, but unexpected conditions prevented. As far as the erection of the steel backstays was concerned there was no disadvantage in thus casting the piers after erection of the steel.

The ground sloped so rapidly upward to the south of the shaft as to bring the top of the backstay piers some 15 ft. higher than the tower piers, thus saving materially in the length of the backstay columns.

The rock ledge was covered in the region of the shaft to a depth of from 6 to 11 ft. with a mixture of boulders and fine ore. The piers for the four main vertical columns were made 4 ft. square and, in case of three of them, reached down with the same section to a rock bearing. The other pier rested at 10 ft. depth on a compact broken rock material of good bearing value and was spread out at the bottom to a footing 5 ft. square. In connection with this concrete work it was planned to line the shaft from ledge up to surface with concrete and to construct a concrete pavement to extend in all directions for a considerable distance from the shaft. It is to slope away from the shaft and is intended to do away with the unsightly mud hole so often found around shaft collars.

Erection of Headframe

The fabricated steel arrived in April and on July 7 work was begun to dismantle and demolish the old wooden structure (see Fig. 1), the regular mine surface force doing the work. After moving sheave wheels, dump plates, and a few other movable parts, the posts on the west side were sawed through and those on the east were actually removed for a few feet in height. Next the skip rope was made fast to certain members in the heart of the structure and the hoist started to wind up the rope, pulling the structure over toward the east.

Meanwhile the foreman of the erection gang and some of his men began the preparation of tackle, gin pole, etc. The first column piece was grappled July 10, at 9:30 a.m. By Aug. 1, all of the tower portion and the upper section of the backstays had been erected (on bolts). The steel headframe during construction and completed is shown in Fig. 9. On Aug. 4 the gin pole was taken down for good after having erected the lower section of the backstays from a new position on the ground. No work was done on Sundays.

After the removal of the gin pole there were still some hand railing, "take-on" members, floor beams, guide-backing channels, etc., to put up. These were all in place by Aug. 6, with the exception of some hand railing which required refitting. Aug. 7 and 8 were spent in installing sheaves.

This erection work was done by a force organized and described as follows:

One foreman, four sky men, three ground men, one hoist man. Steel members were hauled to the site slightly ahead of erection by five men and a team. The steel had previously been unloaded from the cars and spread out systematically over available areas at some distance from the shaft. The foreman and two sky men belonged to the "trestle gang" at the Vulcan mine and were possessed of the advantage gained from their general experience in wooden headframe work and in addition, the special experience of employment in the erection of two large steel headframes at Vulcan. They did excellent work. The remainder of the gang were local men who were handicapped by entire lack of experience in such work.

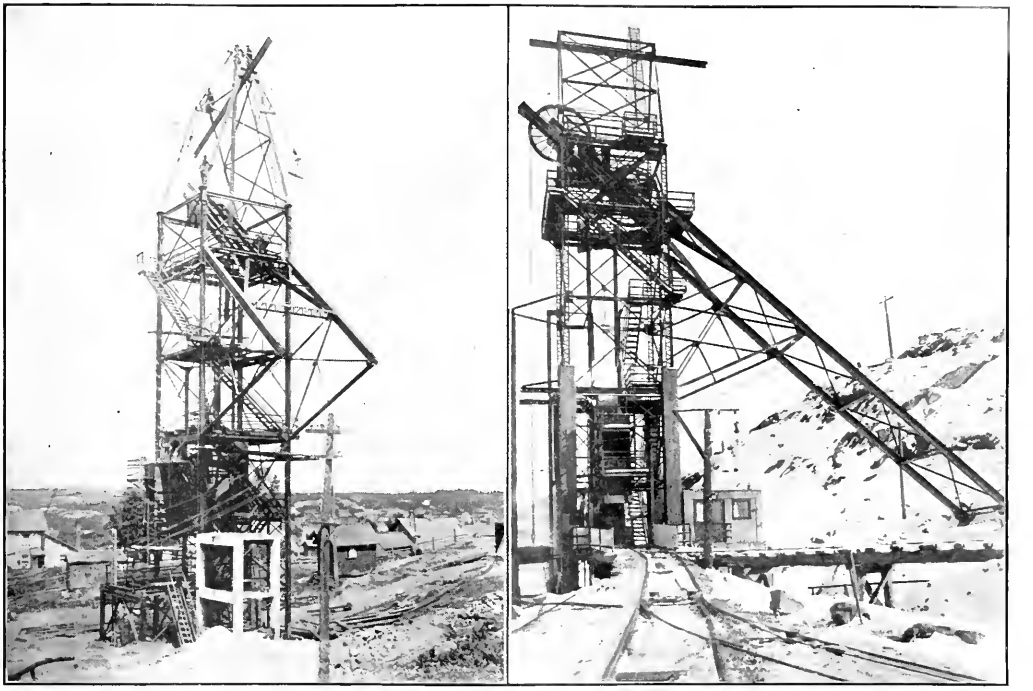

FIG. 9. NEW STEEL HEADFRAME DURING CONSTRUCTION AND AFTER COMPLETION

However, their spirit was most commendable and they became very valuable as they gained experience. An electric hoist was used during erection for all hoisting purposes and was found to be very satisfactory.

The wooden treads of the stairs were assembled with stringers on the ground and the completed flights installed as soon as the supporting framework was ready for them, thus helping greatly to facilitate safe travel up and down during erection.

Riveting was begun July 15 with two gangs of three men each, using pneumatic riveting hammers. On account of the entire inexperience of these men, progress was not at all satisfactory and from Aug. 11 to 15 a third gang was put on to hurry the work along. All riveting was completed by Aug. 20. This work, as well as the erection proper, was under the direction of the foreman above mentioned.

The foreman was on the job from July 7 to Aug. 20, while his two sky men from Vulcan were there from July 8 to Aug. 8. The local force continued after Aug. 20 to adjust sheaves, install wooden guides, construct concrete floors, rebuild tram-track trestle, complete lander's house, etc. Resumption of ore production began Aug. 25 with much finishing-up work still undone. The shaft was thus closed for seven weeks.

As soon as it was convenient, the structure was given two coats of paint—first coat, green; second coat, black.

Idler-Pulley Frames and Small Angle-Sheave Frames

The change in the line of the ropes from the headframe to hoisting house, explained earlier in this article, involved the construction of many new idler-pulley frames for supporting the weight of the ropes and several angle-sheave frames for carrying the ropes through small vertical angles at the various humps on the hill. It was desired to construct them in a substantial and permanent manner.

For the angle-sheave frames, simple steel structures embedded in ample bases of concrete were constructed and seem to serve the purpose well. The deflection angle being small, very little load is exerted by the ropes upon the angle-sheaves, thus allowing the structure to be a very simple and light affair. The illustration (Fig. 8) shows one of these structures carrying an angle-sheave for the skip rope and an idler wheel for the cage rope. This structure is located at the brow of the hill and the hoisting ropes have no intermediate support between this structure and the headframe—a span of about 220 ft. On page 312 of the *Journal* of Feb. 14, 1914, there was published a photograph and a short description of another one of this series of angle-sheave frames.

For the idler-pulley frames (see Fig. 8), masts of scrap boiler tubes were set in holes dug into the rock ledge or in small concrete piers where the rock was not in evidence. Wheel axle shafts of 2-in. double strength pipe were put through holes in these tubes and carried the idler wheels. Where high masts were needed, they were stiffened by guys made of discarded wire ropes. A number of different details are possible in this general design. There was also a view shown in the *Journal* of Feb. 21, 1914, p. 415. Some of these structures made use of old 4-in. boiler flues, while in other cases discarded drill columns were used. In case of the boiler flues, advantage was taken of the fact that a 4-in. standard pipe just telescopes over a 4-in. boiler flue, and the axle shafts were attached to the short lengths of 4-in. pipe instead of to the flue itself. Then the pipe was slipped over the flue, being made rigid by means of setscrews.

Costs of Head Frame

An attempt to give a complete and intelligible record of classified costs of all the features mentioned in this description would not be very satisfactory since the conditions would not be readily understood by the reader.

UNLOADING AND STORING FABRICATED STEEL READY TO HAUL TO ERECTION SITE

	Total supplies		6618 03
	Total labor and supplies		$8402 44

Accordingly I shall confine myself to the structural steel frame proper and its erection, leaving out entirely such related matters as administration and engineering costs, traveling and boarding expense, cost of tools, tackle, electric power, new sheave wheels, concrete foundations, floors, lander's house, etc.

The items covered will be the structural steel delivered by the steel company, steel used in alterations, paint,

and the labor of unloading, hauling, erecting, riveting and painting.

It is not to be understood that the items left out are of small importance. On the contrary they are very considerable, but by reason of their indefiniteness to one not familiar with local matters they would not be of much value for purposes of comparison or estimate. No special economy is claimed, but the cost figures are given rather as a simple statement of the actual cost of work done under average local mine conditions by mine forces of average ability.

The detail drawing and fabrication of the steel work were done by the structural department of the Cambria Steel Co. Erection of the steel headframe was carried on under the direction of P. Sala, foreman. The general design of the headframe and the accessories were made by the writer, who also exercised a general supervision over the erection, aided by R. B. Wallace, the local engineer for the Republic Iron Co.

Quartz Mining in Fairbanks District, Alaska

SPECIAL CORRESPONDENCE

The revival of interest in quartz mining, especially in the Fairbanks Creek portion of the district, is, aside from the Tolovana, the most important development of the year. The erection of the Heilig custom mill was largely responsible for this improvement. The little Huntington mill has proved to be too small, however, and it is planned to install a 7-ft. Lane chilean mill during the summer. This, it is hoped, will give the plant a capacity on the soft Fairbanks Creek ores of about 40 tons a day.

Huddleston Bros. & McNeil have a 100-ft. shaft on a 4-ft. vein at the head of Too Much Gold Creek; in order to avoid the necessity of pumping at greater depth they plan to drive a 600-ft. cro-scut adit. The vein has been traced on the surface for nearly a mile. The operators are building a road to the Heilig mill and will crush 375 tons of ore as soon as the mill is in condition to handle it. Previous runs on picked ore returned about $10 a ton. The richest ore in the Fairbanks Creek belt is at the Mizpah mine, owned by Thompson, Geis & Hess. The last mill-run returned $80 a ton. Most of the ore is free-milling, but rich silver-bearing lead carbonate is reported to have been found at one point. The mine has recently been equipped with boiler and hoist and is prepared to yield a good tonnage as soon as provision can be made for milling operations.

Shaeffer, Golden & Van Orsdale, on placer claim No. 16 Above Discovery, have sunk on what is thought to be the extension of the Mizpah vein. Although the ore is very rich the vein is smaller than at the Thompson-Geis-Hess workings. Stevens, Boyd & Kleinschmidt, lessees on the Mayflower claim, have more than 300 tons of ore ready for milling. The shaft is down 60 ft. Owing to the decomposed nature of the rock, both vein and country, no powder has yet been used, three men mining and hoisting 15 tons of ore a day with ease. The operators estimate that they have exposed between 4000 and 5000 tons of ore of an average grade of $15. The Crites & Feldman 5-stamp mill on Moose Creek is running 10 hours a day. The most important vein on the group of claims embraced in the Crites & Feldman holdings is developed by two adits, one 100 and the other 700 ft. long, most of the ore now coming from the longer tunnel. Foss & Farvin have driven 500 ft. on the McDonough & Mathews ground, lying at the extreme head of the creek. A 75-ton shipment crushed at the Burns mill showed the ore to be of a fair milling grade.

Although the most important recent developments are those on Fairbanks Creek, there is considerable activity in lode mining in other parts of the district. The Rhoads-Hall mine on Bedrock Creek, which is credited with a total production of considerably more than half a million dollars, is employing 25 men and the mill is running night and day. Martin Harris plans to build an arrastre, run by water-wheel, on the Moonlight claim, near Skoogy Gulch. Tyndall & Finn, in the Ester Creek belt, are driving a crosscut adit to tap an 8-ft. vein at a depth of 350 ft. About 700 ft. of driving is required, of which over 600 ft. has been completed. If values at depth are comparable with those found nearer the surface, a mill will be installed on the ground. Some prospecting has been done by contract at the Newsboy, but nothing of value appears to have been found.

Talc and Soapstone in 1914

The United States produces more talc and soapstone than all the rest of the world combined, this industry having nearly doubled in this country in the last decade. According to J. S. Diller, of the Geological Survey, the marketed production in the United States in 1914 was 132,296 short tons, of which 118,479 tons were ground, 17,824 tons were manufactured into various articles, such as crayons, gas tips, laundry tubs, etc., 2913 tons were sawed into slabs and 3080 tons sold in the rough state. The production in 1914 decreased about 2% from that of 1913 when 135,833 tons were produced.

New York, by reason of its large output of fibrous talc for paper making, continued to lead all other states with a production of 86,075 tons valued at $821,286. Vermont was second in point of production with 50,698 tons, but Virginia's output of 21,687 tons exceeded it in value, because the Virginia production is principally manufactured soapstone products. The output in New Jersey and Pennsylvania declined to 7732 tons and in North Carolina to 1198 tons. There was a small production in Georgia, Maryland, Massachusetts, Rhode Island and California.

Prices in the United States averaged $5.83 per ton in the rough, but some of it sold as low as $2 per ton; ground talc brought from $5 to $10 per ton; manufactured articles in 1914 averaged $27.98 per ton. Imports of ground or manufactured talc in 1914 amounted to 15,734 tons as against 13,770 tons in 1913. The principal importing countries were: Italy, 5535 tons; Canada, 5006; France, 4398. Smaller quantities were received from Austria-Hungary, England, Germany, and Japan. The imported talc is chiefly of the higher grades, ranging from $5. for the cheapest French talc to $112 for a special shipment from Germany.

Oil Possibilities near Vicksburg, Miss., forms the subject of a recent press bulletin of the U. S. Geological Survey which has made an investigation in Warren and Yazoo counties. The attitude of the rock beds is obscured by the recent deposits in this region and while no anticlines were noted, there are two monoclinal folds that offer favorable areas for the accumulation of oil or gas. A detailed report, with maps, is now in preparation by the Survey.

Details of Practical Mining

Improved Safety Door for Dump

By H. H. Hodgkinson*

The safety door illustrated in the accompanying sketch has proved to be an improvement on the one described in the *Journal* of Dec. 12, 1914, though it is operated in the same manner. As will be seen from the illustration, the advantage lies in the fact that this door, on account of its construction, opens at each end, thus permitting a car to dump in the chute from either direction without the use of a second door or the necessity of unfastening the hemp rope.

By means of the rope *A* the door is opened and closed for cars approaching in that direction, while the rope *B* operates the door for cars from the other direction. Fig. 1 shows the door being opened by rope *A*, Fig. 2 by rope *B*.

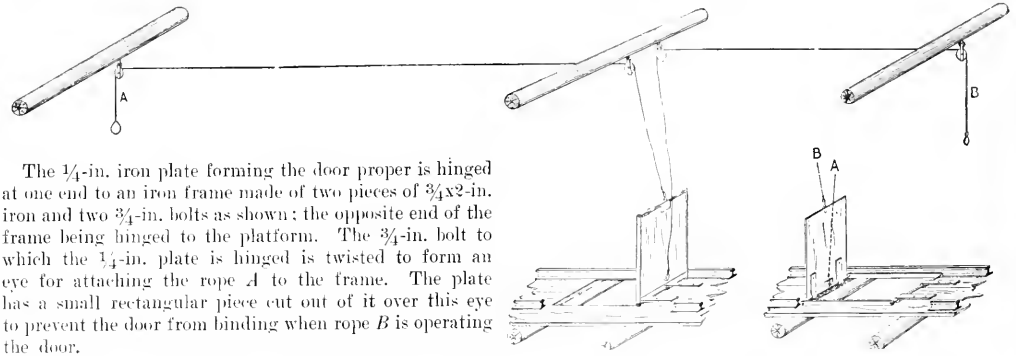

Fig. 1 Fig. 2

FIGS. 1 AND 2. CHUTE DOOR FACILITATING DISCHARGE OF CAR FROM EITHER DIRECTION

The ¼-in. iron plate forming the door proper is hinged at one end to an iron frame made of two pieces of ¾x2-in. iron and two ¾-in. bolts as shown; the opposite end of the frame being hinged to the platform. The ¾-in. bolt to which the ¼-in. plate is hinged is twisted to form an eye for attaching the rope *A* to the frame. The plate has a small rectangular piece cut out of it over this eye to prevent the door from binding when rope *B* is operating the door.

The frame measures 22x36 in. over all, which permits the door to work nicely between the rails of a 2-ft. gage track.

The two hemp ropes *A* and *B* hang down from their respective pulleys about 5 ft. to permit enough slack rope for the door to fall back on the platform when opened from either direction.

*Mining engineer, Franklin Furnace, N. J.

Turbo-Blowers and Turbo-Compressors

Basically considered, turboblowers and turbo-compressors are similar machines, except that the former are used for low pressures and the latter for high pressures. Both classes of machines are therefore constructively different with reference to the number of stages and the delivery volume. Usually the turbo-blowers and compressors of today are built on the principle of the centrifugal pump; that is, the gas to be compressed is conducted in radial paths. Among the few designs that depart from this arrangement is the Parsons, in which the flow direction, as in steam turbines, is axial.

It is difficult to define the boundary between turbo-blowers and turbo-compressors. All turbo machines used to supplant reciprocating blowers should be called turbo-blowers.—*Power.*

Stripping with Dragline Excavators

The Balkan pit of the Verona Mining Co., at Alpha, Mich., is oval in shape. When the stripping is completed its long axis will be about 1200 ft., its greatest width about 700 ft. and the depth will run from 86 ft. to 107 ft.

The machines used are a Bucyrus class-24 dragline excavator with an 85-ft. boom and a 4½-yd. bucket and a Marion model 261 of the same size. Both machines are mounted on skids and rollers. They travel on 4x12-in. planks 12 ft. long, placed 4 wide on each side of the machine. Dragline operation was started in 1914, and is approaching completion at the present time.

The two dragline excavators have been used on opposite sides of the pit, for the most part on different levels. The incline is a continuous spiral, the grade being about 2.6 per cent. with 35-deg. curves and slopes at 2 to 1.

The sharp curves, as well as the heavy grades from the lower levels which have been necessitated by the small diameter of the pit, have rendered it impossible to use standard-gage equipment. Consequently narrow-gage, 4-yd. cars are used. Inasmuch as the large buckets of the draglines could not load cars of such small capacity without a considerable amount of spilling and the consequent danger of derailments, large hoppers are used under which the trains are run. This method has proved most satisfactory. Instead of lining these hoppers with sheet iron, hard maple has been used, as this has been found to offer a better sliding surface for the sticky material encountered.

On the first or top lift, each dragline was served by three trains made up of ten 104-yd. cars each, but at the present time the contractors are using 9 trains and 12 locomotives, three of which are used as pushers on grade out of the pit.

The output of the draglines has been most satisfactory and has compared very favorably with steam-shovel operation on the Mesabi range. The material, however, is ideal for dragline work. The upper portion of it is a quicksand which when drained is easy to dig. Before operations were started, a small creek ran across the pit. The waters of this creek have been diverted, but the bed contains a rather heavy gravel formation. On the northern end of the pit deposits of blue clay, gravel and hard-pan have been found, while gravel and hard-pan exist under the sand at the southern end. The machines are swinging through an arc of about 180 deg. and making a cycle in about 40 sec. The output of the draglines depends of course to a great measure on the car service. The best monthly output for both machines, working two 10-hr. shifts, was 207,184 cu.yd.; the best daily output for both machines working two 10-hr. shifts is 2670 4-yd. cars. The best record for one 10-hr. shift was 800 4-yd. cars, made by the Bucyrus machine.—*The Excavating Engineer,* August, 1915.

Proportion of Fatal Accidents in Metal Mining

In an investigation as to the best means of insuring a diminution in the number of accidents in the mines of Australia, particularly in New South Wales, the 1914 report of the Royal Commission on Mining Industry at Broken Hill states that the fatal accidents in metalliferous mines, in the year 1911, in New South Wales, were 1.81 per thousand of men employed, which was only exceeded in Australia by the number of fatal accidents in Western Australia, which were 2.33 per thousand men employed. Comparing these with the fatal accidents in metalliferous mines in other countries for the years 1909 and 1910, it is stated that only four countries had a larger number of fatal accidents in metalliferous mines per thousand men employed than these noted. These are: France, 3.16; Spain, 3.35; Transvaal, 4.29; and the United States, 4.19.

Oregon and Douglas Fir and Redwood

The term "fir" is applied to the most common wood of the Pacific Northwest. Scientifically it is a bastard spruce, first named by Douglas. Locally it is known as fir or Douglas fir, and distinction is sometimes made between yellow and red fir. These come from the same kind of tree, the yellow fir being most common. The large trees yield yellow fir, while the wood from smaller trees is apt to show a reddish tint. Sun exposure also appears to affect the color to some extent. In California the wood is termed Oregon pine. This wood is strong, and can be obtained in long lengths. Mill run of commercial sizes probably averages over 20 ft. in length. It contains pitch, which forms in seams and pockets, normally occurring even in commercially clear wood within certain limits. The trees usually yield less than 25 per cent. of wood free from sap and knots.

Redwood grows on the Pacific coast from Santa Cruz north into southern Oregon. By reason of the average large diameter of the trees, the logs are cut shorter than in the case of fir, and the commercial mill run averages about 16 ft. in length. The wood is not so strong as fir. About 50 per cent. of the wood cuts up clear and free of sap.—D. C. Henny in *Engineering News,* Aug. 26, 1915.

Keeping Conveyor Belt Records

A new method of recording the cost of various conveyor belts in operation has been worked out by the B. F. Goodrich Co., of Akron, Ohio, in the interest of all belt users.

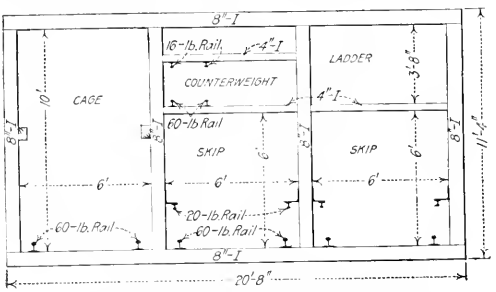
Ordinarily, accurate costs are rather difficult to determine, and many people have not the time to work out an adequate system for making computations. The use of various belts, however, is an important factor, and many a dollar can be saved when it is known where to cut down the tonnage cost.

The card record in question, which is mailed free on application by the Goodrich company, is simple, but most efficient. It will help to stop the small leaks where profit continually slips out.—*Coal Age.*

Sinking New "C" Shaft at the East Norrie Mine

By B. G. Best*

Several years ago the Oliver Iron Mining Co. decided to sink a new shaft on the East Norrie property at Ironwood, Mich. As finally accepted the plans called for a shaft to meet the following requirements: Size, outside timbers, 11 ft. 4 in. by 20 ft. 8 in.; number of compartments, 6; sets, steel, placed 5 ft., center to center; lining,



PLAN OF "C" SHAFT, EAST NORRIE MINE

reinforced-concrete lath; inclination, 64 deg. from the horizontal.

The shaft was located about 250 ft. back of the foot wall in the quartz slates, which dip at an angle of about 64 deg. at this point.

On Dec. 2, 1912, work was started with the following crews: Three gangs of shaftmen—6 miners and 2 helpers—working 8-hr. shifts, 17 shifts per week; 4 fixers, or timbermen, working 10 hr. day-shift only; 4 landers—2 on each 12-hr. shift; 2 hoisting engineers; such men as were necessary from time to time making concrete lath.

The miners drilled, blasted, mucked, placed the steel sets, lath and bearers, cut hitches for the bearers and cut and timbered the stations. The timbermen took down the

*Care of Oliver Iron Mining Co., Ironwood, Mich.

concrete-lined steel, drilled bolt holes in rails and back runners and placed them and assisted the miners in placing the sets.

The rock was hoisted through the middle compartment on a 1-ton sinking bucket on a trolley. The timber and rails were lowered on a truck in the cage compartment. The smoke was drawn out of the shaft through a 10-in. galvanized-iron pipe by an exhaust fan on the surface.

The drilling equipment included 12 jackhamer machines and 12 sets of 72-in. by 7/8-in. diam., 4-point drills. Six of these machines were used in the shaft at one time, while the remaining six were being overhauled. The repairs on the machines were light, however, and during the greater part of the time the six reserve machines were ready for instant use. There were also four No. 3 Ingersoll-Rand machines used for cutting hitches and bearers.

The ideal cut consisted of fifty 6-ft. holes, but at times it was necessary to drill as many as 58 holes. The average time required to drill a round of holes under an air pressure of 65 lb. was 3 hr. At times, however, this work has been accomplished in 2½ hr. This is at an average rate of 16⅔ ft. per machine per hour, and a maximum rate of 20 ft. per machine per hour. A cut broke five linear feet of ground, or 1171 cu.ft. Thus, in 1 hr. one machine, under average conditions, drilled holes to break 64.9 cu.ft. of ground, and under the most favorable conditions 77.6 cu.ft.

The charge per hole was five or six sticks of 80 per cent. 7/8x8-in. Giant gelatin dynamite, or about 1¼ boxes per cut. Firing was done by battery. The first fired were the sink holes in the center of the foot-side of the shaft; after these the holes adjacent to the outer edge of the sink were fired. From four to six blasts were necessary to break the entire cut. Under average conditions 20 min. was required to charge and fire the holes for each blast and 20 min. for the smoke to clear out. By this method after the sink holes had been fired there were always two free faces, and the rock was thrown up against the foot-side of the shaft, making the mucking a great deal easier. The mucking of the dirt from a full cut required about 8 hr.

In sinking the shaft, 14 sets of bearers—four 12-in. by 17-ft. I-beams and two 12-in. by 35-ft. I-beams per set—were placed. The time required to drill hitches and place a set of bearers was 4½ eight-hour shifts.

Five stations, 10x22x17 ft., were also cut and timbered. Jackhamers were used on this work. A station was cut and timbered in 14½ eight-hour shifts, or at the rate of 35.7 cu.ft. per shift.

On Dec. 2, 1913, at a depth of 843 ft., the shaft met a 5x7-ft. raise from the 17th level—1213 ft. below the collar of the shaft. In 12 months the shaft had been sunk 803 ft. through quartz, slates and hard dike. During this time the miners and helpers had worked 5821 shifts in sinking and timbering the shaft, and had removed 188,063 cu.ft. of rock. This is at the rate of 32.3 cu.ft. of rock per man per shift of eight hours, and 13.1 cu.ft. per machine per shift. The average sinking speed per week, based on actual working time, was 18.8 lin.ft. In 713 shifts the men had placed 10 sets of bearers and cut and timbered three sections.

Stripping was commenced immediately and continued to a depth of 1198 ft., 15 ft. above the 17th level. The three crews of shaft men did the stripping, using jackhamers and No. 3 drills. Because of the inability to handle the rock on the 17th level, the stripping was delayed to some extent; but in spite of this the average weekly progress (actual working time) was 34.17 lin.ft., or 5.7 ft. per drill per week. Including lost time, time required for cutting hitches, placing bearers, cutting and timbering stations, the average speed was 25 lin.ft. per week.

The greatest progress for one month was made in March, 1913, when the shaft was sunk 105 ft. and one set of bearers placed. The men worked 589 shifts sinking and timbering, and 32 shifts placing bearers. This is at the rate of 24.2 lin.ft. per week; 5680 cu.ft. per week; 1.426 lin.ft. per gang per shift; 9.47 cu.ft. per drill per week; 41.75 cu.ft. per man per 8-hr. shift; and 55.7 cu.ft. per drill per 8-hr. shift.

The accompanying table shows the number of shifts worked on the different parts of this job, and also the average progress for the different operations:

Month	Sinking	Bearers	Stations	Stripping
December, 1912	244.0	.....	.....	.....
January, 1913	515.0	37.50	.....	.....
February	519.0	32.00	.....	.....
March	589.0	32.00	.....	.....
April	530.5	72.00	.....	.....
May	476.0	.....	165.00	.....
June	490.0	70.50	.....	.....
July	537.5	.....	79.00	.....
August	586.0	25.00	.....	.....
September	449.0	41.00	96.00	.....
October	577.0	25.00	.....	.....
November	522.5	44.00	.....	.....
December	30.0	43.25	130.25	334.00
January, 1914	.....	72.00	75.00	473.00
February	.....	29.75	.....	517.75
March	.....	.....	.....	88.00
Total number of shifts	5821.5	524.00	539.25	1,412.75
Linear feet	803	.....	.....	355
Cubic feet	188,063	.....	19,250	83,141
Lin.ft. per gang per wk.	18.8	.....	.....	.....
Lin.ft. per gang per shift	1.1	.....	.....	2.01
Cu.ft. per man per shift	32.3	.....	35.7	58.8
Cu.ft. per machine per shift	43.1	.....	.....	78.6

The first month there was 40 ft. of overburden. This is not included in calculating rate of progress; the figures represent rock work only.

Engineer's Emergency Level

Every engine room has the means at hand for the construction of the convenient and accurate level described herewith. It is so simple to make as to appeal to anyone (*Power*, Aug. 31, 1915).

It consists of a regular gage-glass, nearly filled with water, and with its ends plugged with putty or other suitable material of a cementing nature. The bubble can

LEVEL MADE FROM GAGE GLASS

be made as long as desired, depending on the work for which the level is to be used; and as the glass is straight the bubble will go the whole length of the glass if slightly elevated. The glass being round and usually reasonably straight, it can be turned over without affecting the location of the bubble or the accuracy of the level. Any suitable mark can be used at the middle to indicate when the instrument is level. This is not intended to supplant the regular level, but to serve in an emergency or to go into limited spaces.

The Assayer and Chemist

Analysis of Spelter

Methods of spelter analysis are the subject of a report from a subcommittee, which has been approved by the Supervisory Committee of the American Chemical Society on Standard Methods of Analysis.

Spelter ordinarily used for brass and similar alloys is usually considered in three grades: (a) "High-grade"; (b) "intermediate"; and (c) "brass-special," according to the amounts of lead and other impurities present. A fourth grade (d) "prime-western," principally used for galvanizing, contains more impurities than the three grades preceding. These grades are covered by the specifications of the American Society for Testing Materials.

The methods of sampling and analysis described below are those generally accepted in the United States for standard analysis in all the larger laboratories of both producers and consumers of zinc and zinc products. The methods of analysis are those originally proposed by Elliott and Storer and Price, whose work has been checked and elaborated by the members of the committee.

Sampling Slabs

Select 10 slabs at random from a carload, and saw each slab completely across from the middle of one long side to the midde of the other, and use the sawdust as the sample; or drill three 9-mm. holes along one diagonal of each slab, boring completely through and taking care to make fine drillings; the holes should be drilled as nearly as possible at the middle and half way between either end and the middle of such diagonals. Go over the drillings or sawings with a powerful magnet to take out any iron which may have come from the drill or saw, and mix the sample thoroughly. The drill or saw must be thoroughly cleaned before use, and no lubricant shall be used in either drilling or sawing.

Methods of Analysis

Lead—The committee considers the electrolytic and "lead-acid" methods described to be of equal merit, so far as accuracy is concerned, but where laboratories are equipped for electrolysis the electrolytic method is preferred as a time-saver.

Lead by Electrolytic Method—Place 8.643 grams of the sample[1] in a 400-c.c. beaker and add sufficient water to cover the sample. Then add gradually and cautiously 30 c.c. of concentrated nitric acid (sp.gr. 1.42); when the action is complete boil the solution for a few minutes to expel nitrous fumes. Wash the watch glass and sides of the beaker, and transfer the solution to a 200-c.c. electrolytic beaker. Dilute to 125 c.c. and electrolyze with a current of 5 amp. The time required for the electrolysis is from one-half to three-quarters of an hour, depending upon the amount of lead present in the sample. Test the solutions for complete precipitation of lead by washing the watch glasses and sides of the beaker, so that the depth of the solution is increased about 12 mm. Then continue the current for 15 min., and if the newly exposed surface is still bright, the lead is completely deposited. Wash the anode three or four times with distilled water, once with alcohol, and then dry in an oven or on a hot plate, at 210 deg. C. for half an hour, and weigh.

The weight of the PbO_2 in milligrams, divided by 100, will give the percentage of lead. The PbO_2 deposit can be readily removed by covering the anode with dilute nitric acid and inserting a rod of copper.

The electrodes are cylinders of platinum gauze with 400 meshes per sq.cm. The anodes are 30 mm. in diameter by 30 mm. high, with a stem 105 mm. long of No. 16 B. & S. gage wire (1.29 mm.), making the total height 137 mm. The cathodes are 12 mm. in diameter by 30 mm. high, with a stem 105 mm. long of No. 16 B. & S. gage wire, making the total height 137 mm.

Lead by "Lead-Acid" Method[2]—Place in a 350-c.c. beaker 25, 15, 10, or 5 grams of the drillings or sawings, according to whether the spelter is of grade (a), (b), (c), or (d) respectively, and add, according to the size of the sample taken, 300, 180, 120, or 60 c.c. of "lead acid" (prepared as indicated in footnote). After all but about 1 gram of the zinc is dissolved, filter on a close filter and wash out the beaker a couple of times with "lead acid" from a wash bottle. Wash the undissolved matter from the filter into the original beaker with water, and dissolve with a small amount of hot 1:1 nitric acid. Add 40 c.c. of "lead acid" and evaporate until strong fumes of sulphuric acid escape. When cool, add 35 c.c. of water (which is the quantity of water evaporated from the "lead acid"), and heat to boiling. Add the first filtrate (containing the greater part of the zinc, and possibly a small amount of lead sulphate), stir well, and allow to stand for at least five hours, preferably over night. Filter on a Gooch crucible, wash with "lead acid," then with a mixture of equal parts of alcohol and water, and finally with alcohol alone. Set the Gooch crucible inside a porcelain crucible in order to avoid reduction of lead by flame gases and mechanical disintegration of the asbestos mat. Ignite for five minutes at the full heat of a Tirrell burner. Cool and weigh as $PbSO_4$.

Iron—Place 25 grams of zinc in a tall 700-c.c. beaker and dissolve cautiously in 125 c.c. of nitric acid (sp.gr. 1.42). Boil, dilute to about 300 c.c., add 10 grams of ammonium chloride, and then ammonia until the precipitated zinc hydroxide has redissolved. Boil, let settle, and filter on an 11-cm. S. & S. "Black Ribbon" or similar filter paper. Wash with dilute ammonia and with hot water. Dissolve the precipitated ferric hydroxide with

[1] The empirical factor weight (8.643) is used instead of the theoretical one (8.66), as the dried dioxide is liable to contain some adherent and included water, expelled with difficulty.

[2] "Lead acid" is a solution of one volume of sulphuric acid in seven volumes of water, saturated with lead sulphate. It is prepared as follows: 300 c.c. of sulphuric acid (sp.gr. 1.84) is poured into 1800 c.c. of water; 1 gram of lead acetate is dissolved in 300 c.c. of water and is added to the hot solution with stirring. The solution is allowed to settle for several days, and is siphoned off through a thick asbestos filter for use. When "lead acid" is used it is unnecessary to consider the solubility of the lead sulphate, since the solution is always brought back to the same volume as the volume of "lead acid" originally added; consequently, when the lead sulphate is filtered, no more lead remains in the filtrate than was originally added in the "lead acid."

hot 1:1 sulphuric acid, add 40 c.c. of 1:1 sulphuric acid, pass through a Jones reductor,[3] wash first with 150 c.c. of dilute sulphuric acid, and then with 100 c.c. of water and titrate with potassium permanganate. The potassium-permanganate solution contains approximately 0.2 gram of the crystals per liter. One cubic centimeter of permanganate solution will equal about 0.000334 gram of iron. Run a blank with the same amounts of acid and water, and correct accordingly.

Standardize the potassium permanganate against sodium oxalate. Weigh duplicate samples of sodium oxalate, 0.0200 gram each, an amount which may require between 49 and 50 c.c. of the permanganate solution. To convert sodium oxalate to iron, use the factor 0.833.

Cadmium—Place 25 grams or drillings in a tall 500-c.c. beaker; add 250 c.c. of water and 55 c.c. of concentrated hydrochloric acid, and stir. When the action has almost ceased, add more acid with stirring, using about 2 c.c. at a time, allowing it to stand after each addition of acid, until finally all but about 2 grams of the zinc has been dissolved. About 60 c.c. of acid in all are usually required; it is best to allow the first 55 c.c. of acid to act over night. Filter, first transferring one of the undissolved pieces of zinc to the filter, and wash a couple of times with water. Discard the filtrate. Wash the undissolved matter on the filter paper into the 500 c.c. beaker, cover and dissolve in nitric acid. Transfer to a casserole, add 20 c.c. of 1:1 sulphuric acid, and evaporate until fumes appear; take up with about 100 c.c. of water, boil, cool, and let settle for several hours (best over night). Filter off the lead sulphate on paper, wash with water, retain the filtrate, and discard the lead sulphate. Dilute the filtrate to 400 c.c., add about 10 grams of ammonium chloride, and pass hydrogen sulphide for one hour. It is occasionally necessary to start the precipitation of the cadmium sulphide by the addition of a drop or two of ammonia to the dilute solution. Allow to stand until the precipitate has settled, and then filter off the impure cadmium sulphide in a loose-bottomed Gooch crucible; remove the cadmium sulphide by carefully punching out the bottom into a tall 200-c.c. beaker. Wipe off any cadmium sulphide remaining on the sides of the crucible, using a little asbestos pulp, add 60 c.c. of 1:5 sulphuric acid, and boil for one-half hour. In case of spelters carrying large amounts of cadmium it may be necessary to add more acid. The dilute acid dissolves cadmium and zinc sulphides, but not lead sulphide. Filter and dilute to 200 c.c., add about 5 grams of ammonium chloride, and precipitate with hydrogen sulphide again in order to get rid of traces of zinc. In case a large amount of cadmium is present, a third precipitation may be necessary. After the final precipitation, let settle, filter, and transfer to a weighed platinum dish, cover, and dissolve in 1:3 hydrochloric acid. Also dissolve the sulphide remaining on the filter paper in hot 1:3 hydrochloric acid, and add it to the solution in the platinum dish. Add a little sulphuric acid, and evaporate the solution until copious fumes escape. Dilute with water, add a few centimeters of concentrated nitric acid to oxidize any filter paper shreds, and again evaporate the solution until fumes of sulphuric acid come off freely. Remove the excess of sulphuric acid by heating the dish cautiously and finally heat to between 500 and 600 deg. C. or to dull redness, and weigh the cadmium as sulphate.

Alternate Method for Cadmium—Proceed as above until the cadmium sulphide has been dissolved in hydrochloric acid. Oxidize with nitric acid, and filter from sulphur. Transfer the solution to a 200-c.c. electrolytic beaker, add a drop or two of phenolphthalein, and then pure sodium- or potassium-hydroxide solution until a permanent red color is obtained. Add a strong solution of pure potassium cyanide with constant stirring until the precipitate of cadmium hydroxide is completely dissolved. Avoid using an excess of the potassium cyanide. Dilute the solution to 150 c.c., and electrolyze with a current of 5 amp., using gauze electrodes of the same size as in the lead determination. The time required is from 1 to 2 hr. The solution should always be tested for cadmium as follows: Raise the liquid in the beaker, and then note after 20 min. the newly exposed surface of the electrode. If it is still bright, the cadmium is completely deposited. Next wash the electrodes with distilled water, and then with alcohol. Dry at 100 deg. C., cool, and weigh. The increase is metallic cadmium.

[3] If, before passing the solution through the reductor, a large amount of lead sulphate is present, it is well to filter it off so as to prevent it from clogging the reductor.

Methyl Red as an Indicator

Methyl red gives a sharper end-point than methyl orange when the two indicators are tested in water with acid or alkali, according to R. T. Thomson (*Analyst*, 1914, p. 518; abstr. *Journ. Soc. Chem. Ind.*), and its sensitiveness, unlike that of methyl orange, is not greatly affected by the presence of neutral salts, such as sodium chloride or sulphate. When methyl red is used as the indicator in the titration of carbonates with acids, the solution must be boiled after each addition of the acid in order to expel free carbon dioxide.

Acid-Proof Table Finish

The following formula for an acid-proof table finish is published by the Bureau of Chemistry of the Department of Agriculture, according to the *Chemist-Analyst:*

Solution A—125 grams of copper sulphate and 125 grams of potassium chlorate are dissolved and diluted to 1000 c.c.

Solution B—60 grams of aniline hydrochloride and 90 cc. of hydrochloric acid, sp.gr. 1.20, are dissolved and diluted to 500 c.c.

Paint the wood first with "A," and as soon as it dries sufficiently, apply a coating of "B," and let dry for several hours. Wash with hot water and repeat operation, until the color is a dark green. Finish by rubbing with raw linseed oil until a jet-black surface is secured.

To Bore Holes in Rubber Corks

The following kink is from the *Chemist-Analyst:* Wet the cork and borer with water before starting and occasionally during the operation. This reduces the friction and makes the cutting easy and smooth. The core will come out in one piece. Corks should be bored from the little end toward the large end. This makes the glass tubing fit tightly, as the hole where started is always bigger than where it ends, and when put in a bottle the neck of the bottle incloses the smaller end of the cork and hence tends to close the hole.

National Exposition of Chemical Industries

When America's first National Exposition of Chemical Industries opens at the Grand Central Palace, New York City, on Monday, Sept. 20, it will mark an epoch in the history of the industries dependent on chemistry, and cannot fail to be far-reaching in its results. It will bring into closer contact than ever before the manufacturers, financiers, dealers and consumers. Elaborate exhibits are arranged, many of them working units, giving visitors the opportunity of seeing for the first time the processes or apparatus at work.

It is expected that President Wilson will be present and participate in the opening of the exposition, an invitation from the advisory committee, composed of well-known chemists and chemical engineers, having been sent to him. The committee is as follows: Raymond F. Bacon, Charles H. Herty, Henry B. Faber, A. D. Little, R. P. Perry, William Cooper Procter, E. F. Roeber, G. D. Rosengarten, T. B. Wagner and Utley Wedge.

Among the institutions which have coöperated to make this exposition a success are the American Chemical Society, the American Electrochemical Society, the American Institute of Mining Engineers, the American Institute of Electrical Engineers, the American Pulp and Paper Association's Technical Section and the Bureau of Commercial Economics.

Program of the Exposition

The program of the exposition will be as follows: Monday, Sept. 20, opening day.

Tuesday, Sept. 21—R. P. Pierce (Barber Asphalt Co.), "Work with the Ultra Microscope"; Howard H. Gross (President Tariff Commission League) will lead a discussion on the tariff question, in which other members of the league will participate; R. S. Frinck (President Frinck Pyrometer Co.), "The Relation of Chemistry and Mechanical Manipulation to the Evolution of the Glass Industry"; Harrington Emerson (The Emerson Co.), "Efficiency," and a meeting of the New York Section of the American Electrochemical Society will also be held.

Wednesday, Sept. 22—Thomas H. Norton (U. S. Department of Commerce), "Foreign Markets for American Chemicals"; F. W. Keough (President American Exporters Association), "Transportation and Shipping Facilities with Foreign Countries"; I. F. Stone (President National Aniline and Chemical Co.), "The Aniline-Dye Situation"; J. L. Lightner (Hershey Chocolate Co.), "The Manufacture of Chocolate."

Thursday, Sept. 23—J. L. Taylor (United States Bureau of Mines), "Explosives"; H. A. Huston (German Kali Co.), "Potash"; Linn Bradley (The Research Corporation), "Solution of Smoke, Dust and Fume Nuisances by Electrical Precipitation"; Percy Wilson (Secretary Association of American Portland Cement Manufacturers), "The History of Cement," followed by a meeting of the American Paper and Pulp Association.

Friday, Sept. 24—S. P. Sadtler (S. P. Sadtler & Sons), "American Contributions to Industrial Chemistry"; W. D. Coolidge (General Electric Co.), "The X-Ray"; L. H. Backeland, "Chemical Industry," followed by a joint meeting of the New York Section of the American Chemical Society and the American Institute of Chemical Engineers.

Saturday, Sept. 25—John Barrett (Director Pan-American Union), "South American Opportunities"; George Frank Lord (du Pont de Nemours Powder Co.), "Farming with Dynamite"; C. B. Heckel (New Jersey Zinc Co.), "Zinc"; besides many other important papers and addresses.

Many Moving Pictures Arranged For

A partial list of films to be shown during the exposition is as follows:

Waterman Fountain Pen Co., "Hard-Rubber Manufacturing"; National Lead Co., "Manufacturing Uses of White Lead"; Lipton Tea Co., "Tea Industry in Ceylon"; National Tube Co., "From Ore to National Pipe"; Henry Disston & Sons, "Making of Saws"; Rogers, Brown & Co., "Steel Industry"; People's Natural Gas Co., "Boring and Piping Gas"; Hershey Chocolate Co., "Chocolate Industry"; Barrett Manufacturing Co., "Tarvia"; Barber Asphalt Co., "Asphalt from Lake Trinidad to Street"; American Cyanamid Co., "Fertilizer from Air"; German Kali Works, "Mining of Potash"; Association of American Portland Cement Manufacturers, "Uses of Cement on the Farm"; General Roofing Co., "Roofs from Rags"; Follansbee Bros., "Tin Industry"; Cheney Silk Co., "Silk Industry"; National Association of Manufacturers, "Crime of Carelessness," "The Man He Might Have Been," "The Workman's Lesson," "An American in the Making"; Printz Biederman Co., "Wool to Clothing"; City of Baltimore, "Sewage Disposal and Filtration"; Ed. Pinaud (Klotz & Co.), "Perfumery"; United Shoe Machinery Co., "Tanning Hides to Shoes"; Rice & Adams, "Cow to Consumer"; Reed & Barton, "Making Silver"; Larkin Co., "Soap"; Sherwin-Williams, "Paint"; Westinghouse Electric Co., "Electricity in a Home"; Universal Portland Cement, "Application of Cement"; The Research Corp., "Consuming Smoke"; Frasche Estate, "Sulphur Mining (Louisiana)"; H. K. Mulford Co., "Hog Cholera," "Nitro-Germ"; General Electric Co., "Electricity in the Mine," "Electricity on the Farm," "The X-Ray," "Electric Lighting," "Motor Application," "Electric Power Transmission"; Bureau of Mines, "Mine Explosion and Rescue," "Safe Method of Bituminous Coal Mining," "Zinc Mining, Milling and Smelting," "Copper Mining, Milling and Smelting"; Starrett Mfg. Co., "Manufacturing of Files"; District of Columbia Paper Mill, "Manufacture of Paper."

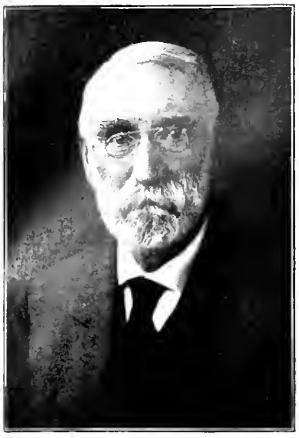
The motion picture program given above has been arranged for the Exposition by the Bureau of Commercial Economics at Washington.

Many of the exhibitors will also have speakers in the auditorium, who will lecture and display by motion and slide pictures the work of their respective companies.

Under the auspices of the Bureau of Foreign and Domestic Commerce, about eight bureaus in the Departments of Commerce, Interior and Agriculture are now arranging noteworthy and instructive exhibits, each of which will be typical and demonstrative of the work of that bureau.

Rutile Exports from Norway in 1913 were 50,730 kg.; in 1914 they were about 50,000 kg., according to a recent consular report. The exports are all to European countries. In 1915 the production is believed to have decreased, as Norwegian firms have been trying to buy rutile in the United States to fill their orders. The demand has increased owing to the use of titanium carbide in electric lamps.

International Engineering Meeting



DR. JAMES DOUGLAS

CHARLES W. MERRILL

E. P. MATHEWSON

Dr. Douglas will receive the John Fritz Medal at the International Engineering Congress on Sept. 20, 1915. Mr. Merrill edited the symposium on gold and silver, while E. P. Mathewson edited that on copper metallurgy

Added interest is given the mining and metallurgical exhibits by the meetings of the International Engineering Congress and various technical societies in San Francisco

Lake Superior Iron Conditions

EDITORIAL CORRESPONDENCE

Ore is moving out of the Lake Superior district at a rapid rate at the present time and it is certain that there will not be any let up until navigation comes to a close when the cold weather sets in. All of the lake fleet are now in active operation and it is believed that the total shipments from the district for the season will reach close to 45,000,000 tons. The Oliver Iron Mining Co., the mining branch of the Steel Corporation, will move about 20,000,000 tons, very nearly the amount that was shipped in 1913, the banner year in the ore business. Some of the independents are not doing so well, but a few of the properties that have not shipped a pound of ore all year may still be able to send out some of their product, as the ore-buying movement has not stopped as yet. Most of the railroads that handle iron ore from the mines to the docks are working all of their equipment, and most of them have handled more ore to date this year than they did during the corresponding period of 1914. The Lake Superior & Ishpeming, which handles most of the ore from the Marquette range, is using every car it possesses and the management wishes that it had the 500 steel cars which were ordered in the spring and which have not been delivered. One day last week a new loading record was made at the Lake Superior & Ishpeming dock at Marquette, when eight ore carriers were loaded and discharged during 20 hr. All of these boats were taken care of at the new steel-concrete dock of the company, which was constructed two years ago.

STOCKPILES MOVING WELL

In spite of the fact that ore is being moved at a lively rate, the mines are not working so strong as they might. This is because of the large stocks at the mines, which must be moved before the operators can take chances on loading up again. Some of the ore that is going down the lakes this year has been in stock for years. In fact, vegetation was growing on the piles of some that is going out and it had the appearance of waste rather than ore. The Cleveland-Cliffs Iron Co. alone had about 3,000,000 tons of ore in stock on the Marquette range in the spring, but over two-thirds of this will be gone by the time winter sets in. Although some of the mines are working with small forces, others are working to capacity in order to keep up with their contracts. The Breitung interests changed their working hours at their Negaunee mines this week, putting on three shifts instead of two, in order to increase the output. This company had considerable ore in stock a few months ago, but the management has stated that there will not be a ton in stock when the boats stop.

As stated previously, it is believed that there will still be some buying this year, as the furnace men are advancing the price of pig iron, which usually means that iron ore will command a higher price in the market, and many of the consumers may want to make a few more contracts before the prices are raised. It is also thought that the vessel rate in 1916 will be higher than it is at the present time, which may lead some to take advantage of the present carrying rates. Some of the operators are rather skeptical about the ore business, as they do not know what is going to happen to the iron and steel markets when the war is over. Others believe that the revival of business that will result in this country will more than compensate for the falling off of war orders. However, the outlook is far from gloomy, and the coming winter should see considerable activity. When the ore piles are shipped the operators are always willing to take a chance on stocking, and they will be more than willing to take risks this winter, with the prospect that prices will be higher in 1916.

Little development work has been carried on in the district this summer, only a few of the companies having diamond drills in operation. There is still some drilling being done on the Cuyuna range, and a few drills are in operation on the Mesabi. The Cleveland-Cliffs Iron Co. has stopped most of the drills that it had working a few miles to the west of Ishpeming, and the conclusion is that ore in commercial quantities was not encountered. This company has a drill working in the City of Negaunee, and it is now down about 2400 ft., but no results are obtainable. A hole was put down a short distance from this one to a depth of about 3000 ft. Luther Brewer and associates have discontinued their drilling on the eastern extension of the Gogebic range, without finding ore. Several hundred feet of formation was found in some of the holes, but the ore was not present. However, it is believed that another campaign will be mapped out in the near future. A little drilling is being done on the Menominee range; but not many drills are working compared with the number that was employed a few years ago.

TAXATION SYSTEM STOPS DEVELOPMENT

Since the Michigan State Tax Commission made its revaluation of all of the iron properties in the state, placing the mines on the assessment rolls at much higher figures than before, the companies have been very backward about looking for new deposits except when they are actually in need of the ore. They do not care about proving up orebodies and paying heavily in taxes unless the product can be disposed of. It is certain that the actions of the commission has greatly retarded new work in the state. Some of the companies have lands which they believe contain bodies of iron ore, but they are not going to start development work until they know that there is a demand for the ore. With an advance in prices and an increased demand it is quite likely that development work will be given a decided impetus.

With the higher taxes and the low price of iron ore the operators have had to economize in every possible way in order to make both ends meet; and some of them have had a difficult time getting a fair return on their investment. Some of the managements have been able to make substantial reductions in their costs by the use of new drill machines, lower-grade powders, electric power, etc. Electric power is becoming very popular on the Marquette and Menominee ranges and more of it is being utilized all the time. The Peninsular Power, which has a large power plant on the Menominee River, has recently closed a contract with the M. A. Hanna Co. to supply its Carpenter and Ravenna mines at Crystal Falls with current. A pole line is also to be extended to the Alpha district to supply the mines in that vicinity. A new 2400-hp. generator is to be installed in the company's steam auxiliary station at Iron River, a contract having recently been awarded to the Westinghouse Electric Co. to make the installation. The Oliver Iron Mining Co. and the Penn Iron Mining Co., on the Menominee range, and the Cleveland-Cliffs Iron Co. on the Marquette range, now have their own power plants. The last named company is not developing

enough current for its needs and is now planning to add another plant on another stream.

Among the mines that have entered the shipping list this year are the Wakefield and Palms-Anvil, on the Gogebic, the Isabella, on the Marquette, and the Carpenter and Balkan, on the Menominee. The Isabella shipped its first cargo of ore on Aug. 14. This property is owned by the Cascade Mining Co., of which O. B. Warren, of Hibbing, Minn., is president. Many of the officials of the company were on hand when the first train left the property, and the miners were given a half holiday with a picnic in a nearby grove. The first ore was taken from the Balkan pit this week by the contractors who are doing the stripping. The ore is taken out in the dump cars, which are run onto a trestle and dumped into the railway cars. Only a small tonnage will be taken out in this way, although it was thought at first that about 200,000 tons would be so mined this year. The Wakefield is the largest of the new mines to start shipping, and will mine about 800,000 tons this year, contracts having been closed for that tonnage. The Palms-Anvil has about 15,000,000 tons blocked out at present and will be a heavy shipper when the ore is required. The Carpenter is working with a full force and will ship steadily all season.

*

International Engineering Congress

A general notice of the meeting of the International Engineering Congress was given in the *Journal* of Sept. 4, 1915. Fuller details are now available. The general sessions of the congress are to be held in the Auditorium Building. The opening session will be held Monday, Sept. 20, at 10 a.m., at which an address of welcome will be made by the mayor of San Francisco. General Goethals, honorary president of the congress, will then address the convention, and the John Fritz medal will be presented to Dr. James Douglas, past president and honorary member of the American Institute of Mining Engineers.

Papers will be presented by eminent engineers from all over the world at the following sectional and parallel sessions: Waterways; irrigation; municipal engineering; railway engineering; materials of engineering construction; mechanical engineering; electrical engineering; mining engineering; metallurgy, naval architecture and marine engineering and miscellaneous. The programs of the mining and metallurgical sections are as follows:

Mining Engineering

Tuesday, Sept. 21, 10 a.m.—"Economic and Social Influence of Mining," W. H. Shockley; "Valuation of Metal Mines and Prospects," T. A. Rickard; "The Valuation of Oil Lands and Properties," M. E. Lombardi; "Valuation of Anthracite Mines," R. V. Norris; "Valuation of Coal Lands," Samuel A. Taylor; "Evaluating Coal Properties in Western Canada," R. W. Cockburn; "Status of Coal Mines in France," E. Gruner; "Workmen's Compensation and Mine Safety," H. M. Wilson.

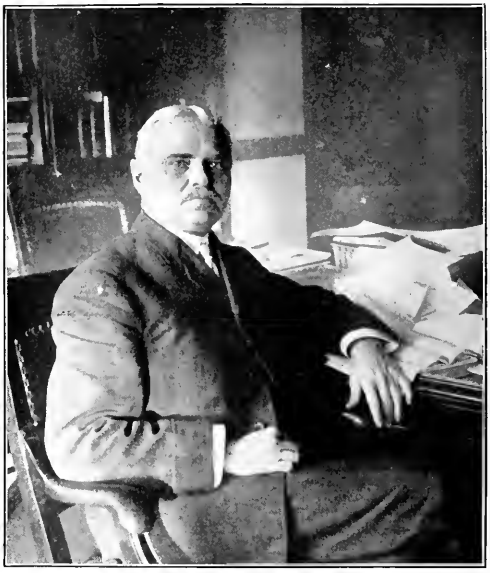
Wednesday, Sept. 22, 10 a.m.—"Functions and Work of Exploration and Development Companies," H. W. Turner; "European Mining Finance," J. L. Gallard; "The Financing of Mines in the United States," Lucius W. Mayer.

Thursday, Sept. 23, 10 a.m.—"Organization and Staff of Mining Companies," W. H. Shockley, also R. E. Cranston; "Relation of Governments to Mining," Horace V. Winchell; "Mine Inspection," J. W. Paul.

Metallurgy

Tuesday, Sept. 21, 2 p.m.—Symposium on Iron and Steel, edited by Henry M. Howe: "Iron and Steel Castings," John Howe Hall; "Metallography and the Hardening of Steel," Albert Sauveur; "Case-Hardening of Steel," F. Giolitti; "The Duplex Process of Steel Manufacture," F. F. Lines; "Methods of Preventing Piping in Steel Ingots," Emil Gathmann; "Steel Alloys," George L. Norris; "Electro-Metallurgy," E. F. Roeber.

Thursday, Sept. 23, 10 a.m.—Symposium on Copper, edited by E. P. Mathewson: "Process in Copper Metallurgy," Thomas T. Read; "Advances in Copper Smelting," Frederick Laist; "Metallurgy of Copper in Japan," R. Kondo; "Copper Metallurgy of the Southwest," Dr. James Douglas; "Reduction Works—Copper Queen Consolidated Mining Co., Douglas, Ariz.," Forest Rutherford; "Advances Made in the Metallurgy of Copper, Globe District, Arizona," L. O. Howard; "Improvements in Design and Construction of Modern Copper Plants," Charles H. Repath.



Copyright, Underwood & Underwood, New York City.

MAJ.-GEN. G. W. GOETHALS, U. S. A.

General Goethals is honorary president of the International Engineering Congress

Thursday, Sept. 23, 2 p.m.—Symposium on Copper (Continued): "Leaching Copper Ores," W. L. Austin; "The Metallography of Copper," William Campbell; "Boronized Cast Copper," Dr. E. Weintraub; "Electrolytic Refined Copper," A. C. Clark; "The Development of Electrolytic Copper Refining," Lawrence Addicks; "Physical Properties of Copper," Carle R. Hayward; "Metallography and Technology of Nonferrous Alloys," William Campbell.

Friday, Sept. 24, 10 a.m.—Symposium on Gold and Silver, edited by C. W. Merrill: "Coarse Crushing Plant;

1000 Tons Capacity," G. O. Bradley; "Crushing and Grinding," L. D. Mills, also M. H. Kuryla; "Solution of Gold and Silver, Including Classification," M. H. Kuryla; "Filtration or Separation of Metal-Bearing Solution from Slime Residue," L. D. Mills; "Precipitation," G. H. Clevenger.

Friday, Sept. 24, 2 p.m.—Symposium on the Metallurgy of Zinc, edited by Walter Renton Ingalls: "Some Main Points in the Economics of the Metallurgy of Zinc," Walter Renton Ingalls; "The Development of Zinc Smelting in the United States," George C. Stone; "The Smelting and Refining of Lead," Dr. H. O. Hofman.

Symposium on the Utilization of Fuels in Metallurgy, edited by C. H. Fulton: "Pulverized Coal in Reverberatory Furnaces," D. H. Browne; "Burning Pulverized Coal in Copper Reverberatories," E. P. Mathewson; "Gas Producer Development," Z. C. Kline; "Surface Combustion (What Is It?)," C. E. Lucke; "Ore Dressing," Robert H. Richards.

State Assistance to the Mining Industry in Australia

Recognizing the great public value of mineral discoveries, and knowing that it was the discovery of gold in large quantities which attracted population to Australia and laid the foundation of its nationhood, the state governments are prepared to assist in various ways all attempts made to discover and open up new mineral areas.

In New South Wales up to the end of 1913 the total sum distributed for the purpose of assisting prospectors amounted to £443,661. During one year £10,302 was advanced and £15,169 was paid by the government of that state as subsidy to the Miners' Accident Relief Fund. In Victoria, under the Mining Development and Surplus Revenue Acts, £417,257 was expended from revenue and £200,000 was provided out of votes during the period 1897 to 1913. In Queensland state assistance to mining during 1913 amounted to £21,698. This was spent in deep sinking, grants in aid of prospecting, construction of roads and bridges to mineral fields, and advances under the Mining Machinery Advances Act.

In South Australia aid is given to the mining industry under the terms of the Mining Act of 1898. Up to 1913 £58,309 had been distributed, a portion of which had been repaid to the government. The government also has a number of batteries at work in the state. In Western Australia advances are made by the government in aid of mining work and equipment of mines, erection of crushing plants, in aid of boring and providing transport. Over £1,200 was expended in one year on water supply, roads, cartage and subsidies for development below the 100-ft. level in small mines. In this state there have been 40 state-owned batteries or reduction plants in operation, the total cost of these being £332,378. Last year the receipts amounted to £47,981 and the working expenditure £55,362. These state-controlled plants have recovered gold and tin to the value of £4,189,955, resulting from the treatment of 960,989 tons of gold ore and 64,920 tons of tin ore.

In Tasmania state aid is also given under the Aids to Mining Act, and in one year £9,847 was expended in prospecting and development work. In the Northern Territory prior to 1912 prospectors were helped by grants of rations and some monetary assistance, but it was found that these privileges were occasionally abused, and now provision is made for generous grants to discoverers of metalliferous ores. Aids granted to prospectors in 1913 amounted to £2,373, of which £633 was paid in respect of gold, £1,865 for copper, and £55 for other minerals. There are immense areas in Australia which have not yet been properly tested for mineral values, and genuine parties prepared to take up this work may, as is shown in the foregoing, expect encouragement from the state or Commonwealth authorities.

The Situation in Mexico

SPECIAL CORRESPONDENCE

Affairs in Mexico during the past few months have been very badly mixed and conditions "intolerable," and yet they do not appear just at this time to be any nearer a definite settlement than in the past. Obregon has developed a strength that is surprising and has driven Villa back through Leon, Aguascalientes and Zacatecas into Torreon, where he is preparing to make another stand. In consequence of these defeats, added to the fact that the printing press is providing a never-failing supply of currency, Villista money has dropped to 1c. to 2c. per peso. Corn is scarce in Chihuahua and Durango and when to be obtained is quoted at a price that makes it almost impossible to obtain by the Mexican laborers. Other food supplies are also scarce. The crops in consequence of a lack of rain will be much less in amount than in previous seasons, added to which is the fact that less of the land has been planted. In Sonora the Carranzistas have apparently been making considerable headway. The states now in part or entire control of the Villistas are Chihuahua, Durango, Coahuila, Sonora, and Sinaloa, the other states being largely controlled by the Carranzistas. Various decrees of Villa have been very inadvisable from a political standpoint, and have injured his prestige immeasurably. Villa's campaign against Guadalajara, instead of concentrating his strength in taking Matamoras and Tampico, may have been largely the reason for his late defeats, in consequence of which the important cities of Queretaro, San Luis Potosi, Saltillo, Monterey, Guanajuato, Aguascalientes and Zacatecas have been taken by the Carranzistas.

Carranza's strength appears to rest largely with Obregon. Gonzales is not considered a very heavy factor, although he has lately taken Mexico City from the Zapatistas. There is considerable speculation as to whether Carranza has any control over the forces under him, except such as they wish to extend to him, and many are of the opinion that should Obregon win out against Villa with his forces he will upon some pretext or other decide to ignore Carranza. Carranza's ideas are so impracticable and his sympathies so obviously antiforeign that it is considered very unlikely he will be recognized by the United States. If he should be recognized, many appear to think it will lead to the gravest trouble with one or more of the European powers when peace has there been declared.

Mining interests have been greatly disturbed by the decree of Carranza raising taxes on mining properties to amounts that range from at least twice to six or seven times the normal amount, and many of the foreign interests have refused to pay. Appeal to the Secretary of Hacienda through the United States State Department's

represented to restore taxes to the normal rate resulted in acquiescence on one day, followed in a few days by a complete reversal of position. In fact, no dependence can be placed on the promises or assurances of the various heads of departments under Carranza.

The appeal of the State Department to the various chiefs of opposing factions that they get together and elect a president has elicited favorable replies from the Villistas and unfavorable replies from all of the Carranzista chieftains that have so far been heard from. If such a movement could succeed, it would be the ideal arrangement and obviate the necessity of any foreign intervention. Whether the United States will recognize the provisional president selected by the various Villa and Zapata delegates and place an embargo on all arms and ammunition going to the Carranzistas is yet to be seen. Vasquez Tagle, the only member of Madero's cabinet who did not resign, has been favorably mentioned as acceptable to the Villistas and Zapatistas. Villa has announced his willingness to retire from the field in order to induce many to come into the convention who would not otherwise appear, yet whether he will do so is another question.

In the meantime nearly all of the mines in Mexico are closed. The only smelters now in operation are those at Chihuahua, Torreon, Mapimi and Cananea. Freight conditions are becoming so bad that it would not be surprising to see the Mapimi and Torreon smelters soon obliged to close.

There is daily train service between Nuevo Laredo and Monterey, and between Juarez and Torreon. Trains operate between Monterey and Tampico about twice a week. Military trains have been in operation between Tampico and San Luis Potosi, and possibly regular passenger trains are now in operation. Service is also established between San Luis Potosi and Aguascalientes, and between San Luis Potosi and Matehuala. The service between Torreon and Durango is interrupted owing to the fact that the city of Durango was lately captured by the Carranzistas. The railroad between Piedras Negras, Paredon and Torreon was, at last accounts, in the hands of the Villistas, with irregular train service.

Copper Production in Russia

Recent official returns give the production of refined copper in Russia for two years past as follows, in metric tons:

	1913	1914	Changes
Urals	17,283	16,790	D. 493
Caucasus	10,003	7,123	D. 2,880
Siberia	5,656	5,616	D. 40
Chemical and refining works	1,380	1,415	I. 35
Total	34,322	30,944	D. 3,378

The decrease in 1914 was chiefly because of war conditions in the latter part of the year. In the Urals the falling off was caused chiefly by shortage of labor. In Siberia there was only a very small change. In the Caucasus, where the loss was greatest, mining and smelting were stopped for a time by actual military operations.

Chronology of Mining for August, 1915

Aug. 1—Workmen's compensation law went into effect in Colorado.

Aug. 5—Dredge of the Empire Gold Dredging Co. in the Leadville district, Colorado, launched, this being the first dredge to operate in that district—Holdings of Mogollon Gold and Copper Co. sold to the Socorro Mining and Milling Co.

Aug. 13—Stocks of Belcher, Crown Point and Yellow Jacket dropped from the official list of the San Francisco Stock Exchange, these companies having been merged as the Jacket-Crown Point-Belcher Mines Co.

Aug. 15—Fire destroyed portion of the town of Upper Rochester, Nev.

Aug. 26—Zeila mine, Jackson, Calif., sold to Kennedy Mining and Milling Co.

Aug. 27—Vannoy H. Manning appointed director of the United States Bureau of Mines.

Aug. 31—Explosion at Orenda mine of Merchants' Coal Co., at Boswell, Penn.; 16 killed.

Lake Superior Mining Institute Twentieth Annual Meeting

EDITORIAL CORRESPONDENCE

The general program of the Lake Superior Mining Institute's meeting was published in the *Journal* of Sept. 4, p. 403. It has been rigidly adhered to up to the time of going to press. The first-aid contest on Monday at the ball park, Ironwood, Mich., included four problems unknown to the contestants until the time of the meet. Results were watched more carefully by spectators this year than last on that account. They were as follows: First prize, a trip to the Cuyuna range and the Minnesota State Fair, Minneapolis, Minn., won by team No. 4, Verona Mining Co., seven men, J. G. Williams, captain; score, 95.25; the prize was donated by the Gogebic Range Mining Association. Second prize, $50, donated by the Du Pont powder company, won by team No. 1, Oliver Iron Mining Co., Mesabi Range, eight men, H. C. Lawry, captain; score 92. Third prize, $30, donated by Lake Superior Mining Institute, won by team No. 3, Odanah Iron Co., seven men, M. Menestrina, captain; score 86.7. Fourth prize, $20, donated by the Institute, won by team No. 2, Montreal Mining Co., seven men, Tim Kirby, captain; score, 86.5. The judging was done by Dr. A. F. Knoefel, a last year's judge, and seven physicians from Terre Haute and vicinity.

In the afternoon automobiles took the party to points of interest on the Gogebic Range. These included: "G" Pabst shaft of the Oliver company, Newport mine; permanent stock trestle at Colby mine; Anvil and Wakefield mines. At the last, the openpit and electrical installation are of particular interest. They are fully described in the *Journal* of Aug. 28. The first business session was held at 7:45, Monday night, in the New Central School, Ironwood, and was called to order by President L. M. Hardenburg. Edwin Higgins then presented the final report on first-aid meets recommending the appointment of a committee on rules and regulations governing such contests. Papers were then given as follows: "Sinking of the Woodbury Shaft at Newport Mine," read by title only, by J. M. Broan. William Kelly called attention to the great record made in sinking this shaft.

"Mining Methods on the Gogebic Range" was read by co-author O. E. Olson, who pointed out the differences developed in the last five years in transportation underground, safety devices, etc. Heavier rolling stock had

necessitated heavier rails and from 7- to 8-ton skips are now used. The paper on "The New Stockpile Trestle at the Colby Iron Mining Co." was read by G. S. Barber. A new type with one-leg bents has reduced the difficulty with alignment. "Opening of the Wakefield Mine" was commented on by the author, W. C. Hart. It was devoted principally to the opening of the pit. A paper on "Grouting at the Francis Shaft of the Cleveland-Cliffs Iron Co." was commented upon by the author, J. R. Reigart. Edwin Higgins pointed out the problems presented in mining sheet ground in the Joplin zinc district. Little timbering is necessary, the shafts are shallow, mining methods are simple and there are comparatively few accidents. Fast hoisting is done without signals. He read some of their costs by way of comparison with those in the Lake Superior district. The principal points of the paper on the use of gunite in steel shafts were pointed out by Stephen Royce, the author. The nomination of the committees followed.

At the Monday evening business session the following committees were appointed: Nominations—J. M. Bush, Marquette; W. J. Richards, Crystal Falls; G. L. Woodworth, Iron River; W. P. Chinn, Virginia; F. W. Denton, Painesdale. Auditing Committee—Frank B. Goodman, Montreal, Mich.; J. E. Jopling, Ishpeming; C. H. Baxter, Loretto, Mich. Resolutions Committee—William Kelly, Vulcan, Mich.; C. Brewer, Ironwood; J. H. Hearding, Duluth; Charles D. Lawton, Hancock; J. C. Barr, Crosby. The Institute was met at Crosby Tuesday morning, Sept. 7, by George N. Crosby, the pioneer operator on the Cuyuna Range. A train of flat cars equipped with seats took the party through the North Range. The initial stop was the Kennedy mine, the first to be opened on the range. Following that the Croft mine was inspected. Here a large tonnage of bessemer ore is opened by a circular concrete shaft in course of sinking. This shaft went 11 ft. out of alignment, but this was corrected and sinking in the ledge is now in progress. The train then went to Armour Nos. 1 and 2 shafts of the Inland Steel Co. and to the Pennington openpit orebody, here 250 ft. wide. It is now stripped and steam shovels are loading ore.

The new hydraulic stripping operations at the Hillcrest mine in charge of W. R. Van Evera were especially interesting. About noon the train went through the openpit of the Rowe mine of the Pittsburgh Steel Ore Co., situated at Riverton, Minn. This property is in charge of J. C. Barr, who last year stripped the ore with hydraulic giants, the first to be used on the Lake Superior ranges. A buffet lunch was served at the Rowe Mine Club, where the Institute members were the guests of Mr. Barr. After this an inspection was made of the Rowe concentrator. This contains the usual log washers and trommels over strong double-deck tables and settling tanks. Raw ore is dumped from the railroad cars on to elevated traveling-chain grizzlies, the oversize crushed, and all elevated by an inclined traveling-belt conveyor to the concentrator bins. The concentrates are elevated in a similar manner and dumped into loading bins which deliver to railroad cars.

The final business session was held in the Crosby High School. A paper on "Some Aspects of Exploration and Drilling on the Cuyuna Range," by P. W. Donovan of the E. J. Longyear Co., was read by title, as was also "Rock Drilling in the Morris-Lloyd Mine of the Cleveland-Cliffs Iron Co.," by J. E. Hayden. Carl Zapffe pointed out important parts of his paper on "A Survey of Developments and Operations in the Cuyuna Iron-Ore District of Minnesota," and laid emphasis on the mines of the South Range not visited by the Institute. He pointed out that in the district as a whole water has caused practically no trouble, contrary to expectations, and notwithstanding the number of lakes adjacent to the mines. Mr. Zapffe also discussed the need for careful magnetic work brought out in Mr. Donovan's paper. "The Mining School of the Cleveland-Cliffs Iron Co.," by C. S. Stevenson, was read by title, and "Experiments in Concentration of the Cuyuna Ores," by Mr. Newton of the University of Minnesota was read in abstract. "Hydraulic Stripping at Rowe and Hillcrest Mines" was read in part by its author, Professor McCarthy of the Minnesota School of Mines.

The business was then taken up of sending a delegate to Washington in December to consider changes in the mining laws discussed and the Institute Council given absolute power to act. All applications for membership since the last meeting were granted. The thanks of the Institute were extended to the railroads, the Pittsburgh Steel Ore Co., J. C. Barr, George M. Crosby and others at Ironwood, Mich. Officers were elected for the ensuing year as follows: President, Charles E. Lawrence; secretary, A. J. Yungbluth. Tuesday evening a barbecue was given at Crosby Farm.

Mineral Exports of Chile

The mineral exports of Chile during 1914 are reported by the *Boletin de la Sociedad Nacional de Mineria* as follows:

Products	Units	Quantity
Gold bars	Kilograms	14,704
Silver bars	Kilograms	4,843,272
Auriferous silver bars	Kilograms	221,850
Gold and silver precipitate	Kilograms	667,100
Copper bars	Metric tons	25,790.515
Copper matte	Metric tons	15,987.030
Cement copper	Metric tons	10.000
Gold ore	Metric tons	32.742
Gold-silver ore	Metric tons	869.328
Gold-copper ore	Metric tons	1,764.831
Silver ore	Metric tons	138.394
Silver-copper ore	Metric tons	493.302
Silver-lead ore	Metric tons	13.155
Gold-silver-copper ore	Metric tons	710.818
Copper ore	Metric tons	68,892.545
Copper-zinc ore	Metric tons	8.000
Molybdenum ore	Metric tons	2.704
Lead ore	Metric tons	105.251
Iron ore	Metric tons	63,505.600
Coal	Metric tons	266,972.000
Nitrate	Metric tons	1,846,783.000
Perchlorate	Metric tons	55.430
Borate	Metric tons	34,203.600
Iodine	Metric tons	488.952

The total fine copper contained in the exports was 45,682 metric tons, this figure being the greatest ever reached, due to the increased production of the Braden Copper Co. The nitrates and borates suffered a loss, owing to the closing of the European market, the exportations of the last half of the year being only about one-half of those of the first semester.

Lake Freight Situation

The following information supplements the short article in the *Journal* of Sept. 4, p. 397.

Both grain brokers and ore shippers continue to call for more vessel capacity. During 10 days recently upward of 2,000,000 tons of ore were sold, with prospects for an additional 2,000,000 to follow. Grain brokers have placed several million bushels at 3c. and are offering more. Prominent vessel owners aver that a large proportion of the total vessel capacity is tied up for the remainder of the season.

Editorials

Accident Prevention in Smelting Works

The American Smelting and Refining Co. has joined the ranks of the concerns publishing monthly magazines with the view of reducing the accidents among their employees. The newcomer is *The Safety Review*. It is not so showy as some of its forerunners, but it is fully as spicy. Some of the statements in No. 1 of Vol. 1 are worthy of remark and comment.

In 11 plants of the company there was a decrease of 19% in the accident rate for the first quarter of 1915, compared with the corresponding period of 1914. In the Durango plant the reduction was 64%; in the Baltimore plant it was only 13%. It would be interesting to know whether these figures indicate anything important with respect to the differences among the works, their character, geography, etc. During the first six months of 1915 the Federal plant worked 136,400 hours, and the Durango plant 93,618 hours without an accident.

The company finds that in blast-furnace work and in the handling of hot metals, in which the men are frequently victims of hot splashes, the nature of the shoe worn is important. Consequently, the men are urged to wear congress shoes, which can be removed instantly, whereby many serious burns are prevented. As for the clothing worn, experiments are being made with treatment by a fireproof liquid. Heavy hot-metal splashes will char cloth so treated, but will not burn it, and there is ample opportunity to remove the metal in time to prevent burns of the person. Experiments with this fire-proofing liquid—"Antignite"—are being continued. The matter of shoes, however, is regarded as settled. In the works of the United States Zinc Co. foot-burns have been reduced 50% by the use of congress shoes.

Special emphasis is put upon the use of goggles by men working at the tap-holes of the furnaces, and attention is drawn to the importance of a proper choice of the goggles. "Care should be taken in selecting a measurement that will conform to the nose of the workman. In addition to this the frame should be bent so it will conform to the shape of the face and the temples, adjusted so they will rest easy back of the ears." Goggles are obtainable in assorted sizes complying with these specifications.

All of the foregoing advice is simple, obvious and helpful, but this great industrial company finds it worth while to dwell upon such minor points. Turning to some of the major matters, the great step in advance, without any doubt, is going to be in the more rigid enforcement of discipline. The following is from a report of certain officials of the American Smelting and Refining Co. who visited the works of the Illinois Steel Co. at South Chicago, Ill.:

> Their discipline is of a strict nature, in the case of accident, as well as in all cases of disorder. The plant is policed, which is a necessity with such a large organization, and every man found guilty of disorderly conduct is compelled to appear before Mr. McKenney (assistant to the general manager), who sits on these cases each morning at 9 o'clock. The man is given a hearing, as in regular court, and reprimand given, which might be discharge in severe cases, or a lay-off of one or more weeks.
>
> Mr. McKenney spoke of the men, and particularly of the way the fellow-workmen would reprimand a man who is seen violating any of the rules or putting himself in unnecessary danger, and it has gotten to the point where the offender is more severely taken to task by his fellow-workmen than by the safety committee. We were told of the case of one foreman, only lately, injured by some bonehead act, and he was ashamed to return to work and face his men.

A similar policy appears to be developing in the American Smelting and Refining Co. The story is told of a foreman in the Tacoma plant who directed a man that had received a little cut to go to the doctor. The man refused. "After repeated urgings the foreman told Joe he was fired if he didn't go and see the doctor." A short time after this incident—probably there had been others of like nature—the Executive Committee of the company adopted a recommendation of the Committee on Safety and Labor that all general managers, managers, superintendents, and particularly foremen, be notified that each and every one would thereafter be held strictly accountable for accidents to employees under them, and that discipline, even to the extent of dismissal, would be administered when necessary in order to further the work of accident prevention. It is that kind of policy that will be more effective in reducing accidents than will be the idea of trying to make everything fool-proof.

Civilian Engineers and Military Service

A movement has been started, and is now well under way, for the organization of a reserve corps of civilian engineers, to be available for use in the country's defense in case of war. This movement, which is indorsed by Major-General Leonard A. Wood, has been taken up systematically by the large engineering societies of the country, including the civil, mechanical, electrical, chemical and mining engineers. All of these organizations working in harmony have appointed members to a joint committee now in touch with the War College at Washington, which is formulating a plan whereby the services of the various engineers shall be promptly available to the greatest advantages to the Government in case of need.

The United States at the present time has in its entire army only 212 engineer officers, most of whom are engaged on purely civil-engineering work in connection with river and harbor improvements. A number are too old, and still others are too young, to undertake some of the difficult problems presented by the necessities of the country's defense, and this work will necessarily fall largely to the civilian engineers who will enter the service when the time comes.

To no group of engineers do the military engineering problems appeal more than to the mining engineers, who are accustomed to working under trying frontier conditions and who are called upon to execute at short notice and in very great haste many difficult engineering

feats. In addition, the mining engineer's daily familiarity with explosives makes him a valuable adjunct to the engineer force of the army.

The mining engineer is also an organizer, and his familiarity with administration and handling men in bodies makes him particularly amenable to the requirements of the service.

Civilian engineers, however, must necessarily have some military training in order to be efficient at the start in their new work. It is not at all unlikely that when Congress convenes and takes up the question of military preparedness—as it undoubtedly will—considerable attention will be focused upon some means for getting the mining engineers into camp for a few weeks to give them the rudiments of military training in a way similar to what is being done in Plattsburg, N. Y., at the present time, where more than 1000 business men are in camp under the tuition of United States Army officers. This business-men's camp follows directly on the heels of a college men's camp at the same cantonment, conducted along similar lines, and will probably be followed by others.

In case of sudden necessity for mobilizing an army in the United States, 1,200,000 men would be required and 40,000 officers would have to be commissioned. At present it is utterly impossible to pick 40,000 men from our entire list of states who are adequately equipped to accept those commissions.

The opportunity which this offers to the mining engineer, both for work congenial to himself and valuable to the country, is entirely unappreciated by the engineer himself. The joint committee of the national engineering societies will, on a plan approved or laid out by the War College and now under consideration, take the lead in preparing the engineers of our country for military training.

Consumption of Zinc for Brass-Making

In the *Journal* of June 19, 1915, it was remarked that it was then assumed that the buying of spelter for ammunition purposes was endless, and in this connection it was suggested: "The brass-making capacity of America, if nothing else, imposes a limit. Assuming the brass-making capacity to be 450,000 tons at the outside, the spelter requirement would be 150,000 tons at the maximum. It is doubtful if in any year previous to 1915 any more than 75,000 tons of spelter was ever used for brass-making."

Since then the brass-making plant of the United States has been put fully into use, and important additions have been, or are being, made. It is now estimated that American brass works will soon be turning out about 45,000 tons of brass per month. This indicates a consumption of about 15,000 tons of spelter, or at the rate of 180,000 tons per annum, figuring on the ratio of copper and spelter in ordinary brass. This is a little in excess of the previous estimate, sufficiently explained by the additions to capacity.

We can begin to get an idea of how things stand. The exportation of spelter during the fiscal year ended June 30, 1915, was about 110,000 tons. Take 12,500 tons per month as the deficiency in Great Britain, France and Russia that must be supplied from here. Add 9,000 as the increased demand for brass-making here. The total is 21,500 tons. The excess over production as compared with the rate of 1914 is somewhat between 15,000 and 25,000 tons. Something like the latter figure is in sight, but it will not be attained until 1916. The approach to it will probably be gradual.

On the other hand, domestic peaceful consumption has been enormously curtailed. But disregarding this, it is probable that production is coming into equilibrium with consumption—indeed, has begun to swing the scale the other way. This is indicated by the behavior of the market. A large, sudden buying demand turns it upward. Having been satisfied, the steady weight of production forces it downward again. We shall probably have a declining tendency that will each time carry the market to a new low level and then a rally that will take it to a point not quite so high as the previous one, until there begins to be a positive accumulation of unsold stocks, when there will no longer be any resiliency and consequently there will be no immediate rebound.

Copper in Germany

According to an American bulletin published in Berlin the German authorities estimate that there are available in Germany 2,000,000 metric tons of copper in one form or another, which quantity will meet the military requirements for upward of 10 years. Shall we then estimate the German use of copper in warfare at 200,000 tons per annum and that of the Allies at as much more, or a total of 400,000 tons—40% of the world's production in 1913? Probably no printed statement of this kind would be allowed in Germany if it were not correct, for certainly there would be no object in exaggerating the rate of consumption, although there might be with respect to the supply.

As to the latter, the reports do not read so comfortably as the bald statement of the huge quantity that is available. A registry of all the copper in the Empire has been made, and nobody is permitted to sell any copper article without permission of the authorities. For copper goods that were voluntarily deposited before Sept. 25 a price of 43.3c. per lb. is being paid. That figure, together with news coming privately, indicates that copper in Germany is becoming very scarce.

Several months ago the *Journal* intimated that zinc ore might be imported into the United States from Sardinia. A cargo is now on the way to Baltimore, whence probably it will go to Langeloth, Penn., for smelting. This will be the first time that Sardinian calamine has crossed the Atlantic Ocean. At the outbreak of the war the Sardinian zinc-ore producers suffered severely, being cut off from their usual market with Belgian smelters. Now, however, they are operating profitably again, selling their ore to England and France.

The United States Bureau of Mines has published a technical paper on "The Buying and Selling of Ores and Metallurgical Products," by Charles H. Fulton. Professor Fulton is an experienced metallurgist and is well qualified to write authoritatively upon this subject. His contribution is one of the best and most useful things that the Bureau of Mines has published and will be helpful in spreading knowledge respecting the conditions of buying and selling ores, especially such ores as go to the silver-lead and copper smelters.

BY THE WAY

The dumps of the old copper mine about four miles from Bristol, Conn., are attracting the attention of some local men, who hope to get some copper out of them by modern methods. This mine, which was first opened in 1836, is said to have a shaft over 400 ft. deep. Connecticut does not rank as a mining state, and it will be a surprise to most people that there is a mining shaft 400 ft. deep within its boundaries.

::

Patrick Clark, the well-known mining man who died recently in Butte, left an estate of about half a million dollars, consisting largely of loans on real estate. Stocks in different mining concerns of unknown value are listed, and among stock of apparent worth are listed the following: Butte-Bullwhacker Copper Co., 128,450 shares; Standard Silver Lead Co., 15,739 shares; Amy Silversmith, 15,214 shares; balance on "Gotem-now" option, $8961; one-quarter interest in Stack Supply Co., estimated at $2500.

※

In discussing the recent disclosures respecting alleged German activities in the United States, one of the New York dailies said: "For instance, a man who was connected with the German financial policy in the United States is responsible for the assertion that a shipload of 10,000 tons of copper had been sent straight to Germany, under cover of a manifest on Copenhagen." The American copper producers would like to know how this was managed. Any or all of them would like to sell some copper to Germany.

※

Australian miners are digging for gold in the trenches on Gallipoli Peninsula, says a dispatch to the Chicago *News*. They were surprised at the similarity of the Gallipoli ground to the Australian gold fields, and their sharp eyes soon discovered traces of the yellow metal. In their spare time the miners built rude placer outfits on the seashore and began washing for gold. They found it, and now the Australian troops with mining experience are passing every minute when not fighting the Turks in washing clay, which is brought to the shore from half a mile inland. One soldier thus made $5 in four hours.

※

According to a newspaper item, when nitroglycerin was invented extraordinary precautions had to be taken to prevent accidents, but notwithstanding this so many disasters occurred that there seemed to be strong probabilities that its manufacture and use would have to be prohibited. One day when Nobel, the chemist, was at work on the problem he cut his finger, and to stop bleeding painted some collodion (a liquid preparation akin to guncotton) over the cut. Having done this he poured some of the collodion, by way of an experiment, into a vessel containing nitroglycerin, when he noticed that the two substances mixed and formed a jelly-like mass. He at once set to work to investigate this substance, and the outcome was blasting gelatin, a mixture containing 90% of nitroglycerin and 10% of soluble guncotton.

The metal markets as reported in Wall St. are often about as follows:

> Boston—Electrolytic copper has been selling during the week at 18c. per lb., although not in large quantities. Smaller producers have adopted the same tactics that were in evidence up to a fortnight ago and have offered the metal down to and made sales at 17¾c.
>
> There has been no difficulty in making sales of lead at 4.90c. per lb., according to the larger producers, in spite of concessions offered by smaller interests and dealers.

Why anybody should pay dearly for what he can buy cheaply deponent saith not. But here is another report:

> New York—One of the leading copper producers is still making sales of electrolytic at 18c., despite the fact that quotations in the outside market rule a half-cent or more below this figure. This is taken as confirming the view that dealers have little copper to offer, and that consumers will look to larger concerns for any considerable amount of metal. Offerings at lower level are being made, it is asserted, not so much for purpose of selling copper, as to depress price in order that dealers may buy.

The logic seems to be a little wabbly.

※

"My kingdom for a horse!" said a king one day in a moment of excitement—but mules are worth real money. About three millions per mule is the value figured by Virginia City's "Oldest Inhabitant." The earliest official record of the boom days on the Comstock Lode is found in a dog's-eared memorandum book in the courthouse at Virginia City, Nev., according to Charles E. Van Loan in the *Saturday Evening Post* of July 31, 1915. In this book appears the formal notice of a transfer of one-third of the famous Ophir mine, the consideration being two mules and the labor necessary to construct two arrastres. One traces the hand of Henry Comstock in this trifling avoidance of labor, but the price paid by the original locators for mules will probably stand for all time a world's record. "You don't need to figure the arrastres at all," says the Oldest Inhabitant, interviewed by Mr. Van Loan. "They were just thrown in with the mules, like. And those mules now; maybe they weren't even good ones, but do you know what they cost? The Ophir was the first of the bonanzas, and before they get through with her they took out twenty millions. Roughly speaking, that's three millions a mule. Oh, well, none of the old boys got much of anything out of the camp. It was the men who came along afterward and put in the machinery." This remarkable transaction foreshadows the fate of the original locators on the lode. Their luck began and ended with the tapping of the vein. "There was McLaughlin now," says the Oldest Inhabitant. "He sold out for less than four thousand and had quite a time while the money lasted. The last I heard of him he was cooking for a mine crew. Comstock got ten thousand for his interest and went over to Carson and bought a store, but he trusted everybody and didn't keep any books. They broke him in a couple of years and he went to prospecting again. He shot himself up in Montana somewhere. O'Riley had a little better luck—for a while. He hung on longer than the others, and when he sold out he started a hotel here. He would have made money if he hadn't got to gambling in mining stocks. He walked out of town one day, flat broke, telling everybody that he was going to make a bigger strike than the Comstock ever dared to be. He stuck to that idea until they put him in an asylum over in California. Yes, the old-timers didn't get the millions. They found 'em, that was all."

PERSONALS

Wilber Judson is at Dolores, Chihuahua, Mex.

John Gross recently returned from Mexico and has opened an office as mining and metallurgical engineer at 523 McPhee Building, Denver, Colorado.

Charles M. Coats, formerly of Taylor, Tex., is now at Collinsville, Okla., where he is employed as a chemist for the Bartlesville Zinc Co.

Frank Bauer announces his retirement from active service on Sept. 1, after many years of continuous service as manager of the Columbia Gold Mining Co. at Sumpter, Oregon.

Robert A. McKean, formerly superintendent of the Keystone works of the Jones & Laughlin Steel Co., Pittsburgh, has been appointed structural engineer to succeed William C. Coffin.

W. McC. Cameron, who has been employed for several years past as consulting engineer to A. Goerz & Co., Ltd., in South Africa, and to several of the Witwatersrand mines, is leaving that country and returning to America early next year.

Dr. J. A. Udden, geologist of the Bureau of Economic Geology in the University of Texas, has been appointed acting director of the bureau, the former director, Dr. Wm. B. Phillips, having resigned to become president of the Colorado School of Mines.

W. R. Farquhar, for many years associated with the United Metals Selling Co., and Russell A. Cowles, vice-president of the Ansonia Copper & Brass Co., have resigned their respective positions to ally themselves with the Metals Trading Corporation, a new concern that is doing an export business.

R. D. Fetherstonhaugh, of Vancouver, B. C., has returned from a visit of several months to the mining districts of the Peace River country in the interests of the Hinterland Resource Co., an Edmonton enterprise, which has taken up several claims on Peace River. He is satisfied as to the occurrence of free milling gold in large quantities.

George T. Holloway, of London, chairman of the Ontario Nickel Commission, has arrived in Toronto, having before leaving England been engaged in collecting data as to the nickel market. He states that one of the first steps of the Commission will be an examination of the Sudbury nickel industry which will be followed by an inspection of the New Jersey refining plants.

R. P. McLaughlin, the California state oil and gas supervisor, has appointed the following deputies: M. J. Kirwan in Fresno and King counties and part of Kern county, stationed at Coalinga; E. B. Latham in Kern, Santa Barbara, and Ventura counties, head-quarters at Santa Barbara; R. B. Moran in Orange, Los Angeles, and Ventura counties, with Los Angeles as head office; and Chester Naramore in charge of work in Kern and Ventura counties.

Herbert M. Wilson, director of the Department of Inspection and Safety of the Associated Insurance Companies, formerly of the Bureau of Mines, will be in San Francisco, Sept. 16 to 25, participating in the various engineering congresses. He will be actively concerned in the first aid and mine rescue demonstrations and contests of the Board of Managers, of which he is chairman. He is also scheduled to read papers on mine safety and on workmen's compensation before the mining sections of the International Engineering Congress, The American Mining Congress, and the World's Insurance Congress.

OBITUARY

A. H. Borman died in New York Aug. 20. He was largely interested in Idaho mining property and for a number of years owned the Jay Gould mine, near Bullion.

William Moorehead died Aug. 13 at Angels Camp, Calif. He was in early days foreman of the Sierra Nevada mine at Virginia City, Nev. Later he was manager of the International Hotel at Virginia City during the bonanza days at that camp.

M. D. Howell died at San Francisco, Aug. 16. Mr. Howell went to California from New Jersey by the way of Cape Horn, arriving at San Francisco Oct. 27, 1849. He was one of the original owners of the Plumas-Eureka gold mine, which was one of the richest ever developed in the state. He was years old.

Benjamin F. Hall died Aug. 25 in Denver, Colo. He was well known among Colorado mining men and had lived in Denver for ten years. He was interested in mining in the Breckenridge and Idaho Springs fields and was commonly understood to be wealthy. He was one of the men primarily responsible for the development of the Breckenridge placer mines, although for the last few years he had not been connected with any of the companies operating there.

SOCIETIES

Iron & Steel Institute—The Autumn meeting will be held in the rooms of the Institution of Civil Engineers in London, England, Sept. 23 and 24. The following is the list of papers that are expected to be submitted for reading and discussion:

1. Wesley Austin: "Influence of oxygen on some properties of pure iron."

2. T. H. Byrom: "Note on the carburization of iron at low temperatures in blast furnace gases."

3. Professor E. D. Campbell: "Influence of heat-treatment on the specific resistance and chemical constitution of carbon steels."

4. Professor C. A. Edwards, and H. Kikkawa: "Effect of chromium and tungsten upon the hardening and tempering of high-speed tool-steel."

5. W. H. Hatfield: "Phosphorus in iron and steel."

6. Professor K. Honda and H. Takagi: "The magnetic transformation of cementite."

7. R. H. Smith: "Sulphur in malleable cast iron."

8. Professor N. Tschioschewski: "Iron and nitrogen."

Institute of Metals—The following is a list of the papers that are to be submitted at the meeting of the institute in London, Sept. 17: 1, "The Corrosion of Gun-Metal," by Dr. C. H. Desch; 2, "Metallic Crystal Twinning by Direct Mechanical Strain," by Prof. C. A. Edwards; 3, "Notes on the Copper-Rich Kalchoids," by Professors Brinton and S. L. Hoyt; 4, "The Constitution of Brasses Containing Small Percentages of Tin—A Contribution to the Study of the Ternary System, Copper-Zinc-Tin," by Dr. O. F. Hudson and E. M. Jones; 5, (a) "Structural Changes in Industrial Brasses," (b) "Hardness of Copper-Zinc Alloys," by Dr. D. Meneghini; 6, "Specifications for Alloys for High Speed Superheat Steam Turbine Blading," by W. B. Parker; 7, "The Physical Properties of Metals as Functions of Each Other," by H. H. Stuart; 8, "Detection of Internal Blow-Holes in Metal Castings by Means of X-Rays," by C. H. Tonamy; 9, "A Thermostat for Moderate and High Temperatures," by J. L. Haughton and D. Hanson.

INDUSTRIAL NEWS

The Canadian Brakeshoe Co., Ltd., of Sherbrooke, Quebec, Canada, has just placed an order for the installation of a Snyder electric furnace to melt steel for the manufacture of 4-in. rounds to be forged into shells for the British Government.

V. A. Stout, Balboa Building, San Francisco, has recently been appointed representative of the Traylor Engineering and Manufacturing Co. for the Pacific Coast States, working under the direction of the western manager, John A. Traylor, of Salt Lake City, Utah.

The Braun laboratory appliances, consisting of crushers, pulverizers, samplers, furnaces, burners and other equipment which are used in all parts of the mining and industrial world, have been awarded a gold medal at the Panama-Pacific International Exposition at San Francisco.

The Mine & Smelter Supply Co. has recently received at its New York office, 42 Broadway, an order from the New Jersey Zinc Co. for 68 Wilfley No. 6 tables; 20 of these tables will be installed at Ogdensburg and 48 at Franklin Furnace, N. J. Supplementing a preliminary order, the Mine & Smelter Supply Co. has shipped to Japan 15 Wilfley No. 10 tables, with special riffling. It has also recently received an order from the Beatson Copper Co. of La Touche Island, Alaska, for one No. 86 Marcy ball mill, 8 ft. in diameter by 6 ft. long. A trial order has also been received for a No. 86 Marcy mill for the Braden Copper Co., Sewell, Chile. The Mine & Smelter Supply Co. has recently shipped to Aguacate Mines, San Mateo, Costa Rica, a 2-stage vertical sinking pump with motor, capacity 350 gal. per min, against 200-ft. head.

Editorial Correspondence

SAN FRANCISCO—Sept. 1

The United States Made the First Payment of $500,000 on the purchase of the Alaska Northern R.R. on Aug. 26. The purchase price was $1,150,000. This action followed the dismissal of the suits brought in Washington and in Alaska, under which the proceedings for purchase had been delayed for the past two months

Convention of Mining-Stock Brokers — The chief object which it is expected will be attained through the first national convention of mining-stock brokers in San Francisco, Sept. 21 and 22, will be the formation of an organization which will provide more adequate protection for the public investing in mining stocks and give a wider market for mining and metal stocks of merit. The latter purpose will be reached through the establishment of a common list of mining stocks to be called and traded in all exchanges which deal in mining stocks.

The Sale of the Zeila Mine in Amador County to the Kennedy Mining & Milling Co. has been confirmed by the filing of the deed for record, on Aug. 26, indicating purchase price of $35,000. The property consists of three mining claims and a mill site situated on what is known as the East belt of the Mother Lode. At this point the distinction between these two divisions of the Mother Lode region is not clearly marked geographically nor topographically. But the geological line of demarcation is plain and the geologists consider the Zeila on a separate vein series from the Mother Lode proper. The Kennedy mine is situated at about the center line of the Mother Lode, about one-half mile west of the center line of the Zeila. The Zeila is situated about 1½ miles south of the Kennedy. The old hoist is of no value for underground operation and would be useful only for the drawing of water from the mine. The Zeila is completely worked out down to the 450-ft. level and while new orebodies have been disclosed and sampled below the old workings it would be necessary to sink a new shaft and install new equipment in order to operate from the Zeila surface. The grade of the new ore so far has not exceeded an average of $4 per ton. The property is now in the hands of men who are not likely to make any mistakes in operation and who are so situated as to be able to mine and mill the ore economically and at a profit. The purchase by the Kennedy will mean much for the advancement of the town of Jackson, where the mine is situated and will strengthen the reputation of the Mother Lode mines and influence other probable investors in the region.

DENVER—Sept. 1

Mining, Metallurgical and Geological exhibits will be prominent at the International Farm Congress and Soil Products Exposition to be held in Denver's auditorium two weeks in September and October. The geological surveys of Wyoming and Colorado will have collections of minerals; the U. S. Bureau of Mines will demonstrate safety and first-aid methods and will explain its accomplishments in the metallurgy of radium; the Colorado School of Mines will operate a flotation unit and an assay office; machinery houses will display their latest contrivances; while various mining counties will be represented by collections of representative ores.

Local Freight Rates on Ores between points within the Cripple Creek district are unjust. Judge E. A. Colburn, owner of the Ajax mine and mill at Victor, has won his contention before the state public-utilities commission. Freight on ore valued at $20 or more between local points—i. e., practically switching—has been the same as from points in the district to Colorado City, the exhibition center. The newly announced rates are 25c. less per ton on local than on outside shipments and this will favor the selling of custom ores to the district's mills such as the Ajax mill. With this point gained, Colburn will remodel his plant for handling custom in addition to his own ores.

The Mary Murphy Mine at Romley, Colo., reëntered the list of dividend payers last October when, after a lapse of many years, it furnished funds for the distribution of 5c. per share among stockholders. In July, 1915, the profits had been such that a dividend of 7c. was again warranted. Under the management of George E. Collins, of Denver, this mine of low-grade, complex ore is upon a profitable basis. The production for 1914 was $397,000. This rate was largely increased during the first half of 1915 when the following sales of mine products were made: Crude ore to smelteries, $47,032; zinc concentrate, $135,637; lead concentrate, $83,807; iron-copper concentrate, $19,674; total, $286,150. The profit for this period was approximately $130,000.

BUTTE, MONT.—Sept. 2

A Union Organizer in Butte is trying to induce miners holding cards in the United Mine Workers of America to join the Western Federation of Miners. This organizer was sent to Butte by the United Mine Workers executive board which has recognized the federation local in Butte as the union affiliated with the American Federation of Labor. The results of the organizer's efforts in bringing about a revival of unionism among Butte miners are not known. It is doubtful, however, whether in the face of past experience any Butte miner now at work will ever join a union again.

The Payrolls of the Butte District at present are the largest in the history of the companies. The Anaconda company alone is employing approximately 10,000 men, in addition to the several thousand employed in Anaconda and Great Falls. The wage scale for miners continues at an average of $4 per day, the monthly disbursement of the Anaconda company in Butte alone being very close to $1,000,000 for labor. The Butte & Superior employs about 1,200 men, the East Butte 600, the Elm Orlu 250, and other smaller operating companies an additional 500. The daily wage paid to miners in Butte is therefore between $46,000 and $50,000. All of the old companies are operating now practically at capacity, though the total copper production is not yet so high as it was a few years ago.

Unwatering the Lexington and Nettie Mines is being pushed by the Anaconda company but it will still be some weeks before all the water is out and the underground workings put in condition for development work. As soon as the Alice properties have been resold on Sept. 10, under the decree of the courts, the Anaconda company, which will no doubt be the successful bidder at the sale, will take up the work of unwatering and developing that property again. At the approaching sale the Anaconda company will be required to pay cash, the previous consideration paid having been in Anaconda stock. The new work in improvements at the Washoe and Great Falls smelteries, on which several million dollars will be spent, is being rushed, and President John D. Ryan, who just completed an inspection of all the properties in the state, expressed himself well satisfied with the progress and the results already achieved by some of the new features in the plants.

SALT LAKE CITY—Sept. 2

A Topographic Survey of a portion of the Oquirrh range is being made by the U. S. Geological Survey. This will include the camps of Stockton, Ophir, and as far as Mercur. Geologic work is to be done later, and has been assigned to B. S. Butler, who worked out the geology and ore deposits of the San Francisco and adjacent districts in Beaver County, published in Professional Paper No. 80.

The Flotation Section of the Utah Apex Mill at Bingham is operating and making a good saving. Magma machines, obtained from the Utah Copper Co., are used. These are 12-compartment machines of which the last four are cleaners. By running the machines in series it has been possible to dispense with the last four sections. The tailings run 0.2 to 0.3% lead. Flotation costs are about 15c. a ton. During July the mine produced 5738 tons of shipping ore and 9270 tons of milling ore. From the latter 2375 tons of concentrates were obtained. The operating profit was $17,620 for the month.

SEATTLE, WASH.—Sept. 1

Four Ships Unloading Copper Ore from Alaska at one time was a spectacle offered at the ore bunkers of the Tacoma smeltery of the American Smelters Securities Co. recently. The four ships had 7100 tons of copper ore from the Ellamar, Latouche and Kennecott mines. So heavy are the shipments of copper from the North that announcements have been made that the plans have been approved and considerable of the equipment has been ordered for the doubling of the capacity of the smelting and refining plant.

Broad Pass May Be a Grave Disappointment, according to Stephen Birch, president of the Kennecott Copper Corporation, who is credited with the following statement in an interview by local reporters on his return from Alaska recently: "We had an expedition in the Broad Pass region all winter and the properties we had under option failed to stand up under investigation. The members of the expedition did not find enough shipping ore to load a packhorse. There may be some tonnage in that country, but the members of our expedition failed to discover it." This statement coming from the head of the Guggenheim syndicate in the North is regarded as counteracting the effect of the original story published about the time of Mr. Birch's return from Alaska last season. Whatever the reason for the latest announcement, Alaskans generally are inclined to take it with a grain of salt. Nevertheless it has caused considerable speculation and some uneasiness in the cites of the Alaskan coast that expect to profit by development of the district.

WALLACE, IDAHO—Sept. 4

The First "First-Aid" Contest in the Coeur d'Alenes will be held at Wallace, Sept. 12, under the direction of Supt. J. L. Boardman of Mine Safety Car No. 5 of the U. S. Bureau of Mines. The committee in charge of the contest consists of J. H. McCarthy, E. P. Smith, W. E. Greenough, Charles McKinnis, P. J. Gearon, J. L. Boardman, and Stanly A. Easton. It is expected that at least 15 teams will be entered.

Antimony Properties in the Coeur d'Alenes are active. A boiler and hoist have been purchased by the Coeur d'Alene Antimony Co. for unwatering the 170-ft. inclined shaft of the old antimony mine on lower Pine Creek. Ore averaging 40 to 70% antimony has been shipped in past. Brown & Finnel are pushing development work on their antimony prospect, which lies southwest of Sunrise. The crosscut is in 80 ft. and has 50 ft. to go to reach the vein, which shows a foot of high-grade stibnite near the surface. Charles Pederson has a promising antimony prospect in Ross Gulch, on the west fork of Pine Creek; ore of good grade is exposed for 200 ft. at surface and driving is under way to cut the vein at greater depth. Recent test shipment of two tons to Salt Lake gave returns of 60% antimony.

GOLCONDA, NEV.—Sept. 1

In the Divide District there are now 100 or more men. Between Humboldt and Owyhee Rivers, nine miles west of Tuscarora, a discovery of silver ore was made a year ago in prominent croppings that looked so barren no one had before thought to break them. Several groups of lessees are at work, but almost everyone is awaiting the driving of the crosscut tunnel of Storey & Campbell, which is expected to cut the vein at a depth of 100 ft. Strikes have also been made two to three miles farther west, one having been reported as showing more gold and much less silver than in the Divide ores proper. So far the Divide vein has been opened in places to a width of 14 to 15 ft. The miners at Golconda and Midas who have been to the "new strike" talk conservatively about it, but concede that if Storey & Campbell cut the vein and it shows as well as in other places, prospects will be considerably enhanced.

MAGDALENA, N. M.—Sept. 2

Mining is Active in Socorro County. At Magdalena the older mines are running full force, and there is considerable activity among new properties. A test shipment of mine-run ore was recently made to the El Paso Smelting Works by the Hop Cañon Mining & Smelting Co., with smelter returns of 12.9 oz. silver and 7.02% copper. The company is completing a 1,500-ft. tunnel, and expects to make regular shipments soon. The Wheel of Fortune mine, adjoining on the south, has lately developed a 5-ft. vein of high-grade copper ore. The Black Cloud mine, recently purchased by Wolf & Moore, is shipping 120 tons of zinc sulphide weekly; new hoist and other machinery is being installed. The Calumet-New Mexico Mining Co. and others are pushing developments with a view of early shipments of copper-silver ores.

IOLA, KAN.—Aug. 30

The Zinc-Smelting Business in Kansas and Oklahoma is extraordinarily active. A great deal of common spelter is being redistilled, especially at Caney, Kan., and at some of the works in Oklahoma. Other smelters will probably go in for this also. There is much talk about the proposed plant of the U. S. Steel Corporation at Gary, Ind., which is still "in the air," but the belief is that it will be built sooner or later. Manufacturers of smelting machinery are receiving many inquiries for equipment from England. The ore supply of the Kansas and Oklahoma smelters is bountiful, and ore is being offered from Spain, Australia and Alaska. The chances are that the price for natural gas will be raised this winter. However, the smelters who are using fuel oil have long contracts for it at low prices. This fuel does finely for firing roasting furnaces and boilers, but is not so good nor so cheap as gas when all things are taken into consideration. All of the smelters in this region have added to their capacity and building is going on constantly.

HOUGHTON, MICH.—Sept. 4

Actual Tonnages of Refined Copper from the mines of the Lake Superior district have been generally overestimated so far this year. It is extremely doubtful if this copper district will produce 300,000,000 lb. of copper during 1915, although there is no doubt at all that the rock tonnages handled in the mills of this district will be higher than ever before. With the exception of one stamp mill, the Trimountain mill of the Copper Range Consolidated, every other stamp head in the district is operating to capacity, some of them working three shifts a day and some working on Sundays. The estimates of refined copper output have been ranging from 20,000,000 to 26,000,000 lb. each month. The Calumet & Hecla figures, in particular have been generally overestimated. Some estimates for August for instance run over 7,000,000 lb. As a matter of fact the Calumet & Hecla has not as yet produced 6,500,000 lb. of refined copper during any month this year and the average has been nearer to 6,000,000 than 7,000,000. There is but one way to increase greatly the output and that is to increase the rock tonnage from the conglomerate lode which is running about 30 lb. to the ton. From a mining standpoint that is impracticable. So the increase in the Calumet & Hecla rock tonnage has been coming from the amygdaloid mine and that is not averaging much over 15 lb. to the ton. At the present price of the metal this low grade rock can be mined and milled at a handsome profit. It is doubtful if the mines will show great increase in the percentage of copper return from the rock tonnage mined this year. A noted exception to this is the Copper Range Consolidated; at all three of its mines, the Champion in particular, the grade of rock is higher than at any time in their history. The picking system, in vogue at these mines, is working out satisfactorily, as is the sand-filling system. Champion rock frequently goes over 50 lb. to the ton and 30 lb. is not an unfair average for the Baltic and Trimountain mines. Of the two Stanton mines, the Mohawk is breaking its copper-output record and is raising the percentage of copper in the rock. Practically all the other mines of the district are willing to take a lower grade of rock which they formerly discarded and are now sending it to the mill and making a profit on it at present unusual metal prices.

CHISHOLM, MINN.—Sept. 3

Conditions in the Chisholm District—The Glen stockpile, an accumulation of four years' standing, has all been shipped. The Duluth, Missabe & Northern Ry. has completed trackage into the Oliver property now opening in Sec. 27, connecting with the line to the Monroe mine. The Duncan has completed its allotment, and will stockpile for remainder of the season, although underground operations will proceed as heretofore. The Leonard-Burt has been working a double shift on one shovel loading ore, and on one shovel loading rock and lean material, the latter being transported to the Sec. 27 property for a stockpile bottom. No shipments made thus far from the Myers or Clark stockpiles and only a nominal tonnage from the Chisholm stockpile, although all ore hoisted from these properties is being shipped.

BRAINERD, MINN.—Sept. 4

Stripping on the Cuyuna Range, according to mine inspector's figures for the year ended June 30, 1915, was as follows: Thompson, 60,000 cu.yd.; Armour No. 1, 610,960; Rowe, 2,000,000; Pennington, 115,832; Hill Crest, 161,000; Mahnomen, 49,558; total, 2,997,350 cu.yd. The average number of men employed on the range were: Underground, 540; surface, 314; stripping, 287.

TORONTO—Sept. 4

Another Gold Discovery, near Kowkash, has added to the excitement over the rich strike of gold in Munro Township. Kowkash is about 300 miles west of Cochrane on the Transcontinental Railway. A number of rich samples have been brought to Cochrane resulting in an old-time gold rush. A west-bound train on Sept. 2 carried 200 prospectors, and since then a number of miners have left Toronto for the new field. The first find was made Aug. 21 by E. W. Kirk Dodds who staked three claims. The discovery was made close to the Kowawkagashama, or Kowkash, River about 20 miles from Kowkash station. The county rock is diabase with basalt dikes occurring as intrusives and a broad belt of porphyry parallels the vein system the samples from which are wonderfully rich.

The Mining News

ALASKA

GRANITE (Port Wells)—July cleanup at this new quartz mine was $25,000, the largest since starting about a year ago. W. R. Millard is superintendent.

ELLAMAR (Ellamar)—This copper-gold property working full time and shipping on nearly every boat. L. L. Middlecamp is superintendent.

INDEPENDENT (Willow Creek)—Working 20 men. Four stamps and two concentrating tables are running, and the tailings are impounded for cyaniding later. L. S. Robe, manager.

ALASKA GOLD BULLION (Willow Creek)—Manager Donald Harris has 60 men working in the mine and 7-stamp mill and small cyanide plant. Plant will be increased next season.

TAKU-ALASKA GOLD MINING CO. (Juneau)—Charles Goldstein, F. B. Hyder, J. T. Welch and A. D. Nash have formed company to develop the Taku claims. F. B. Hyder is geologist for the Alaska Gold Mines Co.

FUNTER BAY MINE (Juneau)—W. S. Pekovich is working this property, originally opened by William Hunter as the Uncle Sam claims near Icy Straits. Equipment consists of air compressor, drills and 10-stamp mill. Sinking started on new shaft.

ALASKA FREE GOLD (Willow Creek)—At this quartz property, beyond Knik in the Willow Creek district, 60 men are employed at the mine and a cyanide plant is in operation. Will install water-power plant for next year's run. W. H. Martin in charge.

ALASKA GOLD BELT (Juneau)—First unit of mill planned is to handle 8000 tons. First tunnel, 3000 ft. long to cut the upper part of the orebodies, is in about 1000 ft. and a lower tunnel 9000 ft. long at sealevel will be started later. Company expects to install 1400-hp. hydro-electric plant. A. B. Dodd, in charge.

ARIZONA

Mohave County

ORION (Oatman)—The shaft has been unwatered and active operations begun in the mine.

UNION BASIN (Mineral)—This company, owning the Golconda mine, has entered the dividend-paying class.

CROWN CITY (Oatman)—The Tom Reed company recently purchased the controlling interest in this property.

CARTER (Oatman)—On the 150-ft. level a shoot of ore has been opened just east of the shaft. Drifting continues on the 250-ft. level.

JEROME-OATMAN (Oatman)—Company recently installed a hoist, compressor, drill sharpener and other equipment. Shaft sinking in progress.

GOLD REED (Oatman)—On the 350-ft. level 3½ ft. of good ore was recently opened. Drifts are being driven east and west from the 375-ft. level.

UNITED EASTERN (Oatman)—Twenty tons of ore, derived from development on the 460-ft. and 565-ft. levels, are being shipped daily to the Gold Road mill. West drift on the 565-ft. level carries highest-grade ore yet encountered in the mine.

Pima County

LAS GUIGAS (Tucson)—Regular shipments of tungsten ores are being made and a large force is employed at the mine.

GOLD BULLION (Tucson)—A small concentrating plant has been installed to treat the molybdenum ores from the Last Chance shaft.

Pinal County

NEW KEYSTONE—Stockholders at special meeting, by a vote of 277,354 shares out of 358,174 outstanding, voted to decrease capital stock from $3,000,000 to $20,797, new shares to have a par value of $1. Property recently sold to Inspiration Consolidated Copper Co., which gave in exchange therefor 39,797 Inspiration shares. New Keystone shareholders will be offered one share of new stock for every nine shares now held. Suit recently brought by Carl H. Pforzheimer, to prevent the sale of the property, has been withdrawn.

Yavapai County

TREADWELL and BROOKSHIRE (Jerome)—These holdings, comprising 77 claims, may be developed, deeds having been deposited in escrow in Prescott National Bank preparatory to exploratory campaign by a new corporation.

CALIFORNIA

Eldorado County

STILLWAGON (Placerville)—Property, two miles south of Henry siding on Diamond Springs R.R., is to be reopened. Was worked in the early '60s having a production of $250,000. Development to vertical depth of 400 ft. by tunnel 790 ft. long. Equipped with 5-stamp mill driven by water power, concentrator, electric plant, electric power for drills. George Willis is superintendent.

Kern County

ANTIMONY ORE discovered on Indian Creek in Amalie district by Charles Hart, J. W. Wells and H. S. Phillips. Supplies have been taken in and development started.

BLACK HAWK (Randsburg)—Recent cleanup by D. A. Bine of 7½ tons of ore yielded $2274. Property includes both placer and quartz ground in seven claims situated on east side of Stringer district. This extraction occupied time of two men for 7 weeks. Several hundred dollars was recovered by hand mortaring. This sort of activity has been beginning of much development in this region which has resulted in making producing mines.

Lassen County

COPPER CROPPINGS reported upon property owned by H. Day of Susanville. Ledge has been known for several years and assays of ore have shown high-grade copper and some silver and gold. Distance from railroad has probably caused investors to give it but little attention.

Mendocino County

WILD DEVIL (Redwood)—This manganese property owned by J. A. Weidleufel has been leased to E. A. Wiltsee, of San Francisco and Fred Grotefend, of Redding. Development will begin immediately. Reported that lease requires extraction of a minimum of 10,000 tons of ore per annum and that the royalty is $1.50 per ton. Term of lease 15 years.

Nevada County

HAWKE DREDGE (Nevada City)—New dredge recently installed has been put in commission. Capacity estimated at 500 cu.yd. per day.

SIGNAL (Grass Valley)—Shaft has reached 100-ft. point and disclosed 14-ft. lode. Mine is situated on Slate Creek and owned by E. M. Taylor of San Francisco.

YOU BET (Dutch Flat)—Fong Tai, who recently leased this property from owners, is reported to have taken leases on adjoining properties. Indications are that drift mining will be conducted on large scale.

EAGLE BIRD (Washington)—Installing 10-stamp mill under supervision of C. J. Klinker. Additional 10 stamps contemplated. Mine has been unwatered and it is expected to have stamps dropping within 60 days.

NORAMBAGUA (Grass Valley)—Reported that company to be organized in Grass Valley has examined mine with purpose of taking purchase option. Mine is developed by 190-ft. tunnel and 400 ft. of winzes and 200 ft. drift.

Plumas County

DREDGE INSTALLATION is contemplated at English Bar on middle Feather River above Nelson by J. W. Larson. This bar was in early days a good producer of placer gold.

WALKER COPPER CO. (Portola)—Reported that new concentrating plant will be installed with capacity of 100 tons. Flotation process will be used. Thirty men are employed.

Shasta County

BALAKLALA (Coram)—Reported that 10-year contract has been made with Mammoth Copper Mining Co. for shipment of minimum 200 tons of ore per day to smeltery at Kennett.

STOWELL (Kennett)—Fire on morning of Aug. 19 destroyed change house, compressor building with compressor and motor, and blacksmith shop. Origin of fire unknown. Pumps, being operated by air, were stopped by fire, and mine is filling with water; pumps have been pulled.

FRIDAY-LOWDEN (Kennett)—Road to this mine from Mammoth company's head-house is nearing completion. Will be used for transportation of supplies and shipping-grade ore. Property purchased by Mammoth company eight months ago; force of men employed preparing for campaign of extensive development.

Trinity County

VALDOR (Junction City)—Marysville Gold Dredging Co. has two Keystone drills prospecting this property of Valdor Gold Mining Co. on Trinity River. Expected to install a small dredge.

COLORADO

Boulder County

WISCONSIN MINING & LEASING CO. (Sugar Loaf)—Shaft is 246 ft. deep and company contemplates sinking another 100 ft.

PRUSSIAN-SLIDE (Boulder)—H. J. Sisty has secured control of this property and plans to drive the crosscut tunnel several hundred feet to cut the Slide vein. The Prussian mill is to be placed in operating condition and cyanide equipment will be added.

BOULDER TUNGSTEN CO. (Boulder)—Arrangements made for crosscut tunnel for drainage and transportation. Grading now for portal and necessary mine buildings. Tunnel will cut veins at depths ranging from 400 to 700 ft. Power plant and drilling equipment will be installed. Recent exploration in Forest Home property disclosed rich ore.

Clear Creek County

CONCRETE (Idaho Springs)—Lease granted to Denver men. A drift will be driven on the vein west from the Newhouse tunnel. James T. Stewart in charge.

EDGAR (Idaho Springs)—Boston Mine Leasing Co. has been incorporated to operate this old property of the Big Five Mining Co. Following Boston, Mass., men are officers: William F. Brennan, president; Horace H. Bradley, secretary; Leonard Williams, treasurer.

Gilpin County

BATES (Black Hawk)—Leasing company has retimbered main shaft and resumed usual mining operations. A 22-ton lot of screenings assayed 0.85 oz. gold, 6.80 oz. silver. An 18-ton lot ran 1.72 oz. gold, 25 oz. silver and 2.22% copper.

Teller County

PORTLAND (Victor)—Altice lease, 200 level, is shipping 2-oz. gold ore regularly.

CRESSON (Cripple Creek)—Another rich pocket has been opened; this one is on the 1300 level or below that struck last winter; ore is of similar character.

AJAX (Victor)—Mackay lease, 100 level, continues to develop strong shoot of $30 ore and is shipping regularly. Ore is 4 to 7 ft. thick and exposed 700 ft. along drift.

ANNIE D. (Cripple Creek)—This property, which is located near Ella W. on Tenderfoot Hill, where rich ore was recently found near surface, is now controlled by F. S. Cropper and J. A. Smith of Lead, S. D., who will commence active development work in near future.

SPECIMEN (Victor)—Chellon and associates, operating under lease on 200 level of this Bull Hill property, have opened vein of high-grade ore from 2 to 5 ft. wide, assaying several ounces gold a ton. Bateman-Kelly lease is carrying on development on 400 level and opening ore worth $40 a ton.

IDAHO

Elmore County

MONARCH (Atlanta)—Running 5 Huntington mills two shifts on old dumps. Amalgamation followed by concentration, and roasting and cyaniding of concentrates.

BOISE-ROCHESTER MINING CO. (Atlanta)—This new company has acquired old Bagdad-Chase property, including Old Chunk and Webfoot claims and 40-stamp mill. Vein in Old Chunk opened for 400 ft. Operating 15 stamps two shifts until new Bleichert tram, capacity 100 tons in 10 hr., is installed. H. D. Richardson, superintendent.

Shoshone County

GIANT LEDGE (Murray)—This company has let contract for 215-ft. raise from lower to upper workings.

SILVER CABLE (Mullan)—Raise connecting upper and intermediate workings completed and company will commence ore shipments soon.

HERCULES (Wallace)—After a shutdown of several months on account of smelting difficulties, the mine has resumed work with a full crew of about 400 men.

POLARIS (Kellogg)—Company has given W. E. Mann, of Spokane, five-year lease on property for reported consideration of $20,000. Consists of three patented claims adjoining Yankee Boy on Big Creek. Previous development work, consisting of shafts, drifts, and crosscuts, cost about $35,000.

REX CONSOLIDATED (Wallace and 52 Broadway, New York)—This new company has bonded the Rex mine for $200,000 if paid within five years and $150,000 if paid within one year. Fire in August destroyed compressor house. The company lately acquired control of the Black Bear mine, comprising about 70 acres lying between the Frisco and Mace mines of the Federal company. In the lower tunnel, the vein is 5.7 ft. wide averaging 2.2 oz. silver, 7.76% lead and 16.57% zinc.

YANKEE BOY (Kellogg)—Four sets of lessees are working on Yankee Boy. Big Creek Leasing Co. sinking winze to determine course of vein and govern driving of new crosscut to tap vein at depth of 600 ft. Promising strike made in winze is said to show 16 in. of ore from which have been obtained assays of 50% lead and 900 oz. silver. First ore found by lessees in March, 1914, after $80 ft. of work had been accomplished, and shipments during rest of that year totalled 358 tons, valued at $38,000.

MICHIGAN

Copper

COPPER RANGE (Painesdale)—Capital to be increased to $10,000,000, to absorb subsidiaries, thus making savings in federal corporate tax.

CALUMET & HECLA (Calumet)—All regrinders, including those handling sands from lake, again operating, after partial shutdown owing to damage to turbine.

WHITE PINE (Calumet)—This Calumet & Hecla subsidiary has No. 4 shaft down 930 ft. Will pay back to parent company preliminary outlay in product, this year.

Iron

BALKAN (Alpha)—The first shipment of ore consisted of 51 cars. This was taken out of the pit by the drag lines. More ore is to be loaded before navigation closes, while some will be stocked.

IRON MOUNTAIN LAKE (Ishpeming)—Boilers are being prepared and it is believed sinking of shaft will be resumed shortly. It is also quite likely that another shaft will have to be put down. Considerable ore was developed by drills. Work was stopped last fall when shaft filled with water, which pumps could not handle.

NEWPORT (Iron Mountain)—This company has taken options on Secs. 33 and 34 and one-half of Sec. 28 and will start exploring within 30 days. The lands are one mile north of Quinnesec and a short distance east of Iron Mountain. The field is considered promising. This company has no mines on the Menominee range at present. It has several large properties on the Gogebic.

MINNESOTA

Cuyuna Range

CROFT (Crosby)—Steel headframe being erected.

ROWE (Riverton)—Concentrator operating 24 hours daily. Two shovels also at work.

CUYUNA-SULTANA (Ironton)—Mining and stockpiling about two cars daily. Output will be treated in concentrator which will be completed about Sept. 1.

BREITUNG (Negaunee, Mich.)—Option has been secured on two forties on Cuyuna Range near Brainerd. Work has started on exploratory shaft. Captain George Jewell, of Negaunee, is in charge. Ore was found by owners by drills but Breitung interests want further information before taking lease.

Mesabi Range

HOLMAN (Taconite)—One additional shovel started Aug. 20, making three shovels working day and one night.

CALUMET (Calumet)—This Hill Annex property fast being stripped. One shovel uncovered ore a few days ago. However, there is still a lot of overburden to be removed. Stripping contract was largest ever let on the Mesabi.

TROUT LAKE (Taconite)—Washing plant started to work night shifts in two units, Aug. 27; and expects to have five units working in a few days. The D. M. & N. Ry. is now running one ore train each hour from washing plant.

GENOA (Eveleth)—Two gasoline trammers installed here. Standard equipment removed from the pit, which is one of deepest on range. All ore will be mined by hand and trammed to surface for loading on cars. Orders have been received to ship as much ore as possible.

FAYAL (Eveleth)—Stripping operations were begun at south side of mine this week. About 90,000 tons of dirt and rock will have to be moved to get at 500,000 tons of ore lying underneath. One shovel is stripping. Several are loading ore from other end of pit. Fifty more men have been given work. The 1915 production will slightly exceed that of 1914, which was 1,500,000 tons.

MISSOURI-KANSAS-OKLAHOMA

ANCHOR (Miami, Okla.)—New concentrating plant being erected on the Buck land will be ready in about 30 days. Frank Stansbury, superintendent, Joplin, Mo.

W. D. LYERLE (Galena, Kan.)—Sludge mill nearly ready for operation on the Weymann land in the Short Creek bottoms. Will handle the sand from the creek bed. The sand will be brought in by means of a cableway.

BERTHA A. (Webb City, Mo.)—Will install two new sludge tables; have 12 already in operation. Another improvement is the installation of a 2250-cu.ft., direct-driven compressor, operated by a 350-hp. motor. This is the first direct-driven compressor of this size to be used in the district.

MONTANA

Fulton County

NATURAL-GAS FLOW was opened at Baker at a depth of about 1000 ft., Sept. 1. Much excitement prevails.

Jefferson County

COMET MINES CO.—This company has recently been organized, M. K. Rodgers, of Los Angeles, president, to lease the old Comet mine in the Basin district. Old mill has been repaired and tailings are being treated.

Madison County

AMERICAN MINE (Iron Rod District)—Five hundred dollars in gold taken from this mine by two men in six hours' time is record of Charles and Eugene Dahler who have extracted this amount from the American recently. Bar of gold was brought to Twin Bridges and weighed trifle less than 30 oz., or approximately $500. After hauling 18 sacks of ore to mill it took two hours to run it through and an hour more to retort amalgam. Tailings will bring about $100 more.

Missoula County

INTERMOUNTAIN COPPER (Iron Mountain)—Company is at present engaged in work preliminary to developing Amador mine near Iron Mountain, recently taken over from the Amador Gold & Copper Mining Co. Water was turned through new flume Aug. 1, providing electric power for pump which is now at work lowering water in mine. Is now below 400 level and is expected to be all out by Sept. 1. Frame for new concentrator is up and mill machinery is expected on ground within two weeks, 200-ton ore bins are finished and development work will commence within few days on levels, including and above 400. Two-mile flume provides water for mill and power plant. With completion of improvements property will be capable of producing in excess of 100 tons of ore per day.

Silver Bow County

RAINBOW DEVELOPMENT (Butte)—Unwatering of Rainbow shaft which was begun some days ago, proceeding rapidly; water now down to point below 1000 level, where Poser fault crosses shaft. Present depth of shaft is 1300 ft. and as soon as unwatering is finished, work of sinking to 1500 level will begin.

ANACONDA COPPER (Butte)—Mining operations have been resumed at Tropic mine of this company where force of men has been started taking out ore from upper levels. Tropic shaft is down 900 ft. Development work was in progress when war caused curtailment of production by 50% in company's mines as well as stopping development work in many of properties. Company has also resumed work of unwatering Nettie mine in western district of Butte camp, which was discontinued when war started. Large amount of work must be done over on account of water filling up some of the levels and part of shaft since. Pumping is still going on at company's Lexington mine and there are several hundred feet of water in shaft to be removed. Good progress is being made, however; mine will soon be in readiness for operating.

NEVADA

Humboldt County

ROCHESTER MINES (Rochester)—Has purchased Big Pocket claim on Block 1 of Crown Point claim.

Nye County

QUIGLEY REDUCTION CO. (Bonnie Clare)—This recently organized Los Angeles company has taken three-year lease on 20-stamp mill and properties of Bonnie Clare Mining & Milling Co.

LITIGATION HILL PROPERTIES (Manhattan)—Negotiations are under way toward a combination of three properties on Litigation Hill, the Manhattan Amalgamated, Earl and Litigation Hill Merger companies; the new company is also to control the mill of Manhattan Milling & Ore Co.

MANHATTAN DEXTER (Manhattan)—After several months idleness, leasers are now starting operations on both ends of the Union Nine claim. The large gloryhole covering the site of the Briggs-Evans lease shows considerable tonnage of medium-grade ore, and Mushett and Wittenberg have taken a lease on these blocks and are installing machinery to drive in from the south under the gloryhole and extract the ore at a minimum of cost. The 10-stamp mill and cyanide plant of the Manhattan Milling & Ore Co. will handle the ore from this lease.

Storey County

UNION CONSOLIDATED (Virginia City)—Saved 10 cars ore averaging $34.72 per ton. Union in southwest drift on 2500 level from Sierra Nevada incline saved 23 tons averaging $10 per ton.

MEXICAN (Virginia City)—West crosscut on 2700 level and south drift No. 3 on 2500 level in porphyry and quartz of low assay value. Mill crushed 144 tons low-grade ore and shipped three bars of bullion to smeltery.

JACKET-CROWN POINT-BELCHER (Gold Hill)—In old Belcher ground, 99 ft. below 1500 station, water reached and being easily handled. Saved 56 cars mill ore from 1300 Belcher raise and 27 cars from 1300 Crown Point northeast crosscut.

NEW MEXICO

Bernalillo County

GOLD STAR MINING & MILLING CO. (Albuquerque)—Company has filed articles of incorporation. Joe Delfrate, Old Albuquerque, N. M., is agent.

Dona Ana County

TORPEDO (Organ)—Claims and equipment in Organ Mountains has been purchased by J. I. McCullogh, L. M. Stiles and others of El Paso, Tex. Consideration said to be $350,000. Property has been one of camp's best producers but has been in litigation for many years.

UTAH

Beaver County

UTAH LEASING (Newhouse)—This company is building a plant to treat the tailings from the Cactus mill of the South Utah Mines & Smelters. Flotation will be used and the capacity will be 500 tons. Kirk & Leavell have designed the plant and will use the Minerals Separation process. The tailings carry 13.5 to 14 lb. copper to the ton with some gold and silver. The Utah Leasing Co. formerly worked a cyanide plant at the Old Telegraph mine in Bingham. The tailings will be moved by hand at the beginning, and a drag line will probably be used later. A 10-year lease has been obtained and plant should be ready in 60 days.

Juab County

TINTIC SHIPMENTS for the week ended Aug. 27 amounted to 142 cars.

KNIGHT-DERN MILL (Silver City)—About seventy men are employed on the concrete work, etc., now in progress.

CHIEF CONSOLIDATED (Eureka)—A portable compressor has been sent to the Scotia mine in West Tintic, and will be used in developing water near this property.

VICTORIA (Eureka)—Ore is being mined from the 1200 level, by the Eagle & Blue Bell which recently acquired control; four cars were shipped during the last week of August.

YANKEE CONSOLIDATED (Eureka)—Shaft on new strike down 40 ft. in good ore. Raising being done to reach ore bed from a tunnel 200 ft. lower; air line has been put in and drills are being used.

UTAH MINERALS CONCENTRATING (Eureka)—About 1000 tons of ore from the Chief Consolidated have been treated at this company's mill. Concentrates carrying 61% lead and 15 oz. silver were shipped week ended Aug. 27. Isbell vanners are used.

UTAH ORE SAMPLING (Silver City)—It has been necessary to work the mill here overtime, to take care of the increased tonnage from Tintic mines; 400 tons a day are being sampled and 10 to 12 cars of ore a week of Horn Silver ore, from Frisco, consigned to the United States smeltery at Midvale.

VICTOR CONSOLIDATED (Mammoth)—The hoisting plant was destroyed by fire Aug. 26. Fire started on 300 level where lessees are working, and burned shaft timbers, buildings, etc. Lessees escaped to surface through workings of the Carisa. Damage placed at about $15,000. A. W. McCune, of Salt Lake, owns control.

Salt Lake County

ALTA-GLADSTONE (Alta)—Molybdenite and wulfenite are being mined and sorted at this property, under lease to Fred Redmond. Vein is about a foot wide.

NEW UTAH BINGHAM (Bingham)—Company reports following assay for ore recently cut in drift from Giant Chief shaft: Copper 5.63%, lead 1.3, silver 32.4 oz., gold $2.80.

CARDIFF (Salt Lake)—Production has been increased to 125 tons daily. Utah Power and Light Co.'s line has reached the mine. As soon as transformers are installed, electric power will be used.

SECRET MINING (Alta)—Work of driving main tunnel for quartzite limestone contact is in progress. Face is in quartzite and several hundred feet more work necessary. Two shifts being worked. Property adjoins South Hecla and Albion. Wm. H. Minor is president.

EMMA COPPER (Alta)—Stringers and streaks of ore are being followed in two places, and 50 tons have been accumulated for shipment. Chas. S. Herzig, mining engineer, has been elected director of this company, and is directing development work. Ground lies west of old Emma mine.

SOUTH HECLA (Alta)—The Griffith-Field lease on the Quincy tunnel level is opening up well, and will begin shipments at once. A lease has been taken by the Bamberger Exploration Co., on a block of ground west of the Griffith-Field lease. The South Hecla company is shipping 40 tons of ore a day from the 250 level.

Summit County

PARK CITY SHIPMENTS for week ended Aug. 20, amounted to 3,364,140 lb. by 5 shippers; for the week ended Aug. 27, 3,562,320 lb.

SILVER KING COALITION (Park City)—New orebodies have been opened recently on and below the 1300 level, in the southwestern part of the property; also below the Alliance tunnel from the new shaft. In both places the percentage of sulphides are increasing. The machinery is being installed in the flotation section of the mill.

Utah County

BAY STATE (American Fork)—This property has been inspected by J. H. Wooton and Salt Lake mining men. Further development is to be done.

MILLER HILL (American Fork)—Ore showing galena has been opened in the Rock tunnel by the Williams lease.

TEXAN (American Fork)—Arrangements have been made by Charles Tyng, T. W. Boyer and W. H. Child, to work this property which adjoins the old Miller Hill. The tunnel now in 840 ft. is being extended.

PACIFIC (American Fork)—Ore carrying galena has been encountered in the 1000-ft. lower tunnel, which was being driven to cut the vein. The tunnel had passed the point where the vein was expected, and a raise was put up reaching ore a short distance above tunnel. Five feet of milling ore with streaks and branches of galena have been opened. Connections will be made with upper workings for better ventilation. Strike thought to be important in proving ore extends to depth. Additional men will be worked. Ore of a gross value of $25,000 has been shipped during a period of several years.

Washington County

A DAILY STAGE LINE has been started between Modena and Goldstrike. Stage leaves Modena 7:30 a.m., and arrives Goldstrike 4 p.m. Fare is $5 each way.

GOLDSTRIKE BONANZA (Modena)—New directors were elected at special meeting Aug. 24, as follows: G. E. Hale, I. Pett, A. E. Rykert, T. Marioneau and D. B. Shields.

VIRGINIA

Norfolk County

VIRGINIA SMELTING WORKS (West Norfolk)—Is reported to be contemplating construction of plant for manufacture of byproducts from smelting fumes.

WISCONSIN

Zinc-Lead District

THE WISCONSIN ZINC DISTRICT is making the largest output in its history under the stimulus of the very high prices now ruling, yet there is a larger tonnage of ore in the bins than before of medium to low-grade ores, which latter the buyers are not taking at present. This is causing the erection of several new separating plants that will take out the iron and raise a 25 to 45% concentrate up to 58 to 62% zinc.

CANADA

Ontario

GOLD REEF (Porcupine)—Leasers of this property are taking out good ore, which is treated in two-stamp mill realizing about $500 per week.

PIKE LAKE (Porcupine)—Two shafts are being sunk and are down 40 and 25 ft. respectively. A large porphyry dike crossing one of the claims is being stripped.

UNITED STATES (Cobalt)—Property has been taken over on a six year lease by Genessee Mining Co. recently organized by Rochester capitalists. Shaft now about 60 ft. in depth will be put down to contact expected to be reached at depth of 400 ft.

GIOVINAZZO CLAIMS (Boston Creek)—These three claims are under option to Stewart Thorn and associates. Body of quartz 20 ft. wide by 30 ft. long has been stripped. Gives low assays of gold.

MEXICO

Sonora

CANANEA CONSOLIDATED (Cananea)—Copper production slightly exceeds 3,000,000 lb. monthly. Flotation is being introduced at this works.

AUSTRALIA

South Australia

AUSTRALIAN MANGANESE CO. (Broken Hill, N. S. W.)—This company has opened a high-grade manganese deposit at Pernatty Lake, in South Australia, about 74 mi. from Port Augusta. Property is 4½ mi. from the East-West Ry. and shipments have been made to Broken Hill Proprietary Co., Newcastle.

The Market Report

Metal Markets

NEW YORK—Sept. 8

During the last week all of the principal metals were dull and uninteresting, and there was but little change in prices.

Copper, Tin, Lead and Zinc

Copper—Owing to the holiday, which extended practically from Friday to Tuesday, there was relatively little attention paid to the copper market. There was neither any particular demand nor any pressure to sell. Copper for domestic delivery was freely offered at 17⅜@17½c., regular terms, or about 17.20@17.30c., cash, New York, and some small transactions were reported around those figures. All of the principal producers, including those who are standing out for 18c., regular terms, for domestic deliveries, appear to be courting business abroad and quite willing to meet Australian and Japanese competition. Some consderable business was taken at £85@86, several large sales at the latter figure being reported on Sept. 7 and 8. With the existing situation in sterling exchange, of course nobody can tell what these sales are going to net until settlements are finally made.

An improved sentiment among the principal sellers of copper may be discerned. Certain houses that heretofore have been rather bearish appear recently to have changed their opinion.

Copper Sheets are quoted about 23c. per lb. for hot rolled and 24c. for cold rolled, with usual extras. Wire prices are unsettled; quotations may be put at 19@19¼c. per lb. at mill. The chief maker does not quote base price.

Imports of Copper for the week ended Aug. 21 are reported by the Department of Commerce as follows: Metal, 3,559,405 lb.; in ore and matte, 485,880; total, 4,045,285 lb. Exports for the week were 9,566,132 lb., the larger items being 6,770,690 lb. to France and 1,413,524 lb. to England.

Visible Stocks of Copper in Europe on Aug. 31 are reported as follows: Great Britain, 24,389; France, 5,554; afloat from Chile, 2,650; afloat from Australia, 4,000; total, 36,593 long tons, or 81,968,320 lb.; an increase of 2,479 tons over the Aug. 15 report.

Tin—This market was without special feature. A fair business was done from day to day, but the aggregate volume was light.

Visible Stocks of Tin on Aug. 31, including tin afloat: London, 6,404; Holland, 26; United States excluding Pacific ports, 8,697; total, 15,127 long tons, a decrease of 954 tons during August.

Lead—A few good orders were taken at material concessions in price. The price of the A. S. and R. Co. remains 4.90c., New York, but about all of the independent producers have been selling at concessions of $1.50@2 per ton, and lead is freely obtainable from them.

Spelter—The market has been steady, there having been neither any special buying demand nor selling pressure. Spelter for September delivery appears to be in fairly liberal supply, but there are not yet any signs of unsold stocks accumulating. September spelter is easily to be had at 14c., October at 13½c., and November-December at 13c. Sales of brass special were made at 15c.

Zinc Sheets—Business has been on a considerable scale. The base price for carload lots is unchanged at $16 per 100 lb. f.o.b. Peru, Ill., less 8% discount.

NEW CALEDONIA

Exports from New Caledonia for May and the five months ended May 31 are reported by the "Bulletin du Commerce" of Noumea as follows, in metric tons:

	May	Five Months
Nickel ore	2600	34,228
Chrome ore	....	8,541
Nickel matte	500	609

The matte reported in May was all consigned to New York.

Spanish Metal and Mineral Exports five months ended May 30 are reported as follows, by "Revista Minera" in metric tons:

	Metals		Ores, etc.	
	1914	1915	1914	1915
Iron	6,915	57 514	3,218 872	1,787,947
Copper	8,660	6,072	62 941	21,152
Copper precipitate	4,757	4,355		
Lead	68,406	60,424	1,260	293
Zinc	962	1,450	39 790	9,371
Quicksilver	827	699		
Manganese			6,449	2,327
Pyrites			1,354,582	628,160
Salt			288,955	206,116

Imports of coal for the five months were 594,901 tons, a decrease of 538,220 tons from 1914; imports of coke, 80,573 tons, a decrease of 80,545 tons.

DAILY PRICES OF METALS IN NEW YORK

Sept.	Sterling Exchange	Silver, Cts. per Oz.	Copper		Tin	Lead		Zinc
			Electrolytic, Cts. per Lb.		Spot, Cts. per Lb.	New York, Cts. per Lb.	St. Louis, Cts. per Lb.	St. Louis, Cts. per Lb.
2	4 5800	47¼	17½ @ 17¾		33¼	4 85 @ 4 90	4 70 @ 4 75	13.50 @14.50
3	4 6500	48⅛	17½ @ 17¾		33¼	4 85 @ 4 90	4 70 @ 4 75	13.25 @14.25
4	4 6700	48½	17½ @ 17¾		33¼	4 85 @ 4 90	4 70 @ 4 75	13.00 @14.00
6								
7	4 6600	48⅝	17½ @ 17¾		33¼	4 80 @ 4 85	4 70 @ 4 75	13.00 @14.00
8	4 6225	48¼	17½ @ 17¾		33¼	4 80 @ 4 85	4 65 @ 4 70	13.00 @14.00

The quotations herein are our appraisal of the average markets for copper, lead, spelter and tin based on wholesale contracts for the ordinary deliveries of the trade as made by producers and agencies; and represent, to the best of our judgment, the prevailing values of the metals, reduced to basis of New York, cash, except where St. Louis is given as the basing point. St. Louis and New York are normally quoted 0 17c. apart.

The quotations for electrolytic copper are for cakes, ingots and wirebars. Electrolytic copper is commonly sold at prices including delivery to the consumers and is subject to discounts, etc. The price quoted for copper on "regular terms" is the gross price including freight to the buyer's works and is subject to a discount for cash. The difference between the price delivered and the New York cash equivalent is at present about 0 20c. on domestic business. The price of electrolytic cathodes is 0 05 to 0 10c. below that of electrolytic. Quotations for lead represent wholesale transactions in the open market for good ordinary brands. Quotations for spelter are for ordinary Prime Western brands. Only the St. Louis price is herein quoted, St. Louis being the basing market. We quote the New York price at 17c. per 100 lb. above the St. Louis price.

Silver quotations are in cents per troy ounce of fine silver.

Some current freight rates on metals per 100 lb. are: St. Louis-New York, 17c.; St. Louis-Chicago, 6 3c.; St. Louis-Pittsburgh, 13 1c.

LONDON

Sept.	Silver	Copper: Standard Spot	Copper: Standard 3 Mos.	Copper: Electrolytic £ per Ton	Copper: Electrolytic Cts. per Lb.	Tin: Spot	Tin: 3 Mos.	Lead: £ per Ton	Lead: Cts. per Lb.	Zinc: £ per Ton	Zinc: Cts. per Lb.
2	23 3/16	68½	69½	84½	17.44	153¼	155	22 10/16	4 63	72	15.71
3	23 3/16	67⅞	68⅞	84½	17 44	154¼	155¾	23 1/16	4 78	72	15 94
4	23½	.	.	....							
6	23 13/16	66	67¼	82½	17 03		154	22⅝	4 76	72	16 01
7	23⅝	66¼	67½	82½	17 03	52½	154	22⅝	4 76	72	15 98
8	23⅝	67¼	68⅛	82½	17 03	52½	154	22 10/16	4 75	72	15 85

The above table gives the closing quotations on London Metal Exchange. All prices are in pounds sterling per ton of 2240 lb., except silver, which is in pence per troy ounce of sterling silver, 0.925 fine. Copper quotations are for standard copper, spot and three months, and for electrolytic, prices for the latter being subject to 3 per cent. discount. For convenience in comparison of London prices, in pounds sterling per 2240 lb., with American prices in cents per pound the following approximate ratios are given, reckoning exchange at 4 80: £15 = 3 21c.; £20 = 4 29c.; £30 = 6.13c.; £40 = 8.57c.; B60 = 12 85c. Variations, £1 = 0 213c.

NEW YORK—Sept. 8

Aluminum—Demand continues good. The stocks of foreign metal here have been drawn down pretty low, and prices are advancing. Quotations are 45@50c. per lb. for No. 1 ingots, New York.

Recent London quotations are £180@190 per long ton of No. 1 ingots—equal to 40.2c. per lb.—a price double that of a year ago.

London reports that, by a recent Government order, the exportation of aluminum salts from Norway has been prohibited.

Antimony—The market has been quiet, with only small transactions. Sales of ordinary brands have been made, mostly in small lots, at 28@29c. per lb.; while 44@46c. per lb. is asked for Cookson's.

Nickel—Quotations for ordinary forms are 45@50c. per lb., according to size and terms of order. A premium of 3c. per lb. is charged for electrolytic nickel.

A late London quotation is £225 per ton, equal to 48.8c. per lb., for metal 98% pure.

Quicksilver—The market has been rather quiet. New York quotations are $89 per flask of 75 lb. for large lots and $90 for smaller orders. San Francisco price is telegraphed at $87.50@90, with market quiet. London price is lower at £17 per flask, with the same figure quoted from second hands.

Minor Metals—Current sales of **Bismuth** are at $2.75@3 per lb., New York.—**Cadmium** is quoted at 6s., or $1.44 per lb. in London; $1.25 per lb. New York.—**Tellurium** is quoted at 80s., or $19.20 per lb. in London.—**Selenium** is quoted at $2@3 per lb. New York for larger quantities; $4.50 @ 5 for retail lots.

Gold, Silver and Platinum

NEW YORK—Sept. 8

Gold and Silver Movement in the United States seven months ended July 31 as reported by the Department of Commerce:

	Gold		Silver	
	1914	1915	1914	1915
Exports....	$117,643,959	$9,774,262	$20,463,126	$28,814,816
Imports....	31,135,137	162,187,374	13,830,568	18,744,541
Excess. .	E $83,508,822	I $152,413,112	E. $15,632,558	E. $10,070,275

Exports of merchandise for the seven months in 1915 are valued at $1,969,787,495; imports, $1,008,909,441; excess of exports, $960,878,054. Adding the gold and silver gives $818,535,217 as the net export balance.

Another large shipment of gold from London was received at New York last week, coming by way of Halifax.

Sales of gold from the New York Assay Office in July were $1,987,000. For the seven months ended July 31 sales were $19,087,928 in 1914, and $16,060,360 in 1915; a decrease of $3,027,568 this year.

Platinum—There has been a sharp advance due to short supplies. Refined platinum, which sold early in the week at $42, is now quoted at $48@50 per oz. The advance is considered temporary, and the arrival of any new supplies would be followed by a fall.

Silver has ruled steady for the past week owing to better demand both in foreign and domestic markets, closing steady at 23⅝d. in London.

A shipment of $400,000 Mexican silver dollars was received in New York, Sept. 7, from Spain. This is an unusual course for such a shipment.

Zinc and Lead Ore Markets

JOPLIN, MO.—Sept. 4

Blende, high price, $89; base per ton, 60% zinc, premium ore, $86; medium, $85@81; lower grades, $80@75; calamine, base per ton, 40% zinc, $78@50; average, all grades of zinc, $81.40 per ton. Lead, high price, $52; base price, $50 per ton of 80% metal content; average, all grades of lead, $49.97 per ton.

SHIPMENTS, WEEK ENDED SEPT. 4

	Blende	Calamine	Lead	Values
Totals this week	10,924,130	$71,230	1,252,060	$511,350
Totals this year	385,716,410	31,092,810	59,468,720	16,888,660

Blende value, the week, $451,360; 36 weeks, $14,629,230.

Calamine value, the week, $28,710; 36 weeks, $689,300.

Lead value, the week, $31,280; 36 weeks, $1,570,130.

A very weak mid-week market closed strong, with buyers in the market for an increased tonnage. Of the week-end purchases but few carloads were shipped. One company picked up from 2,000 to 2,500 tons the last two days, and others had increased purchasing orders. Moyer, of the Western Federation is in the field endeavoring to strengthen the local miners' union and establish an affiliation, promising unlimited support in case of another strike. On the agreement to base the wage scale on average ore prices of preceding month a reduction in the wage scale of 50c. per day was common today. Some fear a strike, and are prepared to meet it as before by making no endeavor to operate.

PLATTEVILLE, WIS.—Sept. 4

The base price paid this week for 60% zinc ore was $85 down to $80 per ton at the week end; medium grades sold from $80 down to $70 base. No sales of lead ore were reported.

SHIPMENTS, WEEK ENDED SEPT. 4

	Zinc Ore, Lb.	Lead Ore, Lb.	Sulphur Ore, Lb.
Week	4,027,000	.....	420,900
Year	129,303,440	4,463,160	18,728,710

Shipped during week to separating plants, 4,892,210 lb. zinc ore.

OTHER ORES

Molybdenum—Reports apparently well authenticated say that $1.25 per lb. has been paid in New York for concentrates carrying 80% MoS_2. Heretofore 90% has been the usual standard. Recent London quotations are 117s.@120s. per unit for molybdenite carrying 90% $Mo.S_2$ or over.—**Tungsten** ore has again advanced. Recent London quotations are 55s. per unit for Wolframite, 70% WO_3; the same price for scheelite of the same grade. In New York $28 per unit has been paid for concentrates carrying 55% WO_3, for immediate delivery. It is understood that buyers are no longer insisting on material free from copper. These prices work out nearly on a parity.

Iron Trade Review

NEW YORK—Sept. 8

The iron and steel trades continue extremely active, and demand for various products is on the increase. How much of this is domestic business and how much is war order or munition business for export is rather hard to determine. Concerns receiving foreign orders are rather reticent about them and details are not to be had in most cases.

There is no doubt, however, that domestic buying is improving and that there is more demand on several lines, notably in structural steel, bars and plates.

Pig iron continues to show strength and there is an increasing call for steel making irons, some large contracts having been placed for basic. Foundry demand is also on the increase.

Some of the speculative iron—chiefly Southern—bought at low prices a few months ago is now coming out at the higher levels which have been reached.

Exports from Baltimore for the week included 3,557,400 lb. wire rods and steel billets to Liverpool; 453,600 lb. pig iron to Rotterdam.

FERRO-ALLOYS

Ferrosilicon—London quotations range from £10 10s. up to £14 10s., according to percentage of carbon.—**Ferrotungsten** is quoted at 6s. 6d.@7s. per lb., for alloys 75 to 85% tungsten and not over 1% carbon.—**Ferrochrome** is £25 10s. up to £30 per ton, the high price being for 4-6% carbon.—**Ferromolybdenum** is 18s.—$4.50—per lb for metal 70 to 80% pure.

Pittsburgh quotations for **Ferrosilicon,** 50%, are $73 per ton at furnace.—**Ferrochrome** 4-6% carbon, 20c. per lb.—**Ferrotitanium,** 8@12½c. per lb., according to grade.—**Ferrotungsten,** $3@3.50 per lb. of contained alloy.—**Ferrovanadium,** $2.25@2.30 per lb. of contained alloy.—**Ferromolybdenum,** nominal, none to be had. All prices are for large lots.

PITTSBURGH—Sept. 7

A very interesting news item just being given out is that the Jones & Laughlin Steel Co. is about to build at once a pipe department at its Aliquippa works. This will round out the Aliquippa works as originally projected, the tinplate and wire departments having been in operation for several years. The new department will contain a skelp mill, with two butt-weld and two lap-weld furnaces.

The steel market is firm and active, but has shown no material improvement over conditions existing in August. As that month is usually dull, with September showing an improvement, the general expectaton is for increased activity as September wears along. Steel prices are firm and show an advancing tendency, though there have been no clear-cut advances in the past week. The 1.35c. price is being very firmly maintained on bars, while shapes are firmer at that figure and plates are approaching the level, there being few plate quotations at under 1.30c. Wire products are very strong, with the usual fall demand in the domestic trade coming on top of an already heavy export demand, and a definite shortage in barb wire is expected. Blue annealed sheets are

very firm at 1.50c., showing an advance of $3 a ton within three weeks, black sheets being firm at 1.90c., an advance of $2 a ton in the same time, while openhearth are quoted at 1.95c. Galvanized sheets are stiffer with the recent spelter advance, but demand continues very light.

It is reported that railroads are very seriously considering their steel needs for next year, as with so much export steel already contracted for extended deliveries there are distinct possibilities of a decided shortage in steel. Even rails, which for years have always been obtainable in any tonnage and for any delivery desired, may be scarce on account of so many rail mills being engaged in rolling large rounds for shrapnel and other shells.

The steel trade has not been seriously concerned over the recent sharp declines in sterling exchange. By far the major part of the steel sold for export has been in dollars and not in pounds sterling. Even in sales for London settlement the profits have been such that the fluctuations in exchange do not mean as much as might be supposed. The steel trade regards the steel it has been selling for export as so necessary that it expects exchange matters to be so adjusted that the business can be continued without any interruption whatever.

Pig Iron—The market has been rather quiet the past week. Sellers are rather reserved and there is not much inquiry. Bessemer advanced 25c. on a 3,000-ton sale for export, at $15.75, Valley, while some small lots have gone at $16. Some sellers have advanced their quotation on basic to $15, but there are still sellers at $14.50, and some off basic has been sold at such low prices as to make the $14.50 quotation on standard look otherwise than absolutely secure. Furnaces are quoting foundry iron at $14.50, furnace, for this year and $15 for the first half of next year, but odd lots can sometimes be picked up at slight concessions. W. P. Snyder & Co. announce the average realized prices on bessemer and basic iron in August, in lots of 1,000 tons and over, at $15.064 for bessemer, an increase over the July average of $1.073, and $14.364 for basic, an increase of $1.405. The market is quotable as follows: Bessemer, $15.75@16; basic, malleable and No. 2 foundry, $14.50@15; gray forge, $14.25@14.75, f.o.b. Valley furnaces, 95c. higher delivered Pittsburgh.

Ferromanganese—The steel trade does not seem to be particularly uneasy about its future ferromanganese supplies, and appears to have fair stocks. It is claimed in some quarters that some material being sent to this country is being sold in prompt lots at ruling prices instead of being applied as deliveries on low-priced contracts. The prompt market is $100@110, fluctuating almost from day to day, while the contract market is nominally $100, Baltimore.

Steel—Still more fancy prices are being paid for openhearth billets, ranging between $25 and $26, Youngstown, equivalent to about $1 more delivered Pittsburgh. There is scarcely any demand for bessemer billets, which are nominally quotable at slightly less than openhearth, while there is no inquiry for sheet bars, which are unquotable, as mills would hardly sell sheet bars at less than billets, while on the other hand sheet and tinplate prices realized are such that mills could not afford to buy sheet bars at anything like the prices being paid for openhearth billets. Rods are scarce and quoted $28@30, Pittsburgh.

SAULT STE. MARIE CANALS

The total tonnage passing through the Sault Ste. Marie canals in July was 9,719,237 short tons. For the season to Aug. 1 the total tonnage was: Eastbound, 20,472,730 tons; westbound, 6,390,641; total, 26,863,371 tons, an increase of 1,182,398 tons over last year. The mineral freights included in the totals were, in short tons except salt, which is in barrels:

	1914	1915	Changes
Anthracite	1,133,532	994,226	D. 139,306
Bituminous coal	5,906,840	4,781,615	D. 1,125,225
Iron ore	14,739,927	18,097,758	I. 3,357,831
Pig and m'f'd iron	142,116	95,595	D. 46,521
Copper	30,087	63,290	I. 33,203
Salt, bbl.	403,331	297,406	D. 105,925

Iron ore this year was 67.4% and coal 21.5% of the totals. The number of vessel passages was 8547, showing an average cargo of 3144 tons.

IRON ORE

It is stated that contracts for Lake Superior ore have been placed with eastern Pennsylvania furnaces to a total of about 500,000 tons. The ores bought were chiefly Mesabi nonbessemers, and the price figures at about 8c. per unit of iron, delivered to furnaces.

Imports at Baltimore for the week included 24,450 tons manganese ore from Brazil.

Exports of manganese ore from India in May were 21,953 tons, against 71,819 tons in May of last year.

Shipments of Lake Superior iron ore in August were 8,081,117 long tons, an increase of 2,211,640 tons over August, 1914. The total shipments to Sept. 1 were 26,806,120 tons, an increase of 5,528,313 tons, or 26%, over last year.

British Imports of Iron Ore, six months ended June 30, were 3,060,639 long tons in 1914, and 3,063,515 tons in 1915; an increase of 2876 tons this year. Imports of manganese ore were 211,465 tons in 1914, and 134,526 in 1915; a decrease of 109,939 tons this year.

COKE

Coke production in the Connellsville region for the week is reported by the "Courier" at 391,310 short tons; shipments, 388,107 tons. The production of the Greensburg and Upper Connellsville districts was 42,905 tons.

The Lackawanna Iron & Steel Co. is installing a plant for the recovery of benzol at its byproduct coke ovens at Lebanon, Penn., with an output of about 1600 gal. a day. The plant will be ready for operation in November.

The coal report of the Geological Survey gives the total production in the United States for two years past as follows, in short tons:

	1913	1914	Changes
Anthracite	91,524,922	90,821,507	D. 703,415
Bituminous	478,435,247	422,703,970	D. 55,731,327
Total	569,960,219	513,525,477	D. 56,434,742

The decrease in the production of bituminous coal was generally distributed over the country, but there were seven states in which the production in 1914 was greater than in 1913—North Dakota, South Dakota, New Mexico, West Virginia, Kentucky, Michigan and Oregon.

Exports and Imports of Fuel in the United States in the fiscal year ended June 30 are reported by the Department of Commerce as below, in long tons:

	Exports		Imports	
	1913–14	1914–15	1913–14	1914–15
Anthracite	3,959,114	3,682,188	8,124	12,358
Bituminous	15,794,966	14,412,995	1,358,002	1,429,608
Coke	7,2,476	602,473	112,541	88,865
Bunker coal	7,851,913	7,062,653	.....	.....
Totals	28,218,469	25,760,309	1,478,667	1,530,771

The bunker coal, or coal furnished to steamships in foreign trade is practically all bituminous. The larger part of the trade, both exports and imports, is with Canada.

Chemicals

NEW YORK—Sept. 8

Conditions in the general market have not changed in any noteworthy degree since last week.

Arsenic—Business is not on a large scale, but the market is inclined to be firm. Prices are about $3.50 per 100 lb. for large lots, up to $4 per 100 lb. for small orders.

Copper Sulphate—On a steady market there has been fair sales. Quotations are $7.25 per 100 lb. for carload lots and $7.50 per 100 lb. for smaller parcels.

Nitrate of Soda—The market is inclined to be strong, and no change in prices is reported. September deliveries are quoted at 2.42½c. per lb., while 2.45c. is named for futures.

PETROLEUM

New oil wells completed in August are noted as follows in the monthly statement of the "Oil City Derrick": Pennsylvania grade, 376; Central Ohio, 74; Lima-Indiana, 34; Kentucky, 4; Illinois, 71; Mid-Continent, 363; Texas-Louisiana, 154. In all 1,076 wells were completed in the fields covered by the review. The new production credited to the completions was 97,850. The figures give an increase of 94 in the wells as compared with July, and a decrease of 35,923 in new production. Among the completions were 248 dry holes and 155 gas wells. At the close of August there were 438 rigs up and 1,554 wells drilling.

Recent "Commerce Reports" state that the Standard Oil Co. of New York is about to open up in business on the east coast of Sumatra. Sites for large godowns have been selected at Belawan, Loebong, Pakam, Tebing Tinggi, Perbangan, Bangan Poerba, Sinantar, Tandjong Balei, and even at Langsar and Kota Radja. The construction work will be undertaken by the West Java Engineering Co., and will be completed by the end of 1916. The headquarters of administration in the Dutch East Indies will be at Batavia. The Standard Oil Co. is contemplating developments in Sumatra on a large scale.

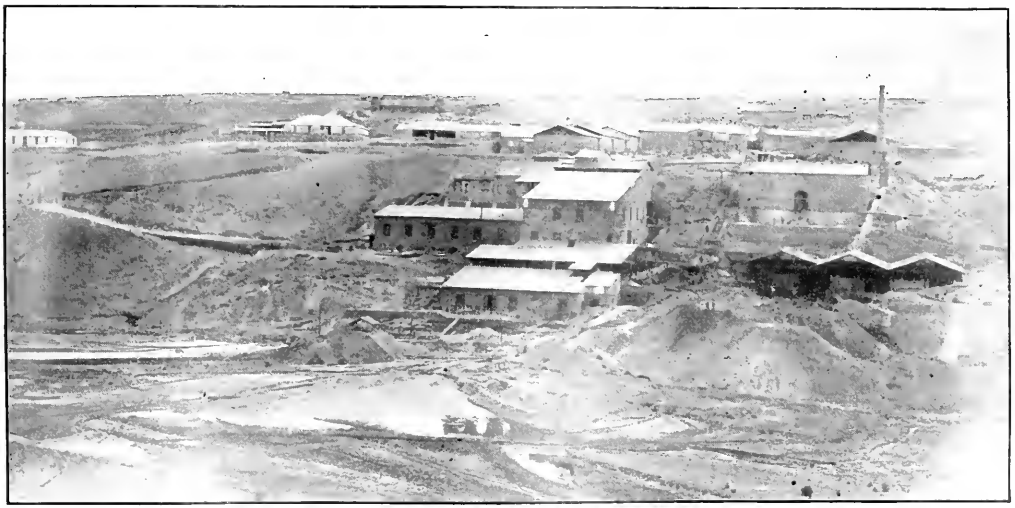
Tin-Ore Dressing at Llallagua, Bolivia—I

By Durward Copeland* and Scovill E. Hollister

SYNOPSIS—Both oxidized and sulphide ores at Llallagua are concentrated on jigs and tables; pyritic middlings are roasted and separated magnetically, the magnetic material being reground and concentrated on tables. The tin occurs as cassiterite in both classes of ores. Operating conditions are expensive on account of high transport charges.

When we were about to leave the United States in 1913 to enter the employ of the Compañia Estañifera de Llallagua, we made some small search of the literature on Bolivia. There were articles on mining and mining equipment, and on milling with pictures of Indians turning a pestle on a stone platform, giving us an illustration of the industry as practiced shortly after the time of Adam.

Having since seen the place from which about one-half of Bolivia's tin comes, we have wondered at the experiences of those whose writings we found. The altitude (about 13,000 ft.) caused us little if any trouble, and among our acquaintances few have been affected. Of course the height above the sea is a convenient and ever-present factor to shoulder the blame for the ill effects of too much food or liquor, two things commonly given every opportunity to do their work by those who come to Bolivia



THE CONCENTRATING PLANT AT LLALLAGUA, BOLIVIA

the subject of Bolivia to find out what conditions—technical, social, climatic and otherwise—we might expect to encounter. Literature we found, and undoubtedly there exists much more than we discovered. There were books on travel, starting at Panama and ending at Patagonia, which told us we might expect to be afflicted with badly bumping hearts when we arrived at the high tableland of from sea-level locations. The climate at Llallagua we have found to be much better than that of either New England or the Middle West. Having had no experience with the climate of California, the writers can make no sweeping statements comparing the part of Bolivia we know with that of the United States as a whole.

The high tableland of Bolivia is within the tropics. At Llallagua from December to May, there are heavy rains, but it does not rain all of the time during these months. During the remainder of the year there is little

*Metallurgist, Cia. Estañifera de Llallagua, and professor of metallurgy, Missouri School of Mines, Rolla, Mo.

†Mill superintendent, Cia. Estañifera de Llallagua, Llallagua, Bolivia.

rain. The season without rains has cold nights, that is, cold enough for ice to form, say—5° C. There are strong winds, particularly during parts of July, August and September. These winds do not blow the whole day but for a few hours only and are, of course, most forcibly felt on the pampas or plains. Through the dry season the days at Llallagua are really delightful—plenty of sun, dry and comfortable. We found that the mines at Llallagua (and at Uncia) possess fairly good equipment, and the mills are not many years behind the times. The Llallagua company has three compressors, about a hundred air drills (half of which are normally in daily use), electric haulage and so on.

Llallagua District Produces One-Half of Bolivia's Tin

It is because we had gained from the available literature an impression so contrary to our experiences that we decided to write this article. We realize that conditions elsewhere in a mountainous country like Bolivia may be quite different from those obtaining at Llallagua, this being particularly true of the climate. Most certainly, also, the tin ores of other parts may be and undoubtedly in some cases are, similar to Llallagua's only in the fact that they contain tin. However, here is produced about one-half of Bolivia's total output of tin, so perhaps the operating conditions are as important as any others when quantity is considered.

The Compañia Estañifera de Llallagua is owned by a group of influential capitalists in Chile. Señor Don Orlando Ghigliotto S. is the general manager, resident in Santiago, Chile, and E. Diaz is resident manager at Llallagua. The property was purchased in 1906 and the present company was capitalized for £125,000, shares having a par value of £1 each. The shares have at times increased greatly in value, being quoted as high as 140 Chilean pesos (about £6). The company has paid in dividends about £600,000, has built from earnings a hydroelectric power plant which will shortly give 800 hp., has installed modern mining and milling equipment, has erected a Deutz motor and Diesel engine plant of 800 hp., and has at present a considerable reserve fund.

The mine of this company and the mines of Simon I. Patiño, at Uncia, are in the same mountain, working the same veins, and are at this writing producing about the same amount of ore. The Llallagua company's production is steadily increasing. In the last few years there has been much litigation between the two companies over disputed territory, but differences have been settled and a definite division line established. The importance of the Llallagua company may be judged from the fact that the yearly production of 8000 tons of *barrilla* (tin concentrates) or 5600 tons of fine tin is about 5% of the world's production, and more than 20% of Bolivia's production. The mines of Señor Patiño, at Uncia, are giving more than 25% of Bolivia's tin. Therefore, from the same mountain and really from veins within an area of a few meters comes about one-half of Bolivia's total output of tin.

Both Oxidized and Sulphide Ores

The ores are, for milling purposes, divided into two classes, the oxidized ores known locally as *pacos* and coming from parts of the mine where surface waters have had good opportunity to flow, and unoxidized ores, *piritas*, which are found in the parts of the mine where surface waters carrying oxygen have had little chance to circulate. The *piritas* material, as the name implies, always contains a great deal of pyrite and other sulphides. It is true, of course, that the *pacos* ores are found usually relatively near the surface while the *piritas* material is obtained from deeper levels, but this is not always the case. The veins or even different parts of the same vein do not offer anything like equal opportunity for waters to circulate without being robbed of their dissolved oxygen. In some of the veins there is at the same level a sharp dividing line between the *piritas* and the *pacos*. In other veins thoroughly oxidized *pacos* are found lower than *piritas* existing in the same vein in unoxidized condition.

The water-concentration section of the mill treats both classes of materials in the same way. The *barrilla* obtained from the *pacos* is called "black tin" and some buyers prefer

CASSITERITE VEIN IN CANCANIRI TUNNEL AT LLALLAGUA, BOLIVIA

it. From the *piritas* ore the *barrilla* obtained is sold under the mark "S.S." to show that it comes from the milling of sulphide ores. It is true that although the *barrilla* obtained from *piritas* is as rich in tin as that from *pacos* ores, still the sulphide *barrilla* contains a little more sulphur and more of metallic impurities than does the *pacos* or black-tin concentrates.

The mineralogical composition of the ores, particularly the *piritas*, is exceedingly complex. The tin always exists as the mineral, cassiterite, no stannite having ever been found at Llallagua. Our cassiterite is black and has a specific gravity of 6.9; the mineralogies give the specific gravity at 6.8 to 7.1. In Llallagua ores, even the

crystallized cassiterite contains small amounts of sulphur and iron, probably pyrite between the planes of the tin crystals. Besides the tin mineral, there occurs in the ore almost everything that one might hope to find. There is always much pyrite; in fact, some of the best ores contain as much as 20% sulphur. Arsenopyrite occurs in large amounts in some veins and is absent in others. Bismuthinite is found in small quantities in nearly all of the pyritic ores. The appearance of the ore when broken, particularly in the case of the very rich material, say, more than 65% tin, would indicate large bismuth percentages, but the assays seldom show any large quantities. This is explained by the fact that the ore seems to break so as to expose to good view the long bismuthinite crystals, and on such ores as those at Llallagua an assay is absolutely necessary in order to form any definite idea of the bismuth content. Such assay is always disappointing. Wolfram, or rather scheelite, is found in all of the veins but not in paying quantities. Native copper occurs in some of the ores, but the occurrence is usually local and the amount of copper in the total is small. Quartz is common and is frequently well crystallized. Then, of course, there are the igneous rock and the slate.

As far as the mill is concerned we are interested in those minerals which are close to cassiterite in gravity. Bismuthinite has a gravity of 6.4, scheelite 6.0 and arsenopyrite 6.0. The bismuth and tungsten minerals occur in such small quantities that they cause us no trouble. Our *barrilla* never contains over 0.5% bismuth. There is not at present enough of the bismuth or tungsten minerals to pay us for their recovery. In the cases where arsenopyrite occurs—and sometimes it comes in large amounts—it is impossible to keep this mineral out of the *barrilla*. However, only small sections of the mine are rich in the arsenical pyrite, or *pirita blanca* as the natives call it, and it is easy to mix the ores so as to keep the percentage of arsenic below 0.5 in the tin concentrates. In case of necessity the ore can be roasted and the arsenic volatilized.

The veins vary greatly in width and in richness. At Llallagua at present there are 15 known veins and more will undoubtedly be found. At times the width of the various veins may be only an inch or two, or in fact may disappear entirely, while again there may be a face of 60% ore more than 1 m. wide and this width and grade may persist for many meters in depth and length. As yet there has been no diminution of tin with depth. A vein, rich near the surface, may grow poor with increase of depth and then rich again at greater distance from the surface. It is not necessary that a vein outcrop. One of the best orebodies in the Llallagua mine at present, a vein nearly 1 m. wide and averaging as mined more than 25% tin, does not so far as we can determine appear at or near the surface. At a depth of 300 m. beneath the surface the ore is as good as or even better than that higher up. Naturally, the tin cannot go down forever, but at 300 m. it still exists undiminished in quantity and quality. In crosscut driving it is not at all uncommon to strike unexpectedly a body of ore of considerable size and richness. The whole mountain seems to be mineralized with veins both in the igneous rock and in the slate. It is true that those bodies of ore existing with igneous material are always more persistent, larger and richer; however, it is a fact that a vein may continue from the igneous into the slate and retain for a few meters its size and richness.

The vein matter and whatever country rock it is necessary to break with it are brought to the surface and then carefully hand-picked by women. Wherever possible the coarsely crystalline cassiterite is cobbed out and sacked ready for the market. This coarsely crystalline material, ready to ship without milling, is locally called *guia* and contains about 65% tin. Some of the veins are for many meters nearly solid *guia* and production in such cases is cheap. The waste rock is rejected and the remaining material containing the relatively finely divided cassiterite is sent 5 km. by aërial tramway to the mill. At Llallagua about 2½ tons of material is mined and brought to the surface for every ton the mill receives. This is in part due to the large amount of preparatory work now being done. Of the present tin production about 5% comes from the *guia* which is hand-picked at the mine.

The mill of the company has at present a single section with a capacity of about 200 tons per 24 hr. When the mill was first built the company was mining *pacos* ores

PRIMITIVE CONCENTRATION AND TRANSPORTATION AT LLALLAGUA

Concentration on the rectangular buddle following hand roasting has been superseded by mechanical devices; jig and table concentration is now followed by roasting in Kauffman furnaces and concentration in Stern magnetic separators. Llama transportation is still used, as Llallagua has no railroad; packages heavier than 100 lb. must be transported over the cart road.

only and the mill was designed to meet the conditions necessary in treating this oxidized, relatively soft, pyrite-free material. At present not more than 15% of the ores which arrive at the mill are of the *pacos* class, the remainder being *pirilas*. For both classes of ores it is necessary to break the material so that all will pass a 10-mm. hole before sufficient of the cassiterite is broken free to make a start in the concentration. The mill is arranged on the graded-crushing, trommel-sizing, Hartz jig plan. Trommels are used to size the ore down to 1.5 mm. when the work is taken up by hydraulic classifiers, followed by settling boxes. Jigs are used to handle all the material above about 0.75 mm. in diameter. The ore finer than 0.75 mm. goes, after classification in Janney classifiers and thickening tanks, to Overstrom tables and Isbell vanners. The middlings and tailings from all jigs treating materials greater than 1.5 mm. in diameter are sent to Huntington and chilean mills. There is being installed at present a 6-ft. Hardinge pebble mill to regrind the coarse middlings and tailings. All jig tailings finer than 1.5 mm. enter the Janney classifiers and are re-treated on the tables. The reason jigs are used to treat material as small as 0.75 mm. is that heretofore there has not been sufficient table and vanner surface. New tables and vanners are now on the ground and in the future the fine material will all go directly to tables with the resultant saving in power, water, and attendance.

Cassiterite the Only Profitable Mineral

The only mineral in the ores that will pay for saving is the cassiterite. With the *pacos* ores there occur no minerals which approach closely in gravity the cassiterite. It is true that the oxidized ores contain much iron oxide, but this oxide is hydrated and porous and therefore relatively light. There is, then, no difficulty with a reasonably good classification in making a clean separation of the cassiterite from the other minerals which accompany it in the *pacos* ores. As in other classes of mills there is, of course, difficulty in saving the fine mineral. The tin ore at Llallagua does not slime badly.

With the pyritic ores the conditions for separation are not so easy. There exists in these unoxidized ores some minerals like arsenopyrite, bismuthinite and scheelite, which are too close to cassiterite in gravity to permit a clean water separation. As before explained the above minerals are not usually present in amounts sufficient to interfere with the grade of the *barrilla*. Pyrite is always present in large amounts. Between the pyrite and the cassiterite there is a gravity difference of two, enough for a clean separation of the two minerals, provided always that classification is good. This is as great a gravity difference as, or even greater than, that between the blende and the dolomitic limestone of the Joplin district of Missouri. So long as the material is relatively coarse there is no difficulty whatever in making a good classification and a *barrilla* free from impurities. "Free from impurities" always means here free from pyrite or, as they say, sulphur. Penalties, and these seem excessive, are imposed (but not always collected) by the European smelters in case the sulphur content of the *barrilla* is high. One form of contract with which the Llallagua company has had experience allows 1% of sulphur without penalty. If over 1% and up to 3%, ½% of tin is deducted for each unit of sulphur, and if over 3% sulphur is present in the *barrilla* the buyer has the privilege of rejecting the lot.

Hand Roasting Too Expensive

As the material grows finer there is difficulty in making at the same time a good tin recovery and a *barrilla* free from pyrite. This is perhaps due to poor classification, but it should be remembered that the amount of sulphur allowable is not large. With the pyrite ores, there was therefore the problem of treating fine-grained pyrite-cassiterite middlings. At first the company installed hand calcining furnaces in which the middlings were dead-roasted as a preliminary to washing on buddles. The only fuel available here for use in roasting is the dung of the llama, this combustible being known as *taquia*. In appearance at least *taquia* is similar to sheep dung. It can be imagined that roasting in hand furnaces with sheep dung costing $10 per ton is a fairly expensive operation. It is not possible to obtain in the firebox of a roasting furnace with this fuel a sufficiently long flame, so the greater part of the fuel is mixed with the ore on the hearth of the furnace. The firebox is used to aid in keeping the mixed ore and fuel up to the ignition temperature. To give air for burning the mixture of dung and pyrite middlings, the working doors of the hearth must be open most of the time. Operating with material all of which will pass 1 mm., a hand furnace 20 ft. long and 10 ft. wide will roast about 4 tons from 30% sulphur to 2% sulphur per 24 hr. The fuel needed (*taquia*) will be about three quintals per ton (1 quintal = 101 lb.). The labor cost is about $1 per ton in addition to the fuel.

The calcined material from the hand furnaces was concentrated in buddles. In these buddles the concentration is primarily a sizing operation. The cassiterite is finer than the pyrite and during the calcination the iron mineral, in changing to oxide, swells. It is true that the particles of iron oxide or gangue will be carried farther down the plane of the buddle than particles of cassiterite of the same diameter. If, however, there exists a great number of small particles of gangue and iron oxide with the cassiterite, concentration in a *tina* or tub is used to keep this material out of the *barrilla*. The ore is fed with an amount of water depending upon its fineness (the finer the less water), and the bed is continually swept to keep an even depositing plane. When the buddle has filled, the bed is marked off by the chief of the section (the *mayordomo*) into concentrates, middlings, and tailings, the concentrates consisting of grains of the finest diameter, the middlings being coarser, and the tailings containing the grains of greatest diameter. Each division is shoveled from the buddle and rewashed until the concentrates are rich enough in tin to be called *barrilla*, and the tailings so poor that they can be sent to the river. The *barrilla* obtained in this manner averages 68% tin and is low in sulphur.

(*To be continued*)

First National Copper

After being shut down for several years on account of complications with the farmers over smeltery fumes, the First National Copper, according to the *Boston News Bureau*, has apparently abandoned the idea of installing devices for the prevention of the emission of these obnoxious fumes. A contract is reported to have been made

with the Mammoth Copper Mining Co., whereby the First National ores will be treated at Kennett, Calif. The Mammoth company will take ore in addition to the 250 tons per day contracted for as fast as the mining company can get its production to a higher basis. This will enable the First National to get in on the present high copper market.

New Almaden Quicksilver Mine

By Richard G. Place*

New Almaden is situated in Santa Clara County, California, about 12 mi. south of the city of San Jose. There is a branch line of the Southern Pacific R.R. running between San Jose and the mines. Instead of rugged mountains that usually surround a mine, the approach is through a beautiful fertile valley of spreading fields and orchards. New Almaden is the largest mercury mine in California and was for a number of years the second largest producer in the world, Almaden of Spain being the premier quicksilver producer.

The main shaft is on the top of a hill, extending down for over 2,000 ft. There is a continuous orebody occurring between layers of serpentine and shale for nearly four-fifths of this distance. Parallel to the orebody is a rhyolite dike. The country rock is sandstone and shattered greenstone.

From the shaft the ore is taken by two cable inclines, that convey it to the retorts at the bottom of the hill. A part of the cinnabar ore is screened, but the majority is fine enough, when it comes from the mine, to be introduced directly into the retorts. Both the retorts and the condensers are of an antiquated type and leak so badly that all the workmen suffer more or less from salivation.

At present considerable profit is being realized by washing the sand and dirt taken from under old parts of the workings that are being remodeled. The washing is done in a rocker such as was used in the early placer mines in this country. The accompanying illustration shows one in operation at New Almaden. So far this year the production has been over 200 flasks per month. The present operators have a lease on the property for 25 years.

*1105 Garfield Ave., Pasadena, Calif.

What Excessive Gold Supply May Do

The National City Bank in its September circular points out in a lucid way what may result from an excessive importation of gold into the United States. In part it says the following:

The Allies still have large holdings of gold. The appeal to the French to exchange their holdings of coin for paper money has brought in over $100,000,000 since May 27, and a similar request lately by the British government has resulted in a noticeable increase in reserve of the Bank of England. Notwithstanding increased liabilities due to the big loan, the reserve now stands at 24%, compared with 16% a month ago. However, these gains are small compared with payments to be made here. Moreover, continued importation of gold is a menace to orderly progress of business in this country. So long as the fabric of credits is not enlarged, additions to gold reserves will do no harm, and serve to broaden the base under the situation; but bank credit is so readily available for a thousand inviting purposes that it is too much to expect of the people that they will abstain from using it for long at a time. They have never persisted in such self-restraint, and bankers have never been proof against their persuasions. There is no money trust strong enough to close the vaults against the public when it is in earnest about wanting accommodations.

There is a normal status, or equilibrium, between countries of the world, in industry, in gold holdings, and in all relations with each other. That status is not fixed, but cannot be changed violently without reaction. It is being changed now, and the prudent man will beware of the reaction. The United States is obtaining more than its share of the world's gold, as gold would be distributed under ordinary conditions, and when the war is over it will not be able to hold the excess. If new supplies have been stored away, unused and unpledged, and can be released without disturbance, well and good; we will have simply lost the interest on their value, and played the part of miser. But if we proceed to build credits on the new store, those credits will have to be liquidated when the base is removed, and liquidation of credits under such conditions is a painful experience. Moreover, the very use of these credits will have effect of expelling the base that supports them, as soon as normal trading conditions are restored. For if under temporary protection and stimulus afforded by the war, our industries are expanded on basis of higher wages and costs, we will be driven out of every foreign market as soon as the war is over, and lose no small share of our home trade also, with the result that the trade balances will turn heavily against us.

It is impossible to use additional credit made available by further increase in gold reserves without raising costs and prices in this country; for it can only be used by extensive borrowing and buying, with inauguration of enterprises which would create a competitive demand for labor at a time when supply of labor is limited; and however desirable it may be to have wages rise by natural progress, nothing will be

Retorting and condensing plant

Washing old mine-filling in a rocker

VIEWS AT THE NEW ALMADEN QUICKSILVER MINE IN SANTA CLARA COUNTY, CALIFORNIA

gained from a spasmodic movement which ends in loss of markets, widespread unemployment and prolonged stagnation. Wages can only be sustained and advanced by a steady demand for products of industries, and this cannot be had if our economic relations with the rest of the world are ignored and heedlessly thrown out of gear. The war is not going to last long enough for us to get far on a career planned only for war conditions.

We should not be alarmed over advent of prosperity because it is likely to end in trouble, but an expansion of indebtedness based on conditions so plainly temporary would be extremely shortsighted. Present bank reserves are more than sufficient to handle any safe degree of expansion and it will be better that the country does not receive additional capital in gold. Whatever is coming to us under these extraordinary trade conditions had better be taken in interest-bearing securities or dividend-paying shares of ownership in going properties, at home or abroad.

Miocene Age of Dodge Gypsum

By Charles R. Keyes*

From a strictly mining angle, it usually matters little what happens to be the geologic age of a mineral deposit. The subject only assumes business interest when the age determination extends the probable volume of available deposits, or points the way to the discovery of new bodies. Just such features are among the important results of recent investigations of the gypsum deposits in Iowa.

The geologic age of the Fort Dodge gypsum beds, which are among the most valuable in the United States, has been long a moot point. Reasoning from lithologic analogy of the Kansas deposits, late deductions have been in favor of a Permian, or Late Carboniferous age. That this inference is incorrect is shown by more recent observations.

The geologic structure of the Iowa gypsum beds, as recently made out, has important economic bearings. In this regard the most remarkable feature is the profound faulting that has taken place in the area. A large block of the gypsum six to eight miles in width has dropped down below the level of the upland plain of the region, and has thus escaped destruction by glacial planation and general stream-corrosion. Since the line of the fault is traceable for a distance of nearly 100 mi. the possible volume of available gypsum is extended far beyond that now opened up.

The determination beyond peradventure of the geologic age of the Iowa gypsum deposits—that the date of its origin is not Carboniferous, Permian, Triassic, nor even Cretaceous, as has been repeatedly urged at different times, but that it is Miocene, or mid-Tertiary—has deep significance. It places the gypsum and associated pink shales among true continental deposits—accumulations on dry land and wholly independent of sea, lake or even running water. It points out the possible occurrence, beneath the deep glacial drift of the state of Iowa, of other incoherent deposits which are not to be classed with the till at all but with the older Tertiary formations.

Since this possibility has been pointed out, evidences of the existence of the pink shales which are inseparably connected with the gypsum have been sought in other parts of the state. As a result these pink shales have been found in a number of places. Whether or not workable beds of gypsum are really associated with them in all cases remains yet to be determined by careful drilling. It seems probable that new fields of gypsum will be discovered.

Inasmuch as the key to the puzzle has at last been found, a large number of deposits that were formerly classed, without much critical scrutiny, with the glacial till have been found to be of earlier formation, and have been determined as Tertiary depositions. It also appears very likely that beneath the great drift-mantle exists an extensive terrane which is altogether Tertiary in age. Hundreds of well records now seem to admit of new interpretations so far as the lower part of the so-called drift section is concerned.

Should gypsum actually be found associated with the various occurrences of Tertiary pink shales which already have been discovered in many widely separated localities in northwestern Iowa, it would perhaps make this region, already very important, worth more than all other known deposits of gypsum combined.

*Consulting engineer, Des Moines, Iowa

Sicilian Sulphur Industry

The production of sulphur in Sicily for 1914 was 334,974 metric tons, a decrease of 11,000 tons from the production of 1913. Exports during 1914 amounted to 338,308 as against 414,716 tons in 1913, according to United States Consul Haven in *Commerce Reports,* Aug. 18, 1915. Production has declined for several years, he reports, owing to lack of capital for financing and to the shutting down of some of the large mines on account of fires.

The production, exports and stocks of sulphur on hand for the last five years are reported in the accompanying table.

SICILIAN SULPHUR STATISTICS

	1910 Metric Tons	1911 Metric Tons	1912 Metric Tons	1913 Metric Tons	1914 Metric Tons
Production	397,808	376,171	357,547	345,974	334,974
Export	393,987	453,826	447,292	414,716	338,308
Stock on hand	640,711	551,422	450,917	376,356	369,001

Owing to the fact that the domestic supply of crude sulphur in the United States meets the demand, none was exported from Sicily to that country. Further, the United States now actively competes with Sicily in the European markets. The decline in Sicilian exports is in part due to this competition, to the increased use of pyrites as a sulphur substitute, and to the paralysis of trade consequent to the war. The exports of sulphur are shown in the accompanying table, giving the countries of destination.

SICILIAN SULPHUR EXPORTS

Destination	1913 Metric Tons	1914 Metric Tons	Destination	1913 Metric Tons	1914 Metric Tons
Sicily	8,504	7,604	Turkey in Europe	1,911	1,177
Italy	72,971	89,611	United States and Canada	1,383	1,919
Austria-Hungary	56,334	25,304			
Belgium	13,321	5,977	Central and South America	7,340	944
Denmark	305	239	Egypt	615	1,260
France	75,186	61,871	Algeria and Tunis	3,242	2,226
Germany	31,968	18,824	Asiatic Turkey	3,596	3,914
Greece	14,615	15,759	British India	5,736	4,316
England and Malta	16,036	12,993	Australia	13,441	1,637
Netherlands	8,975	8,080	South Africa	13,741	2,486
Portugal	14,754	8,427	Other countries	10,362	9,396
Russia	25,892	21,280			
Spain	6,684	9,178			
Sweden and Norway	27,804	23,877	Total	414,716	338,308

The increased cost of the extraction of the ore at the mines induced the producers to petition the government syndicate that controls the sale of the sulphur (Consorzio Obbligatorio per l'Industria Solfifera Siliciana) to advance prices, which request was granted in July, 1914. Prices were increased about 50c. per ton for crude sulphur on board lighters at the port of Girgenti, as follows: Yellow superior, $19.78; yellow inferior, $19.59; brown superior, $19.20; brown inferior, $19.01. (A further advance of 60c. per ton was reported by Consul Samuel H. Shank, of Palermo, early in 1915.)

Crude sulphur in bulk is seldom shipped from Catania. The Consorzio conveys it there for refining and milling purposes and supplies only enough to about fill the demand, and in order to discourage its exports in the natural state from this port the syndicate has established a higher price from Catania than from Girgenti. Refined and milled sulphurs which are chiefly exported from Catania met a fairly active demand during the year. The market prices of refined and milled sulphurs at the end of 1914, per metric ton f.o.b. Catania (in 112-lb. sacks), were as follows: Sublimed flower of sulphur, $34.35; refined sulphur in rolls, $27.98; refined sulphur in lumps, $28.79; and refined ground sulphur, $25.09.

Production of Tungsten and Molybdenum in England

According to the *Times Engineering Supplement,* as quoted by the *Journal of Industrial and Engineering Chemistry,* the outbreak of war found Great Britain deficient in the supplies of many of the rarer metals employed in steel manufacture, and for a time much anxiety was felt respecting the possibilities of manufacturing in England certain of these metals hitherto obtained in large quantities from the Continent. Among these mention may be made of the compounds of chromium, tungsten and molybdenum.

In the case of tungsten, the best wolfram ores are brought from Portugal and India, while the molybdenite used in the preparation of ferromolybdenum comes from Norway, Sweden and Australia. The Australian ores cannot, in the most favorable circumstances, be conveyed from the mines to Britain in less than two months, and as they are extremely costly it would not pay the manufacturer to hold large quantities of ore in reserve.

Process Used at Luton

One factory at Luton, England, has now extended its plant so that it is capable of turning out annually nearly 1000 tons of ferrotungsten and tungsten powder, and it is unlikely that the trade in tungsten powder will ever revert to Germany after the war. The process used at the Luton factory for the production of tungsten powder consists in boiling the finely ground wolfram with a soda solution. The tungstate of soda formed is settled in tanks and dried so as to produce coarse crystals. The compound is then treated with hydrochloric acid in wooden vats, by which means the tungstic acid is liberated as a yellow paste. In order to reduce the acid, it is mixed, after thorough drying, with charcoal in large crucibles and heated for 18 hr. in a reverberatory furnace. The slaglike mass thus prepared is crushed and ground to a fine powder, which is finally passed through 120-mesh wire sieves, and represents tungsten of 98% purity.

In the manufacture of ferrotungsten large 3-ton electric furnaces, each with three suspended electrodes, are used. The feeding of the furnaces takes place by hand in small charges of the mixed ore, with the requisite quantity of carbon, scrap iron and flux. The molten masses of ferrotungsten are drawn off from time to time and after cooling are hand-broken and sorted into various sizes. Owing to the great weight of the material, it is a matter of considerable difficulty to handle it in bulk. It is usually packed in steel casks containing 25 cwt.

The Engineer Function in Modern Warfare

It is being demonstrated that warfare is no longer a display of spectacular heroism, accompanied by a grand fanfare of trumpets, but is largely a question of engineering, one way or another. The use of engineer troops is little understood by the layman, to whom the diversity of engineering features required by an army is astonishing. In the United States Army an engineer company consists of four officers, mounted, and 164 enlisted men, of whom 24 are mounted. Their duties, as outlined in the official bulletin from the office of the Chief of Staff, Washington, D. C., are to apply engineering science to the emergencies of modern warfare in order to protect and assist troops, to ameliorate the conditions under which they are serving and to facilitate locomotion and communication.

Duties of Engineer Companies

In the performance of these duties, engineers are trained and equipped to supplement or amplify, by scientific measures, the efforts of combatant troops in the service of reconnoissance, castrametation, fortification, sieges, demolitions, battlefield illumination, general construction, communication and such other special services of an engineering nature as may arise that are beyond the technical training of combatant troops or such as require the use of engineering implements and material not supplied to combatant troops. The reconnaissance includes both tactical and engineer reconnaissance, surveying, mapping and sketching, photography, drafting and map reproduction. The service of castrametation includes the selection, laying out and preparation of camp and the municipal and sanitary engineering incident thereto, and may include the installation, operation and maintenance of a water-supply system in the case of cantonments.

The service of fortifications pertains both to the attack and the defense and includes the selection of defensive positions when out of the presence of the enemy; rectification of and assistance in the selection of such positions in the presence of the enemy; the location, design and construction of the more important field work; assistance in and supervision of the construction of the hasty defenses wherever possible; the supply of tools and materials; and the reconnoissance, demolitions, water supply and communications incident thereto.

The services of sieges pertains both to the attack and defense, and includes selection and location of defensive line, lines of investment and siege works, the construction of saps, mines, counter-mines and defensive works; the operation of searchlights; preparation for and assistance in attacks, counter-attacks and sorties; organization of captured points; the supply of tools and material; and the reconnoissance, demolition, castrametation, water supply and communications incident thereto. The service of battlefield illumination includes the supply and operation of searchlights, together with any other means to effect the desired end. The service of general construction includes the location, design and construction of wharves, piers, landings, storehouses, hospitals and other such structures of general utility in the theater of operation. The service of communication includes the construction, maintenance and repair of roads, ferries, bridges and industrial structures; the selection and preparation of fords; the construction, maintenance and operation of railways.

To no branch of the engineering profession are these various requirements, either separately or as a whole, more familiar than to the mining engineer. Under average circumstances the conditions under which the military engineer operates are exactly parallel to those under which the mining engineer faces his problems—namely, isolation in the field, lack of tools and equipment, and haste—time being in both instances a most important factor.

With these various engineering problems to be faced it is quickly apparent that a modern army consists of something else besides numbers of men and rifles; and a wonderful field is seen for the mining engineers to render invaluable service, not only in the ultimate issue, but in the present case of improvement and preparation of our national defenses and personnel.

A small number from each engineer company is trained for certain special classes of work, such as sketching, map reproduction, photography, surveying, drafting, demolition, operation of engines, etc.; but practically all of the company are trained for all such kinds of work as roads, fortifications, bridges and mining.

The equipment for each company's use is carried in a combat train, consisting of two wagons containing instruments, tools, tackle, explosives and supplies, for the foot troops; eight mules carrying demolition packs, packs of tools, tackle and supplies, grain, rations and additional tools or explosives, for the mounted detachment of the company. In addition to the equipment carried in the combat trains of the company there is a battalion combat train consisting of one wagon carrying surveying, drafting, photographic and reconnaissance equipment and one wagon containing blacksmith and map reproduction equipment; and also an engineer train of nine wagons with reserve intrenching tools and supplies for infantry, consisting of 234 axes, 63 crowbars, 900 lb. of nails, 1350 mattocks, 4050 sandbags, 117 hand-saws, 117 one- or two-man saws, 2700 shovels, 225 lb. of smooth wire, tool sharpeners, etc.

A battalion, consisting of four companies, of 164 enlisted men each, and the company, battalion and engineer trains, forms a unit of great potentiality in the hands of a competent engineer commander and requires engineering ability of high order to handle, transport and maneuver.

The next Congress will be called upon to make radical changes and additions in our military establishment, and a field is going to be opened for civilian engineers along military or semimilitary lines which will be very attractive, and valuable alike to the country and to the individual engineer.

Miami Copper Co.

The Miami Copper Co. reports that during the first half of 1915 the concentrator treated 589,513 tons of ore, which produced 22,708 tons of concentrate averaging 40.63% Cu. Other data are as follows: Production of merchantable copper, 17,530,865 lb. Average assay of ore, 2.18% Cu. Extraction in milling, 68.16%. Yield of ore per ton, 29.74 lb. of copper.

The finer grinding of the ore, together with improved metallurgical treatment, raised the extraction to 73.98% in June, with only three sections of the mill remodeled. In section 1, remodeled, the extraction was 77.43%.

Extraction of ore from the Captain orebody with the new narrow shrinkage stopes is progressing favorably. The slicing in the main orebody under the large mat of timber has developed in such a successful manner that undoubtedly this method will be continued below the 420-ft. level.

The average cost of copper was 8.6889c. per lb. In June it was only 8.32c. Net income for the half year was $1,296,225, out of which a dividend of $373,556.56 was paid, leaving a surplus of $922,668.69 for the period.

The gross income is apparently figured on an average selling price of about 15.4c. per lb. gross, and the profit amounted to about $1.75 per share. The monthly statistics indicate that this company is working up to a basis of about 50,000,000 lb. per year, which would give it a profit of about $4.75 per share on a 15⅜c. market even if cost of production remained at about 8.7c. per lb.

Mining in China

The Chinese have lately been showing a good deal of interest in the development of their mineral resources. Without any doubt China is going to be a great field for the American mining engineer and the American machinery manufacturer in the not very distant future. According to the New York *Evening Post*, Chou Tzu-Chi, the Chinese Minister of Agriculture, has issued the following order regarding the prospecting of mines in the provinces:

"China is rich in mineral resources, and the reason why mining is not carried on so extensively as it ought to be is that the prospecting work is not done in a thorough manner. When prospecting is poorly done, the minerals are left hidden in the earth. This Ministry has from time to time sent Chinese and foreign engineers to prospect the mines, but on account of the vast area and the unfamiliarity with local conditions, very little progress is made. This Ministry has drawn up regulations governing the prospecting of mines, consisting of seven articles. According to the new arrangement, every magistrate shall make preliminary investigations and submit mineral samples to the Finance Bureau, which shall in its turn send engineers to prospect. Then the Ministry of Agriculture will send engineers to make investigations. The magistrates and the Finance Bureau shall coöperate with and give every facility to the prospecting engineers. The magistrates are required to fill in special forms describing the nature of mines, also of their districts."

The *Chung Hsi Pao* says: "Recently the Wu-fung Mining Co. has located rich deposits of copper in the Choushan Hsien district at places called Dunkaitai and Sikou. A rich capitalist, Mr. Wang, has petitioned the Civil Governor to grant him the right to work the mines at Dunkaitai. As the copper which is used by the Wuchang copper mint in large quantities was imported from Japan, now that local copper mines have been discovered it is necessary to have them developed with the view of supplying the provincial mint. The land partly belongs to the people and partly to the Government, so a boundary line must be marked out in order to prevent future troubles. The Governor has deputed Mr. Yuan to go to the place to verify the report, as well as to mark out the boundary lines."

The Broken Hill Proprietary Co. has closed a contract to furnish the New South Wales Government with 700 tons of rails weekly from its new steel works at Newcastle. The contract is to run for a year, and the price is £7 17s. 6d.—equal to $38.32—per ton at mill.

Valuation of Arizona's Producing Mines

SPECIAL CORRESPONDENCE

The State Tax Commission has announced its valuations on the mines of Arizona. The first Legislature passed an income-tax law providing for a certain proportion of the net, plus a proportion of the gross income, as the valuation for assessment purposes. But this law was operative for only two years, and in spite of considerable urging by the big mines, this last Legislature could not agree on a net-income valuation, which was the demand of the miners. In fact, there was a big fight on over this matter between those representatives favorable to the miners' contention and those headed by the governor who believed that this was not a fair tax valuation. At any rate, the Senate split with the House, and no legislation on the subject was passed, leaving it to the Tax Commission to decide on the valuations. It is believed that in this duty, the commission followed the Michigan plan, as Tax Commissioner Allen of that state was in Phoenix last winter and there outlined their methods and aspirations in full to the public.

The total valuation of mines arrived at by the commission is $121,225,833, an increase of $11,000,000 over last year; but allowing for mines that commenced production during last year, the increase is about 10%, and most of this comes on a few of the larger mines. It will be seen that the old rate of four times the net income, plus one-eighth of the gross income, was a very good guess at a fair valuation if the present figures are anywhere near right. There is a good deal of fault found with this year's results, however, and a number of the mines, notably the Copper Queen, are asking the Tax Commissioner for a rehearing. It must also be noted that these valuations are only for the producing mines, as the nonproducers are not taxed. The final valuations are as follows:

	Mining Property	Improvements
Arizona Commercial Co.	$109,134	$95,787
Arizona Copper Co., Ltd.	6,709,544	6,226,191
Arizona United Mining Co.	28,216	21,570
Bunker Hill Mines Co.	186,750	121,072
Calumet & Arizona Mining Co.	2,054,289	2,895,125
Commercial Mining Co.	37,250	10,300
Commonwealth M. & M. Co.	82,608	290,200
Cons. Arizona Smelting Co.	74,509	364,980
Copper Queen Cons. Mining Co.	29,357,656	5,143,954
Detroit Mining Co.	5,167,981	1,765,085
Duquesne M. & Red. Co.	128,636	75,538
Gold Roads Mining Co.	262,670	166,940
Great Western Copper Co.	41,566	8,778
Thomas Higgins	24,632	
Inspiration Cons. Copper Co.	1,657,817	2,694,346
Iron Cap Copper Co.	119,205	3,250
Leonard Copper Co.	74,378	25,621
Magma Copper Co.	158,118	221,830
Miami Copper Co.	8,739,379	2,746,634
Neales M. & S. Co.	83,960	24,579
Old Dominion C. M. & S. Co.	4,760,488	2,984,911
Ray Cons. Copper Co.	11,904,346	4,709,472
R. R. Richardson	427,362	3,225
Shannon Copper Co.	1,300,192	1,129,980
Shattuck Arizona Copper Co.	4,794,287	89,423
Superior & Boston Copper Co.	55,725	34,785
Superior & Pittsburg Copper Co.	20,551,670	192,010
Tom Reed Gold Mines Co.	3,034,060	175,500
Union Basin Mining Co.	176,677	45,574
United Globe Mines	3,012,767	40,791
United Verde Copper Co.	15,319,160	3,754,480
Vulture Mines Co.	338,490	177,892
Warrior Copper Co.	139,992	8,567
Wolverine & Arizona Mining Co.	143,462	2,200
World's Fair Mine Co., Frank and Josephine Powers, owners	169,093	....
Total for the State	$121,225,833	$35,361,082

These valuations include tracks, etc., heretofore assessed as railroad property, to the amount of $1,455,260.

The Copper Queen continues the heaviest taxpaying company, with a total valuation of $29,357,656, an increase of approximately $3,000,000. The Superior & Pittsburg is next, with $20,000,000, an increase from $16,000,000. This is the greatest individual raise. Inspiration enters the list of producers for the first time, with a valuation of $1,500,000. There are slight increases in Ray, United Verde, Miami and other big companies, while the Arizona Copper Co. drops from $8,000,000 to $6,000,000. Cochise heads the counties in mine valuation with a total of $58,325,468; Gila is next, with $18,538,181; Greenlee has $13,000,000; Pinal, $11,000,000; Yavapai, $15,000,000; Mohave, $3,000,000; Santa Cruz, $725,000, and Maricopa, $338,000.

Progress in the Metallurgy of Zinc in Great Britain

According to the 51st annual report of the British Alkali Inspector, further attention was given during 1914 to the conditions influencing the formation of fume, the means for preventing the escape of fume, and the best methods of dealing with the solid material obtained by such means. Further experiments were made on the fume-arresting efficiency of various types of iron prolong, with special regard to the form favored at each works, and temperature conditions were studied in detail. Owing to the wide difference of practice obtaining at various works, it has been found difficult to state principles capable of general application, but lines for suggested improvement are indicated. The form of prolong favored where oxide or "ashes" are distilled is a cone having a removable cap and divided horizontally into two compartments by a shelf; the gases return over the shelf and are discharged through a wide slotted hole close to the furnace front and well under the ventilation hood. The prolong is constructed to fit the receiver to which it is attached, and its weight is supported by suitable bars hung in front of the furnace. When granular zinc alone is distilled, coke packing is introduced into the upper compartment. The results of the various temperature tests are presented in tables and graphs.

Very similar temperature gradients were observed in works utilizing mainly ore and in those where zinc "ashes" containing volatile chlorides formed the bulk of the charge, although the weights of fume arrested in the two classes of operation were as 2 to 1. The proportion of fume evolved appears to depend on the volume of gas formed, that is, on the proportion of oxide present in the charge, and, for the same class of operation, would seem to be closely related to the heat of the furnace. The greater part of the volatilized chlorine is in the form of zinc chloride, and preliminary experiments showed that on simple treatment with water, the bulk of the chloride could be extracted from the fume and skimmings and recovered, instead of ultimately escaping into the air. The metallic residue could be dried, without risk of firing, before returning to the furnace with a subsequent charge. Hot water should not be used in washing the fume. With a charge of "ashes," the vapors discharged from the receivers during the "steaming stage" were acid to methyl orange and contained free hydrochloric acid, whereas when the charge consisted mainly of ore, the vapors were alkaline, containing free ammonia.

A Byproduct Coke Plant with a capacity of about 2000 tons daily is to be erected in connection with the blast furnaces which are being built by Corrigan, McKinney & Co. at Cleveland, Ohio. The contracts have just been placed.

Mineral-Industry Exhibit at the National Museum

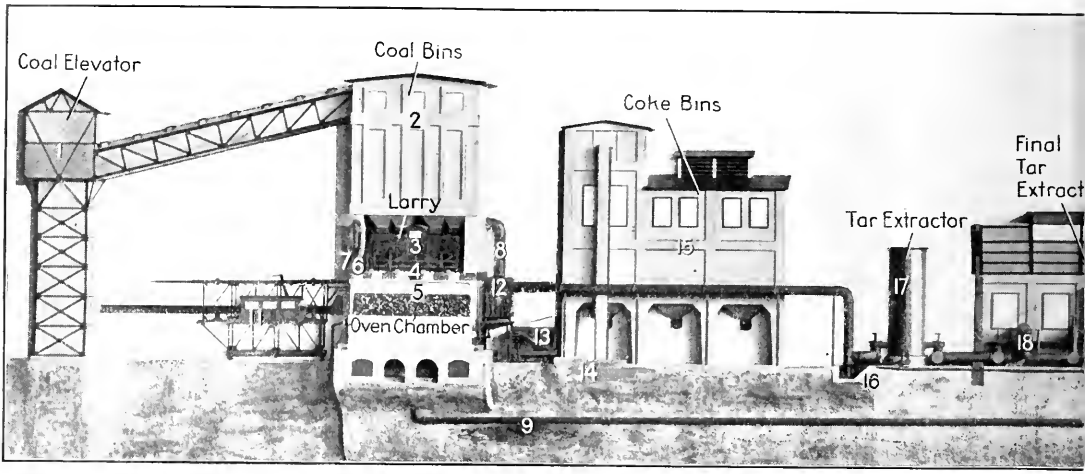
By Chester G. Gilbert*

SYNOPSIS—Model reproductions of each important type of mineral industry, presenting the processes from natural occurrences to finished products, is intended to promote a better appreciation of these industries on the part of the public. The exhibits in the National Museum at Washington are to be supplemented by educational bulletins for popular distribution.

For the purpose of creating a fuller appreciation by the public of its indebtedness to mining and metallurgical enterprises the Smithsonian Institution has arranged for a group of mineral-industry exhibits in the National Museum at Washington. The work is being carried forward in coöperation with important mining and industrial interests, including the Utah Copper Co., National Lead Co., New Jersey Zinc Co., U. S. Steel Corporation, Joseph Dixon Crucible Co., Barber Asphalt Paving Co., Solvay Process Co., American Coal Products Co., Macbeth-Evans Glass Co., etc. With the coöperation of such companies, it is evident that this movement is to be worthy of the interest of all engaged in the mineral industry.

About the middle of 1913, mineral technology was given active recognition in the form of a distinct division in the National Museum. Publicity for this work has been consistently avoided up to the present, but now, at the close of the second year of the new division's active existence, conditions are sufficiently advanced to warrant the statement not only of a definite purpose and of the means to the end in view, but also of assurances derivable from the test of practical application.

From the outset it seemed apparent that technical science and engineering were already adequately provided with media for the intercommunication of ideas, but that the public, whose interest after all is the really vital one, might profit by a more adequate grasp of the mineral technology of the country, and that the opening up of better lines of communication between the producing and consuming extremities might well tend toward a fuller appreciation that would be mutually profitable. In the assumption of such a function, moreover, the Smithsonian Institution would be exercising a peculiar fitness in that such an effort would be projected in its normal direction of a broadening educational influence.



MODEL OF A KOPPERS BYPRODUCT-COKE PLANT AT THE

This wall model is 28 ft. long by 7 ft. high and is constructed accurately to a scale of about $\frac{1}{30}$ actual size. Beginning at the left-hand end of the photograph, the coal hoist is shown conveying coal to the hoppers over the ovens, where chutes feed it into the larry (3), which carries the coal to various ovens and feeds it into the oven chamber (5). No. 11 represents the coke pusher, and Nos. 12, 13 and 14 the coke guide, car and pit respectively. The coke is elevated and delivered into No. 15, which represents the coke-screening station from which the coke is withdrawn into cars and shipped. The gases ascend from the ovens through pipes (6 and 7), and are conveyed by No. 8 to the sump (16), where part of

Mining Not Comprehended by the Public

Viewed in the light of popular comprehension, agriculture and mining—the life and backbone of the country—are in striking contrast. Agriculture is ever present, whereas mining is by nature seclusive, to say the least. With the one, the average mind is thus enabled to project itself, by analogy at least, in a comprehensive motion-picture conception of realities; with the other, the opportunity for the development of any such capacity has commonly been lacking, and the result is at best nothing more than a few scattering snapshots of disjointed facts,

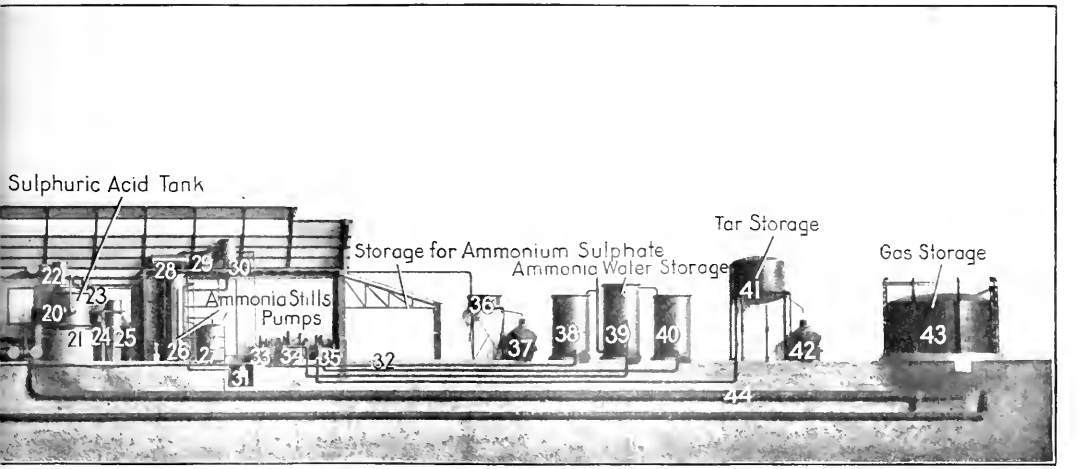
*Curator, Division of Mineral Technology, National Museum, Smithsonian Institution, Washington, D. C.

without the least sequential conception as to the real nature or extent of a given accomplishment. To many people, mining suggests only a twin brother to horse racing, with all the romantic allurements of "inside dope" and "200 to 1 killings." A vision which sees only infesting parasites is the surest evidence of ignorance; and in the case of a commonwealth contemplating its own backbone with such results the ignorance evidenced is calamitous.

Mining and the mineral industries do not represent an errant bit of Utopia uncontaminated, nor are they utterly bad; they are just human, and being human share in the dominant traits of thriving on appreciation as to true worth, and meanwhile measuring up to expectations good or bad. Merited appreciation and unmerited suspicion are just as potent character makers and breakers in industrial life as in that of the individual. To an industry the practical result of indiscriminate suspicion lies in weakened pride and lessened efficiency. To the public the result is felt in a tendency toward the creation of inferior values, coupled with an upward tendency in costs. To the country it means impaired stimulus for achievement.

American genius has also asserted itself over foreign genius backed by a lengthy heritage in skilled artisanship, a new-world standard bearing an American name may be created for an important line of special products and the road opened for the development of important industries. An example of self-sacrificing devotion to industrial effort actuated by patriotism and pride in achievement! There are plenty of others; and such a reflection spread nation-wide would inspire to an infinitely greater national achievement than could ever arise from reflection on the ways of parasites.

It is in the nature of things that the eternal enemies of progress—ignorance and inference—should be especially potent in the general field of mining, for there is no other activity with its significance of demand on attention and at the same time so utterly out of touch with the range of normal human experience. Fake prospectuses and fancy prices do not deserve to characterize mining any more than proprietary fakes and princely fees actually do medicine, but the one group represents about all that effectually reaches the public, while the other is recognized in its true bearing and only serves to reflect the greater credit on what is real in the profession.



UNITED STATES NATIONAL MUSEUM, WASHINGTON, D. C.

the tar is removed. Continuing through tar extractor (17), the gases are forced by the exhauster (18) through the final tar extractor (19) and then to the sulphuric-acid tank, where part of the ammonia is taken out as ammonium sulphate and stored in the storage house (32). From the sulphuric-acid tank the gases continue through pipe (44) to the gas holder (43) at the extreme right of the panel. Nos. 26 and 27 are the free and fixed ammonia stills for obtaining ammonia water, and this solution is pumped by means of pumps (33, 34 and 35) to their respective tanks. The tar coming from sump (16) and the extractors (17 and 19) is pumped through to the storage tank (41), from which it is loaded into cars.

Developing High-Quality Products

There comes to mind a prominent American manufacturer operating in a mineral-industry field where for generations a foreign name has been the unquestionable standard the world over. Now in his fullest maturity this man, leaving the routine of affairs to others, is devoting his undivided attention to perfecting special-quality products to the point where they will surpass those of the foreign standard. His efforts have already met with success in several directions, and in others success is practically assured. As a result, not only are millions of people in this country today profiting by a far better grade of normal product without increased cost, but

Aim of the Mineral-Technology Division

Passing now from analysis of conditions as they have been to the means devised for helping to improve them, "the plans[1] for the development of the Division of Mineral Technology aim toward an embodiment devoted to the interests of the public at large, as opposed to the abstractly scientific or highly technical, and with purposes directed toward the extension of cultural knowledge, together with information concerning current utilitarian facts. In the attainment of these results, it is proposed—to the extent that space is available—to provide model

[1] "Report on the Progress and Condition of the United States National Museum for the Year Ending June 30, 1914"; Richard Rathbun, assistant secretary-in-charge.

reproduction of each important type of mineral industry operating in the field, tracing conditions and processes from natural occurrence to finished products; around that model reproduction as a central theme to assemble in each instance such a systematic exhibit as will best serve to emphasize important features in both manufacturing processes and industrial capabilities; and finally, as each respective series is completed, to make it the basis of an educational bulletin for popular distribution." In other words, the aim is toward enabling the average individual to realize that an ore contains a metal and what the process of reduction implies. It is intended to make the individual familiar in a general way with the life history of the salt he uses and of the plaster on the four walls inclosing him: to familiarize him with the significance of hydrated lime, monel metal, artificial graphite, special-purpose glass and the various other developments, already here and to come, touching on his well-being.

It is possible to misdirect any activity, especially by overdirection. In the present instance overdirection would mean gratuitous advertising, favorable or unfavorable, through the proverbially odious medium of comparison. A presentation of the salient facts involved in a commonsense understanding of conditions, processes and products with their properties, put forth in the manner best suited to catch and hold interest in each separate instance, is the whole end in view. For the museum visitor there will be a minimum of learned effusions in the form of labeling, and a maximum of visualization, so that more or less unaided he may see the ore in its native occurrence, follow through the successive steps and processes, and see exemplifications of products together with their properties when put to practical test. For the public at large illustrations will have to be substituted for realities, but otherwise the same presentation will be available in the form of a bulletin.

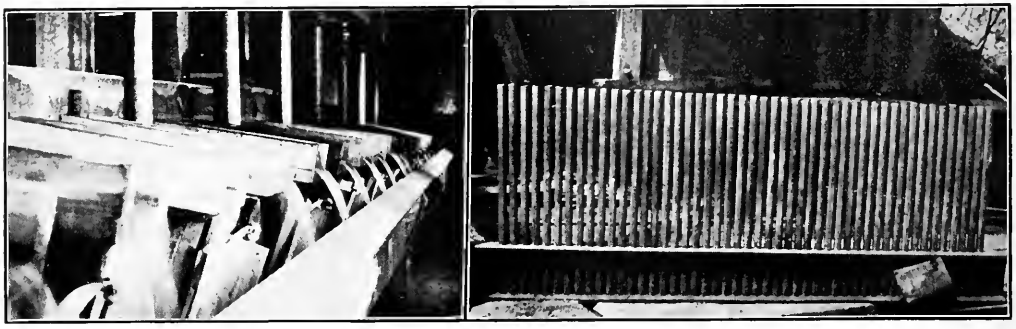
Hearty Coöperation by Producers

Industrial coöperation is essential in this effort, and with but one exception has been given unreservedly from every source thus far approached. The magnitude and diversity of the activities in process of representation at the expiration of the first active year of the movement's existence are suggested by such leaders in the mineral industry as have already been mentioned. Perhaps the most significant feature thus far developed lies in the fact that there has not yet arisen a single instance where industrial coöperation has sought to inject an element of bias or discrimination. The mere fact of readiness to coöperate might simply imply ulterior motives, but the purely impersonal element implies genuine public-spiritedness. In addition to sharing in the general advancement of conditions promoted, the coöperator has his reward in the public recognition of a service; but it is only such recognition as comes to the contributor along conventional lines, and for those who are disposed to ascribe narrow-minded selfishness to industrial interests it is worthy of note that a total of 17 unqualified responses out of 18 solicitations, involving outlays in some instances of several thousands of dollars, will certainly compare favorably with the showing in more conventionally philanthropic circles.

Gold Recovery at Placer Mines

By D. F. Carver*

Discussion of gold-recovery methods in placer mining has shown but few improvements aside from the operation of dredging. That some improvement in a system ought to be forthcoming after its long-continued use seems reasonable, and one case where progress has really been made will be described here.



Launders and classifier pipes Bottom view of spring-steel grizzly

GOLD-SAVING DEVICES AT CAMP CARSON PLACER, UNION COUNTY, OREGON

This system of handling placer material has been in use in California for several years and has recently been installed at the Camp Carson mine in the Blue Mountains, Union County, Oregon. One difficulty in the past has been to handle the material with the primitive sluice-box arrangement. When most of the gold was fine, in the cases of gravels that rapidly filled the riffles, the fine gold passed over the latter into the dump. The tailings in some instances would assay as much as the ground being worked. I shall give here a description of the modified method of operation.

Block Riffles Recover Coarse Gold

The old sluice-boxes with block riffles are used to recover the coarse gold. Experience has shown them to be well-adapted for saving such material. The riffles in the first two boxes are placed in such a manner as to be easily taken up, allowing ready access to the coarse gold that lodges in the first few feet of sluices. At the end of this sluice eight sets of steel grizzlies are placed so

*Camp Carson Mining and Power Co., 1004 American Bank Building, Seattle, Wash.

that the heavy material, over $\frac{1}{4}$ in. in size, is carried into the dump. The finer material is sifted through into an undercurrent flume. The grizzlies do away with all the heavy oversize which has no value and allow the fine material containing the higher value to be handled in a most efficient manner. The flow of water is regulated at this point by a pair of gates designed to balance the water and so permit the oversize to be washed away. The grizzlies are so arranged that the ends of each set project over the next in such a way as to be free of contact. Thus, with one end free, the bars are kept in constant vibration by the heavy boulders passing over them; this prevents the material from clogging the grizzlies and makes the system automatic.

Use of Concentrating Tables

The fine material is carried from this point to a set of nine tables, each 2 ft. 6 in. wide and 8 ft. long, with a drop of 2 in. per ft. On these tables are small steel angle riffles, $\frac{5}{8}$ in. in size, $\frac{3}{4}$ in. apart. They are made in frames which are held in place on the tables by strips of wood and which in turn are secured by wedges. The material coming from the undercurrent flume is distributed evenly over all the tables by gates at the head of each table, opening from a small sluice into which the material runs after leaving the undercurrent flume. The flow of water over these tables is not greater than 1 in. in depth, so that there is no possibility of the fine gold riding past the riffles.

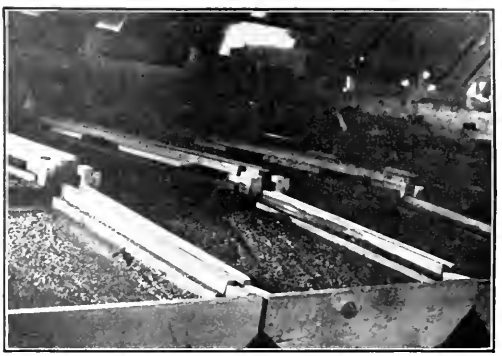
At the entrance to the tables, before the material reaches the small riffles, are 18 trays containing quicksilver—two trays to each table. These trays are similar to those used by the uptodate dredges and are useful in

GRIZZLIES IN PLACE IN THE LAUNDER

catching the fine free gold. The riffles on the tables can be removed if desired, one section at a time, without interfering with the operation of the other tables. It is the work of but 10 min. to remove the riffles of one table, shovel the material into a cleanup box, replace the riffles and remove those of the next table. This permits a cleanup to be made at any time without stopping mining operations in general.

A further separation of material that passes over the small riffles is made by a set of steel screens and hydraulic classifiers. There are nine pairs of the hydraulic classifiers installed below the steel screens. The latter have $\frac{1}{10}$-in. holes, and any material which passes through them is carried into the classifiers, where a separation is made with water under pressure. The light material which contains no gold is taken out of an opening in the upper part of the classifier, while the heavy material drops into the bottom and is taken out through a pipe and then run through a magnetic separator for final cleaning. The classifiers are automatic and, once the flow of water is properly regulated, do not require any attention.

A magnetic separator of large capacity treats the material coming from the lowest opening in the classifiers. This contains principally iron compounds which are picked up by the magnet and carried off on a belt to the



TABLES WITH ⅝-IN. ANGLE-IRON RIFFLES

dump. Gold, being nonmagnetic, drops into the bottom of the separator and is carried into a cleanup box. The belt that carries off the magnetic material covers the surface of the magnet completely, and as the iron sand clings to the surface of the belt and not to the magnet itself, it is automatically cleaned off at each revolution as the belt runs from the magnet.

A large tonnage can be handled at a cost of less than 5c. per cu.yd., and practically all the gold is recovered. Material as low as 8 and 9c. per cu.yd. can be worked at a profit when sufficient tonnage is handled. This recovery system may be used on placer ground that is not suitable for dredging, and can be installed at little cost. At the Camp Carson property all these modifications have been in use a sufficient length of time to remove them from the classification of experiments.

General Petroleum Co.

Editorial Correspondence

The General Petroleum Co.'s balance sheet as of June 30, 1915, and the profit and loss statement for the six months' operation ended June 30 show a decrease in net profit from sales of oil at the wells, due particularly to the decrease in price of light-gravity oil. The profits shown in operation for the six months are materially accounted for by special earnings from a dividend of the Trumble Refining Co., due to the sale of rights of that company. The comparative balance sheet shows assets and liabilities equal to $61,128,450. The capital assets include five items, totaling $57,511,588. The largest item in this group is oil lands and other property amounting to $49,414,962. The next largest item is development and equipment, which amount to $6,212,-

523. The advances to controlled companies, including Federal Oil General Construction, General Water and miscellaneous, totaled $303,585. Capital liabilities amounted to $51,401,700, and the capital surplus, $4,764,607. Deferred payments on lands payable in oil amounted to $25,423, and payable in cash, $35,130. The liabilities to controlled companies totaled $718,495, divided between General Pipe Line and Trumble Refining Co. A suit filed by Mrs. Julia Goldman, a bondholder of General Petroleum, for redemption with interest of ten $1000 bonds is looked upon by some officers of the company as being evidence of opposition to the reorganization plan now being worked out.

New Mill at Elko Prince Mine, Midas, Nevada

SPECIAL CORRESPONDENCE

Construction of the Elko Prince mill on the property of the Elko Prince Mining Co., at Midas, Elko County, Nev., is well under way. Excavation work is completed, the forms are off from most of the concrete foundations and some of the mill framing is now being erected. The mill is being constructed for the Elko Prince Leasing Co. by the Dorr Cyanide Machinery Co., and will cost about $100,000. The daily capacity of the mill will be 50 tons. Ore from the Elko Prince mine and customs ores will be treated. A sampler will be installed in the mill building proper so that custom ores may be used as soon as the mill is ready for operations—probably in December.

The ore will be delivered into bins that will discharge upon a short conveyor feeding into a Telsmith gyratory crusher; the crushed ore will be raised by elevator to the fine-ore bin, whence it will be carried by a special conveyor to a 4-ft. Marcy steel-ball mill, which in turn will discharge into a 5x14-ft. tube mill; thence to a Dorr classifier, the oversize being returned to the tube mill. The Dorr process of counter-current decantation will be used, requiring three agitating vats and two Dorr tray thickeners. The pulp will then pass to an Oliver filter; the gold and silver will be precipitated by zinc dust; a Merrill press will be used. Power will be supplied by a 185-hp. Allis-Chalmers oil engine. Water will be pumped from a gulch at Midas through a 10,000-ft. pipe line to the mill.

Midas is in the Gold Circle mining district, about 50 mi. northeast of Golconda on the Southern Pacific and 35 mi. from Red House on the Western Pacific R.R. An autotruck runs regularly between Midas and Golconda, the roads being in fair shape and on easy grades. The hauling of machinery and supplies is from Red House.

The Gold Circle formation includes chiefly rhyolite, andesite and "bostonite." The mineralization is in vertical fissures in the rhyolite, the hanging wall of the veins in the Elko Prince mine being bostonite. The Elko Prince mine is developed by a crosscut adit about 700 ft. long, from which drifting has been done northward and southward a total distance of from 1,100 to 1,200 ft. on the vein, giving about 350 ft. of backs above this level. Raises and drifts have opened the ground above this level, while winzes and drifts have opened the vein to a depth of 750 ft. and for some distance along the strike.

The vein is a quartz filling carrying gold with silver sulphide. It breaks clean from the bostonite hanging wall but is not so well defined on the rhyolite foot wall, being scattered along numerous planes parallel to the strike with cross-fissures into which the mineralization has penetrated so that the working width will be largely determined by the ability of the miners to carry a narrow stope and by the grade of the rhyolite that will pay to mine. It has been estimated that sufficient ore has been blocked out to net $500,000 over the cost of the mill and operating expenses. The ore averages $40 per ton.

Little mining work is being done at present, but stoping will soon be started. A shrinkage method of stoping will be followed and an effort made to hold the stoping width down to 30 in. Probably sorting in the stopes will be adopted to throw out all coarse foot-wall rock that may be broken. Power drills are used in the mine, the compressor being driven by a Fairbanks-Morse oil engine. An oil engine also drives a dynamo supplying current for a small hoist, and a large compressed-air hoist is installed to raise ore from the levels below the tunnel through the 300-ft. winze which is timbered and equipped with headgear and cage for raising ore cars.

ELLERS LEASE OPENED IMPORTANT VEIN

Paul Ellers, working since January on a lease on the June Belle claim of the Elko Prince property, has opened a new vein paralleling the Elko Prince. It has about the same characteristics as the Elko Prince vein but with indications of proving of greater average width, so there are good grounds for believing that this vein may double the value of the Elko Prince mine. The lessee considers anything from $20 upward as "pay." He is screening the waste, the fines from which are profitable to mill. Custom treatment at the Rex mill costs about $7 per ton and haulage, 50c. Ellers expects to ship steadily to the Rex mill until the Elko Prince mill is completed. The Rex mill has been running under lease from the Battle Mountain owners by Howell & Liddell for about 18 months. It has been reworking old tailings while waiting for Ellers to make steady shipments. The ore developed in the Rex mine is practically worked out, so that the mine will not be able to supply the mill until further progress has been made in opening new orebodies.

Thorianite in Madagascar

The occurrence of thorianite in the Province of Betroka, Southeastern Madagascar, is reported by M. A. Lacroix before the Société de Mines of France. A preliminary analysis gave thoria, 93.02 per cent.; uranium oxide, 4.73; ferric oxide, 0.29; lead oxide, 1.80. The conditions of occurrence remain to be studied. While Mr. Lacroix describes thorianite as a mineral hitherto known only in Ceylon, the *Bulletin* of the Imperial Institute for 1912, page 514, notes the occurrence of thorianite in a gold-placer deposit on the river Boshagoch in the Transbaikal province of Asiatic Russia.

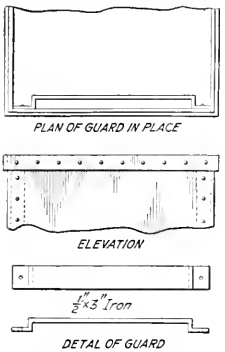
There Were 66,566 Short Tons of Domestic Ocher, umber, sienna, mineral paint, mortar color and ground slate and shale sold in 1914, which was less by 4029 tons than the sales of similar pigments in 1913. Of white pigments—zinc oxide, leaded zinc and the basic sulphate of lead produced by sublimation—there were sold 106,791 tons in 1914. The lead pigments made chemically, including basic-carbonate white lead, litharge red lead, orange mineral and lithopone, showed a decided increase, 245,206 short tons of these pigments having been sold in 1914.

Details of Practical Mining

Finger Guard on Tram Car

By A. E. Hall*

Many minor accidents are caused by chunks of ore crushing the fingers of the trammers against the car rim. In the *Journal* of Mar. 20 a handrail was described which was fastened to the rear of the car and which the trammers grasped instead of the rim of the car body.



FINGER GUARD FOR TRAM CAR

In the accompanying illustration is shown another scheme which is used at Sudbury mines for the same purpose as the outside handrail. Instead of angle iron at the top of the car, there is a strip of ½x3-in. iron running all around. The guard shown was placed on the inside of the car and although it takes up practically no room it accomplishes its purpose very satisfactorily. It is simply a piece of ½x3-in. iron bent as shown and placed inside the car and riveted to the car body. The trammer's fingers go between the guard and the car body.

*

Traction Rope on Aerial Tramways†

The traction or hauling rope for an aërial tramway is invariably a stranded rope with a hemp core, the flexibility depending on the size of the individual wires in the strand and the breaking stress of the material. This rope is endless and in constant motion. In general practice it passes around a driving sheave at one end of the line and around a surging or tension sheave at the other end.

The diameter of the hauling rope depends upon the highest tension occurring in it. To obtain this tension, various formulas are employed, but as it depends upon the weight and friction of the cars and hanling rope, it may be summarized thus:

$$Tension = [initial\ tension + \left(\frac{W}{S} \times H\right) + (w + H)]$$
$$+ [(W + \mu_1 \times N) + (L \times \mu_2 \times w) + (R \times 2)]$$

Where

W = weight of full carrier;
S = spacing of carriers in feet;
H = difference in level between stations in feet;
w = weight per foot of traction rope;
μ_1 = coëfficient of friction of cars;
μ_2 = coëfficient of friction of traction rope;
L = length of line in feet;
N = number of carriers on one side of line;
R = number of supporting rollers on one side of line.

This gives the tension in the rope in pounds, which if multiplied by the factor of safety 6 to 8, and divided by the breaking stress, gives the area of the rope necessary. This is for the general case with the drive at the upper terminal and the load ascending. When the loads are descending the plus sign in the center of the formula becomes minus. To obtain the tension when the ropeway is just put into work, the second half of the formula should be doubled.

*

Normal Underground Temperatures

Men cannot work with full efficiency in high temperature; consequently for both economic and hygienic reasons high temperatures in working places ought to be prevented. This subject has been studied extensively by a Royal Commission on Mining Industry at Broken Hill, New South Wales, from which report, 1914, there appears to be a wide difference of opinion as to what should be the standard of normal working temperatures. In Western Australia the standard is 87° F. dry and 80° F. wet bulb; in Victoria 83° F. wet bulb; in New Zealand 80° F. wet bulb; in Queensland a reasonable degree of humidity must be maintained; that is, at 85° F. dry the wet bulb must not exceed 80° F. If the dry bulb exceeds 85° F., the wet bulb must be at least 7° less.

Quoting from the Royal Commission on Coal Mines, 1909, in Great Britain, the report says: "The existing evidence indicates that in still and saturated air, continuous hard work is practically impossible at temperatures exceeding 80° F., even when men are stripped to the waist; and that, when the air temperature is higher than this, the result is the same if the wet-bulb temperature rises above 80° F. A temperature of 100° F. or 110° F. with the air so dry that the wet-bulb temperature is only 80° F. is thus no worse than air completely saturated with moisture at 80° F. In other words, it is the wet-bulb temperature, and not the actual temperature of the air, that matters when the air temperature is high. In moving air, however, a somewhat higher wet-bulb temperature can be borne than in still air. At wet-bulb temperatures exceeding 80° F., the amount of continuous work which a man is capable of doing without serious rise of bodily temperature rapidly falls off and becomes practically nothing at 90° F. wet bulb. Inasmuch as it seems clear that, for the economical working of a mine, the wet-bulb temperature should not in general be allowed to rise above 81° F., unless there is a good air current, great importance attaches to studying the causes of excessive heat and moisture in mines, and so arranging the ventilation as to

*Creighton Mine, Ont.

†Abstract from article in the "Engineer," London, July 23, 1915.

keep the wet-bulb thermomoter within reasonable limits and insure a good air current throughout the working places of the mines.

The Life of Wood Pipe

The results of an investigation of the lasting qualities of wood pipe carrying water, made under instructions from the director and chief engineer of the Reclamation Service, are given at great length by D. C. Henny, consulting engineer, for the service at Portland, Ore., in *Engineering News*, Aug. 26.

This inquiry on the life of wood pipe covered three general types—continuous wood-stave, section wood-stave and sectional bored.

Reviewing the information, it may be estimated that under conditions of continuous water pressure the life of various kinds of pipe may be as follows:

Wood	Condition	Years
Fir	Uncoated, buried in tight soil	20
Fir	Uncoated, buried in loose soil	4–7
Fir	Uncoated, in air	12–20
Redwood	Uncoated, buried in tight soil, loam or sand, and gravel	Over 25
Fir	Well coated, buried in tight soil	25
Fir	Well coated, buried in loose soil	15–20

Under conditions interfering with complete saturation of the wood, the life is cut down materially. These conditions are in the case of uncoated pipe brought about by open soil and low water pressure. The effect of coating appears to be equivalent to tight soil cover, with possibly the additional advantage of tar in the coating acting as a di-infectant. The effect of unfavorable conditions as to lack of complete saturation is serious in redwood, resulting in a life which may be shorter than 15 years.

On the whole the following conclusions seem justified as regards the relative life of fir and redwood in pipe:

(a) Under favorable conditions of complete saturation fir well coated may have the same life as redwood uncoated.

(b) Either kind of pipe will have a longer life if well buried in tight soil than if exposed to the atmosphere. Such life may be very long, 30 years and over, if a high, steady pressure is maintained.

(c) Either kind of pipe will have a longer life if exposed to the atmosphere than if buried in open soil, such as sand and gravel and volcanic ash, provided in hot and dry climate it be shaded from the sun.

(d) Under questionable conditions, such as light pressure or partially filled pipe, fir, even if well coated, may have only from one-third to one-half the life of redwood.

(e) Under light pressure the use of bastard-sawn staves in fir pipe should be avoided.

(f) The use of wooden sleeves in connection with wire-wound pipe is objectionable and has caused endless trouble and expense. It is possible that the objection may be partially overcome by dipping ends of sleeves in creosote and by applying a heavy coating of tar to the ends of the sleeves. Saturation of sleeve wood will never be as perfect, however, as of the straight pipe, and full creosote treatment of the wood or else some form of metal sleeve, either riveted iron or steel heavily coated, or cast iron will probably be well worth the extra cost.

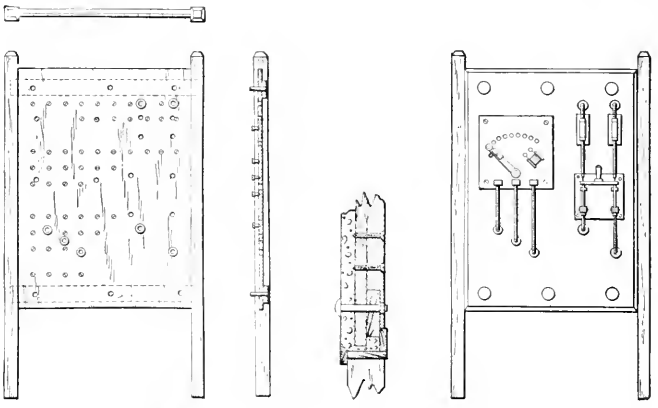
(g) If wooden sleeves are employed, they should be provided for sizes at least from 10 in. up with individual bands to permit taking up leaks.

Wood pipe is not suitable in cases where it cannot be kept full and under pressure during periods of use. Coating cannot under such conditions be expected to afford protection against decay. Coating should be continuous and heavy, not less than one-sixteenth inch to be fully effective, and should preferably consist of more than one individual coat of a mixture of asphaltum and tar, or of an application of gas tar followed by one or more applications of refined coal tar. Little experience, however, can be quoted in support of all-tar coating.

Concrete Switchboard

In a mill where I was employed there is a 500-volt, direct-current motor driving the machine shop, says J. R. Chapman, in *Power*. The switch, fuse blocks and rheostat were fastened to the wall of the building with sheet asbestos for protection.

One day the insurance inspector came in and insisted that a change be made to comply with the underwriters' rules. I suggested getting a slate board, but it was finally decided that a home-made board would do. Accordingly, I took two pieces of 3x3-in. hard wood, 7 ft. long and mortised in two cross-pieces, making a frame 4 ft. wide, as shown above. This was covered with dry pine boards between the uprights, making a tight back for the form. I next placed the fuse blocks, switch and rheostat on the board and marked where the bolt holes came and where the wires would pass. Through the cross-pieces I bored $\frac{5}{8}$-in. holes and drove in wooden pins, leaving them 2 or 3 in. long.



FORM FOR SWITCHBOARD AND END SECTION

For the wires I bored holes to fit porcelain insulation tubes 3 in. long and drove them in as far as necessary. The face of the board was set with $1\frac{1}{2}$-in. screws projecting about 1 in. and spaced 4 in. each. One-inch boards beveled on one edge to about 40 deg. were mitered even with the inside edge of the form to give a beveled edge to the face of the work when done, as shown in the accompanying illustration.

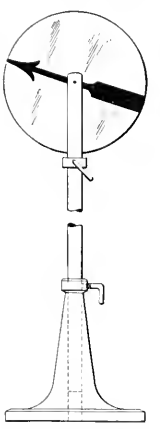
Next, I took a straight-edge and laid it across the front of the form and drove the insulating tubes even with the edge and cut the pins the same length. After the wood-work was done I laid the board on two timbers, face side up, and leveled it by a straight-edge laid across the sides of the form.

A concrete mixture of one part portland cement to three of fine sand, mixed thin enough to run freely, was poured in the form and allowed to set for a week or more. When it was thoroughly dry and hard, the form was removed and the wooden pins driven out through the cross-pieces. The concrete was bolted to the board with ⅝-in. bolts.

The fuse blocks, main switch and rheostat were then fastened in place with ¼-in. bolts through the holes left by driving out the wooden pins. The wiring was mostly at the back of the board, the porcelain tubes serving as passages for making the necessary connections to the apparatus on the front. The back of the board was covered with sheet asbestos for safety and the wires were supported on porcelain cleats. All the conductors were thoroughly insulated from the wood and concrete parts, so that the work passed the underwriters' rules. Finally, the board was painted with a mixture of lamp-black and linseed oil, which gave it the appearance of slate. The whole has a good appearance, as shown in the illustration and satisfies all concerned.

A Holder for Danger Signs

It is conceded by safety experts that the different-colored disk-shaped danger signs now used by many industrial concerns fill an important place as a means of preventing accidents, says J. E. Cooley in *American Machinist* of Sept. 2, 1915. One drawback found in using these is, there is not always a suitable place (or means) to hang or tack them up where a danger exists, and workmen are therefore exposed to hazards because no place is convenient to put up a sign, or it is too much trouble to provide means for this purpose.



A HOLDER FOR DANGER SIGNS

The illustration shows a danger-sign holder that can be moved about for temporary use or fastened to the floor and used in a permanent position. It is made so that it can be used anywhere and so constructed that the sign can be set to a point directly at the danger to be avoided.

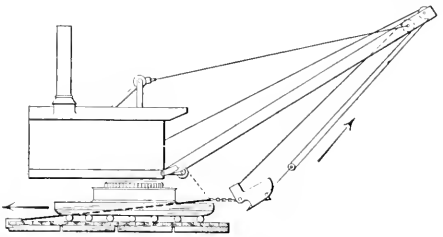
It consists of a cast-iron base, having an adjustable rod about ½ in. diameter, held in place with a binding-screw in the base. At the top of the rod an opening is sawed down a short distance through the center, in which to place the sign, which turns on a small pin, as shown. The binding-collar and screw near the top secures the sign in place, after the arrow-head is set to point at the danger to be avoided.

The use of these holders will prevent many accidents that would otherwise happen. Several of them should be made up and placed where they will be accessible at all times.

Moving a Dragline Excavator Over Soft Ground

An ingenious method is employed by the Winnipeg Aqueduct Construction Co., says the *Excavating Engineer*, for moving its dragline excavators over the soft material in which they are digging. The material is called muskeg, which is nothing but decayed moss and vegetable matter, so soft that it is impossible to get a firm hold with the bucket without digging from 4 to 6 ft. until clay is encountered. This operation naturally caused considerable delay. The following effective method was evolved to overcome this trouble.

The draglines operate on four platforms. When a machine is ready to move and the platform in the rear of the machine is swung and dropped in place in front



TACKLE FOR MOVING DRAGLINE EXCAVATOR

of the machine in the direction in which it is desired to move, the dragline is swung facing the rear. A 20-ft. chain, or better yet, a cable, is hooked by means of a clamp onto the platform which has just been dropped in front of the machine. This cable is run under the base of the machine and the other end is hooked through the bucket chain. When the bucket is hoisted, the machine moves ahead easily in the direction desired. With this method, the machine is ready to dig in five minutes.

Bonus-System Mucking

An instance of the effect of the bonus system on the industry of the men is given by S. P. Brown, chief engineer of the Canadian Northern-Montreal Tunnel and Terminal Construction. Seven muckers were employed in the heading under normal conditions, three in advance throwing the muck back from under the bar and the four other men loading on the cars direct. Mr. Brown says that normally a mucker thinks he is doing a good day's work when he shovels 7 cu.yd. of loose muck into a car, and that really this is all that can be expected of him.

During the record month at the Mount Royal tunnel, however, the four muckers who were loading on the cars handled up to 15 cu.yd. per man per shift, and averaged over 12 cu.yd. In order to appreciate that this is probably a mucking record, it must be remembered that nearly two hours were lost out of the eight in blasting, as two shots were fired regularly every shift. On this work a foreman never had to hire or discharge men during periods of rapid progress. If a man failed to do his share of the work, his comrades ran him out of the tunnel and brought in a better man to take his place.—*Engineering News.*

Details of Milling and Smelting

Corrosion of Iron Pans in Zinc Melting

In hot galvanizing the zinc is generally fused in iron pans, and the iron pans are attacked by the fused zinc, says *Engineering*, Aug. 20, 1915. If that were not so, mechanical galvanizing would hardly be efficient; for the zinc is to adhere to the iron, and it does adhere because it alloys to a certain extent with the iron. The iron pans in which the zinc is fused hence suffer, and the practice considers certain kinds of iron especially suitable for making iron pans. Two years ago the well-known establishment of Julius Pintsch, of Fürstenwalde, observed to its surprise that an iron pan, supplied by an English firm of repute, which had always given satisfaction, was more quickly corroded by the zinc than lower-grade iron pans. The fact was ascribed to a certain peculiarity in the iron, but a more thorough investigation of the problem was deferred.

The results of the subsequent investigation were published last May in the *Zeitschrift des Vereines Deutscher Ingenieure*. Sheets of 10 different kinds of iron were supplied by Krupp in Essen. After having been analyzed and examined metallographically, they were cut up into plates, and pairs of these plates were suspended for 8 hr. in molten zinc at different temperatures. All the plates lost in weight by being kept in contact with the molten zinc, the loss amounting to about 20 grams of iron per hour per square meter of iron surface in a well-heated bath; and as long as the temperature was not raised materially, the composition of the iron did not appear to make much difference.

An increase in the carbon percentage did not favor the corrosion, nor did a change in the manganese proportion. A rise in the phosphorus percentage from 0.025 to 0.090 did not affect the corrodibility either, though the introduction of phosphorus into the zinc bath is of course undesirable. An increase in the silicon percentage did increase the solubility of the iron noticeably, and want of homogeneity in the structure of the iron had the same effect. But these influences were not important, and the temperature of the bath proved of much greater consequence. Zinc melts at 419.4° C. As the temperature of the bath was slowly raised from about 437° C., at which the first observations were taken, the loss of iron increased slowly at first, but much more rapidly afterward, when the temperature exceeded 500° C. In one case the losses of weight were: 20 grams at 437°; 23 grams at 467°, 28 grams a 486°, 41 grams at 495°, 68 grams at 500°, and 288 grams at 532°, the loss being understood as before, per hour per square meter of iron surface. This was not the worst case. One iron lost over 500 grams, another 800 grams in the eighth hour. At higher temperatures, moreover, the differences between the different sorts of iron became much more pronounced.

The chief thing to guard against, then, is an unduly high temperature of the zinc bath. It was further observed that it is advisable to keep the pan, so far as possible, at fairly even temperatures, and to avoid repeated complete cooling and reheating, lest crusts of hard zinc should peel off and impair the iron locally.

*

Theory of the Bucket Elevator

By L. Kresser*

The discharge conditions of a belt elevator can be determined theoretically and in advance of construction. In Fig. 1 the circle C represents the head pulley or the circle described by the backs of the buckets of an elevator. Assume the diameter of this circle to be $2r$ and the circumferential speed v_0, then the centrifugal acceleration is $\frac{v_0^2}{r}$.

In a position of the bucket in which its back is inclined at angle α, as is indicated by line AB, a piece of material at A is subject to the action of gravity and of the centrifugal force $\frac{v_0^2}{r}$. The tangential component of the gravity is $g \times \sin \alpha$ ($g = 32.19$ ft. per sec.^{2}), which is the driving force for the discharge of the material. The frictional resistance is $\left(g \times \cos \alpha - \frac{v_0^2}{r}\right)\mu$, wherein $\mu = tg\,\varphi$ is the coefficient of friction between the material

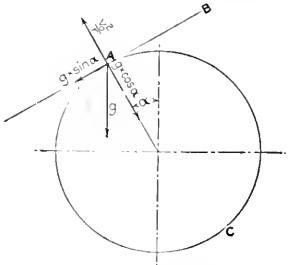


FIG. 1. PARALLELOGRAM OF FORCES, BUCKET ELEVATOR

and the bucket. Ejection of the material will take place as soon as $\alpha = \alpha_0$, α_0 to be determined from:

$$g \times \sin \alpha_0 - \left(g \times \cos \alpha_0 - \frac{v_0^2}{r}\right)\mu = 0$$

The acceleration for the motion of discharge of the material $p_t = g \times \sin \alpha - \left(g \times \cos \alpha - \frac{v_0^2}{r}\right) \times \mu$.

The velocity is:

$$v_t = \int p_t dt; \; put \; \alpha = K \times t \text{ where } K = \frac{v_0}{r}$$

*Mechanical engineer, Passaic, N. J.

$$v_t = \frac{1}{K} \times \left[g \times \cos \alpha_0 + \mu \times g \times \sin \alpha_0 - \mu \frac{{v_0}^2}{r} \alpha_0 - \left(g \times \cos \alpha + \mu \times g \times \sin \alpha - \frac{{v_0}^2}{\mu r} \alpha \right) \right]$$

For an angle of $\alpha = \alpha'$ this velocity is: v_t'.

wherein α' is determined by: $g \times \cos \alpha' = \frac{{v_0}^2}{r}$

For an angle $\alpha > \alpha'$ the acceleration is $p_t = g \times \sin \alpha$ and the velocity $v_t = \frac{1}{K} \times \left[g \times (\cos \alpha' - \cos \alpha) \right] + v_t'$

However, more important than the velocity is the discharge of the material which is: $s_t = \int v_t \times dt$.

$$s_t = \frac{1}{K^2} \times \left[\left(g \times \cos \alpha_0 + \mu \times g \times \sin \alpha_0 - \mu \times \frac{{v_0}^2}{r} - \alpha_0 \right) (\alpha - \alpha_0) + g \times (\sin \alpha_0 + \mu \times \cos \alpha) - g \times (\mu \times \cos \alpha_0 + (\sin \alpha + \frac{\mu}{2} \times \frac{{v_0}^2}{r} \times (\alpha^2 - {\alpha_0}^2) \right] \quad For\ \alpha \leq \alpha'$$

For angle $\alpha = \alpha'$ is the displacement s_t' and for angles $\alpha > \alpha'$ $s_t = s_t' + \frac{1}{K^2} \times \left[g \times (\alpha - \alpha') \times \cos \alpha' - g \times (\sin \alpha - \sin \alpha') + v_t' K \times (\alpha - \alpha') \right]$

The result of this complicated formula has been plotted in the charts of Figs. 2, 3, 4 and 5, which are figured for a value of $k = 1$, and any displacement taken from it is to be divided by the square of the angular velocity. The four charts are figured for coefficients of friction $\mu = 0.2$, 0.4, 0.6 and 0.7. Each curve is drawn for a certain value of the centrifugal acceleration as a fraction of the acceleration of gravity. Values of $\frac{{v_0}^2}{r} = 0.1 \times g$ up to $\frac{{v_0}^2}{r} = 1.0 \times g$ include all slow- and fast-running elevators. By means of the chart it is possible to determine the angle at which a complete discharge of the material from the bucket has taken place.

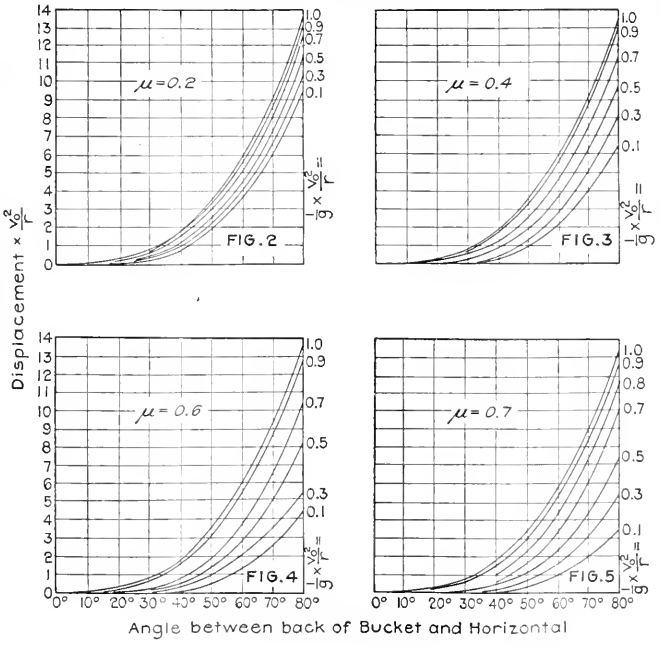
Example: Material: Hard coal $\mu = 0.6$. Size of bucket, 12x6x6. Speed of elevator, 360 ft. per min., or 6 ft. per sec. Diameter of head pulley, 40 in., or $r = 1.66$ ft.

$$\frac{{v_0}^2}{r} = \frac{36}{1.66} = 21.7 \text{ and } \frac{{v_0}^2}{r} \times \frac{1}{g} = 0.674;$$

$$\frac{v_0}{r} = K = 3.61; \left(\frac{v_0}{r} \right)^2 = 13.03$$

For a displacement of 6 in. the chart value is $13.03 \times 0.5 = 6.5$ ft.

We find in the chart for $\mu = 0.6$ a curve somewhat below $\frac{{v_0}^2}{r} = 0.7 \times g$ and reach a displacement of 6.5 ft. at about 70°. If we should prefer an earlier discharge at the same speed we have to use a larger head pulley, for instance, of 52 in. diameter, and the discharge will be complete at an angle of 64°. If we run this elevator with a 40-in. pulley at a speed of 180 ft. per min., or 3 ft. per sec., the discharge will be complete at an angle of 52°.



FIGS. 2 TO 5. CRITICAL SPEEDS OF THE BUCKET ELEVATORS

Hall Sulphur Reduction Applied to Blast Furnaces

The Hall process for the recovery of elemental sulphur has been applied to blast-furnace smelting (U. S. pat. 1,134,846). A reducing flame is introduced at about the normal level of the top of the charge, while the charge is put in through openings which are normally sealed, just as in iron smelting. The reducing flame decomposes the SO_2, while the shutting out of the oxygen ordinarily admitted through the charge doors gives the sulphur no chance to reoxidize. Therefore it passes out of the furnace as sublimed sulphur and is recovered in a gas washer.

Colley Briquetting Process

An ingenious method for rendering ores suitable for blast-furnace treatment is the one patented by Bernard T. Colley, of Rancagua, Chile (U. S. pat. 1,098,883). His process consists in taking the sulphur dioxide from the roasters for the manufacture of sulphuric acid (20% or stronger). This acid is then thoroughly mixed with crushed limestone and agitated, producing calcium sulphate. This calcium sulphate to the extent of 5% is then mixed with the roasted ore, where it exercises the same briquetting power that plaster of paris would.

The Cost of Doing Things

Cost of Mining in Alaska

The figures herewith give details of mining costs at the Alaska Treadwell Gold Mining Co., the Alaska United Gold Mining Co. and the Alaska Mexican Gold Mining Co., Douglas Island, Alaska, for 1914, as shown by their annual reports.

A summary of the table for the Alaska Treadwell shows that the total cost of producing 910,285 tons of ore, 608,794 tons of which were drawn from the broken-ore reserve, was 68.9c. per ton for mining. This cost is made up of 5934 ft. of development at $17.753 per ft.;

DEVELOPMENT COSTS PER FOOT

	Alaska Treadwell	Alaska United Ready Bul.	Alaska United 700-Ft. Claim	Alaska Mexican

Credits	8.329	....	.134	....
Net total cost	$17.753	$13.785	$14.659	$15.696
Feet of development	5,934	3,569	8,528	2,952

sloping 301,491 tons at $1.050 per ton, tramming 910,285 tons at 11.6c. per ton, hoisting 910,285 tons at 9.4c.; and pumping at 1.6c. per ton. These costs consist of 33.8c. for labor, 19.6c. for supplies, and 21.2c. for subsidiary accounts; less 5.7c. per ton for credits. No depreciation is charged in these figures.

The cost of mining on the Ready Bullion claim of the Alaska United was $1.055 per ton for 233,100 tons exclusive of depreciation. Included in this cost is 3569 ft. of development at $13.785 per ft., sloping 249,545 tons at 51.3c. per ton, tramming 233,100 tons, 12.2c.; hoisting 233,100 tons, 13.9c.; and pumping, 3.4c. per ton. These costs consist of 59.8c. for labor, 23.2c. for supplies and 22.5c. for subsidiary accounts. Costs at the 700-Ft. claim amounted to $1.23 for 225,214 tons, of which 106,002 tons were stoped and the remainder was drawn from broken-ore reserves. The cost was made up of 8528 ft.

STOPING COST PER TON OF ORE STOPED

	Alaska Treadwell	Alaska United Ready Bul.	Alaska United 700-Ft. Claim	Alaska Mexican

Total hoisting cost	$0.094	$0.139	$0.119	$0.096

up of 2952 ft. of development at $15.696 per ft.: stoping 167,274 tons at 80.9c. per ton; tramming 233,457 tons at 12.7c.; hoisting 233,457 tons at 9.6c. and pumping 1.7c. per ton. The charge for labor included in these costs was 51.3c. per ton; supplies, 15.4c.; subsidiary accounts, 35.2c. per ton.

Dredging and Hydraulicking Operations in the Yukon

The following data were taken from the report of the Yukon Gold Co. for 1914. At Dawson the dredges began operations on May 12 and ran until Oct. 23. The average length of the dredge season was 164 days, during which the dredges operated 87.2% of the possible time. The thawing cost was reduced 1.39c. per cu.yd. and was lower than for any previous season. A total of 421,835 sq.yd., or 68.6% of the ground handled, was frozen and had to be thawed by steam. The dredges handled 4,800,181 cu.yd. of material, which produced $2,602,685, or 54.21c per cu.yd., at a working cost of 27.62c. per cu.yd.

The Iditarod dredge operated from May 4 to Nov. 11 and handled 668,737 cu.yd. of material, producing $739,631, or $1.10 per cu.yd. The operating cost, including $50,000 depreciation, was 50.2c. per cu.yd., with the dredge operating 91.91% of the possible time. The maximum grade of the creek did not exceed 5% and few boulders were encountered, but large quantities of granitic sand were handled. A total of 67,260 sq.yd. of ground, or 14% of the total area, was thawed by steam.

The three California dredges operated by the Pacific Co. handled 3,198,192 cu.yd. of gravel and produced $322,571. The average cost of the three dredges was 4.27c. per cu.yd., including depreciation.

The hydraulic operations at Dawson handled 3,241,641 cu.yd. of material at a working cost of 7.6c. per cu.yd., exclusive of depreciation of the main ditch. The total amount of water used amounted to 519,834 miner's inches, equal to a duty of 6.02 cu.yd. per miner's inch.

Cost of the Belmont Mill*

The Belmont mill at Tonopah, Nev., was designed and constructed by the Belmont staff. Ground was broken in August, 1911, and milling operation started July 25, 1912. The metallurgical flow-sheet and the machinery adapted to carrying out operations in accordance with this plan were decided upon from experience gained in the treatment of Belmont mine ores at the old Belmont mill at Millers, Nev.

Detail drawings were made by the engineering staff of the Tonopah-Belmont Development Co. under the supervision of Otto Wartenweiler, who also had direct charge of the construction, consulting with the general superintendent of the company, Frederick Bradshaw, and A. H. Jones, superintendent of milling.

The total cost of the plant, designed to handle 500 tons per day, was $465,189.07. The savings in operating costs and increased extraction, as compared with the best results from the old mill at Millers, were such as to return the entire cost of the new plant from the treatment of 269,000 tons of ore, or approximately 18 months' operation. The accompanying table shows the costs of construction.

CONSTRUCTION COSTS, BELMONT MILL

	Excavation, Concrete Walls and Foundations	Floors and Machinery Foundations	Buildings: Frames	Buildings: Covering	Machinery, Including Erection, Piping, Belting, Etc.	Totals
Crusher plant	$5,760.72	$2,527.58	$2,230.72	$1,476.69	$21,174.96	$33,170.67

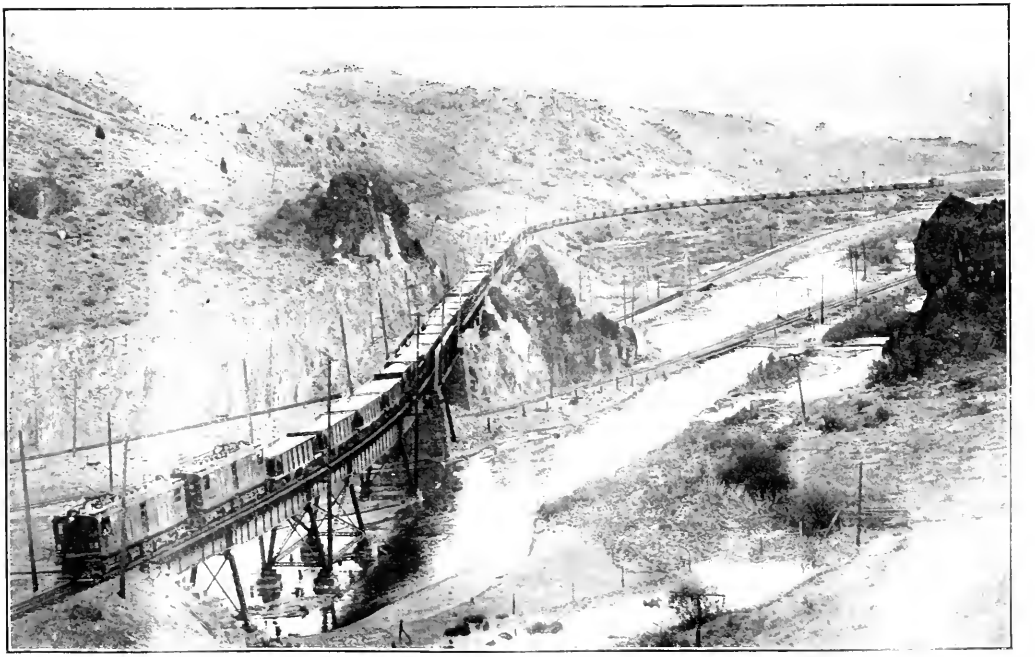
PORTABLE LOADING MACHINE AT THE MORRIS-LLOYD MINE OF THE CLEVELAND-CLIFFS IRON CO.

The muckers shovel into the lower end of the machine, rock being then elevated on a steel-apron conveyor belt and dumped into 8-ton saddle-back cars. A 30% increase of efficiency over simple shoveling was gained.



LONG ORE TRAIN, CONTAINING 75 CARS, ON THE BUTTE, ANACONDA & PACIFIC RY. IN SILVER B[OW], MONT.

At this place the Anaconda railway crosses two transcontinental lines—the Northern Pacific and the [Chicago, Milwaukee & St. Paul—both of which are shown in the picture.

Correspondence and Discussion

Securities of the American Smelting and Refining Co.

The able review of the securities of the American Smelting and Refining Co. and its subsidiary, the American Smelters Securities Co., in the editorial columns of the *Journal* of Aug. 28 has been read by me with much interest.

The answer to the inquiry as to "why one of the premier securities of so solid a company should be available at so low a price" is that in this case the American investor is profiting temporarily by the necessities of his unfortunate European brother. A large part of this issue was originally sold abroad, and the enormous financial requirements of the European War have compelled investors in the belligerent countries to dispose of some of their holdings of sound American investment securities at prices materially below their intrinsic worth; in this respect the market quotations for American Smelters Securities preferred shares, series A, have been particularly affected.

In connection with the table showing the comparative yields of the securities of the American Smelting and Refining Co. and its subsidiary, the inclosed comparison between American Smelting and Refining preferred and American Smelters Securities preferred, series A, will no doubt be of some interest.

STATISTICS OF AMERICAN SMELTERS SECURITIES PREFERRED STOCK A

	American Smelting and Refining Co. Preferred Stock, 7% Cumulative	American Smelters Securities Co. Preferred Stock, Series A, 6% Cumulative
Price	106	85
Yield	6½%	7.06%
Number of times preferred dividend was earned—		
Calendar year 1914	1 9	3 8
Calendar year 1913	2 1	4 4
Average from May, 1905, to Dec. 31, 1914	2 35	3 7

American Smelters Securities preferred stock, series A, has the provision for the retirement of the stock at 100 by lot under the operation of the cumulative annual sinking fund, by which the entire issue should be retired by 1947. The holder of the stock purchased at present prices should therefore receive a profit of $15 per share on his investment, and the profits derived from such redemption will form a considerable addition to the dividend yield.

A comparison of the earnings of the two companies over a series of years shows that the dividend requirements of the latter stock are protected by a materially larger margin of earning power than those of the former; the position of Smelters A is therefore better from an investment standpoint.

The opportunity for material profit through the retirement of the shares at par under the operation of the sinking fund is a feature not possessed by any of the other securities of the American Smelting and Refining Co. or its subsidiary. While the present value of this profit through retirement to any individual investor depends upon the date on which the shares are drawn, the provision is a valuable one and should entitle these shares to a market valuation materially above others equally well secured but lacking this feature.

I am pleased to note a review of securities of this class in the editorial columns of the *Journal*, because it is in the interest of sound mining finance, upon which sound mining operations are necessarily dependent.

EUGENE MEYER, JR.

New York, Aug. 28, 1915.

[The fact remains that in any inter-company dealings to the advantage of the A. S. & R. Co. as against the A. S. S. Co., the latter's preferred A stock is the only one of its issues that could be hurt, barring the common, and that is all owned by the American Smelting and Refining Co.—Editor.]

Holmes Professorship, Colorado School of Mines

On Aug. 12 the Board of Trustees of the Colorado School of Mines created the Joseph A. Holmes Professorship of Safety and Efficieney Engineering, in honor of the late Doctor Holmes, Director of the United States Bureau of Mines.

I was authorized by the board to nominate persons suitable for this position, and we are enabled to offer a salary that would induce a first-class man, trained in such work, to come here. I would therefore be greatly obliged for suggestions as to filling this position.

The specific object of this professorship is to train our students in the use of all life-saving apparatus and in all matters that would be embraced under the general term of safety and efficiency engineering, in so far of course as they may be separated from other work of a similar character.

I believe that this is the first and only professorship of the sort in the United States, and naturally we have to feel our way along a bit. We would like to have the man chosen for the position devote himself, for the next few months, to becoming acquainted with conditions here if he does not already know them, so that he may himself be able to outline the proper course of instruction.

We have felt that there could be no more fitting memorial to Doctor Holmes than the establishment and maintenance of this professorship to bear his name, and surely we must see to it that it is conducted in a manner that he would approve of. One cannot, of course, say offhand just how many and what subjects should be embraced under the general term "safety and efficiency engineering"; but we are resolved to work this problem out according to our best lights and to do this we must have a first-class man in charge of the chair. A modern equipment will be provided and kept uptodate, and we hope to have this chair stand for all that is best in safety engineering.

WILLIAM B. PHILLIPS,
President, Colorado School of Mines.

Golden, Colo., Aug. 28, 1915.

NEW PUBLICATIONS

COAL FIELDS OF BRITISH COLUMBIA. Compiled by D. B. Dowling. Pp. 350, illus. Memoir 69, Canadian Department of Mines, Geological Survey Branch, Ottawa.

A LIST OF CANADIAN MINERAL OCCURRENCES. By Robt. A. A. Johnston. Pp. 275. Memoir 74, Canadian Department of Mines, Geological Survey Branch, Ottawa.

THE FAUNA OF THE BATESVILLE SANDSTONE OF NORTHERN ARKANSAS. By George H. Girty. Pp. 170, illus. Bull. 593, U. S. Geological Survey, Washington.

RECONNAISSANCE OF THE GEOLOGY AND OIL PROSPECTS OF NORTHWESTERN OREGON. Chester W. Washburne. Pp. 111, illus. Bull. 590, U. S. Geological Survey, Washington.

PETROLEUM AND NATURAL GAS RESOURCES OF CANADA. In two volumes; Vol. 1. By Frederick G. Clapp and Others. Pp. 378, illus. Canadian Department of Mines, Ottawa.

THE MINERAL RESOURCES OF TEXAS. By William B. Phillips, Director, Bureau of Economic Geology and Technology. Pp. 362, illus. Bull. 365, University of Texas, Austin, Tex.

WESTERN AUSTRALIA—ANNUAL PROGRESS REPORT OF THE GEOLOGICAL SURVEY FOR THE YEAR 1914. With an Index Map. Pp. 41, illus. Western Australia Geological Survey, Perth.

ANTICLINAL STRUCTURE IN PARTS OF COTTON AND JEFFERSON COUNTIES, OKLAHOMA. By Carroll H. Wegemann. Pp. 168, illus. Bull. 602, U. S. Geological Survey, Washington.

GEOLOGY AND MINERAL RESOURCES OF KENAI PENINSULA, ALASKA. By G. C. Martin, B. L. Johnson and U. S. Grant. Pp. 243, illus. Bull. 587, U. S. Geological Survey, Washington.

REPORT ON THE NON-METALLIC MINERALS USED IN THE CANADIAN MANUFACTURING INDUSTRIES. By Howells Frechette. Pp. 221. Canadian Department of Mines, Ottawa, Canada.

CANADA—SUMMARY REPORT OF THE GEOLOGICAL SURVEY DEPARTMENT OF MINES FOR THE YEAR 1914. Pp. 201, illus. Canadian Department of Mines, Geological Survey Branch, Ottawa.

AN INVESTIGATION OF IOWA FIRE CLAYS. By Milton F. Beecher. Pp. 117, illus. Bull. 40, Engineering Experiment Station. Iowa State College of Agriculture and Mechanic Arts, Ames, Iowa.

REPORT ON MINING OPERATIONS IN THE PROVINCE OF QUEBEC DURING 1914. Theo C. Denis, Supt. of Mines. Pp. 151, illus. Department of Colonization, Mines and Fisheries, Quebec, Canada.

RESULTS OF THE INVESTIGATION OF SIX LIGNITE SAMPLES OBTAINED FROM THE PROVINCE OF ALBERTA. By B. F. Haanel and John Blizard. Pp. 110, illus. Canadian Department of Mines, Mines Branch, Ottawa.

RAPPORT SUR LES OPERATIONS MINIERES DANS LA PROVINCE DE QUEBEC DURANT L'ANNEE 1914. Pp. 150, illus. Division des Mines, Ministere de la Colonisation, des Mines et des Pecheries, Quebec, Canada.

ANALYSES OF ROCKS AND MINERALS FROM THE LABORATORY OF THE UNITED STATES GEOLOGICAL SURVEY, 1880 TO 1914. Tabulated by F. W. Clarke. Pp. 376. Bull. 591, U. S. Geological Survey, Washington.

GUIDEBOOK OF THE WESTERN UNITED STATES. Part A. The Northern Pacific Route with a Side Trip to Yellowstone Park. By Marius R. Campbell and Others. Pp. 212, illus.; $1. Bull. 611, U. S. Geological Survey, Washington.

EXTRACTS FROM REPORTS ON THE DISTRICT OF UNGAVA RECENTLY ADDED TO THE PROVINCE OF QUEBEC UNDER THE NAME OF THE TERRITORY OF NEW QUEBEC. Pp. 208, illus. Department of Colonization, Mines and Fisheries, Mines Branch, Quebec.

A STUDY OF METHODS OF MINE VALUATION AND ASSESSMENT, WITH SPECIAL REFERENCE TO THE ZINC MINES OF SOUTHWESTERN WISCONSIN. By W. L. Uglow. 6¼x9½, pp. 73, illus. Wisconsin Geological and Natural History Survey, Madison, Wis.

ANNUAL REPORT OF THE BRITISH COLUMBIA MINISTER OF MINES FOR THE YEAR ENDING December 31, 1914. Being an Account of Mining Operations for Gold, Coal, Etc., in the Province of British Columbia. 6½x10½, pp. 544, illus. Richard McBride, Minister of Mines, Victoria, B. C.

QUEENSLAND—ANNUAL REPORT OF THE ACTING UNDER SECRETARY FOR MINES. Including the Reports of the Wardens, Inspectors of Mines, Government Geologists and Other Officers, for the Year 1914. Pp. 227, illus. Anthony James Cumming, Government Printer, Brisbane.

CHEMICAL GERMAN. An Introduction to the Study of German Chemical Literature. By Francis C. Phillips. Second edition, 5½x8¾, pp. 252, illus.; $2. Chemical Publishing Co., Easton, Penn.

A new edition, enlarged by 12 pages, of a well-known book.

TRANSACTIONS OF THE AMERICAN INSTITUTE OF METALS, Vol VIII. Edited by Charles Vickers. 5¾x8¾, pp. 394, illus. American Institute of Metals, Buffalo, N. Y.

Contains the proceedings of the meeting of September, 1914, the papers read thereat, and the reports of the officers and committees.

STANDARD HANDBOOK FOR ELECTRICAL ENGINEERS. By Frank F. Fowle. 4x6½, pp. 1984, illus., leather, $5. McGraw-Hill Book Co., New York.

This has been so greatly amplified as to be almost a new publication. It is an indispensable guide to the practising engineer and a valuable supplement to the standard text books. The various sections of the book are prepared by specialists in the fields treated, and the whole then edited by Mr. Fowle.

FINANCING AN ENTERPRISE. A Manual of Information and Suggestion for Promoters, Investors and Business Men Generally. By Francis Cooper. Fourth Edition. $3 postpaid. 5¼x8, pp. 524. The Ronald Press Co., New York.

The usual impression is that any meritorious enterprise can readily find the money for financing it. This book is intended to correct the ordinary idea and to show how to present any proposition in such a way as to obtain it a favorable hearing, and how to choose among the various ways that are open when financial support has been promised. A good book for the investor, promoter and examining engineer.

REPORT OF THE ROYAL COMMISSION ON MINING INDUSTRY AT BROKEN HILL IN THE STATE OF NEW SOUTH WALES. 11¼x13, pp. 862; board covers, 20s. William Applegate Gullick, Government Printer. Sydney.

Report by the commission appointed by the Governor to make inquiry into the advisability of providing, in connection with the various mines in the Broken Hill district of New South Wales, for the abolition of piece work, with a view to making mining work healthier and safer; the reduction of the temperature in the mine workings to 75° F., and if this be impracticable, a reduction in the hours of work in proportion to the increased temperature of the mine concerned; the compensation of employees by mining companies in all cases of industrial sickness or accidents, and the compensation of the relatives or dependents of employees who have lost their lives through sickness or accident; the improved ventilation of said mines; the authorizing of officials of industrial unions to visit any of the said mines or any working places in connection therewith, and to examine the pence-cards with a view to preventing the employment of non-unionists; and the prevention of the wholesale influx into Australia of foreigners unable to speak the English language; as to the best means of insuring a diminution in the number of accidents generally in the said mines; and concerning the provisions of means of exit from the mines in the case of fire, and generally as to the safe working of the mine.

The commission included a member of the Amalgamated Miners' Association, who, in various instances, made minority reports of the various findings.

CATALOG OF TECHNICAL PERIODICALS OF THE LIBRARIES IN THE CITY OF NEW YORK AND VICINITY. Compiled and Edited by Alice Jane Gates, Assistant Librarian of the Engineering Societies, with the coöperation of a committee of the New York Library Club. 8x10, pp. 110; $3. Library Board of the United Engineering Societies, New York, N. Y.

This volume, number one of the bibliographical contributions of the Library of the Engineering Societies is a worthy beginning of a promising series. It is a valuable catalog, or rather a directory, of the technical periodicals and engineering society transactions in or near New York City. It is as valuable to an individual as it is to libraries, in that an engineer, by referring to it, may readily locate a periodical reference in his research notes. The seven large and representative libraries contained in the catalog are: Columbia University Library, Chemists' Club Library, Library of the American Society of Civil Engineers, Library of the Engineering Societies, New York Public Library, Plainfield Public Library, and Library of Stevens Institute of Technology.

The catalog is a great step in a country-wide plan to record effectively the periodicals throughout the various cities, and is the outgrowth of a suggestion made by the late Dr. John Shaw Billings to W. P. Cutter, the librarian. The attempt was made to have a complete record of foreign and domestic periodicals, i.e., to include all changes of title, consolidations, record of indexes published, and suspension or cessation of publication. In short, it aims to be a concise history of every important technical periodical. The entries in the pages are compiled in an original and pleasing manner. The names of the periodicals, arranged alphabetically, are followed by a complete statement of the numbers published. Below this are given the numbers of the periodical to be found in one or more of the libraries represented. The size of the page is 8x10 in., and the printing is set up in two columns making it easy to follow. There are, in all, over 2600 main entries and cross-references with a list of indexes consulted, a list of the libraries and information regarding them, and a brief statement of the system followed. Above all, it is printed on heavy glare-proof paper, is strongly bound, and will prove a valuable addition to any engineer's library.

Naval Advisory Board

The Naval Advisory Board will consist of the following members, each of the 11 societies mentioned nominating two:

Thomas A. Edison, chairman.

W. R. Whitney and L. H. Backeland, of the American Chemical Society.

Frank Julian Sprague and Benjamin G. Lamme, of the American Institute of Electrical Engineers.

Robert S. Woodward and Arthur G. Webster, of the American Mathematical Society.

Andrew M. Hunt and Alfred Craven, of the American Society of Civil Engineers.

Matthew B. Sellers and Hudson Maxim, of the American Aëronautical Society.

Peter Cooper Hewitt and Thomas Robins, of the Inventors' Guild.

Howard E. Coffin and Andrew L. Riker, of the American Society of Automobile Engineers.

William L. Saunders and Benjamin B. Thayer, of the American Institute of Mining Engineers.

Joseph W. Richards and Lawrence Addicks, of the American Electro-Chemical Society.

William Leroy Emmet and Spencer Miller, of the American Society of Mechanical Engineers.

Henry A. W. Wood and Elmer A. Sperry, of the American Society of Aëronautical Engineers.

Secretary Daniels announced, Sept. 12, the names of these 22 scientists and inventors who, with Thomas A. Edison as chairman, will assist the United States navy in its technical development.

The members of the board were chosen by 11 scientific societies of the United States, each of which nominated two men. Mr. Edison was chosen by Secretary Daniels for the chairmanship, the plan resulting in the creation of the board having been taken up first with Mr. Edison as the foremost inventor of this country.

Mr. Daniels announced that he has arranged for the first meeting of the advisory board to take place in his office at 11 a.m. on Wednesday, Oct. 6. At this meeting it is expected that organization will be effected and plans for the conduct of work discussed.

Zinc Production in China

According to an American consular report a Hongkong firm recently placed an order in the United States for a considerable quantity of zinc. Large quantities are used in Hongkong and in the trade field tributary to Hongkong. Heretofore these supplies have been secured almost entirely from Germany and Belgium, though at times some of the metal has been obtained in China. Zinc is produced in Kweichow and Hunan provinces in considerable amounts, and is exported in ordinary years to the extent of about a thousand tons of spelter and ten thousand tons of ore, mostly to Germany and Belgium.

[The production of spelter in China is statistically an unknown quantity. It is produced by a crude method of distillation in minute retorts and the output of any one smelter may be only a few tons per annum, but there may be a good many of them.—Editor.]

Asbestos Deposits Have Been Found Near Pachow in Chungking Province, China, according to a report from United States Consul E. C. Baker. As the asbestos appears to be of good quality and the price is low, the possibilities of direct exportation to the United States may be of interest to certain American dealers at this time. The mining expenses and cost of carriage to Chungking amount to about 75c. United States currency per 100 lb. The production and exportation of this article is a part of the industrial work for boys carried on under the direction of Rev. W. B. Williston, of the China Inland Mission at Pachow, Szechwan Province.

NEW PATENTS

United States patent specifications listed below may be obtained from "The Engineering and Mining Journal" at 25c. each. British patents are supplied at 40c. each.

AGGLOMERATION—Improvements Relating to the Agglomeration of Ores and Metallurgical Products. W. Buddeus, Charlottenberg, Germany. (Brit. No. 29,033 of 1913.)

ALLOYS or Compounds for Improving Copper and Its Alloys. Charles Vickers, Niagara Falls, N. Y., assignor to The Titanium Alloy Manufacturing Co., New York, N. Y. (U. S. No. 1,151,744; Aug. 31, 1915.)

BLAST FURNACES—Method of Heating the Checker-Brick Heaters of Blast Furnaces. A. Pfoser, Baden, Germany. (Brit. No. 18,912 of 1913.)

BRIQUETTING—Mechanism for Preparing Pulverulent Materials for Molding or Briquetting. Ellsworth B. A. Zwoyer and Rolland A. Zwoyer, Perth Amboy, N. J., assignors to Zwoyer Fuel Co. (U. S. No. 1,152,469; Sept. 7, 1915.)

CHEMICALLY PURE METALS—Process for Producing Chemically Pure Metals. O. Voigtlander and H. Lohmann, Essen-Ruhr, Germany. (Brit. No. 27,369 of 1913.)

COPPER—Process for Separating Iron and Nickel from Copper in Certain Ores and Masses. Wilhelm Borchers and Eduard Thilges, Aachen, Germany. (U. S. No. 1,152,699); Sept. 7, 1915.)

CYANIDING—Apparatus for Treating Solid-Bearing Solutions. Lamartine C. Trent, Los Angeles, Calif. (U. S. No. 1,152,769; Sept. 7, 1915.)

DRILL HOLES—Device for Ascertaining the Vertical Angle and Direction of Diamond-Drill Holes. Helge A. Borresen, Marquette, Mich. (U. S. No. 1,152,701; Sept. 7, 1915.)

DRILLS—Chuck for Drills. Willis Coulson, Mace, Idaho. (U. S. No. 1,153,033; Sept. 7, 1915.)

DRILLS—Device for Rotating Pneumatic Drills. Henry J. Cook, Los Angeles, Calif., and Herbert E. Marsden, Ottumwa, Iowa. (U. S. No. 1,152,882; Sept. 7, 1915.)

DRILLS—Improvements to Rock Drills and the Like Cutting Machines. A. Berner, Nuremberg, Germany. (Brit. No. 35 of 1914.)

ELECTRIC FURNACE. Parvin Wright, Seattle, Wash. (U. S. No. 1,152,586; Sept. 7, 1915.)

ELECTRICAL FURNACE. William H. Hampton, New York, N. Y., assignor to Conley Electric Furnace Co., Inc., Wilmington, Del. (U. S. No. 1,152,505; Sept. 7, 1915.)

FLOTATION—Improvements in or Relating to the Concentration of Ores. Minerals Separation, Ltd., London, E. C., England. (Brit. No. 17,327 of 1914.)

HOISTING-ENGINE CONTROL. William J. Lilly, Butte, Mont. (U. S. No. 1,153,124; Sept. 7, 1915.)

LEACHING—Metallurgy of Copper. Raymond F. Bacon, Pittsburgh, Penn., assignor to Metals Research Co., New York, N. Y. (U. S. No. 1,151,236; Aug. 24, 1915.)

ORE REDUCTION—Improvements in or Relating to Ore-Reducing Furnaces. New Metals Process Co., Chicago, Ill. (Brit. Nos. 17,322 and 17,323 of 1914.)

PULSATOR for Pulsatory Tools. Arthur Henry Gibson, Easton, Penn., assignor to Ingersoll-Rand Co., New York, N. Y. (U. S. No. 1,151,936; Aug. 31, 1915.)

RADIO-ACTIVE MINERALS—Improved Process for Treating Ores of Radium, Mesothorium, Thorium and Other Radio-Active Substances. E. Ebler, Heidelberg University, Germany. (Brit. No. 28,445 of 1913.)

RECOVERY—Improved Process for the Recovering of Metal from Ore and Apparatus Therefor. New Metals Process Co., Chicago, Ill. (Brit. No. 17,325 of 1914.)

REVERBERATORY FURNACES—Improvements Relating to Reverberatory Furnaces. Manchester Furnaces, Ltd., and W. A. R. A. J. Lord Globe Works, Manchester, England. (Brit. No. 6,050 of 1915.)

SEPARATING—Ore-Separating Process. Arthur J. Moxham, Wilmington, Del. (U. S. No. 1,151,117; Aug. 24, 1915.)

SEPARATOR—Apparatus for Separating Coal, Ore, Etc. Frank Pardee, Hazleton, Penn. (U. S. No. 1,149,463; Aug. 10, 1915.)

SMELTING FURNACES—Improvements in or Relating to Smelting Furnaces. Anna Nieweth, Berlin, Germany. (Brit. No. 21,738 of 1913.)

STEEL—Process of Treating Steel. Charles Henry Augustus Frederick Lockhart Ross, Balmagown Castle, County of Ross, Scotland. (U. S. No. 1,151,049; Aug. 24, 1915.)

SULPHUR BURNER. Albert Gustav Hinzke, Rothschild, Wis., assignor to Valley Iron Works Co., Appleton, Wis. (U. S. No. 1,149,765; Aug. 10, 1915.)

SULPHURIC ACID—Method and Apparatus for Producing Sulphuric Acid. Georg Schliebs, Cologne, Germany. (U. S. No. 1,151,294; Aug. 24, 1915.)

SULPHURIC ACID—Process of Making Sulphuric Acid. Henry Howard, Brookline, Mass. (U. S. No. 1,151,103; Aug. 24, 1915.)

TUNGSTEN—Treatment of Refractory Metals. Gottlieb Gmür-Zehnder, Aarau, Switzerland. (U. S. No. 1,150,670; Aug. 17, 1915.)

ZINC—Electric Reduction of Zinc Ores. Woolsey McA. Johnson, Hartford, Conn., assignor to Continuous Zinc Furnace Co., Hartford, Conn. (U. S. No. 1,150,271; Aug. 17, 1915.)

ZINC—Method of Smelting Sulphide Ores. Henry L. Doherty, New York, N. Y. (U. S. No. 1,150,841; Aug. 17, 1915.)

ZINC—Process of Treating Zinc Tailings. Arthur C. Spencer, Washington, D. C. (U. S. No. 1,150,897; Aug. 24, 1915.)

Editorials

The Prospects for Copper

Up to about a fortnight ago there were two views respecting copper among producing and selling interests—one bullish, the other bearish. It is unnecessary now to discuss the reasons for the bullish view. The bearish was based chiefly upon the enormously increased production, the weight of which was considered bound to tell. Consumers also held this view and deferred further purchases, even requesting producers to anticipate contractural deliveries, with the expectation that later they would be able to buy copper much cheaper.

Recently there was a change of opinion among those selling interests that previously had been bearish. The reasons for this were two—a growing belief that the military use of copper is much greater than any previous estimate, no matter how large; and the perception that regardless of the increase in production, refining capacity imposes a limit that cannot be overstepped. It is significant that there is but little additional refining capacity in preparation, the only important construction of this kind being at Tacoma and Great Falls.

Confirmation of this theory is to be found in several important things that have recently transpired. Thus it is well known that recent refining contracts have been made at $20 per ton, whereas $15 was formerly regarded as a fine price. Moreover, although the British embargo on crude copper was lifted under certain conditions, the unusual disparity between the prices for electrolytic and standard has continued, showing that refiners are not in a position to buy standard freely. Finally, it is a matter of more or less common knowledge that several copper-producing companies are having to pile up blister copper in consequence of inability to have it refined.

At the beginning of 1915 the electrolytic-refining capacity of the United States was about 148 million pounds per month. At the middle of 1915 it was about 152 million pounds. The new construction that is now going on will raise it to 164 million pounds, but this will not be attained until the end of the year, and it may be that the new plant at Great Falls will not be ready until 1916. Included in the foregoing figures is the small capacity—about five million pounds per month—for electrolytic Lake copper.

The Donora Zinc Works

The Donora zinc smeltery of the United States Steel Corporation is going to be unique in zinc-smelting construction by reason of the extensive use of reinforced concrete in its several parts. There is to be approximately 50,000 cu.yd. of concrete, of which about 30,000 cu.yd. will be reinforced concrete. The plant is also remarkable for the speed with which it is being built. About 1,000 cu.yd. of concrete is being placed per day. This is being done by the Dravo Construction Co., of Pittsburgh. The American Bridge Co. is naturally doing the structural-steel work for the plant. The brickwork is being done by the Steel Corporation's own force of bricklayers, which is recruited from the several plants of the corporation, precedence over everything else being given to the Donora construction.

Contrary to previous reports, the Donora plant is the only one now being built by the Steel Corporation. After the first announcement it was intimated that it had been decided to divide the retorts between Donora and Gary, and the idea obtained credence in well-informed quarters that construction had actually been begun at Gary. This was erroneous, although it is not unlikely that a smeltery will be built at Gary, or in the Illinois coal field, later, which would be a natural development. The Donora plant will have about 10,000 retorts, which will give capacity for smelting about 100,000 tons of ore per annum and making about 40,000 tons of spelter, which will make it the largest zinc-smelting unit in the world.

Things in Technical Literature That Are Not So

In the great flood of literature that is flowing through the pages of the engineering and technical press there are bound to be blunders, the expression of erroneous opinions, the misstatement of what pass for facts. No editor is infallible either in his own writings or in the endorsement that he gives to contributors by printing their articles. However, the contributors are the main offenders, for the simple reason that there are more of them.

Now, there is no great harm in the expression of an unsound opinion. Everybody knows that it is merely an opinion that may be right, may be wrong. Each expression will be weighed by itself. The reprehensible thing is for some one to represent as a fact what is not a fact. That this may happen out of carelessness—intentional deception is probably rare—is no palliative of the harm that is done. The following excerpts from a communication of a correspondent in South America is illustrative of what we mean:

> It has been a pleasure to me to supply the inclosed information, the more because in the course of years American technical papers have been publishing a lot of nonsense about this country. There is a certain Mr. —— who wrote in the "Journal" and also in the —— about Bolivia, and from his writings I conclude that he was in Bolivia about 10 years ago, and then only for a couple of days. His articles are simply redundant; everyone who knows anything about Bolivia is aware of the fact that the mining laws, and especially their execution, are so bad as to prevent any foreign capital from coming in, and that the Bolivians are the worst people on earth from whom to buy mines. There were also some small errors in the editorial in the "Journal" of Oct. 10. The Cia. Minera de Oruro uses the Ingersoll stoper BC-21 in addition to jackhamers for mining. Further, there are no steam pumps; the water is so acid that lead-lined pipe would be required, so the mines are kept dry by bailing with automatic tanks. The San José mine, which lies between two mines of the Cia. Minera de Oruro and works the same veins, bails with buckets made of rawhide. No steam is used at present in either San José or the Oruro mines; the first company has a 200-hp. Diesel engine, and the Cia. Minera de Oruro uses a power plant of 300-hp. Diesel engines and a 120-hp. suction gas motor, which generate a 1000-volt three-phase current.

This power is only used for the mines, the mill at Machacamarca having its own gas-producer power plant.

The —— published some time ago the cost of getting one ton of concentrate from Bolivia to the European smelters, but this account was silly and confusing. It is remarkable that the information published about Bolivian conditions should be on the whole so unreliable. It seems to me that most of the articles are written by people who visit the country for a few days, absorbing during their short stay all the talk that Bolivians will let them have, thinking that they would publish that afterward as true, first-hand information, and that there were no men in the country who did not know better. For instance, I remember some time ago a certain Mr. —— wrote in the —— that the mines of Oruro did not produce any tin, but principally copper, whereas they were shipping tin concentrate at that time at the rate of over 200 tons per month, against two tons of copper precipitate of about 25% Cu. I have often thought to call those scribes to account, but after all did not think it worth while.

We hold that it was not only worth while but that it ought to have been done. The printing of erroneous statements in a technical magazine is apt to be perpetuated by the professors in their textbooks and treatises. Thus there creeps into permanent literature the recording of many things that are not so.

The correspondent whom we have quoted puts his finger upon the explanation of much of this. The editor accepts a contribution from a person whom he knows and believes to be reliable. It may turn out, however, that the contributor was deceived. There does not appear to be any effective way of preventing this. The only thing that can be done in most cases is to print a correction, and in the interest of everybody the readers of a paper ought to draw attention to misstatements that they observe in its pages.

*

Zinc Refining by Redistillation

The extraordinary premiums that have been paid for high-grade and superior intermediate spelter led naturally to the production of such spelter by refining by redistillation, and a large tonnage of refined spelter is now being produced in that way. As has been previously pointed out in the *Journal*, there is no novelty in this, a good deal of refined spelter having been so produced during many years by dross and junk smelters in this country and Great Britain, and also in Sweden and Norway, and perhaps elsewhere. The dross and junk smelters in this country commonly perform the redistillation in large retorts. The smelters in the Scandinavian countries do it in electric furnaces. The practice recently developed in the United States is novel in that the ordinary ore furnace is used for the purpose. Yet even that is novel only in the making of a regular practice of it.

The same thing was tried about 17 years ago in one of the works of the old Cherokee-Lanyon Spelter Co., then managed by A. B. Cockerill. Mr. Cockerill, who was something of an experimenter, thought then to improve his metal product by redistillation. He found that he could make a refined spelter assaying approximately 99.9% Zn, but he found also that he lost about 10% of his zinc in doing it (by absorption in retorts, breakage of retorts, failure to condense, etc.), and the premium realized for high-grade spelter at that time was not enough to pay for making it in this way. When, however, the premium rose to 10@15c. per lb., as it did recently, the aspect of things was changed radically.

Nevertheless there is some doubt as to just how much profit there is in refining spelter by this method under existing conditions, exceptional as they are. The slabs of common spelter are broken up or are recast in little bars, and are piled up in the ordinary retorts, which are heated in the ordinary way. The direct cost of redistillation is variously estimated at 0.5 to 1c. per lb., probably being nearer the lower figure than the higher. Then comes the cost of the zinc that is lost. This is variously stated at 10 to 12%—a confirmation of Mr. Cockerill's experience. If the common spelter that is being redistilled costs 10c. per lb., the loss is 1c. per lb. If it costs 20c. per lb., it is twice as much. The third element of cost is the use of smelting capacity. In normal times, when there is a surplus, this might reasonably be reckoned as nil, but certainly not so at present when smelting capacity is so urgently needed. An Iola furnace of 600 retorts is figured as taking about 30 tons of spelter per day for redistillation, or 60,000 lb. Such a furnace takes normally about 12½ tons of calamine or roasted blende. If the latter, say about 15 tons of raw blende. Now if the smelter can make a profit of $40 per ton in smelting ore (he talks about such figures), he does not make it if he uses his furnace for refining spelter, and such use may therefore be reckoned temporarily as costing him $600 per furnace per day, or 1c. per lb. The total cost of refining is therefore from 3 to 4c. per lb., which is not bad if a premium of 10c. be realized. We understand, however, that there has been some difficulty in bringing all of the product up to the highest grade.

There would probably be a better way of refining crude spelter by redisillation than by using the ordinary ore furnace for this purpose. A specially adapted, fire-heated retort, or an electric furnace after the fashion of Trollhättan, would probably be superior. However, our metallurgists were confronted by an emergency and had no time for either experimentation or new construction.

The craze for high-grade spelter on the part of the Allies prompts the inquiry, What have the Germans been doing for it? In the first place they had a large accumulation of New Jersey willemite which they had been importing and storing during many years. Secondly, they also have been refining crude spelter by redistillation. Having a surplus of smelting capacity and an ample supply of spelter this is for them a relatively inexpensive process.

*

New Projects at Joplin

Two interesting schemes are being promoted in the Joplin district. One of these is for the erection of warehouses, into which ore may be put for storage when the market is unsatisfactory. The other is the erection of a zinc-smelting works to be owned and operated by local persons. Both of these ideas are excellent, and it is to be hoped that they will be carried out. The Joplin district has always been prosperous, and lately the increase of its wealth has been phenomenal, wherefore there ought to be no difficulty in obtaining the necessary money right at home. The advice may be offered, however, that care be taken not to let the promotion and organization expenses run too high, and also that good engineering advice be secured for determining the location and making the plans for the smelting works. Some persons experience a conniption fit when they are told that engineering expense may come to 10% of the total cost of construction, but it is better to pay the engineers $50,000 out of a total of $500,000 than to pay them only $5,000 out of a total of $600,000 and get a poor plant at that.

BY THE WAY

The plan of reincorporation of the du Pont Powder Co. with $120,000,000 capital has been noted in the *Journal,* but on Sept. 1 application was filed for a charter for E. I. du Pont de Nemours & Co. with a capital of $240,000,000, of which $150,000,000 is to be nonvoting preferred, $10,000,000 voting debenture shares, and $80,000,000 common.

Men who are engaged in large affairs often have hard work to determine where good things ought to be placed among their many personal and corporate interests. Too many of our big companies have managements that look upon their companies as customers for their indifferent or doubtful ventures, while the good ones are their own. The attitude is similar to that which is ascribed to Chinese government officials, who are said to look out carefully for the interests of their government when they do not conflict with their own.

The main business street of Kusa, Okla., will be paved with material which contains both gold and silver. It is the residuum or "sludge" from a zinc smelter there, according to the New York *Tribune.* An official of the townsite company has completed arrangements with the smelters to save the waste material. The paving will be done in 60 days. Much of the ore, 100 tons of which will be smelted daily, carries considerable gold and silver. When the gold value is sufficiently great to defray the cost of shipment it is sold to smelters. If found to be insufficient it will be used on Kusa streets.

The term "sappers and miners" is often used for one reason or another, but beyond knowing that it is a military term, seldom with any comprehension of the meaning of or the distinction between the two. The mines and countermines which are used against the enemy are prepared by the miners, while the open trenches, of which so much is heard in the war news of today, are prepared by the "sappers." In military parlance a sap is a narrow trench in the direction of the enemy, generally at an angle to the line of advance to protect against enfilade fire, to give protection of approach or to afford an opportunity for mining the enemy's position.

According to word received in Ottawa, Kan., from Dr. J. Scott Walker, of Chetopa, Western points have no more reason to become excited about gold than has Chetopa. A Denver commission man came all the way to Chetopa to investigate, say press dispatches. For three years past the Chetopa poultry dealer has been shipping large consignments of ducks to the Denver man, who regularly found a quantity of gold in the gizzards of the birds. Particles the size of a pinhead were found and the total amount usually netted a tidy sum for the commission merchant, in addition to his profits for handling the ducks. He went out to the district whence the ducks came and looked around, after which he slipped quietly back to Denver. But the price of land near Chetopa increased materially as a result of his visit when the news leaked out.

A recent number of the "Safety Bulletin" of the Illinois Steel Co. gives the following directions on how to make money at home: Start a saloon in your own house. Be the only customer (you'll have no license to pay). Go to your wife and give her $2 to buy a gallon of whiskey, and remember there are 69 drinks in a gallon. Buy your drinks from no one but your wife, and by the time the first gallon is gone she will have $8 to put into the bank and $2 to start business again. Should you live 10 years and continue to buy booze from her, and then die with snakes in your boots, she will have enough money to bury you decently, educate your children, buy a house and lot, marry a decent man, and quit thinking about you entirely.

Practical experience tells just as surely in war as in peace, says the London *Financial Times.* Mining men are chuckling over how one of their number recently caught out some Royal Engineers who were engaged in warlike mining operations. While in the saps the latter found their light compasses played them some queer tricks, and accordingly they indented, ingenuously enough, for good solid ones of 12 lb. weight. Along came a mining man to the excavations a day or two later and, the vagaries of the original compasses being demonstrated to him, he drily remarked: "What about those picks and shovels in the corner there?" Naturally, as soon as the iron was removed the compasses became normal again, and the "twelve-pounders," which duly arrived later on, were not even unpacked. By the way, while compasses are, of course, very handy and at the same time sufficiently accurate for temporary operations such as mentioned, they are becoming almost obsolete in mining proper.

Virginia City was always speculatively inclined, says Charles E. Van Loan in the *Saturday Evening Post,* but the high tide struck the Comstock in the '70s. Men went money mad, and women, too. In 1870 stock in the Belcher mine went begging at $1 a share; in 1872 it was worth $1525. During the same period Crown Point advanced from $2 to $1825. Those were the days when stock quotations were posted every hour. When the miners came up out of the shafts they rushed to the bulletin boards to see how much money they had made while underground. Rich and poor, high and low, white, black and yellow, everybody gambled. The financial giants of San Francisco were juggling Virginia stocks, and nobody had to wait long for action. Fortunes were made and lost every day. A chambermaid in Virginia City "fooled with stocks a little," and in 1875 she retired with a bank balance of two hundred thousand dollars. A man in Gold Hill lost the best cook he ever had just because she got rich when Consolidated Virginia went up. A $25 investment in Consolidated Virginia would have paid $109,980, if—and this is a big if—bought at the bottom and sold at the top. The same investment in Belcher would have paid $38,125 and in Crown Point, $22,800. At one time or another fortune's wing grazed every man on the Comstock; the grizzled veterans of the bonanza period are able to point out the exact spot where they missed their big chance. "You see," says the Oldest Inhabitant, "there was the stock you knew you ought to buy, but didn't. There was the stock you bought and sold too soon. And then there was the stock you didn't sell soon enough."

Lake Superior Mining Institute

The Sept. 11 issue of the *Journal* contained the telegraphic account of the twentieth annual meeting of the Lake Superior Mining Institute, which opened at Ironwood, Mich., on Sept. 6. Some features of this year's meeting deserve further mention.

Unknown First-Aid Problems

The first-aid contest, held on the morning of the first day, was particularly interesting because the problems used were unknown to the contestants until read to them on the field. Heretofore the problems have been of a more technical nature, permitting previous training with a certain degree of accuracy. Following are the four problems given at Ironwood:

One-Man Event (Time: 15 Min.)—Miner found a distance of 50 ft. in, in closely caved workings, with palm of right hand lacerated and bleeding profusely; in shock. Treat and transport 20 ft. to more open workings, then carry 20 ft. by shoulder lift.

Three-Man Event (Time: 15 Min.)—Miner found in caved drift (2½ to 3 ft. high) in bad air after explosion of powder, unconscious from gases, burns of face and hands. Transport for 20 ft. and administer artificial respiration by Schaefer method for one minute. Treat burns. During transportation one of the rescuers is overcome, becoming unconscious; rescue and administer proper treatment.

Team Event (Time: 20 Min.)—Miner caught by fall of rock; left ear torn off, left shoulder dislocated, left thigh broken in upper third of leg (compound fracture), with profuse bleeding; in shock. Treat and transport 30 ft. on improvised stretcher.

Team Event (Time: 20 Min.)—Miner walks into blast; face badly lacerated over left cheek bone with profuse bleeding; severe laceration of upper part of abdomen; back of right hand lacerated, blood oozing; fracture of right kneecap; unconscious from powder gases; treat on spot (gas has cleared away) and transport 40 ft.

Teams in Good Condition

As pointed out by Dr. A. F. Knoefel, in charge of the judging, and president of the American Mine Safety Association, the slight range of points scored by the winning teams indicated the excellent condition of all teams. He stated that the latter are as good as or better than those he has encountered anywhere else. Each team was told why it was penalized and every member of every team after the contest received a copy of the tally sheet.

Mining Practice on Gogebic Range

In the paper on "Mining Methods on the Gogebic Range," presented at the Monday evening session, O. E. Olsen pointed out some interesting innovations. It has been found desirable to use automatic gongs on the underground locomotives, as well as red lights on the tail of the trains. The gongs are connected with the driving mechanism, and start ringing when the motor starts and vice versa; they can be heard for about 250 ft. The paper on the "Opening of the Wakefield Mine," by W. C. Hart, superintendent of the Wakefield Mine, aroused probably the greatest interest. Doubtless this was because of the fact that Mesabi stripping methods are seldom used on the Michigan ranges. Also the pit had been visited in the afternoon and many had questions to ask.

The depth to which it is profitable to strip came in for its share of discussion.

Cuyuna Range Visited

It is safe to say that the Cuyuna Range never before received so much concentrated attention from mining men as it did on the following day, Tuesday, Sept. 7. George H. Crosby, a pioneer on the Cuyuna since its earliest days, was on hand to see that no point of interest was overlooked—and none was. Carl Zappfe, geologist of Brainerd, Minn., who for years has made a particular study of the formations on the Cuyuna, was able and willing to give the visitors a good understanding of the peculiarities of the range, difficulties of exploration and mining and future possibilities. This was welcomed and appreciated, and there is no question that operators present from the other Lake Superior ranges now have a better knowledge and probably a more favorable impression of the Cuyuna Range.

Standing Committees Appointed

The final business session was held at Crosby, Minn., where the following officers were elected: President, C. E. Lawrence, Palatka, Mich.; vice-presidents, George L. Woodworth, Frank E. Keese, Frank S. Barber; managers, Frank Armstrong, William Wearne; treasurer, E. W. Hopkins; secretary, A. J. Yungbluth.

Standing committees for the year 1916 were also appointed: Prevention of Accidents, W. H. Jobe, Palatka, Mich., chairman; William Connibear, Ishpeming, Mich.; E. W. Walker, Mass, Mich.; W. H. Harvey, Virginia, Minn.; P. S. Williams, Ramsay, Mich. Care and Handling of Hoisting Ropes: W. J. Richards, Painesdale, Mich., chairman; C. E. Holley, Ishpeming, Mich.; C. W. Murphy, Crystal Falls, Mich.; F. H. Armstrong, Ironwood, Mich.; A. Tancig, Hibbing, Minn. Papers and Publications: William Kelly, Vulcan, Mich., chairman; A. W. Gow, Duluth, Minn.; F. W. McNair, Houghton, Mich.; J. E. Jopling, Ishpeming, Mich.; Frank Blackwell, Ironwood, Mich. Bureau of Mines: M. M. Duncan, Ishpeming, Mich., chairman; F. W. Denton, Painesdale, Mich.; A. J. Yungbluth, Ishpeming, Mich., secretary. Biography: J. H. Hearding, Duluth, Minn., chairman; R. A. Douglas, Ironwood, Mich.; M. B. McGee, Crystal Falls, Mich.; W. H. Newett, Ishpeming, Mich.; James Fisher, Houghton, Mich.

*

The Redjang Lebong in Sumatra, the best-known gold mine in the Dutch East Indies, had an unsatisfactory year in 1914, owing to the drought, which extended from May until the middle of November. As the mine depends on water for power purposes, a gradual stoppage of operations was necessitated. Milling was practically suspended for three months, and in October it was feared that the lower levels would be flooded out, as the pumps could only be kept going to a modified extent. As a result the ore crushed showed a heavy decline, amounting only to 62,037 tons, which yielded 28,047 oz. gold and 154,870 oz. silver—an average of 0.452 oz. gold and 2.496 oz. of silver per ton. In 1910, the most prosperous year, there were 103,715 tons of ore crushed, with a return of 85,250 oz. gold and 441,914 oz. silver, an average of 0.778 oz. gold and 4.035 oz. silver per ton. The ore reserves at the end of the year are estimated at 211,000 tons, averaging 0.44 oz. gold and 2.65 oz. silver.

PERSONALS

Arthur W. Burgren is now with the Cinco Minas Co. at Magdalena, Jalisco, Mexico.

D. C. Jackling recently visited the Ray mines and concentrating plant at Hayden, Arizona.

George Long has returned to the United Eastern mine at Oatman, Ariz., after a vacation on the Coast.

C. W. Wright is returning to Sardinia, Italy, having sailed from New York, Sept. 11, on the "Dante Alighieri."

E. A. Cappelen Smith, having put the Chuquicamata plant into successful operation, has returned to New York.

J. B. Armitage of Duluth, Minn., is making examination of a gold-mining property in Rio Grande County, Colorado.

J. R. Finlay has gone to Butte, Mont., where he expects to be occupied with professional work for about two months.

Carl M. Bernegau, vice-president and treasurer of the Keuffel & Esser Co., New York, has been traveling in the West.

H. A. Wagner of the Gray Eagle Reduction Works at Mayer, Ariz., will attend the International Engineering Congress.

A. L. Flagg, superintendent of the Kelvin Sultana mine, is attending the International Engineering Congress in San Francisco.

J. V. N. Dorr, of the Dorr Cyanide Machinery Co., has arrived at New York from San Francisco. He will remain about two weeks.

Alden D. Perley has been appointed superintendent of Hall Furnace of the Republic Iron & Steel Co., Sharon, Penn., which has just gone into blast.

George H. Garrey, who has been on work in the West for the past two months, spent a couple of days in New York last week, but has again left for California.

Frank Jewett, vice-president of the San Francisco Stock Exchange and A. S. Wollberg, member of the governing board, recently visited the Oatman-Gold Road mining districts in Arizona.

W. de L. Benedict left New York last week on his way to California by way of Denver, on professional business. Incidentally he expects to attend the engineering congresses at San Francisco.

James Myers, of Golden, Colo., has again assumed the superintendency of the old Brown Mountain smeltery at Ouray, Colo. It has been operated by the Wanakah Mining Co. for the past two years.

E. L. Rodgers and party of New York have been traveling by automobile in Montana and Washington, and recently left Spokane for Hedley, B. C. Mr. Rodgers is interested in mines in the Basin District in Montana.

F. C. Newton has resigned as superintendent of the Perth Amboy plant of the American Smelting & Refining Co., to become vice-president and general manager of the Newton Manufacturing Co., of Lowell, Massachusetts.

William J. Chamberlain of Denver, well-known mining man and president of the long-established sampling works company bearing his name, was married in Denver, Sept. 3, to Miss Eugenia A. Brueck of Kansas City.

H. W. McCaskey of the United States Geological Survey is in Salt Lake City on a trip of inspection of the Western offices. Mr. McCaskey expects to visit the Alta-Cottonwood district, and the new camp of Goldstrike in Washington County.

George B. Drummond, of Eau Claire, Wis., left on Sept. 7 for the interior of Honduras, Central America, having accepted the position of cashier of the Ulcawas Gold Mining Co. His duties will include the purchase of supplies and machinery.

F. C. French, who has been with the Butte & Superior Copper Co. and other copper properties in the Butte District for the last three years, has returned to Salt Lake City, where he will soon reopen offices for the practice of civil and mining engineering.

G. C. Riddell, superintendent of the East Helena smelting plant, has been a recent visitor in New York and St. Louis. He is on a general tour of zinc- and lead-smelting plants in the East and South, while returning from a vacation on the Atlantic Coast.

W. L. Honnold, who has recently retired from the chairmanship of the Brakpan Mines, the Spring Mines, and the Transvaal Coal Trust, has taken up his residence at the Hyde Park Hotel, London. Mr. Honnold will join H. C. Hoover in the Belgian relief work, and will go to Belgium in October.

Dr. T. O. Bosworth, petroleum expert, who has been making extensive explorations in Northern Alberta, is now pursuing his investigations in the Peace River country. He will lecture in London, England, before the Institute of Petroleum Technologists and hopes to interest British capitalists in the resources of the Canadian West.

It is stated in "Nature" that the sum of £140 has been given to the Royal Society of Arts by R. Le Neve Foster for the purpose of founding a prize in commemoration of his father, Peter Le Neve Foster, who was secretary of the society from 1853 to 1879. The council has decided to offer the prize (consisting of £10 and the society's silver medal) for a paper on "Zinc: Its Production and Industrial Applications."

Vice-President C. F. Kelley of the Anaconda Copper Mining Co. will transfer his residence from Butte to New York on Oct. 1, in order to be more intimately related, in an official way, to the affairs of the Anaconda company, under conditions that result from its recent reorganization. As a result of the acquisition of the International Smelting Co., the Raritan Copper Works and the United Metals Selling Co., the company's business has greatly enlarged, and it has been deemed necessary to increase the executive organization of the company in New York. Mr. Kelley will continue to have direct connection with all operations of the company in Butte and Montana.

OBITUARY

Alexander Tropenas died at Lyons, France, July 14, aged 55 years. He was widely known as a metallurgist and as the inventor of the Tropenas converter.

Charles M. Cabot, who as a stockholder of the Steel Corporation, gained some prominence several years ago by attacking labor conditions in the iron and steel industry, died at his home at Beverly Farms, Mass., Sept. 5. He was 49 years of age. Mr. Cabot served as a member of a committee of stockholders which investigated the general conditions among employees of the Steel Corporation and made certain recommendations subsequently put into effect. In business life he was engaged as a broker. Mr. Cabot was called a crank when he first brought up the subject at the Steel Corporation meetings, but his activity and persistence had much to do with the later action for safety of employees and improvement of working conditions.

SOCIETIES

American Institute of Mining Engineers—In order to make the meetings of the Southern California Section more interesting and fruitful, the executive committee has formed a subcommittee on programs for section meetings, which announces for the coming autumn and winter season, four dinner meetings, at intervals of two months, in which the cooperation of all section members is urgently requested. The subjects chosen for discussion at these meetings, with the proposed dates, are as follows: Sept. 28, "Mining Geology of Mojave County, Arizona"; Dec. 14, "General Geology and Mining Conditions in Southern California"; Feb. 1, 1916, "Petroleum, Its Geology and Technology"; Apr. 4, "General Mining Conditions in South America." Notice of the hour and place of each meeting will be issued later.

University of Arizona—The number of inquiries that have been received relative to the short course for miners to be given by the College of Mines and Engineering of the University of Arizona has proved that there is a great demand for such work. The particular value of the short course as it is to be given by the university lies in the method by which it is to be conducted, which is the intensive study of one subject for two weeks. Inasmuch as the short courses that are of particular interest to the prospectors start early in October, it is desired that those interested make their plans early for attendance. Students may take two, four, six or any number of weeks, the whole year making an admirable trade course in mining. The first course starts Oct. 4, being elementary mineralogy and blow-pipe analysis. Besides this course those of interest to prospectors which immediately follow are courses in elementary mineralogy and petrology, principles of surveying, field geology and prospecting, and assaying. These courses together last 10 weeks, and will be an excellent foundation for more scientific and successful prospecting.

Editorial Correspondence

SAN FRANCISCO—Sept. 8

Gold Was Produced in 30 Counties in California in 1914. Seven of these counties, according to Charles G. Yale, of the U. S. Geological Survey, yielded over $1,000,000 each: Nevada, $3,301,948; Amador, $3,082,002; Yuba, $2,800,713; Sacramento, $2,164,491; Butte, $1,697,120; Calaveras, $1,336,875; Shasta, $1,101,202. This includes both lode and placer production. The leading hydraulic county was Trinity. Placer was the leading drift-mining county and Yuba the leading dredging county. Of the deep-mine producers Nevada County was in the lead, and this county also made a larger increase in gold production in 1914 as compared to 1913, the amount being $383,215. The total ore milled in the state from deep mines in 1914 was 1,993,821 tons. Of this amount 62% or 1,243,529 tons came from the five counties of Amador, Calaveras, Eldorado, Mariposa and Tuolumne. The average yield of ore in Mariposa County was $9.19 per ton; Eldorado, $4.95; Amador, $4.89; Tuolumne, $4.24; Calaveras, $2.32. The two largest lode-mining camps are Grass Valley-Nevada City and Jackson-Sutter Creek. In the Jackson-Sutter Creek district 387,602 tons of ore were treated yielding in gold and silver an average of $5.48 per ton. In the Grass Valley-Nevada City district 267,618 tons yielded in gold and silver an average of $11.38. Kennett, Shasta County, was the most productive metal camp in the state in 1914, producing 243,138 tons yielding $376,846 in gold, $299,110 in silver, $2,411,323 in copper; a total of $3,087,279 or an average of $12.70 per ton. The report shows that silver was produced in all the gold-producing counties; but the leading gold producers were by no means the leading silver producers. The nine counties producing as much as 10,000 oz. were: Shasta, 626,954 oz.; Inyo, 466,575; Calaveras, 109,299; San Bernadino, 67,737; Nevada, 48,487; Amador, 30,800; Tuolumne, 21,731; Mono, 16,436; Kern, 14,470 oz. The total amount produced in 30 counties in 1914 was 1,471,859 oz., being an increase of 92,960 oz. over 1913.

Hookworm Disease Endemic in California Mines in certain mining districts is the finding of Herbert Gunn, M. D., of San Francisco. He further finds that from 50 to 80% of the men working in the mines inspected are infected with the disease; and that the infection is undoubtedly present in practically all of the gold mines in California and just over the border in Nevada. A number of men were examined in Amador and Eldorado Counties and whether the disease is of foreign origin or endemic in the mines, the fact remains that hookworm disease actually exists according to Doctor Gunn's report and the reports of Dr. F. F. Sprague and Dr. E. E. Endicott. The earlier cases reported were Italians, Austrians or Cornishmen, many of whom are known to be infected with hookworm before coming to this country. Of six cases referred to by Doctor Gunn two were American, native of California and never out of the state, two were native of England, one native of Italy and one whose nativity is unknown but who had not been out of California in 48 years. Doctor Gunn states that there is no question that the general efficiency is noticeably impaired and that many of them have to take time off now and again to recuperate. The greatest loss to the mine operators he states is occasioned by the large number of men moderately affected. The danger of the disease being spread is commented upon especially as the sanitary arrangements for the disposal of sewage in the town of Jackson are poor and many of the infected miners too ill to work in the mines live on the nearby farms until recuperated. In connection with Doctor Gunn's report which is made to the California State Board of Health it is stated that the Industrial Accident Commission will take up the matter under recent amendments to the Workman's Compensation law, which make occupational diseases subject to compensation from employers. It is suggested that it will be a part of the duty of employers to endeavor to prevent the disease from spreading. In most cases it is quite likely that the municipalities in which the miners live are more amenable to law than the mine operators, but this particular law applies only to employers. But Jackson is not the only mining town in California that is in need of sanitary regulation; and it is quite likely that wherever hookworm disease is found there will also be found unsanitary living quarters either in the town or at the mine. The prevention of the disease cannot be accomplished except by control of the municipalities in which the infected men reside.

DENVER—Sept. 9

Official Measurement of Drainage Water issuing from the Roosevelt tunnel in the Cripple Creek district was made Sept. 1 by Engineer T. R. Countryman. Drainage amounts to 11,200 gal. per min. The breast was advanced 230 ft. during the first month after resumption of operations and is within 1,400 ft. of the Elkton mine. Three shifts are employed and Supt. Charles Fuller expects to reach the Elkton shaft about Jan. 1.

Boulder County Metal-Mining Association has published, for free distribution, a neat 52-page pamphlet descriptive of the history of mining for precious, semiprecious and rare metals, coal, oil and gas, and nonmetallic minerals in this pioneer county of Colorado. Each of the eight metal-mining districts in the county is described geologically and mineralogically, while one chapter is devoted to the tungsten industry. The pamphlet will be welcomed by persons who appreciate straightforward descriptions of the mining country without exaggerations. It may be had upon application to the secretary of the association, Boulder, Colo.

A Tonnage Record for the Cripple Creek District was established in August when 84,800 tons of ore were shipped to mills and smelteries. This does not mean a maximum valuation for a single month's output, the August production being valued at $1,242,264, or approximately $14.65 per ton. The Pueblo and Globe plants of the American Smelting & Refining Co. handled about 4,000 tons having an average value of $55 per ton; the Golden Cycle cyanide plant at Colorado City treated 38,000 tons of an average value of $19; the Colorado Springs mill of the Portland company handled 10,500 tons worth about $21 per ton; the Portland company's two mills in the district treated 30,600 tons of dump and low-grade material worth $2.59 per ton.

The Federal Industrial Relations Commission Report is so flagrantly unfair to the mining operators of Colorado that Governor Carlson has issued a statement specifically challenging the charge made in the Walsh report that an instructor in the state-university college of law had been dropped through corporation influence because he had appeared as counsel for the United Mine Workers during the strike turmoil a year ago. Explaining that this James Brewster was appointed only to fill a vacancy caused by the drowning of Professor Pease, the appointment being for the remainder of the college year only, Governor Carlson goes on to say: "Walsh and his puppets have not spared from calumny and false imputation the good name of our university. His insatiable gluttony for cheap publicity has caused him to utter a baseless and wicked charge. Had he made an honest investigation he would have found that the charge had foundation only in the mind of a disgruntled professor. . . . Walsh's statement may be given temporary credence in other states but not in Colorado."

The Florence & Cripple Creek R.R. Co. has Passed. It built the first rail line—a narrow gage—into the district, in 1894, and for a few years did a capacity business at high rates. The Midland Terminal Ry. soon followed, with a branch from the main line at Divide, a station on Ute Pass. Some years later, the Colorado Springs & Cripple Creek District R.R. built into the district, circling Pike's Peak on the east and south. The Florence road paid for itself within three years. Competition and numerous serious washouts of track then decreased this road's profits until it finally consolidated with the other roads all of which it then operated with financial success for years. The company also purchased the Golden Circle R.R., a 5.72-mi. electric line that traverses the high, central part of the mining district and reaches numerous large mines not served by the steam roads. The original outside terminal of the pioneer road was Florence but it was shifted to the neighboring town of Cañon City. The recent decision of the directors to abandon the old line follows acts of the residents of the latter town who insist that the company rebuild practically 10% of its roadbed destroyed by floods. This the company did not feel justified in doing since the cessation of cyanidation and chlorination activities in the several custom-treatment plants that formerly existed at Florence. The company has reorganized as the Colorado Springs & Cripple Creek R.R. Co. and will operate all lines except the old narrow-gage. It has started

suits against the treasurer and board of commissioners of Teller County, seeking to prevent the sale of the roads for delinquent taxes and to have tax assessments reduced. The assessed valuation of the Terminal at $25,686 per mile and that of the Golden Circle at $21,872 per mile are claimed, by the company, to be grossly excessive, and payment has been offered the treasurer of the county on what are claimed reasonable figures.

BUTTE, MONT.—Sept. 9

Anaconda Zinc Experiments have been so successful that it is said a plant capable of producing 10 tons per day is now going to be installed. The Anaconda management is active in keeping its engineers in the field, looking for new gold, copper and zinc mines. The recently acquired mines in Chile are reported to be developing favorably.

In the First-Aid Contest Between Butte Teams at the Labor Day celebration at Columbia Gardens, Butte, the team of the Original mine won the honor of going to the national meet at Panama Exposition the latter part of September and will represent the State of Montana in that event. The Original team consists of the following: Elmer Kelly, captain; David Snell, Joseph Beadle, John Campbell, John Butler and Thomas McKeown.

Reduced Wage Scale for Butte Miners—Miners' wage scale for August in Butte district will be at the rate of $3.75 per day instead of $4 per day, as paid in July. Official price of copper, as announced in the "Engineering and Mining Journal," was 16.9c. per lb. for August, or a tenth of a cent below the required 17c. to make the scale $4 per day. Payrolls of all Butte companies, including zinc producers, are based on the copper scale and all companies are making out their rolls on basis of 16.9c. per lb. Opinion prevails that September scale will be back at the $4 rate.

No Miners Marched in the Labor Day parade at Butte. The celebration of Labor Day was the biggest event of the kind ever seen in Butte. All but about half a dozen unions in Butte participated in a parade and the day's celebration. The parade was several miles long, requiring 1 hr. and 35 min. in passing, but not one miner was in the line of march. The large turnout of other union laborers was due to extra efforts that were made by the officers to get the men out in order to make an impressive showing, and heavy fines were provided for failures to march. There is no miners' union in Butte that is strong enough to enforce any such orders on the miners, although there are now three organizations calling themselves miners' unions.

The Butte-Duluth Bankruptcy Proceedings have finally been heard in the Federal Court at Butte and Judge Bourquin has under consideration the petition to declare the company a bankrupt. The petitioners, a number of unpaid miners, based their contention of insolvency on the admissions made in behalf of the company when the latter was thrown into the hands of a receiver upon suit brought by an Eastern creditor. The officers now claim, and did so in the bankruptcy proceeding, that the company is not insolvent, and that it was beginning to make money under the management of Receiver Everett when operations were stopped by the bankruptcy action. Some interesting testimony was given by officers of the company. Superintendent Sherwood stated that the mill was running on ore averaging 1.52% Cu during the last four months of operations, and drill cores to a depth of 202 ft. from the bottom of a 23-ft. pit ran from 0.98 to 2.70% copper. He said that the leaching plant of the Butte-Duluth was the first of its kind ever installed, but since it has been perfected three other similar plants have been installed in other places and are operating successfully on sulphide ores. At the time of the shut-down the Butte-Duluth had just reached a stage where it could operate its mine at a profit. A saving of 50% is now possible in buying acid for the plant, as it used to cost $25 per ton to bring it from Denver, and now it may be secured from the Anaconda company at $12.50 per ton. This effected a saving of 38c. per ton of ore treated. Receiver Everett estimated the value of the company's property at $741,368, against an indebtedness, bonded and otherwise, of $241,368. The total of claims filed is $190,833, of which $42,368 is represented by due bills to miners.

Anaconda Has About Reached Normal Capacity of its mines and it is not expected that the monthly figures will hereafter show any remarkable gains until after the first of the year when the Great Fall smelting works will be in full commission again. The August production, 22,800,000 lb., was the largest of any month this year. The figures for the eight months of 1915 follow: January, 13,700,000 lb.; February, 15,100,000; March, 19,000,000; April, 21,800,000; May, 20,500,000; June, 22,100,000; July, 22,100,000; August, 22,800,000; total, 157,100,000; the figures include the output of the Anaconda company and also the copper from ores received from the North Butte and other smaller producing concerns. The Anaconda company is pushing development work at various properties—copper, silver and zinc properties—but it will be a long time before these mines will be producing. While the pumps are running night and day in the Nettie mine, the silver property on the west side of the Butte district, it is expected that the mine will not be completely unwatered for four or five months. The Nettie seems to drain the entire western section of the district, and before the shut down and curtailment last fall the pumps had been running for eight months, and still all the water was not out of the mine. The Nettie vein is a large one and was a good producer of silver many years ago. With depth the Nettie may develop large deposits of copper and zinc. There is a large area of zinc deposits extending for several miles from the Emma mine in Butte westward beyond the old Blue Bird properties. In the western section several copper properties have also been opened, but none were ever developed to an important producing stage. It is expected that the western section will be pretty thoroughly explored and demonstrated through the work to be done in the Nettie by the Anaconda company, and the owners of other properties there are awaiting results with interest.

SALT LAKE CITY—Sept. 9

Dissolution of the Tintic Smelting Co. was begun on Aug. 31, in a petition filed with Judge A. B. Morgan of Provo. The petition was signed by Jesse Knight, J. William Knight, C. W. Nibley, W. Lester Mangum and R. E. Allen, who represented 4844 shares of stock out of a capitalization of 5000 shares. The petition states there is no opposition to the dissolution. The company was organized in 1906 and built a smeltery at Silver City to treat ore of the Knight mines and other properties in the Tintic district. The plant operated for a short time, several years ago, but on account of not having common-point freight rates, and other matters, did not earn a profit. Since that time the smeltery has been dismantled and a part of the machinery sold. The Tintic Milling Co. controlled by the Knight-Dern interests, is building its new mill at the former smeltery site.

Utah Copper Co. Produced in July 14,641,009 lb. copper, and the August production is estimated to be of about the same amount. Production for the four months just ended will exceed that for any similar period since the beginning of operations; with the July output as given above, the August output estimated at the same rate, the May output amounting to 14,053,705 lb., and that for June to 14,730,912 the total is between 57,000,000 and 58,000,000 lb., making a yearly rate of 171,000,000 lb. Additional dumping ground for tailings has recently been acquired by the company near the Arthur and Magna mills, the purchase price having amounted to about $50,000. There are buildings on a part of the ground, which may be used for dwellings for employees. On the south side of Carr Fork the company is constructing five 6-room houses for the use of the assistant superintendent of the mine, the assistant mining engineer, and others. These houses will be made accessible to the Bingham & Garfield depot by a new road from the south side of the cañon.

SEATTLE—Sept. 8

British Columbia Zinc Properties are entering the most important period of their development. After being considered a misfortune to be avoided and penalized, zinc promises to become a basic source of British Columbia mining wealth and scores of properties that have been idle for years, because of their large zinc showings, are entering the active list. These facts are indicated by developments reported from various points in British Columbia. A feature of the general revival of zinc was the recent bonding of the Big Ledge property at Halcyon, B. C., by English interests from L. L. Tower, of Northport, and associates. The Consolidated Mining & Smelting Co. has begun the erection of the zinc-reduction plant and it is announced that the entire output of the new works at Trail will be taken by the Dominion government until the end of the war.

Yukon Gold Production will reach $5,000,000 this year according to the latest estimates. Last year's production is now definitely established at $4,750,000, which shows that the 1915 production is little more, principally for the reason that the largest dredge in the district—Canadian-Klondyke No. 2, which overturned last October—has not been in operation on account of undergoing repairs. Another dredge, which worked most of last year on Bonanza, is idle this year. Notwithstanding the idleness of these two dredges, the other boats are making a good showing. The Yukon Gold Co. fleet has been doing exceptionally well and two Canadian-Klondyke's three dredges have been in some of the richest ground this year that they have ever worked. The gold produced in the Klondike camp now by dredges comes chiefly

from the Klondike River between Bear and Bonanza Creeks, and from Bonanza, Eldorado, Hunker and Gold Run Creeks. The largest hydraulic operations are along Bonanza benches and Eldorado benches.

KELLOGG, IDAHO—Sept. 8

Cœur d'Alene Mines Employ About 5,000 Men at present, the largest number in the history of the camp. Nearly 4,000 of these are with the larger companies, and it is estimated that there are another thousand scattered over the district on smaller properties. The larger mines, tributary to Wardner and Kellogg, employ 1,450 men distributed as follows: Bunker Hill & Sullivan, 650; Ontario, 150; Caledonia, 50; Last Chance, 300; Stewart, 300. The mines tributary to Mullan employ 665 men as follows: Morning, 450; Hunter, 150; National, 50; Reindeer-Queen, 15. The mines tributary to Wallace employ 1,850 men, distributed as follows: Hercules (Cañon Creek), 450; Hecla (Cañon Creek), 175; Marsh, (Cañon Creek), 100; Green Hill-Cleveland (Cañon Creek), 325; Frisco (Cañon Creek), 100; Tamarack-Custer (Cañon Creek), 225; Success (Ninemile), 125; Interstate (Ninemile), 350.

Rex Consolidated is assuming importance as a new Cœur d'Alene mining company. Charles Sweeny, formerly of the Federal Mining & Smelting Co. has joined the board of directors and will be a member of the executive committee of the new company, with his son, Robert Sweeny, and W. J. Hall, a former director of the Federal company. The other directors of the Rex company are M. J. Sweeny, a brother of Charles Sweeny, and Peter Bernier, president of the Black Bear Consolidated, which recently passed to the control of the Rex company. It is reported that the board is to be joined soon by a New York capitalist, and that it is the intention to make of the Rex another organization like the Federal company. With this object in view the directors are said to be negotiating for two more Cœur d'Alene properties in addition to the Rex and Black Bear.

The Consolidated Interstate-Callahan property, the youngest and richest of the Cœur d'Alene mines, may be placed in the hands of a receiver as an outgrowth of the fight for control at the last annual meeting, held in Duluth on Aug. 16. The Callahan-Boutin faction were unable to vote 170,000 shares held by the Callahan Mining Co., which would have given the insurgents control, and as a result two sets of directors were elected. The Robbers-Percival-Sussman faction, identified with the American Metal Co., is in physical control of the property, and a plea for a receiver was filed in the district court at Wallace on July 27 by the opposition. The complaint alleges that the Callahan company and Frank Boutin "believe that the officers of the American Metal Co. will control the Consolidated Interstate-Callahan Co. and its property for its own benefit and to the loss and injury of the Consolidated Interstate-Callahan Co. and its directors." It is further alleged that the American Metal Co. obtained an unfair contract for a period of 10 years for practically all the output of the Interstate-Callahan, whereby the latter company is receiving and will receive much less than its ores would bring from other smelters. The contract is said to call for a flat rate of $38 a ton for all concentrates. Judge Woods has appointed as receiver Eugene R. Day, of the Hercules. Meanwhile, attorneys for the present management have raised the point that, since the Interstate-Callahan is not an Idaho corporation, the state courts have no jurisdiction and that the case must therefore go before the Federal courts. Pending action on the motion in the Federal court, the receiver is not now in possession, and will not take charge of the property unless the motion is decided in favor of Boutin and associates. Indications are that the contest will be long drawn out and bitter, and the prediction is made that the issues involved will go to the U. S Supreme Court for final settlement.

DULUTH, MINN.—Sept. 11

The Oliver Iron Mining Co. on Aug. 30 requested and received permission to contribute $70 monthly to the state school at Owatonna, Minn., for the care and maintenance of several children of Paul Paulson, deceased. The man was killed while in the employ of the company, and the latter voluntarily paid the widow $5,000, being the legal limit. Desirous of doing more than the legal requirements the company is now assisting in the education of the children.

Leased State Iron Mines will ship 2,000,000 tons, this season, according to the estimates of State Auditor J. A. O. Preus. The record season was 1913, when 2,875,982 tons went forward. According to the records there is an estimated tonnage of 144,000,000 still remaining. Deposits making up this tonnage are contained in the area covered by 47 leases, which have an average of 34 years still to run, thus making the average output required to exhaust these mines about 4,250,000 tons. State leases carry a royalty of 25c. per ton, so there is a total royalty of $36,000,000 in sight for the state, which goes to the state's permanent school, university and swamp-land funds

Iron-Ore Cargoes were leaving the Duluth-Superior harbor at rate of one every hour during the first week in September. At the Ashland, Wis., docks, where much Michigan iron ore is loaded, both the C. & N. W. and the Soo docks are handling exceedingly heavy tonnage. The August shipments down the lakes totaled 8,681,117 tons, being the second largest tonnage of ore delivered in a single month on the Great Lakes. From now on, weather conditions will interfere somewhat with shipments, and it seems that the flood tide of ore tonnage is past. Competent judges state that the season's shipments will scarcely exceed 45,000,000 tons.

Additional Rail Service for the Minnesota Steel Co.'s plant will be provided by the Duluth, Missabe & Northern Ry., which has leased the trackage of the Spirit Lake Transfer Ry., Interstate Transfer Ry. and the Duluth Terminal Ry., giving it the best terminal facilities of any of the Duluth rail lines. The transaction gives the Minnesota Steel Co.'s plant rail service on both sides and through its plant, and facilitates the handling of material to and from the Missabe docks, in Duluth. The lease also offers a reasonable solution as to why the steel company had not constructed docks for direct lake shipment. The D., M. & N. Ry., being a subsidiary of the U. S. Steel Corporation, now affords the latter unexcelled terminal and dockage facilities at the head of the lakes.

HOUGHTON, MICH.—Sept. 15

There is Not the Feeling of Optimism relative to the copper situation in the Michigan district that was evidenced a month ago. There are not, however, any accumulations of metal here. Certainly none that compares with this season in previous years. Most of the companies are sold through the present month of September but the fact is acknowledged that there have ben no heavy bookings beyond that date. It may be a waiting game. If such is the case there is every reason for believing that the large copper producers are in just as good condition to withstand lowered prices as are the consumers.

The Social-Welfare Idea, originating in this district in the Calumet & Hecla's long maintained policy of looking after the men with an almost paternal attitude, is impressing other corporaions in the Lake country. It may be noted that during the recent visit of John Stanton, head of the Wolverine and Mohawk properties, there was an evening reception to 100 heads of departments from the mines and mills, at which Mr. Stanton gave a fine address on the policy of "getting together" for mutual benefit. These same companies continue to pay their monthly bonus checks of 5% to the men. Calumet & Hecla continues its 10% advance in wages, over and above the $500,000 distributed in bonuses in July.

TORONTO—Sept. 11

Important Phosphate Deposits are reported to occur in the Banff National Park in the Rocky Mountains, according to Dr. Frank D. Adams, chairman of the committee on minerals of the Canadian Conservation Commission, and W. J. Dick, mining engineer of the commission. The discovery is regarded as of great importance in connection with the agricultural development of the West. The distribution and extent of these deposits will be studied by the Department of Mines.

The Sesikinika Gold Area has latterly attracted a good deal of attention and many American capitalists are acquiring interests in claims. A Buffalo syndicate has purchased the Malory claims adjoining the Labine for a figure stated at $35,000, and development is progressing in charge of J. Nelson of Haileybury. Frank Loring and associates are working the Gibson-Potvin claims at Goodfish Lake near Sesekinika, having taken up the option at $65,000. The Goodfish Lake Gold Mines Co. are operating the Costello claims, with excellent showings on partly developed veins.

The Kowkash Excitement shows no signs of abatement. The rush of prospectors and speculators, many of them from distant points, is unprecedented in the mining history of northern Ontario. A large area in the neighborhood of E. W. King Dodd's discovery has been staked, though some doubts are expressed as to whether there is much valuable territory outside of the original claim, from which all the rich gold samples that are being shown have been taken. The Ontario Bureau of Mines here is overwhelmed with applications for maps and information. Percy Hopkins, assistant provincial geologist, has been sent by the Bureau to Kowkash to make a preliminary investigation of the formation and mineralogy of the district. T. A. McArthur, inspector of mining recorders' offices for Ontario, has also been sent up to look into the situation and ascertain whether it is advisable to open a recording office in the district, as at present Port Arthur is the nearest point at which claims can be recorded. The department is preparing a map of the Kowkash field on a large scale, which will be issued in about two weeks.

The Mining News

ALASKA

SKEEN-LECHNER (Seward)—These properties sold at receivers' sale. Mill sold to L. V. Ray and mining claims to Harry Hobem.

FRANK SKEEN AND J. W. STEVENSON report finding a rich gold lode on the Champion and Gladiator claims in the Moose Pass district.

ALASKA-EBNER (Juneau)—New company formed in New York will probably start work on the Ebner and Hallum properties in the near future.

TAKU VS. GOLD BELT (Juneau)—Suit has been brought by the Taku Alaska company against the Alaska Gold Belt Co. regarding title to 11 claims.

LANDLOCK BAY (Valdez)—W. A. Dickey has shipped $40,000 worth of copper ore from his claims this summer. Development work will be pushed.

WILLIAM BARTHOF (Knik)—The original locator of most of the Willow Creek claims expects to install a small mill next spring at the Mabel mine on Archangel creek, Willow Creek district.

ALASKA-JUNEAU (Juneau)—New system of shooting large stopes is being experimented with to lower cost of stoping ore. No results given out as yet. John Richards is mine superintendent; P. R. Bradley, general superintendent.

JUALIN ALASKA GOLD MINES (Juneau)—Jean Vanophem and party, having left Brussels by special permission from the German Government on business, are examining the Jualin properties with Consulting Engineer H. G. Young. Mr. Vanophem is president of the Algunican Development Co., which is handling the Jualin property. Last year Mr. Vanophem had just arranged for big work at the Jualin when the war broke out and tied up the Belgian capital that was to be used in the work. No word is given out as to the magnitude of the work now contemplated.

ARIZONA

Gila County

IRON CAP (Globe)—Williams shaft will be put down from 8th to 10th level at once, and a larger hoist installed in near future.

Greenlee County

WESTERN FEDERATION OF MINERS has started strike for increased wages in the Clifton-Morenci district. Mines and reduction works of Detroit, Arizona and Shannon companies closed and 8,000 miners, machinists and electricians reported on strike. Company managers have declined to meet Western Federation representatives.

Mohave County

PAYROLL (Chloride)—Considerable new equipment is being installed by Thomas B. Scott.

NEW JERSEY (Chloride)—The mill is being remodeled and will soon be in commission.

OATMAN GOLD (Oatman)—This company reports cutting the Kokomo vein at a depth of 113 ft. Shaft still in ore at 130 ft.

GOLCONDA EXTENSION—Unwatering of the mine continues, the water having been lowered to the 180-ft. level. Sinking will soon be resumed.

E. R. HOLDEN, of E. R. Holden & Co., Cripple Creek, Colo., is planning to build a custom mill in the Oatman district to treat ores from the smaller mines.

TENNESSEE (Chloride)—Excellent ore has been opened on the 1,200-ft. level. The ore is being shipped to Utah. Shaft is being continued to the 1,500-ft. level.

JEROME-OATMAN (Oatman)—The company is installing a hoist, compressor, drills and drill sharpener. Several new buildings have been put up and roads built.

HAWKSHAW (Oatman)—E. H. Newland and N. C. D'Arcy of Colorado have taken over the Lucky Boy-Hawkshaw group of six claims and the controlling interest in the Tom Reed Annex.

Pinal County

RAY-ARIZONA (Kelvin)—The company is patenting its ground and will soon resume active operations.

WERNER (Price)—A mill is being erected on the property. A pipe line delivers water from the Gila River.

RAY-HERCULES (Ray)—About 40 men are already at work on the property making surface improvements.

KELVIN-SULTANA (Kelvin)—The No. 2 vein has been reached by the crosscut on the 500 level. Drifting east and west will be begun, and the crosscut continued southward.

CALIFORNIA

Eldorado County

BLUE ROCK (Georgetown)—New 10-stamp mill completed by James Flynn. Mine is near Georgia Slide.

FOWLAR (Placerville)—Smooth slugs of coarse gold ranging in value from $5 to $74.50 have recently been cleaned up at this gravel mine on Otter Creek.

Fresno County

COPPER KING (Academy)—Property leased to Charles Leavitt, of Fresno. Unwatering shafts and drifts and a general cleanup of surface has begun. Reported that about 8,000 tons of copper ore is in sight

Humboldt County

FRANK LUBBS (Scotia)—Has uncovered 18-in. vein of high-grade milling ore on placer claim near the Red Cap.

RED CAP (Scotia)—Lower tunnel is in 312 ft. and a 15-ft. crosscut has been driven which is in a diorite dike that parallels the vein.

MOUNTAIN LILY (Scotia)—Good body of milling ore has been disclosed above tunnel No. 2. The arrastre will run on this ore during winter.

Inyo County

MANGANESE ORES from a deposit said to be 100 ft. wide are being mined and shipped by Alexander Yeoman. Ore carrying 50% manganese is shipped to Baltimore, Md. Auto-truck haulage to the railroad costs $7.50 per ton; railroad freight to San Pedro $2.50 per ton and water freight via Panama Canal $3 per ton; extraction of the ore costs about $1 per ton, making a total cost of about $15 per ton.

SILVER KING MINING CO.—(Darwin)—Lease taken on the Lee mine by D. F. Shiveley, D. E. Staats, E. E. Simmons and J. H. Kohlbecker, who formed the above company. Zinc ore will be shipped at present.

CERRO GORDO (Keeler)—Aërial tramway has been rebuilt and is delivering more than 100 tons of zinc ore per day at Keeler. In four months, March, April, May and June, 1,681 tons of zinc ore were mined; zinc content, 1,109,481 lb. Most of this ore came from the 200, 400 and 500 levels. The vertical shaft has reached the 950-ft. point, from which a 250-ft. winze has been sunk.

CARBONATE (Zabriskie)—Ten auto trucks are employed hauling ore to the Tonopah & Tidewater R.R. Trucks carry from 4 to 6½ tons each. Additional trucks have been ordered. Haulage costs about $12 per ton over a distance of 42 miles. Reported that the ore runs about 37% lead, 20 oz. in silver and $5 per ton in gold. The mine has about 900 ft. of development, principally adits at a vertical depth of about 200 ft. The vein varies from 2½ to 15 ft. in width and is easily mined. John Salsberry is manager.

Kern County

OLD MILL (Caliente)—Los Angeles men offered to renew option for antimony claims. Shipment of ore to Magnolia Metals Co. of New York arranged for. Other mines in Amalie district reported to have contracted for shipments to same company.

Nevada County

GOLDEN CENTER (Grass Valley)—First dividend of 4¢ has been declared. The property has been in operation since June, 1914. New hoist in course of erection.

BAGLEY (Grass Valley)—Clyde G. Carr, formerly manager Candelaria Mining Co. of Nevada, and Howard Dennis, of Grass Valley, have bonded this property and retimbered the old shaft down to former tunnel level.

Plumas County

PLUMAS-EUREKA MINES CO. (Johnsville)—Voluntary petition in bankruptcy filed in the U. S. District Court, Aug. 25. Liabilities $133,633, assets $41,515. Principal creditors George W. Phillips, of Massachusetts, and Scheeline Bank and Trust Co. of Reno.

Shasta County

KEYSTONE DREDGING CO. (Kennett)—Reported to have purchased from W. P. Hammon 500 acres of land on west side of Sacramento River two miles above Kennett.

BELL COW (Ono)—Development work on the property on Arbuckle Mountain, west of Ono, progressing with satisfactory results. Grade of ore increasing as depth gained; some high-grade ore opened.

Siskiyou County

VICTORY GOLD MINES CO. (Etna)—New 50-ton tube mill being installed. J. E. Nefroney, superintendent.

Trinity County

UNION HILL (Weaverville)—Mine closed down for the season on account of lack of water.

GOLDEN JUBILEE (Coffee Creek)—Installing two Trent universal machines. Chester L. Proebstel, superintendent.

HORSE SHOE MINING CO (Lewiston)—Preparations being made to resume operations next season, under management of John M. Nicol.

UNION CONSTRUCTION CO. (San Francisco)—Paulsen's ranch, near Lewiston, being drilled. If ground warrants, dredge will be installed.

TONOPAH MINING CO. (Carrville)—Dredging ground being prospected with two Keystone drills. Walter J. Hufford, of Breckenridge, Colo., is in charge.

Tuolumne County

HARVARD (Jamestown)—G. Musente, a miner, was probably fatally injured by being caught between the skip and the timbers at the collar of the shaft.

SPRINGFIELD TUNNEL (Sonora)—Angelo Tuchich, a miner, was killed on Aug. 31 by fall of rock

COLORADO

Eagle County

A STRIKE OF GOLD ORE is reported from a new area in the southern part of this county around the heads of Brush and Lime creeks. Nearest railroad station is Thomasville on the Colorado Midland. District has been named Fool's Peak.

Lake County

ROBERT BURNS (Leadville)—Development in this property near Little Jonny on Breece hill, is still within oxidized zone. Large body of copper carbonate has been opened. Recent shipments have ranged from 7% to 26% copper.

PENROSE (Leadville)—The motor of one of the Providence centrifugal sinking pumps that are unwatering downtown district burned out recently while in operation. During repairs, water rose about 5 ft. in the Penrose shaft despite operation of the other pump.

ALADDIN (Leadville)—Manager Walter W. Davis of the Yak company confirms announcement that his company has secured this group under bond. Exploration performed some time ago through a drift at foot of 200-ft. winze near the breast of Yak tunnel disclosed attractive showings of ore in Aladdin ground. From this drift a new winze will be sunk an additional 150 ft. to reach certain contact or ore zone and, if results are satisfactory, the tunnel proper will be extended into the new territory. While it will be above the ore-bearing formations, its depth from surface will be about 1,250 ft. since the bore will be well into the Mosquito Range.

Park County

LONDON (Alma)—Sixty leasers are working in this lofty, high-grade mine that had been shut down by owners. Four 6-horse teams are busy hauling ore seven miles to station for shipment to Denver. While tonnage from this vein cannot be great, ore is of high quality. First 300 tons marketed this summer averaged 6.5 oz. gold per ton. Ore also runs well in silver and copper.

San Juan County

HIGHLAND MARY (Silverton)—This mine is now in combination with Trilby and Shenandoah mines. Group will be managed by Mr. McLean who plans system of underground connections.

Teller County

HONDO (Victor)—Ore shipped from the Sitting Bull vein runs about $17 per ton.

W. P. H. (Anaconda)—Clutch lease has struck shoot, 4 ft. wide, of high-grade ore.

DOCTOR-JACKPOT (Anaconda)—Five sets of leasers shipping good ore. Starkweather & Wilson lease marketing 2-oz. ore, occurring in a shoot developed more than 100 ft. along the drift.

TRACHITE (Independence)—This United Gold Mines Co. property on Bull Hill makes increasing shipments from its new shaft now about 75 ft. deep, all rock broken being ore averaging about $15 per ton.

PORTLAND-INDEPENDENCE (Victor)—New trestle connecting Portland surface and dumps with top of Independence mill is completed. Remodeling of mill is in progress, six carloads of new machinery having been ordered and some of it already delivered. About 40 blocks of Independence ground are worked under lease.

ISABELLA (Altman)—August tonnage from this mine reached a record; leasers and company shipments amounted to 105 carloads having an average value of about $24 per ton. Among the leases making large showing were the Klondike or Knuth and Theobold, Wolcott, and Dolzell and Comerford. The last-named lease has 7 ft. of high-grade ore.

TRAIL (Victor)—Being developed on 1200 level through Dexter shaft by Orrison & Eby. New orebody from 5 to 10 ft. wide and averaging about $30 a ton in gold has been opened up for distance of 200 ft. Leasers plan to do about 1200 ft. of drifting under stoping ground having depth of 700 ft. Robinson Leasing Co. is conducting its operations through Blue Bird shaft. Development is in progress on 1000 level where crosscut has been driven to cut trail vein and is now opening some encouraging pockets of ore.

LAST DOLLAR (Victor)—Joseph Crumby, leasing on 1,100 level, has settled carload shipment at $37 net per ton. On 1,200 level, leasers have opened a vein parallel to main Last Dollar vein but it has not been sufficiently developed to determine its character. Charles Ellison and James Constantine, miners engaged in shaft-sinking, were killed at the bottom of main shaft, Sept. 3, when the light rope—used temporarily in hoisting to the 1,200 level—broke and dropped the bucket containing them about 30 ft. into the blasts of 16 holes they had just fired.

GOLDEN CYCLE-VINDICATOR (Independence)—Carver lease, on Golden Cycle 400 level, maintains large output of $25 ore. Vein is 5 to 7 ft. thick and has produced steadily for a year and a half. Vust or Hayes lease, in Vindicator 1,100 level, ships high-grade ore from a vein having a core about 2 in. thick and extremely rich. Fish and Harris, Vindicator 700 level, are stoping in a shoot 4 to 7 ft. wide running about 1 oz. per ton. The Shatz leases in the Golden Cycle and Vindicator veins are both shipping. The Vindicator company has paid off 16 of its notes held by the Golden Cycle company. These notes have face value of $500,000, leaving notes amounting to $700,000 still to be met. Usual monthly 2% dividends are being paid by the Golden Cycle company.

IDAHO

Shoshone County

JACK WAITE EXTENSION (Murray)—Installing gasoline-driven compressor and will put on small crew for development work.

REINDEER-QUEEN (Mullan). Ore bins are nearly finished and stoping on small shoot of high-grade ore will commence at once. Main drift advanced 200 ft. in August. Vein, crosscut for 35 ft., is said to average 2 to 3% copper.

CARNEY COPPER (Mullan)—Two veins will be developed. Grading for new compressor has been completed and machinery will be installed at once. A contract has been let for driving No. 3 tunnel an additional 50 ft. No. 2 is in 1,500 ft.

BROWN & FINNELL (Kellogg)—Have cut a 12-ft. vein on their Pine Creek property assaying 40 to 70% antimony. They plan to install gravity tram, flume and sluice, to erect messhouse and bunkhouses, and to commence shipments as soon as possible.

NATIONAL (Mullan)—A shaft has been sunk from the main tunnel 200 ft. along the hanging wall. Vein will now be crosscut and explored by drifts. Quality of the ore is much improved in shaft, assays returning 37.7 oz. silver, 8.8% copper and $1.40 in gold. Mill will be started by Sept. 15. G. F. McCarthy, manager of Hecla mine, is in charge.

EVANS (Wallace)—Benjamin Evans, who has installed a Franz table for reworking the slime tailings below the Interstate-Callahan mill on Ninemile, is recovering from 3 to 5 tons of zinc concentrates a day. One 50-ton car was shipped Aug. 31 and it was planned to ship another by Sept. 10. Tailings are abnormally rich on account of the crowding of the Interstate mill to take advantage of high zinc prices.

CARBONATE HILL (Mullan)—It is understood that bond on this property four miles east of Mullan was taken for Butte & Superior company of Butte. Bonded Aug. 30 for $587,630, the first payment of $75,000 to be made on Sept. 1, 1916, and payments of equal amount to follow at intervals of three months, the final payment of $62,630 to be made on Oct. 1, 1918. Recent strike shows 4 or 5 ft. of high-grade zinc ore, accompanied by considerable lead; rest of vein, probably 10 ft., is lower grade ore. Since making strike, vein has been explored over 100 ft.

MICHIGAN

Iron

WALPOLE (Iron Mountain)—This mine being prepared for active operations. Some miners at the Pewabic will be transferred, and mine may be worked all winter.

SOUTH JACKSON (Negaunee)—Property has worked steadily all summer. Mine is only worked during summer. The ore is in good demand and more could be sold if it could be taken out.

ELECTRIC POWER for the Michigan ranges may be secured from a water power on the Flambeau River, 15 mi. northeast of Ladysmith, Wis., by a Boston syndicate headed by William H. Burgess. A dam is to be built creating a 68-ft. head for the development of 10,000 hp.

MAAS (Negaunee)—At the opening of navigation there were over 300,000 tons of ore in stock here. All but about 25,000 tons will be shipped. This will be left to support the trestles. Working with one full crew. Both this and the Negaunee, which adjoins, will be worked all winter.

MINNESOTA

Cuyuna Range

CUYUNA-DULUTH (Ironton)—Pres. W. H. Locker announces that this underground operation will be resumed shortly. Has been idle over a year.

ADBAR DEVELOPMENT CO. (Brainerd)—Company has started sinking a plank-lined shaft on its property in Sec. 22, 45-30, four miles east of Brainerd. The orebody is covered by till to a depth of 100 ft. The operation is a pioneer in its vicinity, the Wilcox mine two miles eastward being its nearest neighbor.

ROWLEY (Barrows)—Following customary Cuyuna Range plan, an excursion of stockholders (and others) was run from Duluth to shaft site at Barrows on Sunday, Aug. 22. Shaft was duly christened with spring water (the district being "dry"); the mine's namesake turned first shovel of dirt; ladies of town served dinner in grove on property; and excursion then visited other places of interest on Range. Property is held on lease from Northern Pacific Ry. Co. and contains comparatively small body of ore of good grade.

Mesabi Range

UNION (Virginia)—Recently 96 cars of ore were loaded in six hours by a single steam shovel. Said to be a record.

MONROE (Chisholm)—"A" shaft concrete lining now completed. From this shaft the village of Chisholm will procure its water supply from an unused portion of the workings.

Vermilion Range

DULUTH, MINN.—After years of litigation, Jacob and Amelia Stubler, of Duluth, have established title to a one-twelfth interest in a 40-acre tract adjoining the Grant Mine, at Buhl, on Mesaba Range. Tract is valued at $3,000,000. The acquisition came as result of purchase of the one-twelfth interest for $7.25 at forfeited tax sale in 1899.

MISSOURI-KANSAS

JOHN BARNES has encountered ore at Baxter Springs, Kan., at a depth of 15 ft., and already has a 5-ft. face with good ore in bottom of shaft. Will have to install pump, before going deeper.

SAVAGE (Galena, Kan.)—This mine on the Foster land, west of Galena, has been leased to Weir, Pepper and Vo, of Webb City, Mo. A mill will be built.

QUICK EIGHT (Galena, Kan.)—First car of ore shipped last week from 120-acre lease on the Glock land. Work is in new ground at 85-ft. level. W. A. Swan, superintendent.

LA NORA (Carterville, Mo.)—This mine on the Higgins land has been sold for $30,000. A drill will be put to work immediately to prospect the south part of the 52 acres. Meantime work will be continued at the old mine. George Bayless, superintendent.

MONTANA

Broadwater County

BLACK FRIDAY (Radersburg)—In view of proposed railroad from Three Forks to Radersburg, development work has been resumed to add to the ore reserves of 20,000 tons of milling rock. Gold veins vary from 2 ft. to 28 in. in width.

Jefferson County

MONARCH MINING AND MILLING (Clancey)—Work on King Solomon mine, a gold-silver-lead property recently acquired by this company, has progressed to such an extent that ore will be shipped regularly. Manager Moreland, after unwatering mine, has blocked out ore on 400-ft. level which will be tapped with 125 ft. of drift and crosscut. More men will be employed.

Granite County

GRANITE BI-METALLIC (Philipsburg)—Director John P. Meyer, after spending four months at mine, states that since development work was resumed another vein has been discovered, carrying from 60 to 90 oz. in silver and $3 to $5 in gold per ton. There is much low-grade ore on property.

Silver Bow County

BUTTE & SUPERIOR (Butte)—August was another record breaker. Total amount of zinc produced was 14,500,000 lb., nearly 1,000,000 lb. in excess of any previous month. Increase was brought about largely by increased efficiency from new machines in oil-flotation plant. Recoveries averaged 93%, while grade of concentrates was 56%, against 51% in former months.

TUOLUMNE (Butte)—Since unwatering shaft a few days ago, mining has been prosecuted vigorously and shipments have averaged 100 tons daily. This will be increased in near future. The 2,600-ft. level which was just beginning to show up well when mine was shut down, 10 months ago, is being further developed.

RAINBOW DEVELOPMENT (Butte)—Work of unwatering has shown no important damage was done to shaft. Company will push development work rapidly, three shifts having been put to work. Shaft is now down 1,300 ft. and will be sunk at least 200 ft. more.

NEVADA

Esmeralda County

KEWANAS (Goldfield)—A large low-grade vein was opened at a depth of 838 ft., at a point 200 ft. north of the winze from the east crosscut on the 700-ft. level of the Laguna shaft of Goldfield Consolidated.

KLONDYKE PORTLAND MINES CO. (Goldfield)—This recently organized company will run a crosscut from the 150-ft. shaft on its property in the Klondyke district, midway between Tonopah and Goldfield. M. F. Hill, secretary.

Humboldt County

ORE TRANSPORTATION for the camp of Rochester was improved by the opening on Sept. 8 of Nevada Short Line extension up Rochester Cañon to the portal of the Friedman tunnel.

SEVEN TROUGHS COALITION (Seven Troughs)—August production was only $48,000 owing to accident to engine. A 20-in. high-grade vein was opened on 1,200 level and record output would have been made in August but for accident. New 100-hp. gasoline engine has been installed.

ROCHESTER MINES CO. (East Rochester)—Most of the leases have been taken over by the company which is sending about 100 tons daily to the mill. New hoist on 300 level in Crown Point No. 1 was connected up on Sept. 8 and the Big Four winze, now down 160 ft., is supplying good ore from the 450-ft. level.

Lyon County

NEVADA-DOUGLAS (Ludwig)—Machinery of the new leaching plant is being given preliminary tryout.

Mineral County

PAMLICO PLACER CO.—This company has been formed by Sen. Key Pittman and S. H. Brady to operate placer claims at the junction of Neversweat and Pamlico creeks, 9 mi. southeast of Hawthorne. Washing plant and hoist will be installed.

Nye County

TONOPAH ORE PRODUCTION for the week ended Sept. 4 was 9,907 tons, of which Tonopah Mining produced 2,750 tons; Belmont, 3,187; Extension, 1,800; West End, 826; Jim Butler, 1,100, and miscellaneous leasers 244 tons.

BIG PINE (Manhattan)—The drift from the 200-ft. level of the Mushet-Wittenberg working shaft to the southern limits of the claim has been passing through the ore zone ever since leaving the shaft. The average of the drift face during this development was $5 per ton.

MANHATTAN-MUSTANG MINING CO. (Manhattan)—The sensation of the week was the phenomenal strike of high-grade ore in the Train-Chase lease on the Mustang. A series of vug holes containing a soft decomposed quart and talc averaged over $200 per ton. The ore is found in the limestone, but close to the shale contact, about 15 ft. below the surface. Following another small seam, with a winze, the ore makes directly against the hanging wall of shale and the leasers have carried the winze to an incline depth of about 18 ft. From the winze about 10 tons of high-grade ore has been taken and the chute is as strong in the bottom of the winze as elsewhere.

Storey County

MEXICAN (Virginia City)—East and west crosscuts on 2,700 level extended through porphyry and quartz of low assay. Mill treated 172 tons ore averaging $6.55 per ton.

JACKET-CROWN POINT-BELCHER (Gold Hill)—Saved 40 cars ore from Belcher 1,200 level and 13 cars low-grade from Crown Point crosscut. Jacket mill received 676 tons dump rock and 156 tons mine ore.

UTAH

Cache County

A NEW ZINC DISCOVERY is reported 2½ mi. southeast of Hyrum, near the mouth of Blacksmith Fork Cañon. Zinc-carbonate ore of good grade has been opened in the old Moon mine, which years ago was worked as a gold prospect. The ore occurs in limestone, and the mineralized zone can be traced some distance up and down the valley. A shipment of 21½ tons has been made by J. Nolan and C. C. Manghan, of Logan.

Juab County

TINTIC SHIPMENTS for the week ended Sept. 3 amounted to 131 cars, by 16 shippers. The Chief Consolidated, Iron Blossom, Centennial-Eureka and Eagle & Blue Bell had the largest output.

YANKEE CONSOLIDATED (Eureka)—The recent strike at this property is attracting interest among Tintic operators, and work is being done on the north and south in search of an extension of the ore.

Salt Lake County

NEW UTAH BINGHAM (Bingham)—Vein No. 4 in the 150-ft. level is 4 ft. wide with 14 to 24 in. of ore on the hanging wall. Ore in bin from raise on this vein assayed 25.7 lb., 20 oz. Ag., $2 Au., 4% Cu. Main drift beyond No. 3 and No. 4 veins has encountered 2 ft. of $18 ore.

Weber County

WESTERN ZINC (Saline)—This company has taken a lease on a portion of the Lake View Mining Co.'s property on Promontory Point, and is doing active development work. J. C. York is manager. The Lake View company has shipped zinc ore valued between $25,000 and $30,000 since March and has paid $10,000 in dividends.

WISCONSIN

Zinc-Lead District

BELL (Platteville)—Shaft sinking has been started.

LONGHENRY (Benton)—Longhenry Brothers have started milling on the Spensley lease.

STAR (Platteville)—This company has acquired the Grant County mine and mill and begun operating.

VINEGAR HILL (Platteville)—This company has taken over the Hodge mine recently unwatered by the Ben Webster Mining Co.

LAKE SUPERIOR (Shullsburg)—This company of northern Wisconsin people has resumed operations at Shullsburg, after several years' idleness.

MILWAUKEE MINERAL (Highland)—Platte Whitman, of Highland, has purchased the property of this company and will begin mining operations.

GRITTY SIX (Cuba City)—A Chicago company has taken options on the Gritty Six, Raisbeck and Anthony properties and has begun pumping at the Gritty Six mine.

CANADA

British Columbia

YREKA—This property on Quatsino Sound, dormant for some years, will be reopened by Fred J. Rollands, of Spokane.

IVANHOE (Sandon)—The concentrator was destroyed by fire on Aug. 30. The plant, valued at $50,000, was treating ore from Lucky Jim and Surprise mines.

SILVER CUP (Hazelton)—A second carload of ore has been shipped to Trail by Clothier Bros., leasing this property on Nine Mile Mountain. The ore ran 135 oz. in silver and 30% lead.

SWAMP CREEK—Report of rich strike on Swamp Creek near Barkerville, in the Cariboo district, has not been substantiated. C. W. Grain, gold commissioner, states that there is nothing to justify a stampede to the diggings.

Ontario

TECK HUGHES (Kirkland Lake)—Buffalo Mines of Cobalt has finally purchased control for 5c. per share. Power plant and 100-ton mill are to be installed.

TIMISKAMING (Cobalt)—The Nordberg hoist is being installed. It has a capacity for 8,000 lb. from 2,500 ft. and is the largest hoist in the camp.

PORCUPINE CROWN—Drifting is being done at the 600-ft. level on vein 4 to 5 ft. in width with low gold content. Vein on 500-ft. level shows marked improvement in width.

ZINC CO. LTD. (Welland)—This company, backed by the Wooltop Mining Co., of Weedon, Que., is constructing an electrolytic refinery to have a capacity of 5 tons of spelter per day.

HOLLINGER—In sinking the main shaft, a vein, about 9 ft. wide, carrying ore stated to average between $8 and $9 per ton, has been cut. It is about 300 ft. to the southeast of the main vein and running parallel to it. Reported that mill will be enlarged to treat 2,000 tons per day.

DOME—The present shaft being entirely in ore, it has been decided to sink a new shaft on an incline between the office and the mill. The ore will be crushed to 6 in. underground and brought to the surface up the new shaft in skips. Production for August was 28,600 tons, yielding $133,928 or $4.65 per ton.

DOME (Munro Township)—Two gold bars, valued approximately at $50,000, were shipped on Sept. 1 by the Dominion Reduction Co. to the United States mint. The gold was produced from 750 lb. of ore, and it is estimated that the tailings contain gold to the value of $30,000. A previous shipment of about $26,000 was made to Cobalt.

AFRICA

Rhodesia

GOLD PRODUCTION in July is reported at [illegible] oz., being 5,100 oz. more than in June; total gold output for the seven months ended with July, 519,409 oz., or $[illegible]. Other metal output for July was 16,214 oz. silver, [illegible] tons copper and 3 tons lead. The mineral production included 64 tons asbestos, 5,432 tons chrome ore and 35,832 t[illegible] coal.

The Market Report

Metal Markets

NEW YORK—Sept. 15

The week was characterized especially by a noteworthy improvement in the copper market toward the close. On the other hand, lead and zinc were dull and declining right through the week.

Copper, Tin, Lead and Zinc

Copper—During the first four days of the last week, the copper market was dull and disappointing. Copper was freely offered at 17½c., regular terms, and some small sales were reported at that price, with sellers over. Eastern producers are said to have sold at the same price in Western markets, and after paying the back freight, netted only 17.22½c. Some sales for export were made on the basis of 17⅛c., cash, New York. On Tuesday the market woke up and good sales were made at 17⅝@17¾c., regular terms, while business for Europe was taken at £86, equivalent to about 17.35c. here at the current rate of exchange.

Some of the larger producers did no business in this market, but made large sales out of warehouse in Europe of copper that had previously been sent over and stocked there. France was a large buyer. There was some Russian business but the buying for Russian account was very much muddled and transactions with its agents are difficult to manage. The domestic business of the week, especially of the last two days, included some round lots, which were taken to a major extent by the brass manufacturers, although wire drawers were also buyers.

Copper Sheets are quoted about 23c. per lb. for hot rolled and 24c. for cold rolled, with usual extras. Wire prices are unsettled; quotations may be put at 19@19½c. per lb. at mill. The chief maker does not quote base price.

Tin—The market was dull and featureless.

Lead—There was such sharp competition for a relatively small order on Sept. 8, and it was taken at so considerable a cut in price, that the A. S. & R. Co. apparently became disturbed over the situation in lead, and on Sept. 9, reduced its price to 4.70c., thus undercutting the outside producers. However, they immediately came forward with offers to sell at 4.65c., and then at 4.60c., whereupon the A. S. & R. Co. reduced to 4.50c. on Sept. 14. Although this second cut has so far failed to stimulate much buying, the outside producers do not for the moment seem to be disposed to go any lower, and at the close the market had become firm at 4.50c.

Spelter—The aggregate business was relatively small. At the beginning of our week of record the market stood at 13@14c., sales of September metal being made at approximately the higher figure, and of November-December, at the lower. From day to day the market fell off a little. Some of the new and small sellers were rather insistent upon disposing of their product, although what they had to offer was not large. On the other hand, there are signs that unsold stocks are beginning to accumulate in the hands of certain of the older and larger smelters, who are not making any special effort to sell, considering that any upturn of the market would rapidly clean them out. It is quite certain, however, that the position of the spelter market is becoming very much easier with respect to early deliveries. The outstanding feature of the week was the offering of spelter for immediate delivery by the principal buyer. These offers were limited to consumers only. The full meaning of this move is not yet understood.

Sales of brass special spelter are reported at 16c.

Sales of prime Western spelter for delivery in the first quarter of 1916 were made at 11½@11⅝ cents.

Zinc Sheets—Business has been on a considerable scale. The base price for carload lots is unchanged at $16 per 100 lb. f.o.b. Peru, Ill., less 8% discount.

Other Metals

NEW YORK—Sept. 15

Aluminum—Demand continues good, and stocks are lower than ever. The price is firm at 45c. per lb. for No. 1 ingots, and 50c. is reported asked for a round lot for early delivery.

Antimony—The market remains quiet and no large business has been done. Sales of ordinary brands, principally in small lots, have been made at 28@30c. per lb. Cookson's is held at about 45c. but is rather nominal.

Nickel—Quotations for ordinary forms are 45@50c. per lb., according to size and terms of order. A premium of 3c. per lb. is charged for electrolytic nickel.

Quicksilver—The market is rather quiet but pretty firm. New York price is $89@90 per flask of 75 lb., according to size of order. San Francisco reports by telegraph a fair but uncertain market; quotations $85@90 per flask. London price is off 10s. per flask, £16 10s. being named from both first and second hands.

DAILY PRICES OF METALS IN NEW YORK

Sept.	Sterling Exchange	Silver, Cts. per Oz.	Copper Electrolytic, Cts. per Lb.	Tin Spot, Cts. per Lb.	Lead New York, Cts. per Lb.	Lead St. Louis, Cts. per Lb.	Zinc St. Louis, Cts. per Lb.
9	4 6500	48⅞	17 12½ @17 37½	33¼	4 70 @4 80	4 55 @4 75	13.00 @13.00

15	4 6550	48¾	@17 55	33¼	4 50	4 35	@13.00

The quotations herein are our appraisal of the average markets for copper, lead, spelter and tin based on wholesale contracts for the ordinary deliveries of the trade as made by producers and agencies; and represent, to the best of our judgment, the prevailing values of the metals, reduced to basis of New York, cash, except where St. Louis is given as the basing point. St. Louis and New York are normally quoted 0.17c. apart.

The quotations for electrolytic copper are for cakes, ingots and wirebars. Electrolytic copper is commonly sold at prices including delivery to the consumers and is subject to discounts, etc. The price quoted for copper on "regular terms" is the gross price including freight to the buyer's works and is subject to a discount for cash. The difference between the price delivered and the New York cash equivalent is at present about 0.20c. on domestic business. The price of electrolytic cathodes is 0.05 to 0.10c. below that of electrolytic. Quotations for lead represent wholesale transactions in the open market for good ordinary brands. Quotations for spelter are for ordinary Prime Western brands. Only the St. Louis price is herein quoted, St. Louis being the basing market. We quote the New York price at 17c. per 100 lb. above the St. Louis price.

Silver quotations are in cents per troy ounce of fine silver.

Some current freight rates on metals per 100 lb. are; St. Louis-New York, 17c.; St. Louis-Chicago, 6.3c.; St. Louis-Pittsburgh, 13.1c.

LONDON

Sept.	Silver	Copper Standard Spot	Copper Standard 3 Mos.	Copper Electrolytic £ per Ton	Copper Electrolytic Cts. per Lb.	Tin Spot	Tin 3 Mos.	Lead £ per Ton	Lead Cts. per Lb.	Zinc £ per Ton	Zinc Cts. per Lb.

14	23½	68¼	70	84½	17.54	153½	154½	23 1/16	4 79	71	14.76
15	23 5/16	69⅛	70¼	84½	17.54	152½	153½	22 13/16	4 76	68½	14.21

The above table gives the closing quotations on London Metal Exchange. All prices are in pounds sterling per ton of 2240 lb., except silver which is in pence per troy ounce of sterling silver, 0.925 fine. Copper quotations are for standard copper, spot and three months, and for electrolytic, price for the latter being subject to 3 per cent discount. For convenience in comparison of London prices, in pounds sterling per 2240 lb., with American prices in cents per pound the following approximate ratios are given, reckoning exchange at 4.80. £15 = 3.21c.; £20 = 4.29c.; £30 = 6.43c.; £40 = 8.57c. £60 = 12.85c. Variations, £1 = 0.21½c.

Gold, Silver and Platinum

NEW YORK—Sept. 15

Gold in the United States, Sept. 1, is estimated by the Treasury Department as follows: Held in Treasury against gold certificates outstanding, $1,260,979,669; in Treasury current balances, $211,925,634; in banks and circulation, $583,826,-835; total, $2,056,732,138, an increase of $50,332,599 in August.

Gold Sales from the New York Assay Office in August were $2,448,845, being $461,845 more than in July. For the eight months ended Aug. 31 the total sales were $21,900,416 in 1914 and $18,509,205 in 1915; a decrease of $3,391,211 this year.

Silver—The market has remained steady in London the past week around 23½d. Sellers have not been pressing and shipments from this side continue small. The U. S. Mint purchased 600,000 oz. on Sept. 10 and 500,000 on Sept. 14. The fluctuations in sterling exchange have affected the New York prices.

Coined Silver in the United States, Sept. 1, is estimated by the Treasury Department as follows: Standard dollars, $568,-271,655; subsidiary coins, $185,887,011; total, $754,158,666. Of the standard dollars $483,764,000 are held in the Treasury against silver certificates outstanding.

Platinum—The market is strong though demand has been rather checked by the recent advance. A sale at $45 per oz. is reported earlier in the week, but today dealers hold at $48@50 per oz. for refined platinum, and about $54 per oz. for hard metal. The shortage of supplies has not been relieved as yet.

Zinc and Lead Ore Markets

JOPLIN, MO.—Sept. 11

Blende, high price, $83; base per ton 60% zinc, premium ore, $80; medium, $79@75; lower grades, $74@70; calamine, base 40% zinc, $75@50; average, all grades of zinc, $78.58 per ton. **Lead,** high price, $51.90; base price, $50 per ton of 80% metal content; average, all grades of lead, $51.23 per ton.

SHIPMENTS WEEK ENDED SEPT. 11

	Blende	Calamine	Lead	Values
Totals this week	11,127,980	898,730	1,825,790	$519,350
Totals this year	396,844,390	31,991,540	61,294,510	17,408,010

Blende value, the week, $443,030; 37 weeks, $15,072,260.

Calamine value, the week, $29,480; 37 weeks, $718,780.

Lead value, the week, $46,840; 37 weeks, $1,616,970.

Owing to the lower price offerings a large portion of the premium ore was withheld from market this week. It was not definitely known until midafternoon today what would be the high price offering for next week's delivery. Buyers inclined toward $75, but it was necessary to pay $80 to secure any portion of the better product.

The Granby Mining & Smelting Co. and lessees on the company's land, are carrying nearly 3,200 tons of blende and calamine for a stronger market. The total stock is approximately 5,700 tons.

PLATTEVILLE, WIS.—Sept. 11

The base price paid this week for 60% zinc ore was $75 per ton, one sale being reported at $77. Medium grades sold at $70 and low grades at $65 per ton base. No sales of lead ore reported.

SHIPMENTS, WEEK ENDED SEPT. 11

	Zinc Ore, Lb.	Lead Ore, Lb.	Sulphur Ore, Lb.
Week	4,597,840	.....	472,000
Year	133,501,080	4,463,160	19,200,750

Shipped during week to separating plants, 5,301,980 lb. zinc ore.

MONTANA ZINC ORE

During August the Butte & Superior Mining Co. mined and milled 45,140 tons of ore, producing 12,907 tons concentrates which averaged 54% zinc, the approximate content being 13,879,000 lb. zinc. The recovery is estimated at 91.6% for the month.

Iron Trade Review

NEW YORK—Sept. 15

Activity in the iron and steel trades has not abated, and conditions are practically unchanged, except that there is an improvement in domestic orders and more railroad buying.

The mills generally are busy and in some cases find it difficult to keep up with their orders. This is especially the case with some that are working on export business.

Pig iron continues to be strong and more active than for some time. There is good buying of basic pig at advanced prices, but foundry iron is rather slower. Not very much business has been done for next year.

Pig-iron production, which on Jan. 1 last was at the rate of about 18,000,000 tons a year, has now risen to a rate of 33,500,000 tons yearly. An unusually large proportion of the present iron-making capacity belongs to the steel works furnaces. Of the active capacity on Sept. 1 only 24.4% belonged to the merchant furnaces.

The United States Steel Corporation reports the total of unfilled orders on its books Aug. 31 at 4,908,455 tons, or practically the same as on July 31, the decrease being only 20,095 tons.

The final decree of the Circuit Court dismissing the suit against the Steel Corporation was filed at Trenton, N. J., Sept. 10. The United States has 60 days in which to appeal.

Pig-Iron Production shows a further increase in August. The reports of the blast furnaces, as collected and published by the "Iron Age," show that on Sept. 1 there were 249 coke and anthracite stacks in blast, having a total daily capacity of 91,075 tons of iron, an increase of 4,275 tons over Aug. 1. Making allowance for the charcoal furnaces, the estimated production of pig iron in the United States in August was 2,809,000 long tons; for the eight months ended Aug. 31 it was 17,636,300 tons. Of this total 12,943,250 tons, or 73.4%, were made by furnaces owned or operated by steel works.

PITTSBURGH—Sept. 14

The steel mills are falling farther behind in deliveries, despite the fact that strictly new business is relatively light and the orders booked are chiefly in the form of specifications on old contracts. Recent inquiries as to contracts for bars, plates and shapes for fourth quarter have elicited the reply from mills that such contracts would really involve deliveries in the first quarter, as the mills are filled up already, and 1.40c. has lately been named by such mills as care to quote at all. For weeks bars have been 1.35c. for delivery at mill convenience and plates and shapes have lately firmed up to that level.

The decrease of 20,085 tons in the Steel Corporation's unfilled obligations during August confirms what has been stated for some time, that the mills are so well filled that they are curtailing the contract obligations accepted. In July the corporation's obligations increased 250,344 tons and in June 413,-598 tons.

Earnings of all the steel companies have been increasing rapidly. All estimates are that the Steel Corporation will report more than $40,000,000 for the current quarter, and some estimates run up to $48,000,000. Even with $40,000,000 the corporation could wipe out the deficit accumulated since the beginning of last year and have enough left for a 1% common stock dividend.

The war demand for steel is unabated as to total tonnage. A new feature is the sharp increase in demand for steel for large shells, 4-in., 5-in. and 8-in., the last named involving forged steel rather than the rolled rounds of which so large a tonnage is being made.

Idle railway cars decreased from 265,364 on Aug. 1 to 183,-659 on Sept. 1 and a shortage is fully expected at crop-moving time. The railroads have lately been sounding the steel market as to 1916 deliveries, fearing they cannot get material if they do not early. The car shops are very busy, but can work out their present orders in a few months and a fresh burst of freight-car buying is expected for the near future.

Pig Iron—A sale of upwards of 1,000 tons of basic iron was made Saturday at $15, Valley, and yesterday a sale of 2,000 tons was made at the same figure. Producers have been quoting $15 for some time, but these are the first sales definitely reported. Foundry iron is strong but not in very active demand. Demand for bessemer is chiefly for export. There are several idle merchant furnaces in the Valleys and the question before the market now is whether advances can continue with these furnaces seeking to accumulate a back log of tonnage upon which to blow in. We quote: Bessemer, $16; basic, $15; foundry and malleable, $14.50@15, depending on delivery; gray forge, $14.25@14.75, f.o.b. Valley furnaces, 95c. higher delivered Pittsburgh.

Ferromanganese—It is understood that some of the English producers have resumed quoting $100 on contract, with time of delivery rather uncertain. The prompt market continues to fluctuate between $100 and $110 per ton.

Steel—The scarcity of steel, particularly openhearth, is daily growing more acute. Even Steel Corporation subsidiaries have paid $26 at maker's mill for basic openhearth billets, and any odd lots that can be found at this figure are quickly absorbed. There is no active demand for bessemer billets. We quote basic openhearth billets nominal at $25@26, Pittsburgh, and bessemer billets nominal at $25@26. Sheet bars would hardly be sold at less than billets, but buyers could be found at several dollars a ton less as prices obtainable for sheets or tinplates would not warrant paying the price. Rods are very scarce. Makers regard the market as $29@30, but there are practically no sellers at that price.

Foreign Trade of the United States in iron and steel and manufactures thereof is valued by the Department of Commerce as below for June and the fiscal year ended June 30:

	June		Fiscal Year	
	1914	1915	1913-14	1914-15
Exports	$18,927,958	$31,757,103	$251,480,677	$225,888,350
Imports	2,835,110	2,003,234	31,790,851	22,712,868
Excess exports	$16,092,848	$29,753,869	$219,689,826	$203,175,498

April, May and June showed heavy gains in exports, but not sufficient to offset the losses of the earlier part of the year. Imports showed a steady decline throughout the year.

FERRO-ALLOYS

Ferromanganese is quoted at $110@112.50 per ton for domestic 80% material.—**Spiegeleisen** has been sold at $27 per ton for 20%, at furnace.—**Ferrosilicon,** 50%, is quoted at $73@75 per ton at Pittsburgh. Bessemer ferrosilicon is from $20 per ton for 10% up to $24 for 14%, all at furnace.—**Ferrotitanium** is 8@12½c. per lb., according to size of lots and delivery.—**Ferrovanadium** is $2@2.25 per lb. of contained vanadium.

FOREIGN IRON

Pig-Iron Production in Germany in June was 993,496 metric tons, being 7,528 tons more than in May. For the six months ended June 30 the total make was 9,288,196 tons in 1914 and 5,534,337 in 1915, a decrease of 3,753,859 tons this year.

Steel Production in Germany in June was 1,080,786 metric tons, being 36,679 tons more than in May. For the six months ended June 30 the total production was 9,380,867 tons in 1914 and 6,121,889 tons in 1915; a decrease of 3,258,978 tons.

Pig-Iron Production in Canada for the first half of 1915 is reported by the American Iron & Steel Association as follows: Basic, 292,556; bessemer, 5,238; foundry, 59,646; other kinds, 9,385; total, 366,825 long tons. This compares with 263,512 tons in the second half of 1914, and 442,430 tons in the first half. Of the make this year 287,818 tons were for the use of the makers and 69,007 tons for sale as pig iron. There were 360,530 tons made with coke and 6,295 tons with charcoal as fuel. The province of Ontario made 205,368 tons, or 56% of the total, the balance being made in Nova Scotia and Quebec—chiefly Nova Scotia.

SAULT STE. MARIE CANALS

The total freight passing through the Sault Ste. Marie Canals in August was 10,540,781 short tons. For the season to Sept. 1 the total freight was: East bound, 28,721,967; west bound, 8,682,185; total, 37,404,152 tons, an increase of 2,788,193 tons over last year. The number of vessels was 11,766, showing an average cargo of 3,179 tons. Of these vessels 9,618 used the United States canal and 2,148 the Canadian. The mineral freights included were, in short tons, except salt which is in barrels:

	1914	1915	Changes
Anthracite	1,426,591	1,274,174	D. 152,417
Bituminous coal	7,900,621	6,552,627	D. 1,437,994
Iron ore	20,633,194	25,962,787	I. 5,329,593
Pig and m'f'd iron	173,907	118,360	D. 55,547
Copper	40,278	79,254	I. 38,976
Salt, bbl.	496,108	393,853	D. 102,255

Iron ore was 69.4% and coal 20.7% of the total freight reported this year.

IRON ORE

Eastern iron ore prices are rather stiffer, and some sellers have made small advances. Current prices are 7@7½c. per unit of iron, delivered at eastern Pennsylvania furnaces.

Lake ore shipments in August, as noted last week, were 8,081,117 long tons, an increase of 2,211,640 tons over August, 1914. For the season up to Sept. 1 shipments by ports are reported by the "Iron Trade Review" as follows:

Port.	1914	1915	Changes
Escanaba	2,165,692	2,935,862	I. 530,172
Marquette	1,719,791	1,773,653	I. 723,860
Ashland	2,079,776	2,801,219	I. 721,443
Superior	7,776,831	4,439,088	D. 3,137,743
Duluth	4,112,367	9,378,530	I. 3,226,163
Two Harbors	3,953,650	5,418,068	I. 1,464,168
Total	21,278,107	26,806,420	I. 5,528,313

Of the August shipments 6,504,987 tons, or 80.5% of the total, went to Lake Erie ports. Stocks on Lake Erie docks Sept. 1 were 7,118,847 tons, a decrease of 166,303 tons as compared with last year.

Duluth shipments were 35% of the total against 19.5% last year, while the Superior shipments fell from 33.6% of the total in 1914 to 14.3% this year.

Imports at Baltimore for the past week included 6,600 tons manganese ore from Brazil.

COKE

Coke production in the Connellsville region for the week is reported by the "Courier" at 391,310 short tons; shipments, 388,107 tons. Production of Greensburg and Upper Connellsville districts, 42,905 tons.

Connellsville Coke—There is inquiry for furnace coke for the first half of 1916, but with prompt coke available at $1.60@1.65 and operators feeling that they should obtain much higher prices for next year it is very hard for buyers and sellers to get together. There is much talk of sliding-scale contracts, a favorite idea apparently being to make coke $1.75 minimum with basic pig iron at $13.75, Valley, and settle each month on the basis of 5c. rise in coke for every 25c. rise in pig iron. Foundry coke is $2.30@2.60 for prompt and $2.40@2.60 for contract.

Anthracite Shipments in August were 5,330,831 long tons, being 396,622 tons more than in July, but 152,912 tons less than in August, 1914. For the eight months ended Aug. 31 the total shipments were 43,321,389 tons in 1914 and 41,860,340 tons in 1915, a decrease of 1,461,049 tons, or 3.4%, this year.

French Coal Production in 1914 is reported by the Comite Central des Houilleres at 29,786,505 metric tons, a decrease of 11,057,113 tons from 1913. The decrease is entirely due to the war operations, which cover important coal producing districts.

Imports of coal and coke into Chile in 1914 were, in metric tons:

	Coal	Coke	Total
Great Britain	527,576	9,588	537,164
Australia	516,889	6,720	523,609
United States	143,404	1,885	145,289
Other countries	69,690	28,718	98,408
Total	1,257,559	46,911	1,304,470

Owing to the opening of the Panama Canal and the stoppage of exports from Great Britain, it is expected that in 1915 there will be a large increase in American coal.

Chemicals

NEW YORK—Sept. 15

The general markets are steadier than they were, with fair demand reported in most lines.

Arsenic—Business remains rather quiet but the market is steady. Prices are about $3.50 per 100 lb. for large lots, up to $4 per 100 lb. for small orders.

Copper Sulphate—The market is steady, with a fair business doing. Prices are $7.25 per 100 lb. for carload lots and $7.50 per 100 lb. for smaller parcels.

Nitrate of Soda—The market is steady on a good business for the season. Prices are unchanged at 2.42½c. per lb. for spot and 2.45c. for futures.

Potash Salts—Imports of potash salts into the United States for the seven months ended July 31 are reported by the Department of Commerce as below, in pounds:

	1914	1915	Changes
Carbonate	12,351,589	8,582,016	D 3,769,573
Hydrate	4,718,257	2,028,142	D 2,690,115
Nitrate	1,917,047	14,855	D 1,902,192
Cyanide	301,175	862,127	I 560,952
Other potash salts	3,753,901	2,075,545	D 1,678,356
Total	23,041,969	13,562,685	D 9,479,284

Imports of crude salts used chiefly as fertilizers were as follows for the seven months, in long tons:

	1914	1915	Changes
Kainit	201,878	6,646	D 195,232
Manure salts	135,422	13,647	D 121,775
Sulphate of potash	27,765	10,101	D 17,664
Muriate of potash	142,896	56,721	D 86,175
Total	507,961	87,115	D 420,846

The large decreases shown were due to the interruption of shipments from Germany by the war.

PETROLEUM

Exports of mineral oils from the United States in June were 209,368,274 gal. For the fiscal year ended June 30 the total exports were 2,269,218,073 gal. in 1913-14, and 2,176,427,305 gal. in 1914-15, a decrease of 92,790,769 gal., or 4.1%, last year.

Oil prices are again advancing. An increase of 5c. has been announced in Pittsburgh, bringing the price up to $1.65 per bbl. for Pennsylvania grade.

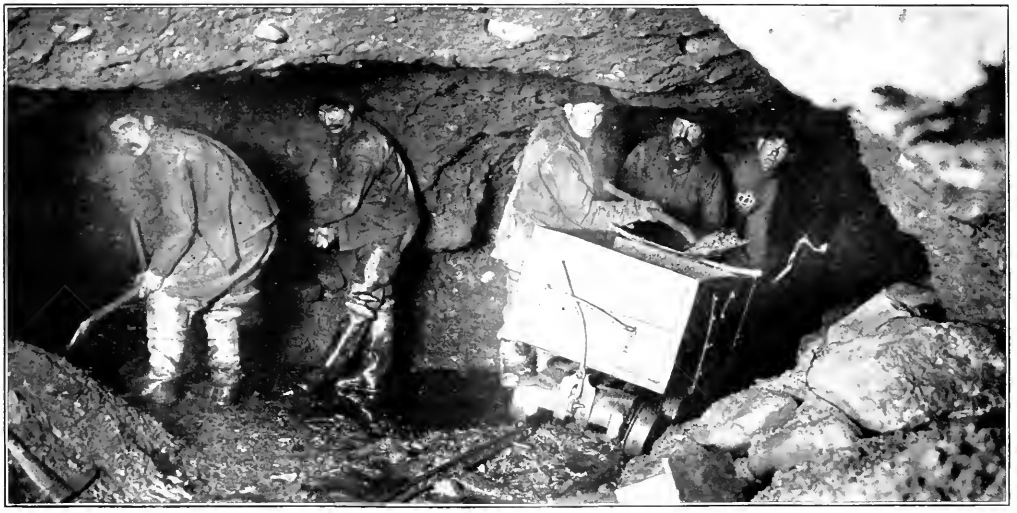
Stoping Methods at Fairbanks

By Hubert I. Ellis*

SYNOPSIS—Efficient extraction of gravel from the Fairbanks mines depends upon the thawing of the ground and upon the proper handling of material. Shoveling is the crucial feature, and in it the best men and tools are employed. The frozen ground holds well, since it resembles concrete in strength.

In the typical drift mine, stoping commences at the crosscuts, about 200 ft. from the shaft, and is carried on toward the shaft. For the first thaw, short points 4 or 5 ft. long are used and these are driven in both sides of the crosscuts—one set pointing upstream and the other downstream—thus virtually making two thaws at one operation, as shown in Fig. 1. This is possible only with the first thaw, since it is impossible to shovel into one car from two faces that are constantly becoming farther apart and since the accumulation of waste and the slabbing of the roof prohibit the use of two cars under ordinary circumstances.

By running the crosscuts at a distance of 100 ft. from the shaft instead of 200 ft., by leaving frozen pillars along the runway in the stoped-out area and by working both toward the shaft and away from it, it would be possible to save part of the time and expense of opening up and at the same time to double the area of working face. So far as known, however, this scheme has never been tried in spite of certain obvious advantages. There is no evident reason why it should not be applied with success to small mines where only a small crew can be worked on account of lack of room at the face, but it is generally considered the best practice to commence stoping at the farthest point from the shaft and to work inward at all times, thus keeping away from the waste and the dangerous portion of the roof. The proposed combination method of stoping for small mines, whereby the number of shovelers can be doubled, is shown in Fig. 8.



MINING UNDER UNFAVORABLE CONDITIONS

Workmen are crowded, the car is small and on a poor track, and pools of water stand on the floor

Fairbanks placer miners are wont to consider all workmen "dead-heads" except the shovelers and it is therefore planned to have as large a proportion of them on the crew as possible. Consequently it is always desired to work as many men at a given face as can be done without interference, other things being equal, and the method of mining is devised with this end in view. Cuts at the face are at a disadvantage in this respect, since [illegible] men are all that can conveniently shovel into one [illegible] the same

*Kellogg, Idaho.

time. Where the gravel is tight, however, and picking takes up a considerable portion of the shoveler's time, it is sometimes possible to use six or even eight men to the car. With the ordinary mine with an upstream and a downstream face—each divided into two parts by the main drift—only two cars can be used at a time, since switches and turnouts are rarely included in the equipment. With wheelbarrows more men can be worked in a small space and they thus have an important advantage over cars for small mines. When using an eight-wheelbarrow bucket eight shovelers can work in each crosscut without interference, and by having one gang shoveling while the others are dumping their loads at the shaft this number can easily be doubled. For wide paystreaks, where there is ample face area, however, cars are to be preferred.

Type of Mine Cars in Use

To avoid raising the gravel farther than is absolutely necessary, cars must be as low as possible, and for this reason the ordinary mine car is unsatisfactory. Cars are usually built to hold four or five wheelbarrow loads of gravel and are made of light lumber lined on the inside with light sheet iron. The bodies are set directly on the trucks and are fastened firmly to them, so that in dumping it is necessary to raise the whole car, the front wheels serving as a pivot. Considerable skill is required to dump these cars without loss of time, since the forward part of the load frequently slides out, shifting the center of gravity well behind the front wheels and causing the rear wheels to settle back on the rails, from which position it takes a heavy lift to raise them. With experience the car man learns just the right speed required for the car to dump itself, but constant care is necessary lest the car over-ride the dumping obstruction and pile into the bucket-hole, load and all, in which event the shovelers must be summoned from the face, with consequent ill-feeling and loss of time.

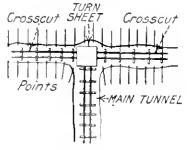


FIG. 1. METHOD OF PUTTING IN FIRST THAW

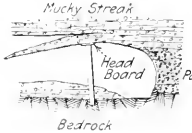

FIG. 2. STILL SET TO THROW SLAB AWAY FROM ROOF

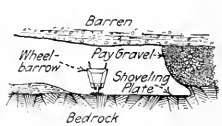

FIG. 3. METHOD OF UNDERCUTTING THE FACE

Effect of Thawing on Exposed Faces

For all thaws after the first, longer points are used and these are driven in the face toward the shaft. To shift the car track near the face the workmen scatter along it, drive their picks into the ties, and drag the entire section over at one time. When wheelbarrows are used at the face and dumped into cars in the main drift, the leader usually dumps his load and continues straight ahead into the other crosscut, thus becoming the last man on the next trip. This saves delay and serves to equalize the distance so that each man has the same average length of wheel.

In putting on a thaw it is impossible to avoid thawing some of the barren roof exposed by the removal of previous thaws, and this thawed portion either falls at once or hangs so precariously as to be dangerous to work under. In either case the part close to the face must be removed and it is thrown back where it is out of the way and where it serves in a measure to support the roof. The amount of waste thawed varies with the nature of the material and the care with which the points have been tended, but there is frequently a depth of two feet or more to be shoveled back before it is possible to attack the face. One advantage in the use of long points is that there is a proportionately smaller quantity of waste to handle.

After the pay has been stoped over a large horizontal area the roof, being left without adequate support, commences to slab. The gravel, especially that above the pay, always contains layers—of greater or less size and thickness—of muck or gravel consisting of a large proportion of muck and it is along these lines of weakness that the slabs form, as shown in Fig. 2. The slabs form very slowly. Starting as a mere crack, the opening gradually enlarges, the slab increasing in area and becoming thicker and thicker. Usually little change can be noticed from day to day, but they are a menace at all times to those working under them. If the face remains stationary for some time they break off close up against it and in the course of a week or two it becomes inaccessible. It is then necessary to drive a new crosscut to obtain a stoping base. Even when work is carried on continuously, if the face is not advanced very rapidly, the slabs may catch up while thawing is in progress and come down while the shovelers are at work. Fatalities from this cause are rare, however, since the slabs give warning a few minutes before they fall by a steady shower of small rocks sounding like a gentle rain. When the foreman receives this warning he moves the crew to another face, bringing them back after the slab falls, usually within half an hour or so.

Slabs continue to fall at intervals, the roof becoming higher and higher, until the whole space becomes filled and the roof is firmly held. In some cases subsidence extends to the surface, but this is usually not noticeable for several years after stoping, if at all. In a few years the entire mass usually settles so firmly that mining may be carried on underground exactly as before in case pay has inadvertently been left in the roof or in bedrock. Indeed, it would sometimes be difficult to tell that the area had ever been mined were it not for broken timbers and other such foreign material.

Holding Roof with Frozen Pillars

Many attempts have been made to hold the roof over stoped-out areas by artificial support, but without material success. Posts, plain timber bulkheads, bulkheads filled with gravel, drift sets, and other methods have consistently failed of their purpose, except where temporary support only was desired. The only sure way to hold the roof is to leave pillars of frozen gravel. These need not be large, 3 ft. in diameter at the small point usually being sufficient, and they need not be closely spaced. A few such pillars will hold as much as all the bulkheads that could be crowded into the mine. Observation indicates that pillars of concrete have no advantage over the frozen gravel

of the North when it comes to supporting weight. The most modern practice, however, is to make no attempt to support the workings except around the shaft and where it is desired to keep certain drifts open for communication with other workings. A row of stulls is sometimes placed parallel with the face a few feet back and these are canted backward at the top, as shown in Fig. 2, so as to throw any slabs that may chance to fall away from the face. Most of the stulls are recovered and used again and again.

The most expensive detail of placer mining is the picking of the gravel and the shoveling into wheelbarrows or cars. Refinements of methods are impossible and chief dependence is on the strength and endurance of the workmen. Men of an ingenious turn of mind have tried here as in other parts of the world to invent a satisfactory shoveling machine, but without success. One such machine worked to the entire satisfaction of the inventors in a snowbank at surface but balked when taken underground. The best the operator can do is to keep plenty of gravel before the shovelers, to furnish them with the best of tools in the best of condition and to eliminate delays by keeping runways, hoist and car tracks in good shape. The men

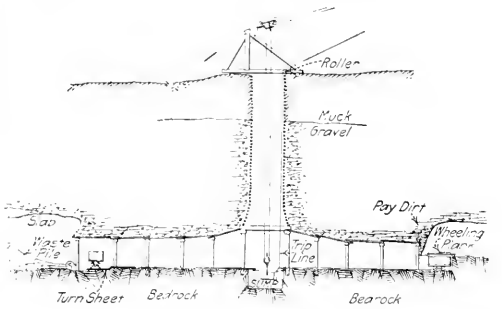

FIG. 4. GENERALIZED SECTION OF A PLACER MINE

are driven at top speed from morning till night. Very few members of the English-speaking nationalities are employed for work of this character. Russians, Scandinavians and natives of southern Europe make up the greater part of the shoveling gang, and the placer crew is comparatively homogeneous that does not represent half a dozen nationalities.

Shoveling the Most Important Operation

The output for each shoveler varies from 75 to 150 wheelbarrows per day of 10 hr., depending on working conditions, the length of trips and—chiefly—on the character of the gravel. For most mines the average ranges from 100 to 120, with the emphasis on the lower figure. In estimating working costs it is usually counted that a shoveler will strip from 30 to 35 sq.ft. of bedrock per day—equivalent to about 7 cu.yd. of material in place. The steady grind, day in and day out, is extremely hard on the crew and many are unable to stand the work. Some of the men have to force themselves to eat more than they want to keep from becoming hungry and weak a short time before noon and evening, and the scheme has been tried with moderate success of giving the shovelers a light lunch of coffee and doughnuts, pie, or cake at 10 a.m. and 4 p.m. The first Alaska Legislature, which met in 1913, established the 8-hr. day for all quartz mines, but the attempt to pass a similar law for placer mines was defeated by the members from Nome and Fairbanks. As was predicted at that time, the question came up at the second session and the law was extended to apply to placer as well as to lode mines. The new law is a step in advance, for no one who has worked alongside the shovelers of Fairbanks can deny that eight hours of such work is sufficient.

The No. 2 round-pointed shovels 5 ft. long over all are used and these are discarded as soon as the point becomes slightly rounded or the shovel wears so thin as to become too limber for efficient work. The life of a shovel, barring accidents, is from two weeks to a month. It is considerably less when shoveling plates are used than otherwise. Picks weighing 6, 7 and 8 lb. are used, the heavier ones being preferred at most mines. These are kept in good repair at all times and are laid aside for resharpening as soon as they become worn and dull. One man will dull from two to five or six in a shift, one for each half-day being a common allowance, with plenty of extras in case the point breaks or bends. Many picks are lost through carelessness on the part of the shovelers, who usually toss their dull picks behind them on the waste pile when taking sharp ones. These are often forgotten and are buried.

Shoveling to Clean the Bedrock

Bedrock gives the shoveler the most trouble. It is frequently tight and blocky and is difficult to remove, and there is a tendency for the green shoveler, in order to keep his turn, to remove the top gravel ahead of bedrock. Then when he comes to take up bedrock he finds that he has a tough proposition on his hands and must either drop out for a turn or two or must delay the rest of the gang. He soon learns that the easiest and most satisfactory way is to remove the bedrock first, undermining the gravel as shown in Fig. 3 until it caves onto the shoveling plate, when he may be able to work as much as an hour without additional picking. Some operators object to the use of shoveling plates on the ground that they wear out the shovels too rapidly and cause loss of time in leveling off for them and putting them in place. Where bedrock is composed of soft, decomposed schist through which the shovel can be pushed with ease there is some point to this objection, but for the great majority of mines—which have blocky bedrock—the use of plates is to be recommended. Fig. 4 shows a generalized section through a placer mine arranged to use cars at the downstream face and wheelbarrows at the upstream face.

Different Methods on Vault Creek

Different conditions on Vault Creek and its tributaries from those prevailing in the rest of the district have led to the development of a slightly different method of mining. The ground is deep—much of it being 200 ft. to bedrock—and the paystreaks are narrow and irregular. Owing to the time and cost of sinking, prospecting must be done with as few shafts as possible. Similarly, owing to the narrow paystreaks and the way they twist and turn, it is not feasible to drive long tunnels and crosscuts to prepare for stoping, as is the usual practice in the Fairbanks district. The first rule becomes "follow the pay," and it is often impossible to do this and keep the drifts straight. There is probably no other place in Alaska where ground stands as well after stoping as it does on Vault Creek and its most important tributary, Treasure

Creek. Slabs rarely form and when they do they are small and cause little trouble. These factors have combined to make it desirable to start the stopes near the shaft and carry them away from it in both directions. A pillar must of course be left around the shaft, but it need not be of great extent.

The method is illustrated in Fig. 5. The runways are kept open by timbering with three-piece sets and lagging tightly. If this is not done the waste that comes down with each new thaw must be shoveled away, and in time it accumulates in such quantity as to form a sort of large hopper with the wheeling-plank in the center and with sides reaching to the roof, as shown in Fig. 6. After this stage is reached all the gravel that falls over a wide area collects on the running-plank and must be removed by hoisting. Small timbers only are required, since they soon become covered on all sides with waste and confine much of the heat of the pipe line, thus insulating the frozen roof. Consequently the weight of the thawed gravel resting on the sets is comparatively slight.

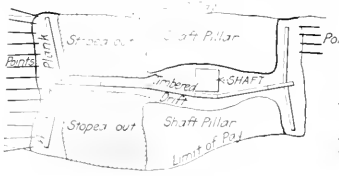

FIG. 5. METHOD OF WORKING AWAY FROM SHAFT

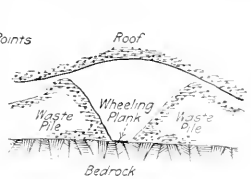

FIG. 6. WASTE ACCUMULATION ALONG UNTIMBERED RUNWAY

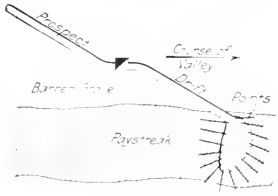

FIG. 7. VAULT CREEK METHOD OF PROSPECTING

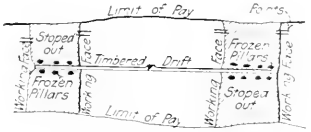

FIG. 8. COMBINATION METHOD FOR NARROW PAYSTREAKS

Wheeling Gravel on Bad Grades

Bedrock surface is irregular and in following it the floor of the tunnel rises and falls, making a variable grade. The pay is likely to swing from side to side and the drift must twist and turn in order to keep near the center of the pay-streak. It is evident that this is one place where wheelbarrows for transport, on account of their greater flexibility, have a great advantage over cars and they are used almost exclusively. When, owing to lack of grade, water will not flow in away from the face, it is removed by means of siphons and injectors. After a depression in bedrock has been crossed, however, it is gradually allowed to fill as the roof thaws, the wheeling-plank being raised correspondingly. Timbering is necessarily delayed in this case, but the advantages of having a runway of even grade through which the water will drain to the sump at the shaft outweigh this disadvantage. There is nothing, aside from working under a low roof, that tires a workman and decreases his output so much as wheeling up a grade. On the level he need only hold the handles of the wheelbarrow at the proper elevation and it virtually runs itself, but on an upgrade it is necessary to push from an awkward angle and on a steep downgrade it is necessary to hold back, which is hardest of all. Owing to the fact that most shovelers doing their own wheeling play out first in the wrists it is desirable to avoid wrist strain as much as possible.

Prospect shafts are usually sunk of such size as to be suitable for actual mining and if no pay is found at bedrock it is difficult or impossible to tell whether the pay-streak is toward the creek or toward the hill, or whether the shaft is merely in a low-grade area in the main pay-streak. Since the pay is often not rich enough to permit of much expense for prospecting and development—and this is one of the chief reasons for adopting the method of mining under discussion—every foot of work must be done with a view to possibilities for further use. Crosscuts are therefore not driven directly across the creek in looking for pay but are run diagonally so that they will serve as runways in case pay is discovered, one angling up the hill, the other toward the creek, as shown in Fig. 7. This serves to prospect the channel in all four directions at once. Although one drift will usually be in waste the operator generally considers himself lucky to have one face in good pay all the time.

Manchurian Iron Developments

An iron industry in Manchuria is to be built up by Japanese capital. Consul-General S. P. Heitzleman at Mukden writes that "among the nine mining areas in South Manchuria where Japanese are permitted, by an exchange of notes between the Japanese and Chinese Governments on May 25, 1915, to prospect for and operate mines, one of the largest and most promising is the iron mine in the Anshanchan region, between Liaoyang and Penhsihu, in the central part of Shengking Province." The extent of the deposits is said to equal that of the Hupeh mines. "The working of this mine is to be intrusted to the South Manchuria Ry. Co. The railway company will not confine its labors to mining ore, but proposes to manufacture iron as well. For smelting purposes neither Fushun nor Yentai coal is suitable, and it is said Penhsihu coal will be used. A site for the smeltery on the opposite side of the Penhsihu River which comprises about 83 acres of land has been chosen and the negotiations for its purchase are about concluded. The undertaking is to assume considerable proportions, and the capital for investment is estimated to be not less than $5,000,000."

A Process for Producing Tungsten Powder has been patented by Robert Rafn, of Porsgrund, Norway, and assigned to the General Electric Co., says "Engineering." The production of amorphous tungsten powder by reduction of tungsten trioxide is usually difficult of accomplishment, as a crystalline product most often results. The inventor has shown, however, that by making the reduction in two stages—first with ammonia gas at red heat, producing the so called blue tungsten oxide, and then with hydrogen at cherry-red heat—the resulting product is a tungsten powder of remarkable fineness.

Explosives Used in War and Metal Mining

By Percy E. Barbour

SYNOPSIS—Guncotton is the basis of the most important military explosive and of the second most important mining explosive. Benzol and toluol are important coal-tar products which furnish bases for manufacture of picric acid used in military explosives and nitro-substitution compounds used in low-freezing dynamites. Dynamites graded into five distinct classes, each of which has advantages and disadvantages. Low-freezing dynamites without ammonium nitrate give excessive amounts of noxious gases, and with ammonium nitrate are decidedly hygroscopic. Straight dynamite is best adapted for the widest range of work; gelatin dynamite for wet work. Least amount of obnoxious gases is given off by the gelatin dynamites. Correct explosives to use not determined by any fixed rule but by experience and judgment of the mining engineer.

Although the munitions of war are almost never used by the mining engineer (unless he happens to be operating in Mexico at present), and the explosives common to mining are only to a slight extent used in war, yet the requirements of the two have an inter-relation which is not distant. Dynamite, the commonest of mine explosives, is used in war only for demolitions, as in the case of bridges, structures, etc., and to a comparatively limited extent in the present war for the destruction of the enemy's trenches, and in hand grenades. But the basis of the most important explosive used in war and the basis of the second most important explosive used in mining is the same—guncotton—which is the essential ingredient of all smokeless powders, of blasting gelatin and of all gelatin dynamite.

Smokeless Powder and Guncotton

The manufacture of this explosive is complicated only from a mechanical standpoint. There are no chemical mysteries about it. Smokeless powder is also called nitrocellulose, the principal ingredients of which consist of cotton or cellulose, nitric acid, sulphuric acid, ether and alcohol.

Smokeless powder in the chamber of a gun is not intended to be detonated, but to be exploded by a progressive combustion, the result of which is determined by the characteristics of the gun or the service expected of it. The rate of the combustion depends upon the amount of surface exposed, hence the perforations which give this added surface to the powder grains.

Nitrocellulose is a general term applied to products resulting from the action of nitric acid on cellulose, in which the organic cellular structure of the original cotton fiber has not been destroyed. Guncotton is a nitrocellulose of high nitration, consisting of a mixture of insoluble nitrocellulose with a small quantity of soluble nitrocellulose, and a very small quantity of unnitrated cellulose. The chemical name for guncotton is tri-nitrocellulose, and the formula is $C_{12}H_{14}O_4\ (NO_3)_6$.

Owing to the fact that guncotton ordinarily contains a large percentage of water, it is most suitably adapted for use in military mines and submarine or other work of wet nature. Dry guncotton is used to detonate charges of wet guncotton. When dry it is very sensitive and is classed as a detonator and must be handled carefully, while wet guncotton, contrary to general impression, is one of the safest explosives to handle.

Nitrocellulose Compounds

In the manufacture of nitrocellulose, by varying the strength and the proportions of the nitric and sulphuric acids, their temperature and the length of time that the cotton is in them, a number of different products are obtained varying in the rate at which they will burn and the effects produced, and in the degree to which they are soluble in various solvents. This gives many different grades of explosives to which various names are applied at the will of the manufacturer and which are capable of a wide latitude of adaptability to different requirements.

Cordite is a British smokeless powder consisting of 37 parts of guncotton, 58 parts nitroglycerin and 5 parts vaseline. This powder gives a very high muzzle velocity with a low pressure in the powder chamber, but the temperature of its explosion is so high that it causes a rapid erosion of the bore of the gun. Therefore, another form of this powder known as Cordite M.B., in which the ratio of the guncotton and nitroglycerin is reversed, has been made which overcomes these disadvantages. This illustrates the possibilities of different combinations of the same materials to effect different purposes.

Benzol and Toluol and Derivatives

Increased interest attaches to benzol and toluol at the present time on account of the number of plants being constructed to manufacture them. They are used in the manufacture both of dyestuffs and high explosives for war munitions. The United States Steel Corporation has three plants nearing completion—one at Farrell, Penn., one at Gary, Ind., and one at Birmingham, Ala. The Lehigh Coke Co. is building a benzol plant at South Bethlehem, Penn.; the Woodward Iron Co., Woodward, Ala., has a new benzol plant in operation; the Lackawanna Steel Co. has a benzol plant at Buffalo; and the Benzol Products Co., working with the General Chemical Co., the American Coal Products Co. and the Semet-Solvay Co., is building a plant at Marcus Hook, Penn., which will soon be in operation. The Dominion Steel Co. of Canada is manufacturing benzol on a large scale, and the Crows Nest Pass Coal Co. is also contemplating the building of a similar plant.

Benzol is a coal-tar distillation product comprising a mixture of benzene with variable quantities of toluene and other homologues of the same series. The Rittman process, of which we have heard so much lately, is a process whereby these products may be obtained from the distillation of petroleum, but at the present time they are only obtained commercially by distillation of

coal-tar products, principally as a byproduct from coke ovens. The product known as "crude benzol" is further fractionally distilled, and by this means separated into pure benzene, toluene and other true chemical compounds. Benzene[1] is C_6H_6 and toluene is C_7H_8. A 90% benzol is a product of which 90% by volume distills before the temperature rises above 100 deg. C. The composition of a 90% benzol is about 70 benzene, 24 toluene, and 4 to 6 of lighter hydrocarbons. Toluol is an impure form of toluene, so alike that the difference is only detected by a slight discoloration on the addition of sulphuric acid.

Toluene possesses the property of rendering oxygen very active and when treated with nitric and sulphuric acid and heated for several days yields tri-nitro-toluene, an explosive of a high order which is superseding the use of picric acid as a base for shell fillers for artillery use.

Tri-nitro-toluene and tri-nitro-toluol are practically the same, and have been abbreviated to trotol or t.n.t. in United States Army parlance. This explosive, trotol, is also used, especially for submarine mines and in the German 42-cm. guns and is, next to picric acid, the most terrific explosive in the service.

Picric Acid

Benzene, a redistillation product from benzol, is used in the manufacture of carbolic acid or phenol; this in turn is the basis of picric acid, which latter is the base of most of the high explosives used at the present time in the European conflict. When phenol (carbolic acid) is treated with nitric acid, a nitrate called tri-nitro-phenol is formed. Its only use is as an explosive. It is not only an explosive of itself, but more particularly is used as an ingredient of special explosive mixtures. Most of the new so-called shell-filler explosives are either picric acid or mixtures of picric acid salts called pierates. Among these are ecrasite (Austrian), lyddite (English), melinite (French), shimose (Japanese), etc. The exact compositions of these are secrets carefully guarded by the different governments.

The explosive used in the United States Army as a shell filler is known in the service as "Explosive D." This is a picric-acid derivative, the exact composition of which is maintained a secret by the Government. Its relative force of explosion is twice as great as that of guncotton, which of course is ample recommendation for its use in armor piercing shells.

Picric acid, although a powerful explosive, forms in connection with lead, iron and some other metals, some very sensitive and dangerous compounds. This is true to such an extent that it is dangerous to paint the interior of a shell—which is to be loaded with a picric acid derivative—with a paint which has either red or white lead in it, and it is also dangerous to use red or white lead in screwing in a shell plug. Trotol does not have this disadvantage, and it is for this reason that it is displacing, in this country at least, picric-acid explosives.

Dynamite

Dynamite is a general term for all high explosives composed primarily of nitroglycerin and some solid matter as an absorbent. Low explosives comprise the saltpeter mixtures, such as gunpowder, in which explosion is brought about by simple but rapid combustion, giving rise to a large volume of highly heated gases but leaving almost one-half of the original mass as a solid residue. In the high-explosive class, explosion is the result of the compound being wholly resolved into a large volume of highly heated gases, with little or no solid residue, the change taking place many times faster than the combustion in the saltpeter (KNO_3) class of low explosives. Low explosives exert a relatively slow pushing effect upon the substances on which they act at the moment of explosion, while high explosives, on account of the high rate and power of detonation, have a shattering effect upon the substances with which they are in contact.

Dynamite was originally invented as the result of an attempt to saturate black powder with nitroglycerin, in order to get a powder of increased intensity, it being inconvenient to use the nitroglycerin itself alone, as the explosive. The disadvantages of this early attempt were overcome by using kieselguhr as absorbent for the nitroglycerin and the original brand of dynamite was evolved. This original absorbent, base or "dope" as it is commonly called, was a porous, lightweight earth and added in no way to the explosive force of the nitroglycerin and remained as a solid residue after the explosion. If this dope is a substance which will neither burn nor explode, it is called an inactive base; if it will burn or explode it is called an active base, and may be either an explosive compound, a combustible compound, or a mixture of a combustible and an oxygen carrier. Experiment developed the fact that if a dope was used which was an active base, and which would either explode or furnish oxygen for the other explosives, the force of the explosion was greatly increased. It was also found that with an inactive base a dynamite containing less than 30% nitroglycerin could not be exploded, but with an active base a satisfactory explosive could be made containing as low as 5% nitroglycerin. If it were not for this fact the popular 5% nitroglycerin powder, sometimes called granulated nitroglycerin powder, largely used in quarrying operations, could not be detonated.

The character of this active base is possible of an almost infinite number of commutations, with an equal number of brands of dynamite possessing varying characteristics, and here is the labyrinth into which the mining engineer has been hopelessly plunged heretofore.

Nitroglycerin consists of glycerin, nitric acid, and sulphuric acid, and is made by allowing a small amount of glycerin to enter into the presence of the strongest acids, chemically pure, mixed in the proportion of two parts sulphuric to one part nitric.

Modern Grading of Dynamite

There are only five important grades of dynamite which need be considered in mining engineering work: Judson powder, straight nitroglycerin dynamite, ammonia dynamite, low-freezing dynamite, and gelatin.

Judson powder is a low-grade granulated nitroglycerin powder, containing about 5% nitroglycerin, which is used for quarrying or road work or railroad excavation. An average composition of such powder is 5% nitroglycerin, 35% combustible material composed of sulphur, coal and resin, and 60% sodium nitrate, the latter being used as an oxidizer. Except that this powder has nitroglycerin for its base, it would hardly count in the class of dynamite, as it so much more closely resembles

[1]Benzine is a distillation product from petroleum.

black powder, the composition of which is 16% charcoal, 11% sulphur, 73% sodium nitrate.

Straight nitroglycerin dynamite is graded according to the nitroglycerin content, which varies in commercial brands from 15 to 60%. The following compositions are given by analyses by the Bureau of Mines.[2]:

COMPOSITIONS OF STRAIGHT NITROGLYCERIN DYNAMITES OF VARIOUS STRENGTHS

Ingredients	15%	20%	25%	30%	35%	40%	45%	50%	55%	60%
Nitroglycerin	15	20	25	30	35	40	45	50	55	60
Combustible material*	20	19	18	17	16	15	14	14	15	16
Sodium nitrate...	64	60	56	52	48	44	40	35	29	23
Calcium or magnesium carbonate	1	1	1	1	1	1	1	1	1	1
	100	100	100	100	100	100	100	100	100	100

*Consisting of wood pulp, flour and sulphur for grades below 40%; wood pulp only for other grades.

In other than straight dynamites the trade rating is not a measure of the nitroglycerin content, as the following tables of ammonia and low-freezing dynamites will show, and other brands of dynamite of the same commercial rating have not been found to be equivalent in every respect to straight dynamite. The rating, 40% for instance, for more than one kind of powder of very different blasting properties, is an unfortunate and misleading one.

Straight Nitroglycerin Dynamite

An analysis of 40% straight nitroglycerin dynamite, quoted from Bureau of Mines Technical Paper 17, is as follows: Moisture, 1.45%; nitroglycerin, 39.46%; sodium nitrate, 42.62%; calcium carbonate, 1.11%; wood pulp, 15.36%; total, 100%.

Some form of oxidizer is necessary in an explosive. Saltpeter is the common ingredient of black powder for this purpose; five-sixths of its oxygen is available for oxidization and the nitrogen is given off in a free state. Sodium nitrate contains more available oxygen than the potassium salt and is more commonly used in dynamite, although at very high temperatures it exercises a less powerful action upon the other combustible ingredients. It cannot be used for ordinary gunpowder, because it is hygroscopic. Because this is so largely used in ordinary dynamite is one reason why the latter will deteriorate so rapidly if stored in a damp place, as for instance a wet drift underground. Calcium carbonate, magnesium carbonate or sodium carbonate are inert bases, which are added to the dynamite to neutralize any free acid present.

This explains the function of each of the ingredients of the ordinary straight dynamites shown in the analysis: Nitroglycerin is the explosive; wood pulp is the combustible absorbent; sodium nitrate (Chile saltpeter) the oxidizing agent; and calcium carbonate is the neutralizing agent.

Straight dynamite can be had in 75 and 80% strengths on special order but its use is almost always ill-advised. It is too sensitive both to shock and to friction to be transported safely and it gives off extreme amounts of obnoxious gases.

Nitroglycerin dynamites freeze at temperatures between 45 and 50 deg. F.

The ammonia dynamites are practically straight dynamites with part of the nitroglycerin replaced by ammonium nitrate. Sulphur is usually one of the constituents of this type of dynamite, and the wood pulp may be largely replaced with flour. The substitution of ammonium nitrate for the nitroglycerin has one slight advantage over the use of sodium nitrate, namely, that on explosion it goes completely into gas. Other than this, it has no advantage except to lower the cost of manufacture of the dynamite. It gives a weaker and less powerful explosive. Ammonium nitrate does have an advantage, however, in the manufacture of explosives for use in coal mines because on explosion a considerable amount of water is formed which lowers the temperature of all of the products of the explosion.

Ammonium nitrate is hygroscopic to such an extent that its use in military explosives has been entirely discontinued.

When ammonium nitrate is dissolved in some solutions a considerable amount of heat is absorbed and this property is utilized in many so-called freezing mixtures. Ammonia dynamite freezes at temperatures lower than straight dynamite and when some of the nitroglycerin is replaced with nitro-substitution compounds a low-freezing ammonia dynamite is obtained with still lower freezing point. The following tables from Bulletin 80, p. 23, Bureau of Mines, give the ingredients of these types:

COMPOSITIONS OF TYPICAL AMMONIA DYNAMITES

Ingredients	30%	35%	40%	50%	60%
Nitroglycerin	15	20	22	27	35
Ammonium nitrate.....	15	15	20	25	30
Sodium nitrate.....	51	48	42	36	24

	100	100	100	100	100

*Composition similar to that of the combustible material in straight dynamite of grades below 40%.

Low-Freezing Dynamites

Nitro-substitution compounds have been used as components of dynamite, particularly because they lower the freezing point of the nitroglycerin therein. The nitro-substitution compounds are substances derived from coal tar, after having been acted upon by nitrating solutions. These mixtures reduce the temperature of the freezing points to 35 deg. F., which gives the dynamite its type named. This low-freezing quality is the only advantage of this type of powder, which, like ammonia dynamite has a lower rate of detonation and hence less disruptive effect than straight dynamite. It also has the disadvantage of the deliquescence of the ammonium nitrate and cannot be stored in damp places. A typical analysis of the composition of low-freezing dynamite is quoted from Bulletin 80, p. 22 of the Bureau of Mines.

COMPOSITIONS OF LOW-FREEZING DYNAMITES

Ingredients	30%	35%	40%	45%	50%	55%	60%
Nitroglycerin	23	26	30	34	38	41	45
Nitro-substitution compounds	7	9	10	11	12	14	15
Combustible material*.....	17	16	15	14	14	15	16
Sodium nitrate.....	52	48	44	40	35	29	23
Calcium or magnesium carbonate	1	1	1	1	1	1	1
	100	100	100	100	100	100	100

*Composition similar to that of the combustible material in straight dynamite.

Nitroglycerin acts as a solvent under certain conditions to dissolve soluble nitrocellulose, and the mixture that

[2]Bulletin 48, p. 7.

forms will set to a jellylike mass. In this way, or by the use of other solvents, the explosive known as blasting gelatin is formed. This is rated at 100% nitroglycerin, meaning that the dope has absorbed an amount of nitroglycerin equal to 100% of its own weight. This is the most powerful explosive that transportation companies will accept for carriage, and while perfectly safe to handle, in fact much safer than straight dynamite above 40%, is altogether too violent for ordinary mining operations, although having a field all its own for special applications. This composition is diluted by mixing it with a dope such as nitrate of soda and wood pulp used in straight dynamite, and the mixture so formed is known as gelatin dynamite. This gelatin dynamite is made in various grades rated by per cent. strength, as are the straight dynamites. The reason blasting gelatin gives so much greater force is because it gets more complete combustion on explosion than any of the other dynamites, and this additional chemical action greatly increases the heat, hence the volume of the gases and the force of the explosion. The initial shock necessary to detonate blasting gelatin is six times greater than is required for dynamite. This applies in only a slightly less degree to the gelatin dynamites, which is the reason a stronger cap is necessary when using this type of explosive. Unlike straight dynamite, gelatin dynamite is very sensitive to shock when frozen. In its ordinary condition its sensitiveness is increased by heat, but under usual circumstances it is much less sensitive to shock and friction than straight dynamite is. Aside from the strength of this explosive the greatest advantage of this type is its almost complete combustion and hence the freedom from noxious gases after the explosion. The next great advantage is the fact that it can be used in the wettest kind of work. A cartridge placed in water will turn white on the surface, on account of the nitroglycerin in the outer layer being displaced. The nitrocellulose remaining forms a protective coating for the rest of the mass, and makes it practically waterproof. However, those gelatin dynamites of low grades which contain a large proportion of hygroscopic nitrate have this water-resisting quality to a less degree than those higher up the scale.

Gases from Explosion of Dynamite

Both the amount and the quality of the gases produced by the explosion of dynamite are of important consideration, because the effect of the explosives is directly due to the quantity of gas generated. Referring to the last column in the following table, it will be seen that 60% straight dynamite generates about 50% more gas than does 40% straight dynamite. The tendency to use 60% dynamite underground should be discouraged, because while it is true that it does have much greater disruptive force than 40% dynamite, it gives such a large volume of obnoxious gases that smoke troubles are likely to overbalance any advantage due to using this stronger explosive. The figures in this table are taken from a more elaborate one in Bulletin 48 by the Bureau of Mines, and the results are concisely stated in its Bulletin 80, p. 25, as follows: "The low-freezing dynamite produced on detonation larger volumes of poisonous gases than any other explosive tested, one sample of the gaseous products of combustion of a low-freezing dynamite containing 47.47% by volume of carbon monoxide. The straight nitroglycerin dynamite produced 26.9 to 34.6% of carbon monoxide; blasting powder produced 10.8% carbon monoxide, and 8.7% hydrogen sulphide; granulated powder produced 2.7% carbon monoxide, and 15.7% hydrogen sulphide; and ammonia dynamite produced 3.8% monoxide, and 5.4% hydrogen sulphide. The gelatin dynamite on detonation gave the least amount of poisonous gases, namely, 3.0% carbon monoxide and 4.1% hydrogen sulphide."

GASEOUS PRODUCTS RESULTING FROM TEST OF EXPLOSIVES*

Class and Grade of Explosive	Gaseous Products (% by Volume)							
	Carbon Dioxide	Carbon Monoxide	Oxygen	Hydrogen	Methane	Nitrogen	Hydrogen Sulphide	Volume of Gas (Liters)
30% straight nitroglycerin dynamite	22.9	28.4	0.0	20.6	0.7	27.4	...	85.8
40% straight nitroglycerin dynamite	27.3	26.9	0.0	18.0	0.4	27.4	...	88.5
50% straight nitroglycerin dynamite	24.4	31.2	0.0	20.7	0.7	23.0	...	105.5
60% straight nitroglycerin dynamite	22.2	34.6	0.0	23.2	0.8	19.2	...	128.9
60% low-freezing dynamite	8.9	47.4	0.0	31.0	0.6	12.1	...	169.5
40% ammonia dynamite	41.4	3.8	0.0	3.1	0.8	45.5	5.4	65.6
40% gelatin dynamite	50.8	3.0	0.0	1.8	0.8	39.5	4.1	60.3
5% granulated nitroglycerin powder	51.3	2.7	0.0	0.9	0.7	28.7	15.7	61.6
Black blasting powder	49.7	10.8	0.0	1.8	0.6	28.4	8.7	67.8

*These explosives are not the same as given in the previous tables.

Summary of Characteristics

The straight nitroglycerin dynamite develops greater disruptive force than any of the other types of explosives, class for class, and where shattering effects are required should be used in preference to any other kind. Straight dynamite freezes at temperatures between 45 and 50 deg. F. The chief disadvantage in the use of straight dynamite is the considerable volume of obnoxious gases which are given off on detonation. These dynamites also are not suitable for use in very wet work.

Ammonia dynamite freezes at a lower temperature than the straight dynamite, and gives off less obnoxious and poisonous gases. It does not have the same strength as straight dynamite, grade for grade, is hygroscopic to an extreme degree and must be kept in perfectly dry storage or the deterioration is very rapid. Also it cannot be used in wet work. It is cheaper than straight nitroglycerin dynamite and is advisable for work where straight dynamite gives too violent an explosion. Ammonia low-freezing dynamite differs only from the above in that the freezing point is about 30 to 35 deg. F.

Low-freezing dynamite has practically the same advantages and disadvantages of the ammonia dynamite except that on detonation it produces the largest volume of obnoxious gases, and should not be used underground where the ventilation is poor.

Gelatin dynamite is the safest dynamite to handle and generates the least amount of obnoxious gases when detonated. It is the only dynamite to use in connection with wet work. It costs more than straight dynamite and does not give, grade for grade, the same disruptive effect, otherwise it would completely replace straight dynamite in mining work.

Gold-Bearing Quartz Veins in Dutch Guiana

By J. B. Percival*

The gold-bearing quartz veins in Dutch Guiana, South America, have not yet been exploited to any great extent, although there are indications that with the necessary capital to open and develop them thoroughly, the veins will prove as rich as any in South America.

Three Distinct Gold Zones

The best-known quartz veins in the colony are in the first gold zone. There are three distinct zones—the first, about 50 mi. from the coast, the second, 100 mi. and the third, between 160 and 180 mi. These gold zones have an easterly and westerly direction and run practically through the whole country. The first zone, which embodies the Mindrinettie Creek district, has proved the richest so far, although on both the others rich ore has been discovered.

Up to the present in Dutch Guiana only the alluvial deposits have been extensively worked, but within the last year or two the quartz veins have been receiving attention. The large quantities of sharp-cornered quartz, lying about the hillsides, would show that it is in close proximity to its source. Lately, veins have been discovered showing visible gold on several properties. Portions, broken from the vein, are very rich. A large amount of the alluvial gold of the country comes from these quartz veins which have been broken down and eventually deposited in the creeks.

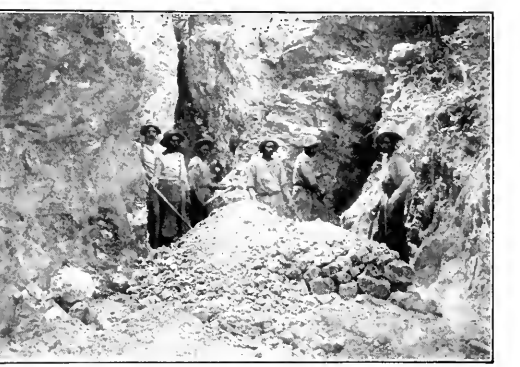
The best-known veins in the first gold zone are to be found on the Dejonge and Guyana Gould Placer concessions, where some of the veins have a thickness of 5 m. A geologist, who explored this part of the country and on his return to Europe published a paper entitled "A Brief Outline of the Surinam Gold Industry" said: "The most important part of the first gold zone examined by me is to be found between the Guyana Gould Placer Concession and Dejonge's property. The reefs continue their course along many hundreds of meters in an easterly and westerly direction. In the vicinity of the Guyana Gould property, the quartz veins are thickest and found at about a distance of 60 m. above the creeks and thus easily accessible. The gold percentage so far is remarkably high."

On the geological map of the colony the situation of these concessions is clearly shown to be slightly north of the fifth degree of latitude and west of a range of hills running from the Tempatie River across Bergendaal in an east-west direction. Most of the gneiss strata lie east and west and incline steeply toward the north.

The minimum level of this part of the colony is only 10 m. above Paramaribo, the capital; and, although the concessions mentioned are about 55 mi. from the coast, the altitude of the highest hill in the middle of these properties is but 500 m.

On the north, east and south of these concessions many good-looking veins are exposed for miles, and all that is required is capital to develop them. The railroad traverses the country and guarantees good communication with Paramaribo.

PROSPECTING PARTY BREAKING CAMP



MINING RICH QUARTZ IN DUTCH GUIANA

Quartz veins of different thicknesses are met with almost everywhere in the interior of Dutch Guiana. They do not, as a rule, take the same course as the steep gneiss formation, but notwithstanding carry more or less gold. A striking feature is the utter absence of basic and acidic eruptive rocks in some parts of the colony, which is not encouraging to those who maintain that the presence of similar rock formations is the cause of Dutch Guiana's gold wealth.

Farther south, that is to say, in the second and third gold zones, the country is very mountainous. Dutch Guiana is undoubtedly a rich country, and capital judiciously spent would make it a large producer.

Laboring men from temperate climes are not adapted to local conditions in Dutch Guiana. They could not exist on food of the kind supplied to the natives of the country, who are black and colored and earn only 50c. per 8-hr. day, with rations free. Black labor is good, comparatively speaking. When you can get a man to shift 300 cu.ft. of overburden, on the placers, in a day, it is good work, and of this the natives of Dutch Guiana are

*Box 139, Paramaribo, Dutch Guiana, South America.

quite capable; but they must in every case be supervised by white men.

In regard to climate it may be safely said that, if white men from northern countries take proper and known precautions, no fears need be entertained. There are tropical inconveniences but the resident soon becomes habituated to them. It is probable that at no distant date Dutch Guiana will become an important gold center. What is now required is a better knowledge of local conditions by strangers abroad.

Manganese-Ore Supplies

One of the products that is essential in our steel industry, though its actual quantity is not so great as is generally supposed by those unfamiliar with the case, has been materially affected by the war conditions abroad. This is the manganese alloy which is used—generally in the form of ferromanganese—in both the converter and the openhearth furnace in making steel. The quantity of this alloy consumed for several years has been only about 1% of the total steel produced in the United States, but its use cannot be dispensed with, as no substitute has yet been found.

Difference Between Ferromanganese and Spiegeleisen

Two alloys of this kind are known familiarly in the trade, the difference being mainly in degree. The more important is ferromanganese, which has from 60% manganese up, the standard being 80%. This requires, of course, high-grade ore for its making. Spiegeleisen is lower in grade, the standard being 20 to 25% manganese, and can be smelted from ores which are more nearly manganiferous-iron than manganese ores. The use of ferromanganese is preferred and has been increasing for several years, while that of spiegeleisen has been declining.

The consumption of ferromanganese and spiegeleisen in the United States for three years past has been, in long tons:

Ferro:	1912	1913	1914
Domestic	125,378	119,495	100,731
Imported	99,137	128,070	82,997
Total	224,515	247,565	183,728
Spiegel:			
Domestic	102,561	106,980	76,625
Imported	1,015	77	2,870
Total	103,576	107,057	79,495

For the eight months ended Aug. 31, 1915, the total ferromanganese and spiegeleisen made in this country was 132,514 tons, which would indicate a total production of more than 200,000 tons for the year, notwithstanding the supposed scarcity of ore.

The sources of the raw material for our domestic product have been as follows, for three years:

Imports:	1912	1913	1914
Russia	83,334	124,337	52,680
India	128,645	141,587	103,583
Brazil	81,580	70,200	113,924
Other countries	7,102	8,966	13,107
Total	300,661	345,090	283,294
Domestic production	1,663	4,048	2,635

The ore from other countries was chiefly from Cuba. The total imports of ore in the half-year ended June 30, 1915, were 58,148 tons, being 76,133 tons less than in the corresponding period of 1914. The domestic production for several years past has been rather less than 1% of the ore used in our furnaces. The excess of foreign ore used has not been altogether because of the scarcity of domestic ore. The necessity of crushing and concentrating most of our ores and the cost of transportation have discouraged attempts to compete with foreign ores which had the advantage of cheaper mining, of little or no cost of preparation and of cheap water freights. No one anticipated the time when supplies might be cut off, and the consideration was only for present pront, not for provision for the future.

War and Manganese Shipments

The war in Europe introduced new and unexpected elements into the question. The exports of manganese ore from the Caucasus were cut off altogether, while those from British India were prohibited for a time, and when the strict embargo was raised, they were seriously restricted in quantity. The only free source of ore left was in Brazil, and to increase shipments from that country it was necessary to enlarge mining facilities, which required time and money. The ore resources in that country are large, but have never been properly developed.

Of course the immediate result of these conditions has been a strong advance in the prices of ore and of manganese alloys. Ferromanganese, the alloy most used in steel making, was quoted in the first half of 1914 at $36 to $38 per ton at Baltimore, where most of the foreign metal is imported. The current quotation is up to $105, Baltimore, for early delivery, while there have been sales of domestic ferro as high as $112.50 per ton, or three times the price a year ago. Ore has advanced in like measure. The Carnegie Co. bought in 1914 domestic ores on a schedule which made 26c. per unit of manganese for 49% ore the highest price, and this was understood to be a higher figure than was paid for imported ore, the company desiring to promote domestic production.

At the present time 45c. per unit is being named for 48% ore, while limitations as to silica and phosphorus are not as strict as they were. It is understood that the Brazilian ore that the Steel Corporation is now importing costs from 11 to 12c. per unit at seaboard, the ore running from 45 to 48% manganese, and being low in phosphorus.

Naturally there is a good deal of talk about prospecting for manganese ores and about reopening and developing old mines. The time is favorable, but so far there has been no large source of these ores brought to the point of commercial production.

New German Copper Refinery

A new German electrolytic copper-refining plant is to be installed, according to the London *Electric Review*. It is announced that the Hüttenwerke Niederschonweide proposes to erect a plant in the vicinity of Bitterfeld for the production of electrolytic copper. The energy required is estimated at 2,000,000 kw.-hr. per annum, which would be obtained from the Electro Works Co., of Golpa Jessenitz. The carrying out of the scheme would increase to three the number of works turning out electrolytic copper, the two existing being those of the North German Refinery Co. and the Kayser Metal Co.

Tin-Ore Dressing at Llallagua, Bolivia—II

By Durward Copeland* and Scovill E. Hollister†

SYNOPSIS—To separate the pyrite from the valuable cassiterite in the sulphide ore at Llallagua, Bolivia, roasting and magnetic separation were applied, following jig-and-table concentration. Kauffman 5-hearth mechanical furnaces and Stern wet-type magnetic separators have replaced hand furnaces and buddles.

As can readily be appreciated the production of *barrilla* from the pyrite-cassiterite middlings by means of hand furnaces and buddles was expensive at Llallagua, Bolivia, both because of the high-priced fuel and the large number of laborers—even though the labor is cheap—that were required. Because of this high cost, and because the hand furnaces were inadequate to handle the larger amount of fine pyrite-cassiterite middlings resulting from the treatment of a constantly increasing percentage of pyrite ore from the mine, automatic roasters and magnetic separators were installed. This installation is handling all of the fine middlings produced and the hand furnaces and buddles are now but interesting relics of the past.

Roaster-Magnetic-Separator Installation

The only problem the roaster-magnetic-separator plant must solve at Llallagua has to do with the treatment of pyrite-cassiterite middlings consisting of grains of small diameter. In these middlings the minerals have been broken free from one another, but a separation was not made by the water-concentrating machine of the mill. This does not mean that a reasonably good separation on classified material cannot be made between cassiterite and pyrite. On a table, for example, even with reasonably good classification it is difficult to make a high tin recovery without including in the concentrates so much pyrite that the sulphur becomes high enough to cause smelter penalties. The roasting furnaces employed to prepare the ore for the separators use no fuel except the sulphide in the ore, therefore, on the tables it is the practice to attempt no direct *barrilla* but to cut in with the band of tin enough of the band of pyrite to give concentrates with at least 25% sulphur as pyrite. The roasters require about 25% sulphur in order that the charge shall be self-burning (the furnaces are 13,000 ft. above sea level). The material, therefore, which the magnetic-separator plant has to treat is pyrite-cassiterite middlings with 25% or more of sulphur, usually containing at least 15% of tin, and nearly all of the middlings are finer than 1 mm.

The middlings are first taken to a drying floor of concrete, where the material is spread and raked over by hand until a greater part of the moisture has evaporated. There is still in the ore as it goes to the furnace feeder about 5% moisture. Five Kauffman furnaces, made by the Erzröst Gesellschaft of Frankfort-am-Main, Germany, prepare the ore for the magnetic separators. The Kauffman furnace used is of the five-compartment type, similar in general design to the McDougal furnace so common in American roaster practice. To cool the center shaft, air is supplied by a small fan. The air for burning the sulphide is regulated by an exhaust fan and adjustable air inlets in the furnace. Each of the furnaces has an iron pipe connection to a dust chamber, situated between the furnaces and the exhauster. From each of the furnaces the ore is delivered into a short conical trommel of unperforated sheet iron. The trommel serves two purposes: (1) To make constant the feed to the separators, and (2) to cool the ore somewhat. The ore leaving the trommel is hit by a stream of water which carries it through wooden launders to the magnetic separators. The separating machines are of the Stern wet type and were made by the Electro Magnetische Gesellschaft, Frankfort-am-Main. The nonmagnetic material is, if the feed is right, *barrilla* of sufficiently high tin percentage for exportation. In case there is an excessive amount of nonmagnetic material that is not tin, in the product the concentrates are re-treated on tables before shipping. The magnetic material is sent to the Hardinge mill for regrinding and from there to classifiers and tables.

No Carbonaceous Fuel Required

This plant is unusual in a number of ways. The ore is prepared for the separators by a furnace using no carbonaceous fuel. Therefore, since the magnetic oxide cannot easily be obtained, the problem is to roast to the magnetic sulphide. The "flash roast"—where the ore is passed through the furnace rapidly, and the bulk of the heat comes from the burning of carbon fuel, and where this heat drives off a part of the sulphur of the pyrite—is not applicable here. When the carbon fuel is used it makes no difference whether the sulphide burns or not, since the heat itself will drive off enough of the sulphur of the pyrite to make the resulting iron sulphide magnetic.

At Llallagua the heat to keep the furnace above the ignition temperature of the pyrite must come from the burning of a part of the sulphide itself. We have carried on extensive experiments to find which is the best degree of roast to make an iron mineral of the greatest possible magnetic permeability. The simplest method of regulating this is to control the percentage of sulphur in the furnace product. Our ores average about 27% sulphur and the best results are obtained when the furnace product still contains 10 to 12% sulphur. It would undoubtedly be more satisfactory, in case the furnace feed varied greatly in the amount of pyrite contained, to regulate the operation by the amount of sulphur in the magnetic part of the separator discharge. When working best the magnetic material from the separators contains about 22% sulphur and 50% iron, while the nonmagnetic part has about 1.5 to 2% sulphur and 2.5% iron. The roasted ore should be black and of metallic luster. In case the roast

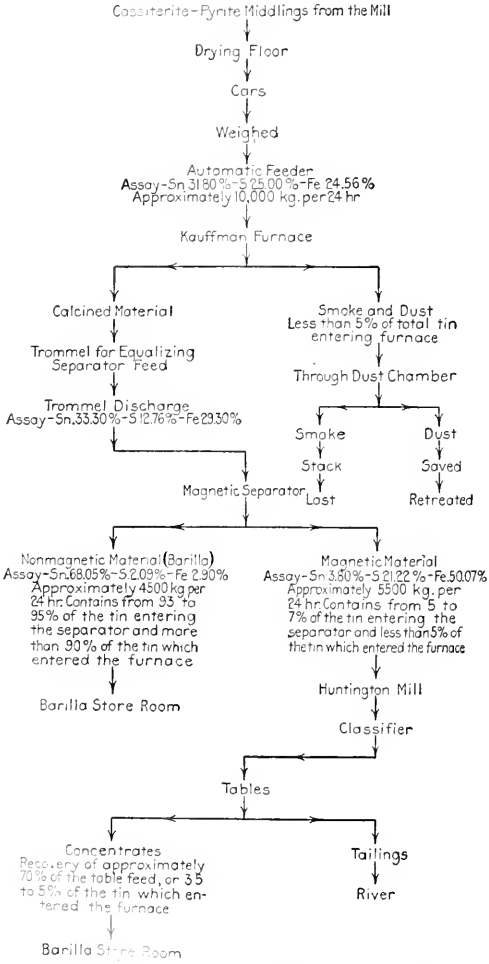
*Metallurgist, Cia. Estañifera de Llallagua, and professor of metallurgy, Missouri School of Mines, Rolla, Mo.

†Mill superintendent, Cia. Estañifera de Llallagua, Llallagua, Bolivia.

has proceeded far enough to give to the product a reddish color the separators do poor work and the *barrilla* runs up in iron.

Magnetic-Separator Work Dependent on Satisfactory Roast

It is, of course, true that the entire success of the magnetic separation depends on the work done by the furnaces. If the roast is properly made the magnetic machines must work well, while if the iron mineral is not made sufficiently permeable during the roast the separators cannot make clean *barrilla*. It is undoubtedly true, also, that the highest temperature prevailing in the furnace is of great importance because of its effect on the reactions that can take place. With a regular feed and air supply, the sulphur percentage is the most convenient means of regulation. Our furnaces will roast about 10 tons each per 24 hr. when preparing the ore for the separators, that is, roasting from about 25% sulphur down to 10%. This is about 400 kg. per sq.m. of hearth area. It should be remembered that the furnaces are 13,000 ft. above the sea, that the greater part of the feed passes 1 mm. and that when entering the furnace the feed contains 5% moisture. If a quantity greater than that mentioned is fed, the furnace soon gets cold, more air simply aiding in the cooling. It is possible that with more rapid stirring and more air the furnace capacity could be increased. Our furnaces have two rabbles per compartment and the center shaft makes 3 r.p.m.



FLOW SHEET OF MAGNETIC-SEPARATING PLANT

The amount of flue-dust made by the furnaces is surprisingly small when the fineness of the material treated is considered. Ordinarily the flue-dust produced is less than 5% of the weight of the furnace feed. The percentage of tin is always much less in the dust than in the feed. When the ore has 20% tin the material caught in the dust chambers never contains more than 5% tin, so the loss in dust is small; such loss never amounts to more than 2% of the tin charged to the furnace. The draft through the furnace is not particularly strong. The cassiterite does not decrepitate. All of the material which enters the furnaces is sufficiently heavy to be caught in water-concentrating machines. Under the conditions mentioned one would not expect to find in the flue dust much of a mineral which does not change either chemically or physically during its passage through the furnaces.

Trouble from Arsenic Condensation

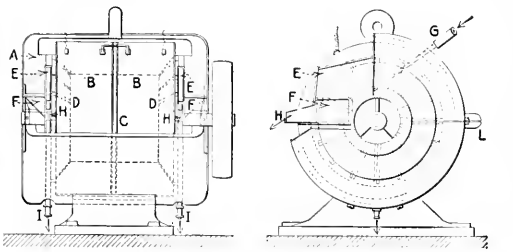
With the furnace installation as made at Llallagua there are some difficulties due to the fact that the design seems to have been made without a good knowledge of ores and conditions. Each of the furnaces is connected with the dust chamber by a sheet-iron pipe 80 cm. in diameter and 8 m. long. In the sulphide middlings treated there is always some arsenopyrite. During the roast a large part of the arsenic volatilizes as arsenious oxide. The sheet-iron pipe mentioned is of sufficiently low temperature to allow some of this arsenious oxide to condense, and every month there must be a cleaning of the pipe. Much of the arsenic fume passes the dust chamber and condenses in the exhaust fan. At present this fan has to be cleaned of the rock-hard oxide of arsenic once in every six weeks. We have installed two exhaust fans, one of which is always in operation. To drive the fan requires from 7 to 10 hp., depending upon the amount of arsenic that has been condensed, and this power costs at least 15 bolivianos per day (1 boliviano = approximately $0.39). With a stack of sufficient height, enough air could easily be obtained without the fan. The fan may be necessary for the regulation of air in sulphuric-acid making but is not needed in our roast and should not be installed at a place where power is so expensive. The cost of a proper chimney would be small as compared to the operating cost of the fan, and such a chimney will soon be constructed at Llallagua.

Stern Wet Magnetic Separators

The Stern type of separator is particularly adapted to the problem at Llallagua where the only material on which the magnetic machines are needed is the fine jig middlings and table concentrates. At the mines of Señor Patiño, in Uncia, there has recently been installed a large magnetic-separator plant using Humbolt-Wetherill machines; preceding these machines with screens such as might be found in a pyrite-blende separator in the United States.

The reason for the magnetic separators on the tin ores of Llallagua and Uncia is to do work which the mill could not easily perform. The mill did not complete the separation because classification was difficult on account of the fineness of the material. We can, therefore, see no reason for following the water end of the mills at Llallagua or at Uncia with another plant requiring classification and working poorly on fine ore. The gravity difference of two is sufficient to enable the mill to make a first-class separation of the cassiterite from the pyrite in the coarse ore. The wet separators used at Llallagua treat the whole product and work well on unclassified and fine-diameter feed.

A sketch of the Stern separator is shown herewith. The magnetic field is obtained by passing the electric current through the stationary coils *B* inside of which the iron core *C* revolves. Attached to the revolving iron core *C* are the flanges *D* which are beveled at the ends to concentrate the magnetic lines. The chambers *E*, in which the separation takes place, are between the revolving flanges *D* and the cast-iron body *A* of the machine. The roasted ore mixed with water, after passing a small sta-



STERN WET-TYPE MAGNETIC SEPARATOR

tionary screen to remove occasional large pieces which might clog spigot *I*, enters the separating chamber at *F* and is immediately subjected to the magnetic field. The nonmagnetic material, in this case the cassiterite, falls to the bottom of the separating chamber and passes out through the spigot *I*. That material of the feed which has sufficient permeability is raised above the water level of the separating chambers until finally it is hit by a stream of water from the jet *G* and is washed out of the machine through the spout *H*. To enable the stream of water from *G* easily to wash out the magnetic material, the field strength is lessened by having a segment cut out of the cast-iron body *A*. During the time the magnetic material is being raised out of the water the action of the lines of force, due to the revolving flanges, causes the material to turn over and over and gives good opportunity for entangled nonmagnetic particles to escape. The separating chambers are kept so full of water as to cause a constant overflow at *L* in order that the water may retard a rapid fall of the feed through the magnetic field.

Separators Require Little Power

The strength of the field may be easily varied by changing the strength of the current through the coils. Ordinarily at Llallagua about 6 amp. per machine is employed, the voltage being 110, which means about 1 hp. per machine. The revolutions of the flanges *D* may be increased or decreased, the effect being opposite to the same changes of the belt speed of an ordinary belt type of separator. The speed found best at Llallagua is about 11 r.p.m., but this can be varied according to the amount and class of the ore being treated.

The Stern separator occupies a floor space of 3½x3 ft. and the height from the entrance of the feed to the spigot *I* discharging the nonmagnetic material is 26 in. The capacity of the Stern separator on the fine-grained material treated is about 18 tons per 24 hr. Three separators can be used to handle the product from the five roasting furnaces, which leaves one separator always in reserve. The quantity of water needed for the separator varies with the amount and nature of the feed, it being necessary to have the water in the separating chambers always at the level *L*. Ordinarily about 2 cu.m. of water per hour are used with the feed to one machine and as much more for each separator to wash out the magnetic material.

The separators have given little trouble. About the only difficulty has been with the separating chambers. The side of the separating chamber next to the revolving flanges was, as supplied by the makers, made of steel containing enough nickel to be nonmagnetic, the idea being to have this necessarily nonmagnetic material sufficiently hard to resist the mechanical wear. In our ores there is always a little chalcopyrite and during the relatively low temperature roast some of the copper forms sulphate. The nickel-steel plates rapidly precipitated this soluble copper and the side of the separating chamber was soon destroyed, the wear being more chemical than mechanical. The nickel-steel has been replaced by copper plates and this trouble overcome. A separating chamber now lasts at least six months and can frequently be soldered to go a few months more.

Relation of Tin and Nonmagnetic Gangue

The most important point to take care of, if a *barrilla* rich in tin is to be obtained, is the relation between the tin and the nonmagnetic gangue in the furnace feed. If the percentage of nonmagnetic gangue is more than about one-fourth of the percentage of tin it is impossible to obtain 65% *barrilla* even if all of the iron mineral be removed.

The commercial results of the separator installation are good as compared with those obtained by the use of the old hand furnaces and buddles. With the hand furnaces the *barrilla* cost was about 1.90 bolivianos per quintal while the Kauffman-furnace magnetic-separator installation on the same material, produces a quintal of *barrilla* for 1.18 bolivianos.

The first cost of the Kauffman-furnace installation including the furnaces, freights, building, transmission, motor, fans, erection and all accessories was 160,000 bolivianos ($55,000) of which the total first cost of the furnaces in Europe was 24,000 bolivianos. The separator installation complete cost about 60,000 bolivianos ($21,000).

Three men per shift are required in the roasting department and three during the day to dry the ore and bring it to the furnaces. The separators use two men per 12-hr. shift although one man could do the work.

(*To be concluded*)

Superphosphate Is to Be Produced in the district of Slobodsk, Perm Province, Russia. The Department of Agriculture is aiding the local zemstvo in the enterprise.

Details of Practical Mining

Skip with Cable Guides

By Jesse Simmons*

A self-dumping skip operating on cable guides has been installed by E. R. Graham, superintendent of the Mogul Mining Co., Terry, S. D. The illustrations show the skip in dumping position at the top and a closer view with the skip hanging from the crosshead.

Dumping is accomplished by two hooks attached to the bottom of the skip, engaging a piece of 2-in. steel shafting that lies on the horizontal timber extending out to the left about half way up the headframe. Two bars

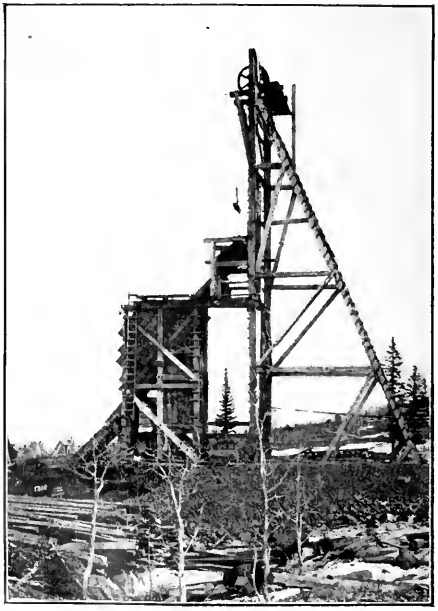


FIG. 1. SKIP IN DUMPING POSITION

are fastened to this shafting at right angles to it and are provided with hinge connections so that the shafting is pushed up and out of the way by the skip coming upward. The shafting immediately drops into position when the skip bottom has passed; the engineer then drops the skip on the shafting, which is a few inches to the side of the center of the skip and causes it to tip. The hooks then engage the shafting and prevent its falling. The lip of the skip drops over until it rests on a timber. After the skip has dumped the engineer pulls it up quickly; the hooks in disengaging cause the skip to swing, and while it is swinging it is quickly dropped past the shafting. It is then stopped for a second or so, until it ceases swinging and is then lowered to the station at the bottom to be loaded. The cable guides are ¾-in. steel ropes.

Channel iron, ½x6 in., was used for the crosshead, two pieces being bolted together, with wood between. At each end 1-in. holes were bored to permit the guides to pass through. From the crosshead the skip is suspended by two short pieces of cable. The guides are fastened at the top to the headframe and at the bottom pass through I-bolts in heavy sills. The skip has a capacity of 1,800 lb. of rock—the load of a single mine car. The engineer finds it comparatively easy to hoist 50 to 75 skips per 8-hr. shift, besides having time to

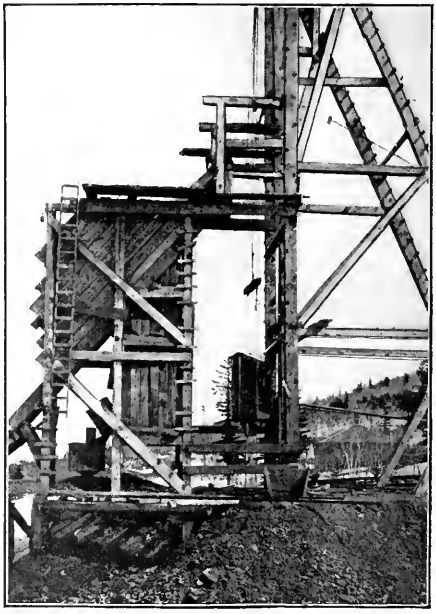

FIG. 2. SKIP READY TO LOWER

assist the blacksmith, repair the five or six stoping drills used underground and do other odd jobs.

The shaft is 135 ft. deep to the present loading station, and for the first 30 ft. only, is timbered with square sets; the remainder of the shaft is plank-lined. The rock is mostly a hard, firm shale, with some sandstone, lying nearly horizontal and having but a slight tendency to slough or cave. The shaft was sunk at a moderate expense, requiring considerably less excavation than if it had been planned to be timbered fully. It is one of the principal sources of ore supply for the company's mill. At the left in Fig. 1 may be seen a C., B. & Q. R.R. car being loaded for shipment to the mill. Waste is handled through the bin under which the mine car is seen standing. At present waste is used for stope filling.

*Deadwood, S. D.

The Bonus System Applied to Tunnel Driving*

The rapid advance made on some of the recent "record" tunnels, notably the Mount Royal, Arizona Copper, St. Louis Water-Works, Laramie Poudre, and Los Angeles Aqueduct, seems to have been due very largely to the bonus system of wages. This system was used at all the tunnels mentioned, and is the only practice of note that was common to those five contracts. Different types of drills, some with and some without carriage mountings, both long and short rounds, and different methods of handling the muck were used.

The cost of tunnel driving varies with the rate of progress. The saving realized by the bonus system in the labor cost is shown in the tabulation:

LABOR SAVING BY BONUS SYSTEM

	Per Cent.
Mount Royal Tunnel	15
Arizona Copper Tunnel	20
St. Louis Water-Works Tunnel	50
Laramie Poudre Tunnel	31

The cost of driving the tunnels during the record months under the bonus system has been compared with the cost of driving before the bonus system was adopted. Before considering the several projects separately the accompanying tables should be examined. Table 1 gives some general data as to character of rock, size of heading, etc., while Table 2 shows the approximate number of men at work.

TABLE 1. DATA OF TUNNELS WHOSE RECORDS ARE COMPARED

	Mount Royal Tunnel	Arizona Copper Tunnel	St. Louis Water-Works Tunnel	Laramie Poudre Tunnel
Rock	Trenton limestone with igneous dikes	Granite porphyry; good drilling	Both hard and soft limestone	Moderately hard, gray or red granite
Size of tunnel heading	8x12 ft.	8x8 ft.	8 ft. diameter (circular)	7½x9½ ft. (elliptical)
Average cross-section	3.56 cu.yd. per ft. advance	70.04 sq.ft.	95 sq.ft.	62 sq.ft.
Record advance in 31 days	810 ft.	790 ft.	745 ft.	653 ft.

TABLE 2. TOTAL LABOR ON TUNNEL CONSTRUCTION

	Mount Royal Tunnel	Arizona Copper Tunnel	St. Louis Water-Works Tunnel	Laramie Poudre Tunnel
Superintendents	2		1	1
Foremen or bosses	3	1	3	3
Drillers and helpers	24	12	24	15
Muckers	24	15	22	18
Miscellaneous labor of all classes	59	12	51	22

The bonus paid to the men at the Mount Royal tunnel was 7% of their daily pay for every foot over 14 ft. per day. The influence of the bonus system on the work at this tunnel is shown by Table 3.

TABLE 3. MOUNT ROYAL TUNNEL

Costs	A Typical Month Without Bonus	Record Month With Bonus
Labor	$9,980 00	$15,883 00
Equipment and supplies	2,927 00	4,750 00
Total, including overhead	13,916 00	21,633.00
Advance	434 00	810 29
Per foot (labor)	$23.00	$19 61
Per foot (labor, equipment and supplies)	29.76	25 47
Per foot (total)	32.06	26 70
Per cubic yard (labor)	6.48	5 51
Per cubic yard (total)	9.00	7 51
Saving (in labor) in cost per foot, by bonus system		3 39
Saving (in labor, equipment and supplies) per foot		4 29
Saving (total) per foot		5 39
Saving in total cost per cubic yard		1 50

At the Arizona Copper tunnel the men received regular wages, and for every foot of advance over 350 ft. per month a bonus of $7 was divided. This was only a trial, but although it was found that the bonus was excessive it was not reduced, as the duration of the test was short. The tunnel was driven the first month without a bonus and the three succeeding months with a bonus. A comparison of the advances and the costs per foot of tunnel in each case is shown by the figures in Table 4.

TABLE 4. ARIZONA COPPER TUNNEL

Costs	Without Bonus	With Bonus		
	First Month	Second Month	Third Month	Fourth Month
Labor	$3,773 00	$5,314 24	$5,802 69	$6,374 77
Equipment and supplies	2,013 33	2,013.33	2,013 33	2,013 33
Labor, equipment and supplies	5,786 33	7,327 57	7,816 02	8,588 10
Advance in feet	350	582	664	762
Per foot (labor)	$10 78	$9 13	$8 74	$8 63
Per foot (labor, equipment and supplies)	16 53	12 59	11 77	11 27
Cubic yards of rock removed, labor, equipment and supplies	6 33	4 82	4 51	4 32
Saving on labor, per foot, by bonus system		$1 65	$2 04	$2 15
Saving on labor, equipment and supplies, per foot		3 94	4 76	5 26
Saving on labor, equipment and supplies, per cubic yard		1 51	1 82	2 01

Three shifts per day were employed at the St. Louis Water-Works tunnel. A minimum advance of 72 ft. per week was set, and for all over that amount the following bonus rates were paid: Superintendent, 50c. per ft.; heading foreman, 50c.; muck foreman, 30c.; drill runners, 30c.; drill helpers, 20c.; nipper, 20c.; muckers and cage men, 10c. Each shift was credited with one-third of the extra progress and received one-third of the bonus.

TABLE 5. ST. LOUIS WATER-WORKS TUNNEL

Costs	Estimated Without Bonus	Cost per Day With Bonus
Labor	$381 75	$381 75
Total bonus per day		66 80
Advance, feet per week	72	745
Labor per foot	$37 09	$18 66
Labor per cubic yard rock removed	10 54	5.30
Saving in labor, per foot, by bonus		18 43
Saving in labor, per cubic yard, by bonus		5 24

Three shifts per day were employed on the Laramie Poudre tunnel. For the first part of the work each underground workman was paid a bonus of 25c. per day for each 25 ft. in excess of 400 ft. per month. This system was soon discontinued, as it was found to be not only cumbersome but excessively high, and the following system was adopted: When the rate of driving for any calendar month exceeded 400 ft. and was less than 500 ft., each underground employee was paid $10 extra; between 500 and 600 ft. the bonus was $15, and between 600 and 700 ft. it was $20. In order to distinguish the bonus money from the regular wages the bonus was paid by check. The itemized account is given in Table 6.

TABLE 6. LARAMIE POUDRE TUNNEL

Costs	Estimated Without Bonus	Cost per Day With Bonus
Straight wages	$242 65	$242 65
Total bonus per day		29 68
Advance per month in feet	400	653
Labor, per foot	$18 76	$22 94
Labor per cubic yard removed	8.16	5 60
Saving per foot due to bonus		5 82
Saving per cubic yard due to bonus		2 56

The bonus system at the Los Angeles Aqueduct tunnels proved to be a great success, and all tunnels here were driven under this system. The bonus was shared by the tunnel foreman, shiftboss, miners and muckers. All back-trimming was done by the crew, which shared the bonus. Overbreakage was about 30%.

The bonus varied from 20c. to 40c. per ft. over the base rate, depending on the class of material encountered. At the start it was estimated that a reasonable progress

*J. R. McFarland, 5710 Kimbark Ave., Chicago, Ill., in "Engineering News," Aug. 26, 1915.

would be 8 ft. per day with three 8-hr. shifts. A bonus system based on this advance gave 40c. per ft. in excess of the 8 ft. Thus it was expected that the monthly advance would not fall below 248 ft.; as a matter of fact, 10.8 ft. per day was averaged, giving a monthly progress of 330 ft. The standard tunnel crew consisted of 16

TABLE 7 DAILY COSTS, LOS ANGELES AQUEDUCT TUNNELS

Average daily progress	10.8 ft.
Average cost, direct charge	$51 10
Equipment	6 50
Pipe lines and operation	46
Roads, trails and maintenance	1 40
Buildings	1 49
Surveys	24
Division administration	2 12
Executive administration	1 92
Miscellaneous losses, test, phone, operation, etc	53
Grand total cost per foot of tunnel	$65 76

men in untimbered tunnels and 23 men in timbered tunnels. In dry tunnels miners received $3 per day and muckers and timbermen $2.50 per day; in wet tunnels each man received 50c. more per day. The itemized account is given in Table 7.

Track Ropes for Tramways*

There are two main types of rope which are used as track cables in aërial tramways—the spiral and the locked-coil construction. The main advantage of the spiral type is its cheapness, and in lines transporting a small tonnage per hour it will generally answer the purpose. When, however, a larger tonnage and the consequent heavier carriers enter into the question, its disadvantages begin to be apparent. The runner wheels passing over this type of rope come in contact with it only at one point of each of the top wires, whereby the wheels have grooves rapidly cut into them and the wires themselves begin to wear and commence to break. In order to overcome this difficulty, spiral ropes are generally made of a material having a higher breaking stress than that of the material used for locked-coil rope. A further disadvantage of spiral rope is that moisture penetrates between the individual wires and rusting occurs, thus shortening the life of the rope. Rope composed of several strands surrounding a hemp core is sometimes employed, but is not to be recommended as the individual wires are apt to break because of their small diameter. Spiral rope of the usual type should consist of 19 wires in ropes of 1 in. diameter and of 37 wires in ropes up to 1½ in. diameter.

Above 1½ in. diameter, locked-coil rope should invariably be used. To obtain the required diameter of the carrying rope, various makers employ different formulas. It may be obtained from the usual formula for the tension in ropes, but it has been proved by experience that much trouble is caused by breaking in consequence of the bending near the saddles, and for this reason many firms employ formulæ based upon stresses resulting from bending. The formula used by Pohlig, of Cologne, is:

$$\textit{Weight per meter of rope} = \frac{0.85}{100}[\textit{weight of carrier} + (\textit{distance between carriers in meters} \times \textit{weight of traction rope per meter})]$$

This is for spiral-construction rope. It works well for the small lines up to about 50 tons hourly capacity. For each additional five tons, 0.05 should be added to the factor 0.85. With locked-coil rope the factor 0.85 becomes 1.05.

The correct laying out of the profile for a ropeway can only be done after much experience; but a few points of importance may be mentioned. Although the rope really hangs in a catenary, it is the usual practice to assume the parabolic formula to obtain the dip of a rope; that is:

$$Dip = \frac{L^2 W}{8 T}$$

where

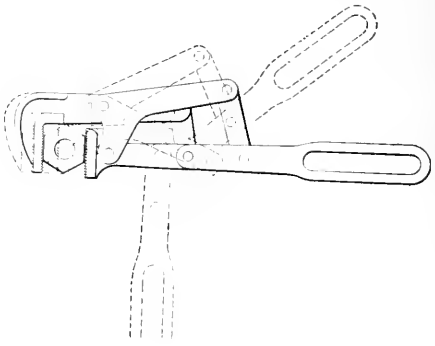
L = Span;
W = Weight per unit length;
8 = The constant;
T = The tension.

When the line is laid out on paper the curve of the rope obtained from this formula is set out and the supporting trestles placed accordingly. It sometimes happens in practice, however, that when the rope is fully tensioned, it floats or rises up from the supporting tower, perhaps because of a small error in the drawn profile. To avoid this, some makers employ a so-called factor of safety for the dip; that is, the denominator $8T$ is multiplied by a constant, the formula giving as a result a dip more than the actual. This factor may be taken at 1.5 for spiral rope and 1.1 for locked-coil rope.

* Abstract from "The Engineer" of July 23, 1915.

Hayward Pipe and Nut Wrench

The Hayward Wrench Co., of St. Louis, Mo., is manufacturing a new pipe and nut wrench, called the "Hayward," in which the wrench opens and closes by a link motion operated entirely by the pull on the wrench



LINK MOTION MONKEY WRENCH

in tightening or loosening the nut. By an ingenious application of this motion the face of the movable jaw remains continually parallel to the face of the fixed jaw. In the illustration the upper dotted line shows the position of the handle when the wrench is fully open, the full lines when it is gripping the nut shown, and the lowest dotted lines, the position when the jaws have met.

Peruvian Mines Employ Nearly 20,000 Men, according to the "Boletin" del Cuerpo de Ingenieros de Minas. Of these, over one-half are employed in the Department of Junin, in which are situated the important operations of the Cerro de Pasco Mining Co. and those of the Backus & Johnson Co.

Details of Milling and Smelting

Recent Progress in Pyrometry

A general review of progress in pyrometry is given by C. R. Darling (*Journ. Royal Soc. Arts*, p. 63, 1915; abstr. *Journ. Soc. Chem. Ind.*, June 15, 1915).

Since 1910 no pyrometers based upon new principles have been introduced, and the advances made have been confined to improvements in methods previously in use. The values now generally recognized for purposes of standardization are—Water, boiling point, 100° C.; aniline, boiling point, 184°; naphthalene, boiling point, 218°; tin, melting point, 232°; cadmium, melting point, 321°; lead, melting point, 327°; zinc, melting point, 419°; sulphur, boiling point, 445°; antimony, melting point, 631°; sodium chloride, melting point, 800°; silver, melting point in reducing atmosphere, 961°; gold, melting point, 1,063°; copper, melting point, graphite covered, 1,083°; lithium metasilicate, melting point, 1,202°; nickel, melting point, 1,450°; palladium, melting point, 1,550°; platinum, melting point, 1,755°; tungsten, melting point, about 3,000°; carbon arc, about 3,500° C.

Thermo-electric Pyrometers—Base metals have been used to a considerable extent for the construction of thermocouples. This has been so not only because of the comparative cheapness of such materials, but the fact that properly chosen base-metal couples develop a relatively high e.m.f. Kowalke has shown that base-metal couples are liable to alter if subjected to continued heating, and suggests that such couples should be "aged" by continued heating before calibration. Carbon and graphite couples have been used for temperatures exceeding 1,200° C. (Bidwell, *Phys. Rev.*, June, 1911). The potentiometer principle has been largely adopted for commercial instruments.

Few changes have been introduced in resistance pyrometers. Sir William Crookes has shown recently that platinum is measurably volatile above 1,000° C., and this explains why pyrometers give erroneous readings when continuously used for higher temperatures.

Charge Car at Midvale, Utah

In connection with the new mechanical-charging system for handling materials from stock bins to furnaces at the plant of the United States Smelting Co., Midvale, Utah, there are used three Brownhoist electric

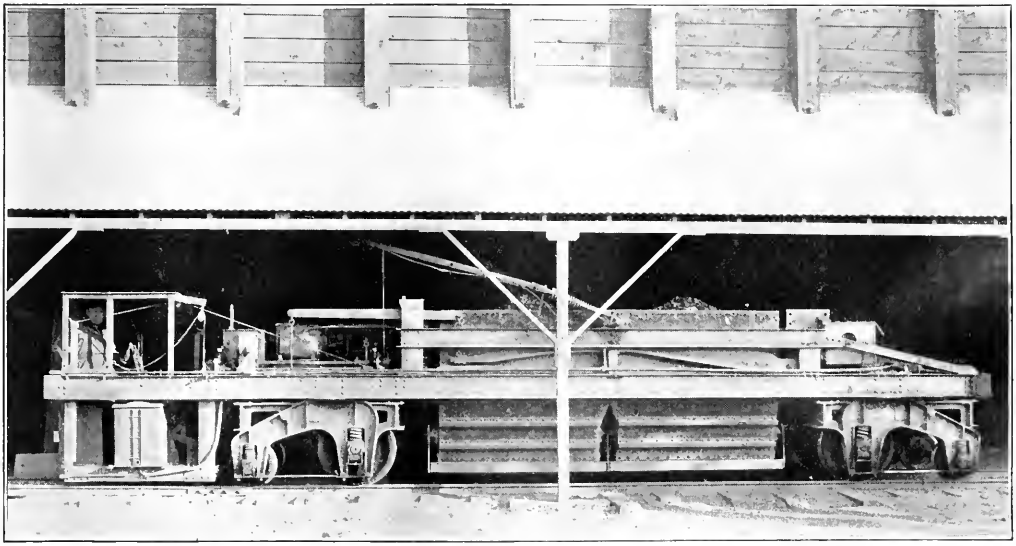


FIG. 1. BROWNHOIST LARRY COLLECTING CHARGE FOR LEAD BLAST FURNACES AT MIDVALE, UTAH

larries of the type shown in Fig. 1. The charge car is mounted on two four-wheel swivel trucks, each having one large pair of wheels and one pair of guide wheels, which permit the larry to be operated on sharp curves. A 19-hp. 500-volt direct-current motor drives the car at full load at a speed of from 600 to 700 ft. per min.

As will be noted in Fig. 2, the operator's platform contains, in addition to the scale beams for weighing the charges, the traveling and bin-gate-operating controllers and the foot brake. The car has a capacity of 120 cu.ft., and the charge is dumped into the furnace through drop-bottom gates. The hopper frame is suspended on scales, so that the weight of each class of material is shown on the scale beam on the operator's platform. The scales have multiple beams, such as are commonly used in mak-

ing up lead-furnace charges. Each beam is set for the exact amount of the certain kind of material wanted, and the operator allows this material to flow into the hopper until the beam balances.

The bins storing bulk materials, such as coke, lime rock, iron ore, roast, etc., are provided with belt gates, shown in Fig. 2. The bedded ores are drawn from the bins by means of the reciprocating arc gates shown in Fig. 3. The bin gates are operated by a 7½-hp. motor on the larry, the connection being made by means of gearing. When the larry, which was built by the Brown Hoisting Machinery Co., of Cleveland, Ohio, is stopped in the proper position beneath the gate, the operator by throwing a lever connects the gate mechanism with a motor on the larry. This operation simultaneously breaks the current through the travel motor, thereby making it impossible to move the car while it is connected to the bin-gate gear. A careful operator, with this traveling charge car, is able to make up the charge with the accuracy necessitated by the extreme sensitiveness of the lead blast furnace.

FIG. 3. BEDDED-ORE BINS WITH ARC GATES ALSO OPERATED BY THE CHARGING LARRY

Ore Weighing at the Bunker Hill Mill

At the large concentrating mill of the Bunker Hill & Sullivan Mining and Concentrating Co., at Kellogg, Idaho, a total of about 1,250 tons of ore per day is handled. In consequence of the extreme care which is taken in this mill to secure the highest possible extraction, it is believed that accurate tonnage estimations of the material entering the mill are essential. In order to insure accuracy, a rather elaborate system of weight estimation and checking has been established.

The actual weights are obtained from a Blake-Dennison automatic weigher, which estimates the quantity of material passing over the inclined conveyor belt that delivers ore from the rockhouse into the mill bins. Ore is deposited upon this belt through four Challenge feeders driven by belts, so that the rate of feeding may be made to correspond with conditions.

In order that the weight obtained by the Blake-Dennison machine can be checked from time to time, a fifth Challenge feeder is installed, delivering at a rate equal to the combined rate of the other four. This machine is used only to check weights, and when it is put into use the others are thrown out. A box that holds about 800 lb. of ore is placed on a Fairbanks scale and its contents weighed accurately and then dumped into the Challenge feeder. While this is being fed onto the conveyor belt, the box is filled and weighed again, the contents then being thrown into the feeder. In this way the actual weight of the ore being fed to the belt can be obtained for a measured period and compared with the weight shown by the Blake-Dennison automatic weighing machine during the same time. So long as the automatic weigher checks within 50 lb. in 8,000, in comparison with the hand-weighed parcel of ore, no change is made, but if the error is greater the weighing machine is adjusted to read correctly. This checking is performed at intervals so that no risks will be run of errors in the weight of mill feed. The system is easily managed and insures correct estimation of the amount of ore handled daily by the mill. It is said that the weighing machine does not require frequent adjustment, but maintains its accuracy over long periods of time. The tests are made often to insure safety.

Prevention of Action of Ferric Iron on Copper Cathodes

The re-solution of cathode copper in a cell containing ferric salts is said by Lawrence Addicks to be greatly inhibited by aluminum salts (U. S. pat. 1,138,921). The conditions under which he operates are described as follows: Cu, 3%; ferrous iron, 3%; alumina, 3%; a little free sulphuric acid to prevent the formation of basic salts; current density, 13.5 amp. per sq.ft.; a temperature of 115° F.; and a circulation sufficient to hold the ferric iron at about 0.25%. Under such conditions a 70 to 90% current efficiency can be obtained.

The Assayer and Chemist

Electro-analysis of the Second Group Metals

In a paper read at the New Orleans meeting of the American Chemical Society, E. P. Schoch and Denton J. Brown elaborated on their earlier work on the electro-analysis of the sulphureted-hydrogen group of metals. Their earlier work showed that copper, tin, lead, bismuth and antimony can be determined accurately by electro-deposition out of acidified chloride electrolytes which contain suitable reducing agents such as hydroxylamine or formalin. The present paper asserts that copper, bismuth and antimony can be deposited simultaneously and can be separated from tin and lead; that tin and lead can be deposited simultaneously and separated from cadmium; that copper or bismuth can be separated from antimony by dissolving alloys of these metals in nitric acid plus tartaric acid and electrolyzing the solutions with a limited cathode potential; that bismuth phosphate can be precipitated quantitatively out of the same solution; that tin may be separated completely from lead by dissolving an alloy of these two metals in nitric acid plus potassium nitrate; and that silver in silver chloride may be determined by dissolving the latter in ammonia, adding ammonium nitrate and electrolyzing.

These facts are all combined in the following systematic procedure for the rapid electro-analytical determination of all the common metals the potentials of which are more noble than that of cadmium.

(A) Dissolve sample in hydrochloric acid or in *aqua regia;* an insoluble residue—silver chloride—is dissolved in ammonia plus ammonium nitrate, and the silver determined electrolytically.

(B) Treat solution *A* with hydroxylamine—mercury, gold and platinum will be precipitated.

(C) Out of filtrate *B* remove arsenic by distillation with hydrochloric acid, and determine arsenic iodometrically.

(D) Electrolyze retort residue *C*—copper, antimony and bismuth will be deposited with a cathode potential limited to 0.45 volts (against the normal calomel electrode).

(E) Dissolve metal deposit *D* in nitric acid plus tartaric acid, and precipitate bismuth as bismuth phosphate.

(F) Electrolyze filtrate *E* with a limited cathode potential—copper alone will be deposited. Antimony is obtained by difference.

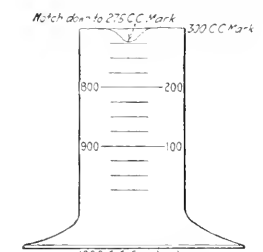
(G) Electrolyze residue *D* with a cathode potential limited to 0.7 volt against the normal calomel electrode: tin and lead will be deposited. Treat the deposit with nitric acid plus potassium nitrate: the solution contains all the lead and this metal may be deposited as lead peroxide, or the residue of tin oxide may be dissolved in hydrochloric acid plus hydroxylamine and the tin determined by electrolysis.

(H) Electrolyze residue *G* to obtain cadmium or other metals.

Assay of Cyanide Solutions, Lead Acetate Method

Many variations of the lead-acetate method for assaying cyanide solutions have been devised and published, most of them differing only in details. While all these methods will give good results, the majority of them require so many steps and so much time that it is apparent that they have never been tried out under practical working conditions in a busy laboratory, or that the writers intended them to be used only in experimental work where the chemist could devote his entire attention to a few solution assays.

The method described here was devised to meet the requirements of a laboratory where the assayer is called upon to run 10 to 20 solution assays daily in addition to 50 to 70 fire assays and perhaps a few leads, coppers, zincs, etc., and has no time to manufacture lead cones, wash the sponges numerous times, filter, scorify and what not, yet must obtain accurate results. No claim is made for any improvement in the chemistry of the assay. The advantage of the method lies in the speed with which a number of determinations can be made, due to the mechanical manipulations that will be described in detail. Briefly the assay consists of the following steps: Measuring out 10 a.t. solution, adding 30 c.c. lead acetate solution and 1½ to 2 grams zinc dust, heating, adding 50 c.c. hydrochloric acid, boiling, removing and squeezing the sponge, drying the sponge and cupelling.



APPARATUS FOR SOLUTION ASSAYING

The 10-a.t. charge is measured in the graduate shown in Fig. 1. A 1000-c.c. graduate is cut off at the 300 c.c. mark and a notch broken out of the rim down to the 275-c.c. mark, or thereabouts. The exact size of this opening can only be determined by trial and should be such that when the graduate is rapidly filled to the top the excess solution will flow out through the notch down to the 292-c.c. mark, surface tension holding the liquid above the bottom of the notch. The advantage of this graduate in saving time is apparent, no careful filling and pouring out to a certain mark being necessary. The solution is added rapidly and the excess drains off immediately, leaving exactly the right amount.

Solutions are usually brought to the assay office in beer bottles or the like. Time can be saved in pouring by

grasping the bottle with the hand inverted, turning the bottle over and at the same time giving it a quick rotating motion. The solution will then run out whirling, as water does down a drain, rapidly and with no gurgling.

The beakers are now placed on a hot plate. A beaker of 600-c.c. capacity, tall shape, is most convenient for a 10-a.t. charge, as it takes up less room on the hot plate, and the extra volume prevents the charge from boiling over when the acid is added. Lead-acetate solution 30 c.c. and 1½ to 2 grams of zinc dust are now added. A 250-c.c. graduate cut off at the 100-c.c. mark from the bottom is most convenient for measuring the acetate solution and hydrochloric acid. A quantity of the zinc dust may be kept in a pan or dish and dipped out with a spatula. After a trial or two the exact amount can be estimated. The addition of these two reagents takes but a minute for a number of assays. The acetate solution must be saturated. In order that a sufficient quantity of the solution be always on hand, two or more bottles should be prepared, the supernatant liquid from the oldest bottle being decanted when needed, and after the determinations are made all the bottles should be violently shaken to insure further solution of lead acetate. The bottles will then clear by the next day. When one bottle is empty it should be refilled and the next bottle in order used. As soon as the solutions on the hot plate come nearly to the boiling point, 50 c.c. HCl is added to each, and the solutions boiled until perfectly clear. The hotter the plate the quicker the solutions will clear, within reasonable limits of course. The sponge formed will cling together if the lead-acetate solution used was clear, and will usually float. This can be easily removed from the liquid by means of a 6-in. wood paddle, shown in Fig. 2, placed on an inverted spot plate and by a few squeezes between two paddles shaped into a cube, with nearly all moisture removed. If the spot plate is tipped up at a slight angle by means of a block of wood, as shown in Fig. 2, the liquid will flow off as it is squeezed out of the sponge.

The cubes of lead sponge are next placed upon the hot plate and thoroughly dried; the plate, however, must not be so hot as to cause lead globules to melt out of the sponges. After drying, which takes but a few minutes, each sponge is wrapped in a piece of lead foil about 1½ in. square and is then ready for cupelling.

It will be observed that the time required for measuring the solutions, adding reagents and preparing sponges for cupelling is reduced to a minimum. While the solutions are boiling the assayer can be busy with other duties, getting the sponges ready for cupelling when all the other cupelling is done. Hence a number of solution assays can be run with little expenditure of time and with little attention. The results too are all that can be desired of the average solution assay. Even traces of metals are easily saved, and the duplicates check remarkably well.

*

Cupellation Losses

According to a recent investigation by W. J. Sharwood (*Trans.* A. I. M. E., August, 1915), cupellation losses on silver or gold buttons of different weights, run under identical conditions, closely follow this rule:

$$y_1 \text{ (weight lost)} = cx^{\frac{5}{6}}$$

$$y_2 \text{ (percentage lost)} = cx^{-\frac{1}{6}}$$

where c is a constant to be determined by running a proof and x is the weight of the button. The bearing of this is: If c be determined by a proof, in a muffle where there are buttons of varying weights, then a correction can be calculated for all the various-sized buttons from the one known case.

*

Making Up Standard Permanganate Solution*

It is well known that a $KMnO_4$ solution freshly made with the usual distilled water of an industrial laboratory precipitates MnO_2, thus changing its strength. Instead of endeavoring to prevent this I help it along as nearly to completion as possible and find our finished solution does not change more than the contraction and the expansion due to changes of temperature alter it.

The procedure is as follows: Weigh out the amount of $KMnO_4$ necessary to make the solution somewhat weaker than the desired strength (enough weaker more than to compensate for some incidental evaporation later on). Put the solution into a number of large flasks and place them on the steam plate. Make another solution in the same way, but much stronger and much less in volume; place this also on the steam plate and keep both near the boiling point for some time—two days if possible.

The reactions that precipitate MnO_2 will be practically completed, and no water may thereafter be added to either solution. Filter both solutions separately through filters made of prepared asbestos spread over broken glass in a large funnel or percolator. Then determine their strength precisely and measure the weaker solution carefully.

Add to the weaker solution a sufficient amount of the stronger to bring the strength up to the desired factor. This amount is determined by the following formula:

$$n = \frac{m\,(a - c)}{c - b}$$

in which

m = Number of cubic centimeters of the weaker solution;
a = Factor of the weaker solution;
n = Number of cubic centimeters of the stronger solution required;
b = Factor of the stronger solution;
c = Factor of the desired solution.

By substitution n is obtained. Add this amount of the stronger solution to the weaker and mix thoroughly. Determine the strength of the resulting solution. A correction is seldom necessary. Its factor is exactly what is wanted and its variation practically negligible.

I have always kept my $KMnO_4$ solution in a carboy painted black. I do this by tradition, but as to whether it is really necessary I have some doubt. A carboy of $KMnO_4$ solution lasts about a year, and one carboy showed the following variation in its iron factor as shown by testing with sodium oxalate furnished by the United States Bureau of Standards: 9-17-13 = 0.002807; 10-27-13 = 0.002808; 1-4-14 = 0.002800; 4-22-14 = 0.002790.

The method is widely applicable. It can be used to advantage in making standard alkali solutions for phosphorus determinations in iron and steel. In this the carbonic acid may be precipitated with excess Ba $(OH)_2$ and the supernatant solutions used.

*From an article by H. E. Moyer in the "Chemist-Analyst."

Refining Cyanide Precipitates

By H. T. Durant*

SYNOPSIS—Ordinary methods of acid treatment of cyanide precipitates fall short of the desired results because all the impurities are not removed. The methods pointed out in this article enable the practically complete removal of foreign substances and the production of high-grade bullion.

The mixed product that results from the usual clean-up in cyanide plants consists, before any acid treatment and apart from gold and silver contents, of two classes of constituents. The first class includes those substances which are, or could be, rendered soluble with the aid of sulphuric acid, though not necessarily under the conditions which are possible at cyanide plants; and the second class includes those substances which could not be rendered soluble by these same means.

Separation of Impurities

The group of substances that are soluble in sulphuric acid consists principally of zinc metal and compounds, copper metal and compounds, and iron and its compounds. There are, besides, various complex cyanides, ferrocyanides, and other elements which occasionally exist in various combinations and quantities, such as magnesium, aluminum, nickel and tellurium.

The group of substances insoluble in sulphuric acid consists principally of sand, calcium carbonate, calcium sulphate, lead and its compounds, and carbonaceous matter. Of these substances sand is usually present as a result of defective filters or of atmospheric dust. Both of these causes can be guarded against and therefore the amount of sand present can be kept down. Calcium compounds cannot always be so easily kept low. Lead, apart from being a more or less regular constituent of zinc, has often to be used to aid the precipitation work. Carbonaceous matter is also present in zinc to a slight extent. It is evident that if everything which is theoretically soluble in sulphuric acid were actually so, there would remain for smelting very small quantities of impurities after acid treatment. The general analysis of the slimes before and after acid treatment, and also after the drying or calcining that follows the acid treatment, is pretty well known to operators.

Usual Acid Treatment Incomplete

As a rule there remains after acid treatment a large proportion of substances belonging to the first class. This is evident from the base metals in the bullion produced, also from a rough, pocket-lens examination of the slimes after acid treatment and calcination.

The fact that certain complex cyanides are not affected by the acid treatment is shown by the ammonia given off during the subsequent calcination. It is easily seen by a small-scale experiment that material which has been acid treated and calcined will usually, by further acid treatment, yield in a soluble condition more of the substances of the first class. This further acid treatment has of course been rendered effective by the calcination (oxidation) which has converted sulphides into sulphates or oxides, and insoluble cyanides into soluble compounds. Beyond this, any metallic zinc that during the first acid treatment might have been protected by lead or copper or the sulphides of these metals, will be oxidized during calcination or otherwise prepared for further acid treatment.

The ordinary acid treatment is generally carried out in a lead-lined tank fitted with a water-seal cover, gas-escape pipe, steam-heat attachment and mechanical agitator, or in some apparatus that answers the same purpose. In any case the efficient agitation is most important, as all the material that is to be acid treated should be kept well in motion.

As this acid treatment proceeds the increasing amount of fine slimy material formed will tend more and more to protect material from the action of the acid, and therefore efficient agitation, even to the point of attrition, becomes more and more important. When the ordinary acid treatment has been finished so that practically no further action takes place and the slimes are still in the acid-treatment tank, any substances of the first class which remain can be removed by the procedure that I shall outline; and any lead or lead compound that may also be present can be turned into sulphate so that it will not appear in the final bullion bar.

Removal of Residual Impurities

First of all decant or filter off as much as possible of the well-settled zinc solution, leaving all the slimes in the acid-treatment tank; then run in fresh water till the total weight of water is about five times the assumed dry weight of the slimes in the tank. While continuously and thoroughly agitating, add separately strong sulphuric acid (whatever strength is available) and then bichromate of potassium previously dissolved in as little hot water as possible. It is better while this treatment is going on to keep the contents of the tank heated. These two chemicals are always required in the proportion of 2½ lb. of actual sulphuric acid (or say 4 lb. of 66% acid) to each pound of solid bichromate of potassium. The actual total amount of acid and bichromate to be used will naturally depend on the quality of the slimes in the tank; but each addition of say 10 lb. of sulphuric acid (or 16 lb. of 66% acid) will be followed by 4 lb. of bichromate of potassium dissolved in as little hot water as possible.

Three or four minutes after adding the bichromate a small sample of filtered solution from the tank can be tested for chromic acid by well-known tests or it may be evident from the color of the filtered solution. When chromic acid is present and persists for a minute or two the acid treatment is finished, but until this persistence of chromic acid in the solution is obtained it is necessary to continue the addition of sulphuric acid and bichromate as described. When treatment is finally finished, the slimes, after very thorough water washing, are collected and dried in the usual way and are then ready for smelting.

It has been found that a small-scale trial in a glass flask will show in a few minutes the alteration, if any, when the treatment with acid and bichromate follows the ordinary acid treatment. This treatment with acid and

*Mining engineer, 3 London Wall Buildings, London, England.

bichromate should not be carried out until the ordinary acid treatment has been worked to a finish, as previously described. Salt or hydrochloric acid should not be used either in the ordinary acid treatment or in the subsequent acid and bichromate treatment. After treatment with acid and bichromate the slimes will settle well without any of the usual aids, such as glue and alum.

Some Alternative Practices

Instead of bichromate of potassium there could be used the same weight of bichromate of sodium. Similarly, permanganate of potassium or sodium in calculated equivalent quantity could be used, but it is not so satisfactory for several reasons. If the treatment with acid and bichromate is carried too far the only trouble is that silver will begin to be dissolved, although this can be recovered from the solutions if necessary. The finished slimes are heavy and after slight heating, in order to dry them thoroughly, will generally appear as annealed gold, and sometimes will show the gold color even before heating.

Unless much sand is present no flux other than borax glass is required; it is well, however, always to add a little niter to oxidize any small amounts of carbonaceous matter that may be present. The finished slimes must be smelted in a clay crucible. They must not be put in a plumbago crucible and should not be in contact by stirring or otherwise with plumbago or any reducing agent during or before smelting; otherwise a mixed lead matte may be formed. The final bullion should be practically free from zinc, lead and copper. The extra cost for acid, bichromate and labor in this work will be more than compensated for by the decreased cost of fluxes in the smelting; by the fact that no light, dusty slimes will be handled; by the saving of time, labor, and fuel in the smelting; and by decrease in the amount of slag produced. Practically all the bullion will be obtained at once in the bars.

Nevada-Douglas Mill Running

The furnace for the manufacture of nitric acid at the leaching plant of the Nevada-Douglas mill at Ludwig, Nev., started Aug. 30 and the crushing of ore in the new mill at Ludwig commenced Sept. 2, according to the Yerington *Times*. The mill is about completed, though the furnaces and driers are not yet fully installed and some additional tanks will be built. A force of 10 masons is rushing to completion the Wedge furnace, which will treat 250 tons of ore per day. The oxidized-ore yard, which will accommodate 2,500 tons, is also built and ready for receiving the ores now passing through the crushers.

The repair work at the mines is all done, and as soon as the mill and furnaces are completed a force of probably 100 men will be put to work in the mine, largely increasing the number now employed. There are about 100 men on the leaching plant finishing the mill, tanks and furnaces and installing the remaining machinery. At first it is expected to treat from 200 to 300 tons per day, and then as soon as the present plant is finished to increase the tonnage to 500 tons per day. As the mill capacity can be run up to 750 tons per day the leaching capacity will be increased by adding another unit to meet the requirements of the mill.

Australian Zinc Contracts

During the week of Sept. 4, the Zinc Corporation made a further attempt in the High Court to obtain a decision on the effect of the war upon its contract with Aron Hirsch & Sohn, of Halberstadt, Germany, says the *Mining Journal* of London.

It will be remembered that on a previous occasion the plaintiffs were nonsuited, but since that date legislation has been passed providing for the representation of enemy parties in a suit. The facts of the case are, shortly, that the Zinc Corporation, by an agreement dated Sept. 14, 1908, agreed to deliver 355,000 to 385,000 tons of zinc concentrates in certain quantities from their works at Broken Hill to the defendants. At the time the contract was entered into the company was registered in Victoria, but in July, 1911, it was incorporated in England. The Australian Government has, since the war, by the Enemy Contracts Annulment Bill, terminated these contracts. The English Government, however, has up to the present taken no such step, and on the result of the action now proceeding, in which a decision will no doubt be sought in the House of Lords, eventual action by the British Government will probably depend.

The most material clause in the contract, numbered 17, provided as follows: "In the event of any strike, lockout, combination of workmen, interference of trade unions, suspension of labor, whether partial, local, or general, and from whatsoever cause arising, floods, storms, fire, stoppage of water supply, washaways of railways, accidents, acts of God, force majeure or perils of the sea, breakdown of machinery, or inability of the Silverton Tramway Co. to provide the necessary trucks for taking away the concentrates, or in the event of any cause beyond the control of either the sellers or the buyers preventing or delaying the carrying out of this agreement, then this agreement shall be suspended during the continuance of any and every such disability."

Mr. Gore-Browne, K. C., on behalf of the company, argued that the agreements had not been merely suspended in the terms of this clause, but had been entirely abrogated as involving commercial intercourse with the enemy. Such intercourse, where one of the parties was an alien enemy, was prohibited as illegal. Therefore the contract under which those transactions took place was itself rendered illegal and void. It would be an utterly unreasonable view for the court to take that the plaintiffs must sit down and wait for the end of the war for the rights under the contract to revive. Suppose Germany carried on the war for 20 years, and history repeated the Napoleonic wars, were all these transactions to be open to enforcement then? A contract which tended to the advantage of the enemy country or was prejudicial to the interests of this country was prohibited. The contract here was detrimental to the interests of this country, because it altogether prevented the plaintiffs from selling zinc concentrates during the period of the war. It was important that this country should have a large supply of spelter for the manufacture of munitions of war. If the contract was merely suspended during the war it would be impossible for the plaintiffs to sell their zinc concentrates to persons other than the defendants, because no one would expend large sums in the erection of refining works unless it was certain that the supply of zinc concentrates would be continued after the war.

It was clear, on looking at the details of the agreement, that it was not intended that the whole of the agreement should be suspended under clause 17, but only the making and taking of deliveries should be suspended, and therefore as something had to be done under the contract during the war which involved commercial intercourse with the enemy the contract was dissolved. Further, war was not one of the causes within clause 17 which gave the right to suspend the contract. Force majeure meant something of a physical nature which prevented the contract from being carried out, and it did not include war. The words "any cause beyond the control of either the seller or the buyer preventing or delaying the carrying out of this agreement" must be construed as ejusdem generis with the causes previously mentioned, and did not include war, which was a totally different cause. He submitted that the contract came to an end, vested rights under the contract alone being enforceable after that date.

On behalf of the defendants, Mr. Compston, K. C., submitted that the outbreak of war was an event which was not so different from the events mentioned in the clause as suspending the fulfillment by either side of contractural obligations that it could not apply to this case. During the war there was necessarily a suspension of some of these obligations, but it was not contrary to public policy for a contract made before the war to provide that after the war trading

should be resumed with persons who in the interval had become alien enemies. The defendants denied that the zinc concentrates purchased in Australia were imported into Germany to be there smelted. They were imported to and smelted in England, France, and Belgium, and only a small proportion went to Germany. All past consignments were not freed from the conditions of the contract, and although payment could not be demanded until there had been an adjustment of the invoices such an adjustment did not involve prohibited commercial intercourse between the seller and the purchaser.

On Sept. 7 decision was delivered against Aron Hirsch & Sohn by Mr. Justice Bray, according to the London *Financial News*, which says:

Giving judgment, his Lordship said that when war broke out the defendants, to whom the whole of the plaintiffs' output of spelter was to be sold, according to the agreement, became alien enemies, and they at once told the plaintiffs that they would discontinue the acceptance of any more spelter until the end of the war. The Zinc Corporation now contended that the outbreak of hostilities rendered the performance of the contract by them illegal, and the defendants, on the other hand, submitted that the delivery of the spelter was merely suspended until the war was over.

His Lordship said the questions were: Was war to be one of the causes of the suspension of the contract, and what was the meaning of the words "shall be suspended"? The court could not substitute for an agreement made between the parties another agreement minus one of its terms. The difficulty was that an event had arisen which was not contemplated when the agreement was entered into, and, after having given careful consideration to the clauses and all the circumstances of the case, he had come to the conclusion that the contract should be declared to be dissolved as from Aug. 4, 1914, when war broke out. Plaintiffs would be absolved from the obligation to supply the goods to defendants without prejudice to the defendants' rights to take proceedings for alleged breach of contract by the plaintiffs before that date.

Judgment was entered accordingly for the plaintiffs with costs. The defendants intimated that they would appeal.

Shortage of Metals in Austria

According to a Reuter dispatch from Zurich, dated Sept. 5, a highly significant admission of the growing shortage of war metals in Austria is contained in a semi-official communiqué from the Central Metals Organization, which was established jointly by the Government and the Ministry of War for the purpose of obtaining metals for the manufacture of munitions. The communiqué frankly states that hitherto the Organization has never appealed to the public because it has been obtaining all necessary supplies from wholesale quarters, but that since the latter are now exhausted it is forced to invite the public to sell voluntarily their metal goods rather than force the authorities to requisition them. All owners of articles composed of pure nickel, copper, brass, and bronze are directed to sell them forthwith to the Metals Organization. This applies to merchants and dealers as well as private persons.

This seems to lend color to the Italian charge that the great bronze statue of Dante at Trent has been broken up and remelted.

Asphalt in Honduras

Asphalt has been found in Honduras, according to a report from Special Agent G. Harris to the Department of Commerce. The discovery is on the west coast, in the vicinity of Juticalpa. Prospects uncovered for over 450 ft. show the bed to be of great purity, and there are outcroppings for several miles. The discovery was made by an American citizen resident in Honduras, who has the control of the property. It is considerably distant from the Pacific port of Amapala, which will have to the port of shipment, but is on the line of a new mode road the Government of Honduras is preparing to construct, so that motor transportation will soon be available, and it is not greatly distant from the logical line of the contemplated railroad from Amapala to the interior.

Clifton-Morenci Strike

More than 8,000 miners, about one-half of them Mexicans, are on a strike in the Clifton-Morenci district for higher wages. The strike, which became general Sept. 12, has tied up the mines of the district, and serious trouble is threatened by the Mexican element involved in the strike.

The Mexican miners were receiving from $3 to $3.50 a day, and the more skilled American miners received wages running to $5 a day. The companies refuse to grant the demand for more pay.

Agitators of the Western Federation of Miners have been in the district for weeks stirring up the men, and it is said Mexican agitators have also been appealing to the prejudices of the Mexican miners.

The *Boston News Bureau* prints the following under date of Sept. 21:

"Entire plants of the Arizona, Detroit and Shannon copper companies in Clifton, Morenci and Metcalf have been formally turned over to Sheriff Cash of Greenlee County for protection.

"Sixty-five to seventy deputies are posted to guard the mines and smelteries, which are also heavily picketed by strikers. No attempt will be made to operate. At mass meeting strikers ratified committee of nine named to treat with companies. Two representatives of the companies were present at meeting. Companies posted notices they were willing to treat with the men, but could not recognize Western Federation miners. Situation quiet and no trouble is anticipated. Strikers are confident of victory and companies are equally determined."

Ontario Mineral Production in First Half of 1915

The Bureau of Mines report for the first six months of 1915 states that the output of gold for Ontario during that period was $3,530,072, as compared with $2,011,069 for the corresponding period of the previous year. Of the total yield for the period under review $2,267,620 came from Porcupine. Promising developments are in progress in other fields, particularly in the Kirkland Lake district. The Goodfish Lake section is also being developed, and ore of remarkable richness is being taken from the Dobie mine in Monroe township.

The diminution in the output of silver continues, the value of the output for the period being $5,188,763, as compared with $7,053,418 for the same period in 1914. The falling off in value is partly due to the lower prices being obtained for silver, but is also largely due to the exhaustion of the high-grade ore from the mines.

The output of nickel is the highest ever recorded, but on the basis of present production the amount will be considerably exceeded in the second six months of 1915.

The production of copper, iron ore and coal showed slight increases, while pig iron and cobalt-nickel oxides showed a decline.

Precious-Metal Production in the United States

A memorandum of the revised statement of gold and silver production in the United States in 1914 was given in the *Journal* of Sept. 4. The full statement of production by states as apportioned by the Director of the Mint and the Geological Survey is shown in the table herewith. The figures for gold are the value; for silver the quantity in fine ounces.

	Gold: Value		Silver: Fine Oz.	
	1913	1914	1913	1914
Alabama	89,200	$12,300	100	300
Alaska	15,201,300	16,547,200	366,700	865,900
Arizona	4,104,400	4,568,900	3,912,000	4,439,500
California	20,241,300	21,251,900	1,421,500	2,020,800
Colorado	18,109,700	19,962,400	8,989,700	8,804,400
Georgia	13,300	16,800	100	100
Idaho	1,244,300	1,187,200	9,477,100	12,573,800
Illinois			2,300	1,900
Maryland	700	200		100
Michigan			333,700	415,500
Missouri			38,900	60,400
Montana	3,320,900	4,143,600	12,540,300	12,536,700
Nevada	11,977,100	11,536,200	15,657,400	15,877,200
New Mexico	892,000	1,219,100	1,666,900	1,771,300
North Carolina	115,200	130,300	1,700	1,500
Oklahoma			800	6,200
Oregon	1,477,900	1,589,400	172,200	147,400
South Carolina	4,100	3,200		
South Dakota	7,211,200	7,334,000	172,600	179,800
Tennessee	7,700	6,400	109,000	102,800
Texas	200	8,800	429,800	574,700
Utah	3,570,300	3,377,000	11,282,300	11,722,000
Virginia		300	200	1,500
Washington	657,500	587,800	218,700	341,300
Wyoming	17,500	6,700	1,200	100
Continental United States	$88,176,100	$93,429,700	$66,796,200	$72,444,800
Porto Rico	1,100	2,800		
Philippines	707,200	1,099,300	5,300	10,300
Totals	$88,884,400	$94,531,800	$66,801,500	$72,455,100

California was the leading gold producer in 1914, Colorado second, Alaska third and Nevada fourth. A second group of large producers included South Dakota, Arizona, Montana and Utah. The eight states named produced 93.8% of all the gold won in the United States.

In 1914 Nevada was the chief silver producer, Idaho being second, Montana third and Utah fourth. A second group included Colorado, Arizona, California and New Mexico. None of the other states produced as much as a million ounces of silver.

Michigan Iron Lands at Auction

SPECIAL CORRESPONDENCE

The holdings of the Pittsburgh & Lake Angeline Iron Co. were sold at public auction at Ishpeming, Mich., on Sept. 15. The Cleveland-Cliffs Iron Co. bid in the Lake Angeline mine for $27,000. Only other bidder was the Jones & Laughlin Ore Co., which bid $26,500. This is believed to be a remarkably low price for the mine, building, machinery and 60 dwelling-houses. The tract comprises 700 acres. The Mitchell property, three miles south of Ishpeming, sold for $2,000. Other small tracts, none of which contain mineral, were sold for low prices. The entire holdings did not bring $35,000. The Cleveland-Cliffs Iron Co. has not decided what will be done with Lake Angeline, but it is believed that the little ore in sight will be mined, and exploratory work carried on. The property lies between the Lake and Salisbury mines of Cleveland-Cliffs, and it is believed that chances of locating other high-grade leases are good. The land contains about 2,000,000 tons of low-grade ore, which is not in demand at this time. The Mitchell also has considerable low-grade ore, with some better grades at depth. The Mitchell stopped working several years ago when the Oliver Iron Mining Co. closed its Sect. 21 mine. The Oliver company was pumping the Mitchell water at that time, and the Lake Angeline company did not care to go ahead and install pumps and take care of the heavy flow.

American Institute of Mining Engineers, San Francisco

EDITORIAL CORRESPONDENCE

The American Institute of Mining Engineers began the 111th meeting in San Francisco on Sept. 16 at the Bellevue Hotel. The meeting was opened by C. W. Merrill presiding, and an address of welcome on behalf of California was delivered by Gov. Hiram Johnson. President Saunders replied to the Governor's welcome on behalf of the Institute, and the technical work of the sessions was begun by the presentation of a paper on "Underground Mining Systems of Ray Consolidated Copper Co.," by Lester A. Blackner. This was followed by a paper on "Some Problems in Copper Leaching," by L. D. Ricketts; "Notes on Homestake Metallurgy," by Allan J. Clark; and the "Metallurgy of Gold in the Witwatersrand District, South Africa," By F. L. Bosqui.

The afternoon was occupied by two sessions in separate apartments. The Gold and Silver session was presided over by F. Lynwood Garrison. The following papers were presented: "Mill and Cyanide Plant of Chiksan Mines, Korea," Charles W. DeWitt; "Electric Furnace for Gold Refining at the Alaska-Treadwell Cyanide Plant," W. P. Lass; "Cyaniding Practice of Churchill Mining Co., Wonder, Nev.," E. E. Carpenter; "Zinc-Dust Precipitation Tests," Nathaniel Herz; "Recovery of Mercury from Amalgamation Tailings, Buffalo Mines, Cobalt," E. B. Thornhill; "Slime Agitation and Solution Replacement Methods, West End Mill, Tonopah, Nev.," Jay A. Carpenter; "Amalgamation Tests," W. J. Sharwood; "A Rule Governing Cupellation Losses," W. J. Sharwood; "Tonopah Plant of the Belmont Milling Co.," A. H. Jones. The session on Geology and Mineralogy was presided over by James F. Kemp. The following papers were presented: "Geology of the Iron-Ore Deposits In and Near Daiquiri, Cuba," James F. Kemp; "Formation and Distribution of Residual Iron Ores," C. L. Dake; "Occurrence of Covellite at Butte, Mont.," A. Perry Thompson; "Formation and Distribution of Bog Iron Ores," C. L. Dake; "Geology of the Burro Mountains Copper District, New Mexico," R. E. Somers; "Additional Data on Origin of Lateritic Iron Ores of Eastern Cuba," C. K. Leith and W. J. Mead; "Method of Making Mineralogical Analysis of Sand," C. W. Tomlinson; "Formation of the Oxidized Ores of Zinc from the Sulphides," Y. T. Wang; "Copper Deposits of San Cristobal, Santo Domingo," Thomas E. Donnelly.

For the remaining period of the convention the technical program provides for a session on electro-metallurgy, in conjunction with the American Electro-Chemical Society, to be presided over by Lawrence W. Addicks, president of the latter society; a session on Petroleum and Gas, Arthur F. L. Bell presiding; a session on Mining, Milling and Non-ferrous Metallurgy, Karl Eilers presiding; a session on Iron and Steel, Joseph W. Richards presiding.

The Panama-Pacific Exposition management provides for an American Institute of Mining Engineers Day at the Court of Abundance. Other social entertainments and technical excursions are provided for by the International Engineering Congress. The technical excursions include visits to fire systems, gasworks, water-works, delta lines and power plants in and around San Francisco. The distant technical excursions include the deep gold mines at Nevada City and Grass Valley, the hydro-electric development at Blue Lakes, the gold-dredging fields at Oroville, the hydro-electric development at Las Plumas and the oil fields at Coalinga. The pleasure trips began with an automobile ride for the ladies attending the Institute on Thursday, which included a visit to the Cliff House and the exposition. Other visits will include a trip to Mt. Tamalpais, a lawn party at the University of California, another automobile trip for the ladies, a banquet at the Palace Hotel and a cruise and inspection trip of the harbor of San Francisco. Besides the program by the International Engineering Congress, D. C. Jackling has placed at the disposal of members of the Institute and ladies his private yacht "Cyprus." The cruise will extend to points of interest on San Francisco Bay and possibly through the Golden Gate.

California Metal Output, 1914

The total yield of mine gold in California in 1914, as reported by the United States Geological Survey, was $20,653,496, an increase of $246,338 over that of 1913. With the exception of one year (1883) the mine-gold output of the state in 1914 was higher than at any other time since 1864, fifty years ago.

In 1914 there were 658 properties reporting production, of which 318 were deep mines and 340, placers. The producing deep mines may be classified by metal product as follows: Gold, 211; copper, 19; silver, 7; silver-lead, 6; and lead, 9. Of the placer mines 105 were hydraulic, 60 dredges, 70 drift, and 105 sluicing or surface-placer mines.

The 318 deep mines made an output of 2,465,485 tons of ore, of which 2,050,317 tons were siliceous precious-metal ore, 397,868 tons copper ore, 640 tons lead, 460 tons silver, and 16,180 tons silver-lead ore.

In 1914 there were treated in gold and silver mills in California 1,993,821 tons of ore, containing altogether $10,743,207 in gold, an average value of $5.39 per ton, and $91,327 in silver, an average value of $0.05 per ton. This gives a total value of $10,834,534 in gold and silver, or an average per ton of $5.44 in both metals. In milling the 1,993,821 tons of ore there was recovered as bullion $8,637,329 in gold and silver, or $4.33 per ton; and from this ore was derived 16,072 tons of concentrates, which yielded in gold and silver $2,197,205, or an average of $47.69 per ton.

The 449,132 tons of smelting ore treated yielded altogether metals valued at $5,633,856, or an average of $12.54 per ton, including all metals. There were treated also 22,532 tons of old tailings, which yielded $83,624 in gold and silver, or an average of $3.71 per ton.

The 340 productive placers in California yielded $9,080,849 in gold and $19,287 in silver, a total of $9,100,136, which is an increase of $242,590 from this source over the yield of 1913. The dredge yield fell off $306,900 in gold, but there was an increase in total output from the hydraulic, drift, and surface placers of $551,572 gold or $244,672 more than the decrease in the dredge yield. Of the total placer gold the 60 dredges yielded $7,783,394, or 86%; the 105 hydraulic mines, $702,884, or 8%; the 70 drift mines, $329,948, or 3%; and the 105 surface or sluicing mines, $264,623, or 3%. There are now 60 gold dredges operating in the state, and since the commencement of dredging in California in 1898, the total gold yield from this source to the end of 1914 has been $71,307,766.

Of the total ore milled in California from deep mines, 1,243,529 tons, or 62%, came from the mines in the five Mother Lode counties of Amador, Calaveras, El Dorado, Mariposa, and Tuolumne. This ore yielded, on an average, in gold and silver, $5,075,552, or $4.08 per ton.

The mine production of silver in California in 1914 was 1,471,859 fine oz. Of this, 1,436,982 oz. was won by deep mining. The larger part of the output, 1,267,752 oz., was derived from crude smelting ore. The greatest output was made, as usual, by Shasta County, where the yield from the smelting of copper ores was 592,727 oz.; from siliceous ore, 33,220 oz.; and from placers, 1,007 oz.; a total for the county of 626,954 oz., valued at $346,706.

The copper produced from California ores in California in 1914 was 30,507,692 lb., a decrease of 4,067,315 lb. Copper was produced in Amador, Calaveras, Imperial, Inyo, Mariposa, Mono, Placer, Plumas, Riverside, San Bernardino, and Shasta Counties.

The yield of lead in 1914 was 4,251,923 lb., an increase in quantity of 737,581 lb., and in value of $11,194. Most of the lead was derived from Inyo County, though some came from Shasta, Kern, and Placer Counties. The zinc production in 1914 was 389,471 lb. In 1914 only three mines produced zinc, all in Inyo County.

Missouri's Investigation of the Alleged Zinc-Smelting Trust

JOPLIN CORRESPONDENCE

The state investigation of the alleged zinc-smelting trust in Missouri was started in Joplin, Sept. 14. The opening session was conducted by John B. Ewing, assistant attorney general. Senator Frank W. McAllister is sitting as a special commissioner named by the supreme court. The hearing is being conducted to determine if there exists sufficient evidence of the violation of the trust laws of Missouri to warrant the state legal department in entering and prosecuting complaints against the several zinc-smelting companies engaged in business in the state. The real cause of the present investigation was the agitation started last February in the zinc-ore producing districts by some dissatisfied producers. This resulted in demands for an investigation being placed before Attorney-General Barker. The dissatisfaction arose from the fact that, when the ore market reached abnormally high levels and normal prices were more than doubled, the generally used basis of buying ore, based on the current market price of spelter which is usually figured a ratio of 8 to 1, began to decline and developed as low as 5 to 1, causing much dissatisfaction among the producers, who became convinced that the buyers of zinc ore were in a combination to hold down the price and stifle competition.

Representatives of the Illinois Zinc Co., American Zinc Lead and Smelting Co., Edgar Zinc Co., Mineral Point Zinc Co., Prime Western Spelter Co., Grasselli Chemical Co., Hegeler Zinc Co., Joplin Separating Co. and the Matthiessen & Hegeler Zinc Co. were present at the hearing. These present were only a small portion of the smelting companies engaged in business in Missouri.

Many witnesses were summoned, but only a few of them could be found in time for the hearing. Charles T. Orr declared that no important difference was ordinarily observable between bids of competing ore buyers on the highest grades of ore. On lower grades, he said, the variation in bids was sometimes considerable.

Very little testimony, beyond that tending to show there is no great variance between the prices offered for standard zinc ores in the southwest Missouri district by buyers for smelting companies, has been so far offered. That this condition was brought about by caution on the part of the buyers and a long-established custom of not interfering with one another's customers was the only explanation offered by witnesses.

Several buyers, who have represented smelters here during many years, testified that they act very largely on their individual judgment, without instructions from headquarters as to prices. The variation between bids on low grades of ore was generally admitted to be greater. Every buyer examined denied that the buyers, of whom about 14 are stationed in the district, ever held meetings. No testimony to show that meetings were held has been introduced.

Several of the largest ore producers and buyers were examined, but no evidence was secured showing any violations of the Missouri anti-trust laws. There was a decided lack of coöperation and interest on the part of the operators toward the investigation. In fact, the absence of mine operators from the sessions of the hearing has been its one conspicuous feature.

Attorney-General Ewing examined such witnesses as could be secured. The examination of mine operators and ore buyers was brought to a close Sept. 15, with the inspection of a batch of the buyers' correspondence requisitioned by Attorney-General Ewing, who hoped to determine the method employed by the buyers in fixing the weekly ore prices. This part of the investigation was conducted privately. Further investigation of the alleged zinc-smelting trust will be conducted in St. Louis on Sept. 21, at the Planters Hotel.

Nevada Metal Production, 1914

The production of gold, silver, copper, lead and zinc from Nevada ores sold or treated in 1914, according to the United States Geological Survey, was valued at $29,300,812.

The output of recoverable gold from Nevada mines in 1914 was 555,[illegible] oz., valued at $11,181,188, and of this amount 87.29% was derived from dry or siliceous ore. The placer-gold output was 18,250.05 oz., of which 10,345.04 oz. came from placer mines in Nye County. The dry or siliceous ores contained 484,296.46 oz. of gold; copper ores, 49,476.61 oz.; and lead, zinc, and copper-lead ores contained 2,879.35 oz. Bullion from gold and silver mills contained 439,919.37 oz.; concentrates, 11,686.38 oz., and crude ore shipped to smelters, 55,375.09 oz. The mines of Esmeralda County produced nearly one-half of the total gold, or $5,226,367, and the Goldfield district yielded $4,705,240 of this total. Nye County produced $3,377,262 in gold; the Tonopah district yielded $2,648,833; the mines of the Comstock lode produced $434,387 in gold, and Humboldt, Mineral, White Pine, and Churchill Counties, in the order named, each produced more than 15,000 oz. of gold.

For three years prior to 1914 the silver output of Nevada had been steadily increasing, but on account of the low prices of the metal in the last half of the year 1914 there was a slight decrease in silver. The total output was 15,455,491 oz. valued at $8,546,887. Of this total yield 14,721,094 oz., or 95.3%, was credited to siliceous ores; 286,935 oz., to lead ores; 181,733 oz., to copper ores; and 115,138 oz., to lead-zinc ores. Ores treated at gold and silver mills were credited with 12,100,494 oz.; concentrates, with 1,721,318 oz.; and crude ore, with 1,600,315 oz. Nye County produced 11,424,769 oz.; the Tonopah district produced 11,388,452 oz., or 73.7% of the entire silver production of Nevada; the Comstock lode, or Storey County, yielded only 278,599 oz.; Churchill County's output was 1,545,926 oz.

In 1914 Nevada produced 60,986,450 lb. of copper. The greater part of the copper, 50,366,650 lb., came from concentrates, while 10,551,000 lb. was from crude ore shipped to smelters. The mines at Ely were operated at a reduced rate, and the Mason Valley smeltery was idle during a good part of the year.

The lead output of the States was 12,809,655 lb. Clark and Lincoln Counties continued to outrank all others in the production of lead, the combined output of these two counties being 10,193,098 lb. White Pine County yielded 915,602 lb. and Elko County 860,826 lb. The yield of lead from concentrates was 3,937,126 lb., and that from crude ore 8,791,246 lb.

The zinc ores of Nevada produced 12,980,232 lb. of recoverable zinc figured as spelter. Clark County produced 11,862,149 lb. of the entire zinc output, the remainder coming mostly from Lincoln County although small shipments were made from Eureka County during the year. The greater part of the zinc material is oxidized. From crude zinc ore shipped, 6,116,898 lb. were recovered, and from concentrates 6,863,334 lb. were recovered.

There were 131 producers of gold, silver, copper, lead, and zinc in Nevada in 1914. Of the total of 4,522,022 short tons of ore sold or treated, 1,461,577 tons was treated in gold and silver mills, principally cyanide mills; 2,768,193 tons was concentrated, and 261,018 tons shipped to several smelters. The largest part of the total tonnage, 2,882,121 tons, represented copper ore; 1,594,486 tons was siliceous ore; 16,088 tons, lead ore; 9,490 tons, zinc ore; 3,762 tons, copper-lead ore; and 16,075 tons, lead-zinc ore.

Japanese Mineral Output, First Five Months of 1915

According to the Department of Agriculture and Commerce, the Japanese production of minerals for the five months, January to May, 1915, was as follows:

Item	Amount	Change from 1914
Gold	3,079 kg.	I. 2.2%
Silver	59,979 kg.	I. 1.3%
Copper	26,895,887 kg.	I. 4.0%
Iron	19,917,887 kg.	D. 30.5%
Coal	7,681,407 tonnes	D. 9.0%
Crude oil	178,878,780 liters	I. 23.7%
Sulphur	22,331,817 kg.	D. 6.2%

Editorials

The Definition of "Smelting"

Careless use of words sometimes breeds trouble, an interesting example of which recently happened. In the vernacular almost every kind of an ore-reduction works is either a "mill" or a "smelter." The idea of the mill is a plant wherein the ore is crushed for the mechanical separation of its mineral constituents, or a stamp amalgamation mill, or a plant for the extraction of the precious metals by chlorination or cyanide lixiviation. Almost everything else is a "smelter," and especially is the idea of a smelter associated with the buying of ores in lots on samples. Thus we read of ore going to smelters who in reality are merely magnetic-separators, etc.

Recently an item was published in the news pages of the *Journal,* as well as in several daily papers, to the effect that the Weedon Mining Co., Ltd., of Quebec, was going to build a "zinc smelter" at Welland, Ont. The company has written to us that it has suffered much annoyance owing to this item. Among other things the farmers of the vicinity of Welland rose in protest against the project. In fact the company was going to erect a plant for the hydrometallurgical-electrometallurgical extraction of zinc. In the eyes of the news reporters this was a smelter, and hence the trouble.

Just what is a definition of smelting? On this subject lexicographers are vague. The process of reducing lead, copper and iron ores in the blast furnace is unquestionably smelting. Here are conveyed two ideas—namely, (1) the reduction and fusion of a metal and (2) the scorification and fusion of the gangue or the impurities. The production and discarding of a slag seems to be an essential part of the conception. In the treatment of metallic products the proportion of slag may be very small and the process is commonly described as "refining." A man who treats the black precipitate from the cyanide process is never called a "gold smelter." He is a gold refiner. In the reduction of zinc ore in the ordinary way there is necessarily only one of the two main ideas of smelting. The metal is reduced and drawn in molten state, but the gangue of the ore is not scorified and fused if the metallurgist can help it, and in many cases he can. The British call the zinc smelter a zinc distiller, which is precise.

In the reduction of zinc ore for the manufacture of zinc oxide by the Wetherill process, and similarly in the reduction of antimony ore by the Herrenschmidt process, there is neither fusion of the metal nor of the gangue. However, the processes are commonly called smelting and the operators thereof are smelters, although the only connection with the main idea is that they treat the ore in furnaces. If zinc is to be extracted hydrometallurgically and precipitated by electrolysis, there is not even that connection; for although the ore may have to pass through a roasting furnace that would not be necessary if it were an oxidized ore. The only furnace in the plant might be that for melting cathodes, which particular part of the process would be melting, not smelting, as everybody would agree.

Proposed Patent Reform

If there ever be any reform in the Patent Office procedure of the United States, there ought to be introduced a new form of letters patent. At present this document consists of two parts—the specifications and the claims. There ought to be a third—a synopsis of both. There might, moreover, be advantageously introduced some subdivisioning of the specifications. It would not be worth while to make these suggestions, or to give any attention to the subject, were it not that patent specifications are an important part of technical literature. The Patent Office authorities claim that they are the most important part—that every new discovery, new process, new idea is sooner or later recorded authoritatively in their office in the form of an application for a patent, and that in making any investigation it is scarcely necessary to search outside of their files. This is not absolutely sound, but there is no doubt a good deal of meat in it. But, admitting that, we submit that the patent files are forbidding and are cluttered with so much rubbish that it is very difficult for anybody—even for a skilled patent-examiner, we imagine—to find in them what he wants.

Let us illustrate. Our attention recently fell upon a newly granted patent for "Method of Smelting Sulphide Ores." This title in itself drags a red herring across the scent of the investigation. The patentee in fact describes a process for zinc smelting, but in order to have his patent as broad as possible he gives it the less definite title. We do not urge any encroachment upon the rights of an applicant. Let him take all that the law allows him. But why should not the Patent Office give to every patent an index title, with the understanding that it does not commit or limit the patentee?

This particular patent in specifications of 291 lines and claims of 160 lines (four pages of text) describes and protects a process that we summarize as follows:

Blende is crushed to minus-100-mesh size and is burned in suspension in the combustion chamber of a distillation furnace, its heat performing the distillation of a charge of ore in the retorts thereof. The products of combustion are conducted through a bag house (bags of asbestos fabric) and the zinc oxide collected therefrom is mixed with coal and charged into the retorts of the distillation furnace. The retort gases are conducted into the combustion chamber of the distillation furnace to assist in the distillation of the zinc.

The claim might be: "The combination of the above steps, and specifically the burning of blende in suspension and the utilization of the heat thereof for zinc distillation."

We shall not discuss the practicability of this ingenious conception of making zinc-sulphide ore do its own smelting or suggest a study of the respective exothermic and endothermic reactions involved; but we submit that all that anybody skilled in the art of zinc smelting needs to know is comprised in our summary,

which might be even more brief. Such a summary ought to be printed as the introduction of every patent specification.

The patent upon which we have commented is manifestly the protection of an idea. There are other patents which are based upon observations of things that happened. A process patent should be subdivided in some such way as the following:

Review of State of the Art: The inventor and his solicitor usually consider it to be necessary to go into this at length. Thus is the reader told repeatedly in zinc-smelting patents that blende is finely crushed, roasted, mixed with coal, and distilled in small cylindrical retorts, with certain drawbacks such as excessive use of fuel and labor, imperfect extraction of zinc, production of blue powder, etc. The Patent Office might usefully adopt a set of standard summaries of the state of each art and in prefacing each new specification with the appropriate one the labor of the drawer of the patent would be lightened and if properly subheaded, as it should be, the reader could skip it if he wanted to, as generally he would.

Next there should be a subhead, "Observations," under which the applicant should tell what he had learned in the laboratory, in the works, or elsewhere. This would be the star feature of many patents. At present it is not given sufficient prominence. Take the famous Everson flotation patent, for example. How much more impressive would it have been if the experiments that the applicant had really made had been brought out in a striking way. In later years they were dug out, to be sure, but there are thousands of dusty, pigeonholed patents which contain scraps of useful information that nobody knows about. The proper exposition of such in the patent office papers would be a real contribution to technical literature.

Finally there should be the subhead of the "Proposal," the way the applicant aimed to do something new and useful, based upon his observations and ideas. In the cases of many process patents there would of course be no subhead "Observations." In such patents a subhead, "Ideas," might well be introduced.

Technical men are generally wishful that there be not so many patents as at present, so many of them being upon mere combinations of steps that would be obvious to anybody who had to take them; but temperateness in the dissipation of paying money for patent fees is probably too much to hope for, although progress in this, as in the prohibition of alcoholic drinking, may gain unexpected headway. In the meanwhile, however, conditions will be somewhat ameliorated if patent specifications and claims be reformed in the ways herein suggested.

Notes About Copper Selling

So long as the war continues, deranging the ordinary machinery of commerce, nobody need be surprised by erratic conditions in the commodity markets, especially those of international character, like the copper market. It is interesting to review some recent features and comment on some current factors.

A little while ago we boasted that we were going to emancipate ourselves from the London standard market. Moreover, that we were going to sell copper in dollars and cents, nevermore in pounds sterling. We are obliged to admit that the wish was father to the thought—that we cannot do what we hoped.

The rise and fall of standard copper in London still sways sentiment here—partly through the medium of Wall Street, partly otherwise—no matter whether it ought not to.

We ought to be able to say that Europe must come to us for copper and must pay us in dollars and cents if we demand it; but when we try to put such a policy into effect, we find that we are simply playing into the hands of the London dealers who will sell European consumers in the way they are used to, and we run the risk of losing our own customers.

The violent fluctuations in the rate of exchange have greatly increased the element of gambling in selling copper for delivery abroad. Thus a pound of copper sold on the basis of £86 realizes nearly 18.05c. if exchange be 4.70 and only about 17.85c. when exchange is 4.65. There were recently sales of copper to domestic consumers at 17¾c. per lb., netting the seller about 17.55c. after deducting discount and freight charges. At the same time the same sellers were willing to sell for export at £86, and did so, which with exchange at 4.65, as it was then, corresponded to 17.85c.; and after deducting c.i.f. charges netted 17.25c. to 17.35c. here.

This difference in price was a feature right along in the recent dull market. Producers were stiff in their attitude toward domestic buyers, but were willing to take less from foreign buyers. Let anybody figure this out as he wants to. Of course about half of the domestic production of copper has got to be sold abroad anyhow. The British pundits who have seen malevolence in the attitude of the American sellers of spelter may like to explain the generosity of the sellers of copper.

There have indeed been three prices for copper of late, on an ascending scale—namely, the price to European buyers, the price to domestic consumers, and the Wall Street price. The last has been pretty steady at 18c. per lb., although there have been threats that it might go to 20c.

The strike of copper miners in the Clifton-Morenci district has turned out to be serious, the several mines and smelteries having been formally put in the hands of the sheriff, who thus has the responsibility of preserving them. Elsewhere among the copper mines there has been remarkable peace and contentment. The bitter strike at Lake Superior and the amusing affair at Butte cleared the atmosphere. The policy of paying the men on a sliding scale corresponding to the price for copper, introduced in many districts, has proved a good one. It is a simple and satisfactory system of profit-sharing, which makes the men feel that they are partners in the business.

The investigation of the alleged zinc-smelting trust opened at Joplin, Mo., last week has already resulted in a fiasco, as everybody of good information knew it would. Only two or three mine operators took the trouble to attend the hearing, and none of them had any evidence of importance of offer. Several ore buyers for smelters testified that the there had never been collusion among themselves, but that they had simply bought ore for their

principals as cheaply as they could. Perhaps the most remarkable thing is the way the smelters turn these men loose in the district, telling them only to buy a certain tonnage of ore and not to exceed a certain price, and leaving the rest to their judgment, skill and honesty. There have rarely been cases of misplaced confidence. The ore buyers of the Joplin district are a good lot of men.

BY THE WAY

The ill-fated Quebec bridge is now being melted down by the Canadian Car and Foundry Co. for use in making shrapnel. The mistake of the civil engineers is furnishing additional employment for the metallurgist.

⁂

The mining and metallurgical gentlemen who are interned in the Douglas Aliens Camp, Isle of Man, Great Britain, find time heavy on their hands and have appealed for American books and journals about minerals and metals that can be spared by generous members of the fraternity in this country. Dr. W. A. Dyes (address Douglas Aliens Camp, Isle of Man, Great Britain) will attend thankfully to the distribution of any literature of this kind that may be sent him.

⁂

The word "terrain" is frequently being used in the war news of today, and although a foreign military word it is becoming common in civilian use, as it has long been in army parlance. Terrain means, according to the "Century Dictionary," a part of the earth's surface, limited in extent considered with reference to its fitness or use for some special purpose, as for a battlefield. The word, although little used, heretofore, is so expressive that it will often be employed to designate territory under consideration and will soon become familiar in the English vocabulary.

⁂

"On a raft 100 ft. underground two bandits at Webb City, Mo., who held up street-car conductors on Sept. 19, paddled to safety through abandoned mine shafts. The mines had been flooded a few days before when a big levee along the river near by collapsed. The bandits floated for six miles underground, climbed to the surface and fled," says the New York *Tribune*. "The men, both masked, held up three conductors near the car barns and got $200 in money and watches. Bloodhounds were put on the trail, which led to the mouth of an abandoned mine. Officers found traces of the men having hastily constructed a raft. The hounds picked up the trail again at the mouth of another shaft, but too late to overtake the men." Thus do the dime novels of our boyhood come to pass in real life.

⁂

About Oct. 1 the headquarters of the statistical bureau of the American Iron and Steel Institute will be removed from 261 South Fourth St., Philadelphia, to 61 Broadway, New York, where the general offices of the institute are. The building in Philadelphia was first occupied by the American Iron and Steel Association under the direction of James M. Swank as secretary about Jan. 1, 1874; when the association was merged in the institute at the beginning of 1913, the statistical department was continued at the Philadelphia office. The building, which was originally a dwelling house, is plain and simple in its exterior and in all its fittings and furnishings, but it served its purpose well for 42 years and many of the older members of the association will learn of its abandonment with regret. The new offices are in the 36-story skyscraper of the Adams Express Co. in New York.

⁂

To the students of union-labor activities the following will doubtless prove of interest: It is very probable that before very long all union workmen dying in Hudson County, N. J., will have to have union funerals. They will be laid out by union embalmers in union caskets, carried by union pallbearers to a hearse driven by a union driver, and buried in a grave dug by union gravediggers or else cremated by union cremators. William F. Kavanagh of the Central Labor Union of Hudson County declared that such will be the rule if the resolution he proposes to introduce at the next meeting of the union on Thursday evening, Sept. 17, is passed. "It is entirely consistent with trade unionism that the bodies of men who were loyal to the cause of union labor should be handled by none but union men," according to Kavanagh.

⁂

The naming of Virginia City, Nev., is related in the *Saturday Evening Post* of July 31, 1915, in Charles E. Van Loan's interesting distillations of his conversations with the "Oldest Inhabitant." In the autumn of 1859 the town acquired a name. "And there was something queer about that," says the Oldest Inhabitant. "There used to be an old prospector round here named Fennimore. They called him Finney for short, and sometimes Ole Virginny on account of his always talking about his native state. Finney liked his liquor pretty well, and one night he fell and broke his bottle. He poured out the drop or two that was left—poured it on the ground. The boys asked him what he was doing. 'I'm christening this camp,' says he. 'It's time she had a real name and from now on she's Virginia Town.' When the postal authorities sent out the cancellation stamps, 'Town' was changed to read 'City.' Old Finney made an awful row about that, but the Government outheld him and Virginia City she was."

⁂

Reuter's agent at Zurich states that agents are conducting a diligent and systematic hunt for copper throughout Switzerland, according to the London *Financial Times*. They are penetrating the mountains to the remotest valleys and persuading the peasants to part with this precious metal. Taking advantage of the ignorance of these country people they tell housewives that their copper utensils are burned out and offer to give them new pots and kettles in exchange, which of course prove to be of greatly inferior metal. The business is enormously profitable, since the agents pay only 2d. to 4d. a lb. for copper which they sell to Germany for ten times as much. The Germans are constantly finding new ways of getting copper from the Swiss. There are no brass smelters in Switzerland and taking the advantage of this the Germans insist upon receiving an equal amount of copper for every delivery of brass. And as the copper in brass weighs only one-half to two-thirds as much as the brass, a surplus is thus obtained.

PERSONALS

Leo Von Rosenberg, of New York, is in eastern Oregon.

Kirby Thomas, New York, has been in the Tintic district, Utah.

Prof. F. W. Sperr of the Michigan College of Mines has gone to California.

Henry Krumb and F. S. Schmidt, of Salt Lake City, Utah, are in Alaska reporting on several properties.

A. I. D'Arcy, general manager of the Atlanta Mine has returned to Goldfield, Nev., after having visited different places in California.

Charles W. Newton, superintendent of the Consolidated Interstate Callahan Mining Co., Wallace, Idaho, spent several days in Spokane this week.

W. Ray Cox, who for several years has been a mineral inspector of the General Land Office at Portland, Ore., has been appointed professor of Mining and Metallurgy in the School of Mines at the Oregon Agricultural College, Corvallis, Oregon.

W. R. Coleridge Beadon, who has been engaged in mine management and engineering for the past 18 years in Montana, India and Burma, chiefly for John Taylor & Sons, London, is now investigating the possibilities of old gold workings in the highlands of the Dekkan in India.

The New York Section of the Mining and Metallurgical Society of America held its annual election of officers at the Machinery Club on Sept. 16. J. E. Johnson, Jr., was elected chairman; A. H. Rogers was reëlected vice-chairman and D. M. Liddell, reëlected secretary-treasurer.

F. C. Cheney, mining engineer of Cleveland, Ohio, aged 21, formerly assayer and surveyor at the Hudson Bay Mine, Cobalt, but recently with the Dome Lake, Porcupine, Ont., disappeared on Aug. 23. On that date he left Timmins to go to the Dome Lake, and called at the Schumacher and Dome mines, but has not been seen since, though an extended search has been made for him.

J. M. Turnbull, of Trail, B. C., has been appointed professor of mining in the University of British Columbia. Mr. Turnbull for years has been a mining engineer with the Consolidated Mining and Smelting Co. of Canada, Ltd., graduated from McGill University, Montreal, in 1897. During the long period he has been associated with the Consolidated he has had a close and extensive experience with the productive mining industry of British Columbia, besides which in his capacity of examining engineer he has travelled throughout the various districts of the Province, so that he has acquired much valuable information relative to its mineral resources.

OBITUARY

John Cameron died at Virginia City, Nev., Sept. 4, aged 75 years. He was for many years connected with the Yellow Jacket Mine on the Comstock.

William H. Woodward died recently at Park City, Utah, aged 74 years. He had been for over 30 years a prospector and operator in that district and had located several important mines.

James Hendrickson was killed in the Albion tunnel at Alta, Utah, Sept. 16. The miners struck a heavy flow of water on that day, which was followed by a large volume of carbon dioxide. Mr. Hendrickson, with another man, both armed with oxygen helmets, went into the tunnel to open up the air line, but was overcome, notwithstanding the helmet. He was a mining engineer, a graduate of Columbia University and had been in Colorado and Utah about 12 years past.

SOCIETIES

American Institute of Metals—The ninth annual meeting will be held at Atlantic City, N. J., Sept. 28-Oct. 1, and will be a joint meeting with the American Foundrymen's Association. Many interesting papers are promised.

American Electrochemical Society—A meeting of the New York section was held at the New Grand Central Palace, Sept. 25. The speakers of the evening were: John Barrett—"The Great Pan American Opportunity." Thos. H. Norton—"The Possibilities of Niagara for American Electrochemistry."

Franklin Institute, Philadelphia—The program of lectures to be delivered at the 1915-1916 meetings has been published. Among them are the following relating to metallurgical subjects: Oct. 20, 1915—"Recent Progress in the Metallurgy of Copper," by H. O. Hofman. Dec. 2, 1915—"Magnetic Investigations of Iron and Steel," by John D. Ball. Dec. 9, 1915—"Smoke as a Source of Atmospheric Pollution," by W. F. M. Goss. Mar. 30, 1916—"Some Problems in Physical Metallurgy at the Bureau of Standards," by George K. Burgess. Apr. 6, 1916—"Use of Powdered Coal in Metallurgical Processes," by C. J. Gadd. Apr. 13, 1916—"Heat Measurement as Related to the Industries," by Charles W. Waidner.

Yale Engineering Association—There has been recently formed an organization among graduates of Yale University known as the "Yale Engineering Association," the purposes and objects of which are clearly set forth in a circular letter which has been widely distributed to Yale graduates. The officers of the Association consist of: President, Edwin M. Herr, Westinghouse Electric and Manufacturing Co.; vice-president, Harry N. Covell, Lidgerwood Manufacturing Co.; secretary-treasurer, Richard T. Dana, consulting engineer. While any Yale graduate is eligible for membership, yet the association naturally appeals more strongly to those who are engaged in engineering pursuits, transportation or manufacturing. It is proposed to hold the first meeting of the association in New Haven the early part of November.

American Mining Congress—The meeting of this body was held in San Francisco, Sept. 20-22. The provisional program provided for the opening session on Monday morning, Sept. 20, and for the afternoon address on "What the United States Bureau of Mines is Doing and Hopes to Do for the Metalliferous Mining Industry," Van H. Manning; "Plain Writing," Dr. George Otis Smith; "Federal Influence in the Settlement of Industrial Disputes," Dr. Martin D. Foster.

Tuesday's sessions were devoted to reports of Committees on Prevention of Mine Accidents, on Uniform Mine Reports, on Alaskan Affairs, and on Revision of Mineral Land Laws. Papers were: "Rights of Way Over the Public Domain," Hon. Charles S. Thomas; "The Right of Appeal from Decisions of the Interior Department in Cases Where the Government is Charged with an Interest," H. H. Schwartz; State versus Federal Leasing of Natural Resources Where Government Control is Essential to Public Welfare" (general discussion); "California's Water Infiltration Law," Fletcher McN. Hamilton.

At noon memorial exercises in honor of the late Dr. Joseph A. Holmes, Chief of the Bureau of Mines, were held.

In the evening the business meeting and election of officers were held.

The sessions on Wednesday, Sept. 22, were devoted to reports of the Committee on Resolutions, on Mine Taxation, on Mining Investments, on Freight and Ore Treatment Rates. Papers and addresses on "The Development of Mine Taxation in Arizona," G. H. Dowell; "Mining on Government Indian Reservations," F. Lynwood Garrison; "Workmen's Compensation Insurance and the Coal Mining Industry," Herbert M. Wilson; "The New Plan of Mining Insurance," David Ross; "Mining Hazards on the Pacific Coast," Dr. F. L. Hoffman; "The Iron Resources of Utah," Prof. Fred J. Pack; "The Future of the American Zinc Industry," Otto Ruhl; "Interesting Phases of the Anthracite-Mining Industry," Dr. E. W. Parker; "Federal Control of the Coal Mining Industry," including a discussion of the Sherman Law, the Clayton Bill, and the Federal Trade Commission, Rush C. Butler.

On Wednesday evening a complimentary banquet tendered to Van. H. Manning, the new Director of the United States Bureau of Mines.

TRADE CATALOGS

The James Quartz Mill & Crusher Co., Denver, Colo. Catalog No. 12. Quartz Mills and Crushers. 20 pp., illus., 6x9½ inches.

The Brown Hoisting Machinery Co., Cleveland, Ohio. Catalog U. Brownhoist Transfer Cars and Larries. 32 pp., illus., 6x9 inches.

Sullivan Machinery Co., 122 South Michigan Ave., Chicago, Ill. Bulletin No. 72. Sullivan Drill Sharpener. 24 pp., illus., 6x9 inches.

The Electric Storage Battery Co., Philadelphia, Penn. Handbook H L. Low Voltage Isolated Electric Light and Power Plants with the Chloride Accumulator. 52 pp., illus., 6x9 inches.

Editorial Correspondence

SAN FRANCISCO—Sept. 15

Patrick Creek Copper Mines, owned by W. Duley and O. B. Lauff, of Crescent City, have been taken on a purchase option by George P. Reuter and Arthur A. Slobbling, of Portland, Ore. The mining districts in Del Norte County have the great disadvantage of lack of adequate transportation. The only travel or connection is by steamer to San Francisco or Portland and Seattle. The proposed railroad now under construction from Grants Pass, Ore., to Crescent City will put the Del Norte districts in direct transportation connection with the Southern Pacific and will aid very largely in the development of the copper ores in Del Norte and Siskiyou Counties. The Queen of Bronze mine in Josephine County, Ore., and the Britten mine in California are shipping copper ore to Kennett, by way of the new railroad. The possibilities of northwestern California and southeastern Oregon will soon be made evident, and if the proper methods of development are applied to that region, they will add very largely to the future gold and copper production of the Pacific Coast.

Semi-Monthly Pay Day provided for by law passed by the last legislature does not appeal to miners generally. At the Argonaut in Amador County, the company has proposed to make the semi-monthly pay day optional with the men. Those who wish their money twice a month instead of once will be accomodated. It is probable that the majority at this and other Mother Lode mines will express their preference for the monthly pay day. Miners can see very little merit or advantage in the law, especially when working for reliable operators, and they are not much disposed to changing their habits in the matter of paying their bills which formerly have been settled once a month. So far as the mine owners are concerned, the law necessitates more labor in the clerical departments and some inconvenience probably, but this is of no great importance so far as it affects the industry generally. Mine owners and employees are not the only persons to be considered under this law. In fact they furnish rather a small proportion. There are other industries whose employees will be very largely benefited by semi-monthly pay days, and the law was meant for their benefit, without particular consideration of the mining industry. At any rate the industry will not suffer by reason of the law and it is not going to disturb mining men enough to make a fuss about. By the active work of the California Metal Producers Association, and its friends in the lobby of the last legislature, some very bad bills were killed and while some bills got by which are not particularly to the advantage of the industry, mining men have nothing particular to grieve about and should be very well satisfied with present conditions. The mine-safety rules are being got into good shape, the mine-insurance rates have been reduced, and altogether the mining industry has fared better than it has in a good many years past so far as legislation affects it.

DENVER—Sept. 16

A New and Standard-Gage Route into the San Juan mining region is being sought by the Denver & Rio Grande Ry. Engineers believe they have found a practicable route starting from the station of South Fork, between Del Norte and Creede, following up a water grade, crossing the San Juan Mountains in Mineral County and then traversing the rough prairie to Durango. President B. F. Bush and party of railroad officials have been touring the proposed route by wagons.

Charges of Fraud that had been preferred by Rufus C. Elder and Frank E. Mann against Samuel D. Nicholson, Julius Rodman and John A. Ewing, all prominent in Leadville mining, were dismissed by Judge John A. Rimer of the U. S. District Court, Denver. This suit was brought a year ago by executors of the estate of George W. Elder, a stockholder in various Leadville mining companies controlled by the above defendants and allied with the Guggenheim interests.

The Denver Branch of the United States Mint, according to Thomas Annear, superintendent, is the storehouse of upward of $465,000,000 worth of coin and bullion. He believes that Colorado will during 1915 produce from $8,000,000 to $10,000,000 more in gold and silver than it did last year. For the past four months, the mint receipts from Colorado mines have been nearly 25% above normal. More bullion is stored in the mint at Denver than in any other building in the world, it is believed. The coinage department is at present making only silver quarters.

Entire Holdings of the Tin Cup Gold Dredging Co, were sold, Sept. 2, by the United States court of bankruptcy, Denver. The property comprises a fine hydro-electric power-generating plant at St. Elmo, in Chaffee County; a transmission line thence over the continental range to Tin Cup, in Gunnison County, about 16 miles; a complete gold dredge with 3½-cu.ft. buckets, 2,300 acres of dredgeable ground; and a complete equipment of buildings, churn drill and tools. This valuable outfit was sold for $5,000 to Colorado Springs parties. One more recorded instance of failure in a promising mining enterprise resulting from management by inexperienced men and a heavy promotion overload. The complete outfit was never given a reasonable chance to operate.

BUTTE—Sept. 14

Although the Butte Mining Companies Paid in wages in August about $350,000 less than they did in July, nevertheless the payrolls last month aggregated $1,700,000. July was the biggest month in the history of the Butte mines, so far as the payment of wages is concerned, although the output of copper and the net earnings were not nearly so large as during some previous months. There are fully 13,000 men employed in the Butte mines and the rate of wages fell from $4 to $3.75 per day because copper sold under 17c. in August, the rate of wages being based on the price of copper. The Anaconda company alone paid out $1,180,000 for wages in August. The Butte & Superior paid out $170,000, which was about $5,000 less than in July, and the North Butte paid $93,000, the East Butte $90,000, the Butte-Ballaklava $15,000 and the Clark properties $60,000. It is estimated that the mining companies and other employers of labor in Butte pay out a total of $2,600,000 in wages each month.

The Output of Copper is being gradually increased by the mining companies but the total is still far from what it was a few years ago. The Anaconda company official report of August production shows the output to have been 22,800,000 lb., the largest production of any month this year, and that includes the output of the North Butte company, nearly 1,800,000 lb., and some other custom product. During the other months of the present year the Anaconda company reported production as follows: January, 13,700,000 lb.; February, 15,100,000 lb.; March, 19,000,000 lb.; April, 21,800,000 lb.; May, 20,500,000; June, 22,100,000 lb.; July, 22,100,000 lb. In August of last year the output was but 14,750,000 lb., and in 1913 it was 22,500,000; in 1912, 25,250,000 lb. The copper-producing companies now are the Anaconda, North Butte, East Butte, Butte-Alex Scott, Elm Orlu, Davis-Daly, Butte-Ballaklava, Pilot-Butte and Tuolumne. About the only development company operating in Butte at the present time is the Rainbow, a Cole company, which is engaged in developing the Rainbow and Butte & London properties. Sinking was resumed in the Rainbow shaft a few weeks ago and in the Butte & London last week.

SALT LAKE CITY—Sept. 16

The Salt Lake Stock and Mining Exchange appointed delegates to the National Brokers Convention in San Francisco, Sept. 21 and 22, as follows: George H. Dern, W. D. Nebeker, J. C. Dick, Fred C. Dern, and J. A. Hogle. Messrs. G. H. Dern, Dick and Nebeker have also been appointed delegates to the American Mining Congress, which meets at San Francisco during the same week.

SEATTLE—Sept. 15

Lower River Claims are Showing Up Well under development, an average of 50c. a yard being obtained from the claims in the open cuts. Considerable activity is also in evidence in the camp. About 36 operators now are busy doing development work.

The Strike Among Miners at Long, near Rico, has closed down many placer claims, and only two small concerns are operating on Long and Bear Pup Creeks. A good many of the men affected by the strike are scattering to other creeks and some are leaving the district entirely. The operators offer to pay $4 a day for muck, but the men

want $5 and have struck to enforce their demands. At present there is no indication of a compromise, as the mine owners say the ground will not stand the wage scale.

WALLACE—Sept. 17

The Controversy Between the Hercules Mining Co. and the American Smelting & Refining Co., which has been occupying the attention of this district for the last three months, still affords material for much interesting speculation. Having failed to secure a satisfactory contract for the treatment of its ores, the Day interests, which control the Hercules, opened negotiations for the old Northport smeltery, near the British line in the State of Washington, owned by an English company. These negotiations resulted in the purchase of the plant by the Days for $80,000. The plant has long been idle and is said to have originally cost over $1,000,000. The Days evidently intend to embark in the smelting business, not only handling the ore of the Hercules and other mines they control, but will do a custom business also. The smeltery was built to handle copper ores and is now being remodeled to treat lead ores also. There are a number of interesting features in connection with this move on the part of the Days, and the belief still prevails in some quarters that the purchase of the Northport plant was merely a bluff to force the A. S. & R. to make concessions to the Hercules. The owners of the Hercules are not a unit on the smelting proposition. The company is not incorporated and it is known that at least two of the large owners, August Paulson and L. W. Hutton, of Spokane, have declined to go into the smelting enterprise. It was therefore up to the Days, Harry L., Eugene R., and Jerome J., to furnish the sinews. It is now learned that the funds for the extensive work that is going on in rebuilding the Northport plant are being provided by the Tamarack & Custer Consolidated Mining Co., which is controlled by the Days. This company is incorporated under the laws of the State of Nevada, which it appears give practically unlimited powers to the three members of the executive board. This company has a large ore reserve and for several years has been operating steadily, but has never paid a dividend. Its surplus is estimated as high as $600,000 and it appears that this money is to be used to overhaul and restore the old smeltery to a condition of activity. Another interesting feature of the situation is that Harry L. Day, one of the brothers who dominate the Hercules and Tamarack & Custer, is still president and general manager of the Federal Mining & Smelting Co., a subsidiary of the American Smelting & Refining Co., with which the Days are now at loggerheads and with which they are preparing to compete in the smelting of Coeur d'Alene ores and the ores of other districts.

CHISHOLM, MINN.—Sept. 18

With the "safety-First" Idea in mind, the Oliver Iron Mining Co. is experimenting with a small attachment on the shoes of its surface timber crew, to permit of greater ease and safety in getting over the logs. The device is a small piece of sole leather with a spiked plate, and is detachable. It has been found a good safeguard against loss of footing because of loose bark, rolling logs, snow, ice, etc.

DULUTH—Sept. 18

Bathtubs in Miners' Cottages are to be tried on the Mesabi range. At Chisholm, a local plumber has been given a contract to install bathrooms in 11 company houses of the Oliver Iron Mining Co. in Monroe Location. This is in line with the welfare work being done by the company.

Taxes and Penalties aggregating $67,794.84 have been paid by the Oliver Iron Mining Co. and Pickands-Mather Co. on mining property in Hibbing, Minn. Such taxes were paid only on mining property held under state leases, indicating that the operators propose to take no chances on the possible forfeiture of their state leasehold interests, as all state leases contain the usual clause requiring prompt payment of taxes. Officials of the above two companies, as well as the remaining nine operators, state that this small payment does not mean the abandonment of the fight against the alleged municipal extravagance of the Hibbing officials. No other part of the $1,500,000 tax levy has been paid by the mining companies.

HOUGHTON—Sept. 20

The Proposal to Consolidate Centennial with Osceola has not been heard from further, although the proposal is by no means dead. There have been two meetings of large shareholders, entirely independent of the Calumet & Hecla interests and at these it was determined not to go ahead with matter in hand until the results of the Tamarack proposal to sell out all individual holdings to the Calumet & Hecla should materialize or should be dropped. The belief is general that the average miner or shareholder in Calumet has a pretty fair knowledge of the conditions underground in both of these properties and Centennial shareholders are waiting to see what sort of a proposal the Calumet & Hecla is willing to accept from the Tamarack and then they will go ahead and make their proposal to the Osceola. W. E. Parnall, who was here making an examination of the Tamarack, in connection with the proposal to sell out, has completed his underground investigation and returned east.

The New Arcadian is now operating a small crew of men at a point 1,400 ft. south of present shaft. It is hoped to pick up the same rich amygdaloid that is now making such a continued good showing in each opening in the main shaft. The point where this preliminary work on a possible second shaft is going forward is the pit where work was undertaken 5 years ago. At that time the overburden was found to be 30 ft. deep and it was expensive work to get to the solid rock. This pit has been unwatered and the first blasts uncovered some good-looking amygdaloid, much like that taken from the first shaft. The conglomerate, presumably the Calumet, was shown in three points in the shaft and in two diamond-drill cores in previous records. Assuming that the amygdaloid is about the same distance east of the conglomerate in this mineral formation, present locality ought to disclose the formation in quantity and quality.

NEGAUNEE, MICH.—Sept. 19

There Will Be Very Little Ore Left in stock when the shipping season comes to a close this year. The piles at the Negaunee, Maas, Hartford, Rolling Mill, Mary Charlotte, Breitung Hematite and Queen Group will all be forwarded. These are the only operating mines at present, with the exception of the South Jackson, which is operated only during the summer months and which will ship about 60,000 tons this year. Negaunee is now in as good a condition as any city in the Michigan iron district, with a number of large mines, and all ore to be loaded and sent out. There should be no worry about the winter there. If it is true that the price of ore is to be advanced 50c. before next spring, the operators will want to get out all that they can and have it ready to ship. Higher prices also mean that some mines that are now idle are apt to be started up again. Some of the high-cost producers always have a difficult time breaking even when the market prices are low, but they are able to derive a profit when bessemer ore is selling above $4 and nonbessemer is above $3. The present prices are $3.75 for bessemer and $3 for nonbessemer.

GRAND RAPIDS, MINN.—Sept. 19

Operations in Itasca County are epitomized in the report of the mine inspector covering the period from Feb. 1, 1915, to July 1, 1915, just published. It shows that there are 21 mines in the territory and that 10 were operated during the period covered by the report. Six of them shipped ore during that time. Stripping operations were carried on by five companies. The Hill-Annex removed the largest amount of dirt during the five months, stripping 746,000 cu.yd. The Canisteo came second, with 214,000 cu.yd. Other mines stripping were the Bennett, Quinn-Harrison and the Hawkins. The greatest shipment of ore was from the Canisteo pit, at Coleraine, with 442,000 tons. Other shipments were as follows: Hill mine, 266,000 tons; Holman, 240,000 tons; Judd, 95,000 tons; Mississippi, 153,000 tons; Hawkins, 61,000 tons; Quinn-Harrison, 136,000 tons. During the period 1,285 men were employed. Of these 1,113 worked on surface. Only 172 were employed underground. There were but two fatal accidents during the five months, a far better record than for any previous period since the district was opened. Otherwise no one suffered serious injuries, fractures or amputations. The minor accidents were few in number. It can be clearly seen that the "safety-first" campaign is having good results. Since the period covered by the report, activities have been greatly increased. More mines are working and more men are employed. The outlook is very bright on that part of the Mesabi.

TORONTO—Sept. 18

From the New Kowkash Gold Field many prospectors have returned discouraged with the impression that there are few favorable indications outside of the original discovery. The expectations of claimholders have since been revived by another important find, distant 15 miles from the King Dodds discovery, from which rich samples are shown, which is regarded as indicating the extent of the field. While the geological formation is considered as favorable, there are few rock outcrops, and much stripping away of the overburden must be done before the value of the field can be determined. Under these conditions it is not likely that superficial prospecting will result in further sensational finds, and though prospecting parties are still going in, there is little disposition on the part of capitalists to make investments before the value of the field is established. The report of Percy Hopkins, assistant geologist of Ontario, which will probably be made public in a few days, is awaited with much interest.

The Mining News

ALASKA

PATTERSON AND FINLEY (Fairbanks)—Have made their fourth cleanup on Livengood creek. About 223 oz. of dust were taken out, netting $3,982, which averages $17.86 per ounce.

ROSS & BYRONS CLAIMS (Nome)—A four-horse team load of ore has been brought out and shipped to the Tacoma smeltery for treatment. It was blocked out of a quartz stringer in bedrock, 40 ft. from the surface, and has a high mineral content.

THOMAS-CULROSS (Valdez)—Has started development work on larger scale than heretofore, owing to extraordinary value of ore recently uncovered. Property is located near Thomas Bay, on Culross Island, in Port Wells district, 70 miles from Valdez. Last shipment made to Tacoma smeltery showed value of $140 per ton. Vein is exposed for distance of 1,500 ft. and runs from sea level to the top of the Coast Range.

YUKON GOLD (Dawson)—Has bought 3½ miles of placer ground on Greenstone creek, in the Ruby camp, and will install a dredge there soon, according to reports. Company took ground under option year ago and only recently finished prospecting it. Dredge with 3½-ft. buckets will be installed and operated by steam, as it has been found the creek is not long enough to warrant installation of all the necessary equipment for an electrical plant.

ARIZONA

Gila County

INSPIRATION (Miami)—During August mill handled 85,000 tons of ore. Made extraction of 83 per cent. against a predicted recovery of 85 per cent. when mill reaches capacity. September tonnage expected to be 125,000 tons.

CALIFORNIA

Amador County

AN IMPROVISED MILL has been constructed by Harry Troop in Pioneer district and reported to be doing good work. Mortar block size of common die is sunk in the ground 8 or 10 ft. Two pieces of timber 6x10-in. section, 10 ft. high, are bolted to two sides of the mortar block. Sides are boarded up proper height and die placed therein. Screen is fastened above die and ordinary iron fittings are used.

CLINTON (Jackson)—Six men working at this gravel mine, using water hoist to lift boulders and heavy gravel out of pit. The bar is about 100 ft. deep and produces coarse gold.

KENNEDY (Jackson)—Rolla White, underground engineer, was caught in sheave at the hoist, Aug. 28. He was coming out of shaft riding bail of skip and hoist engineer not noticing him gave him no time to get off at collar of shaft.

PRODUCE DEVELOPMENT (Ione)—Cleaning, drying and shipping kaolin and sand is in progress. When present cleanup is finished a steam drier will be installed. Company will manufacture pottery and other products. More men will be employed.

EAST EUREKA (Sutter Creek)—This mine, originally Poundstone, is reported to have been bonded to Alexander Rennie. Property is equipped with 20-stamp mill, which was built about three years ago. Mine has been idle for year or more. Preparation is being made for unwatering old shaft.

CENTRAL EUREKA (Sutter Creek)—Directors at San Francisco levied an assessment of 5c. a share. Indications on lower levels are that little more work should disclose large orebodies. During this development mill will crush ore from three lowest levels. Company employs 100 men James A. Davis is superintendent.

Butte County

WATER FOR ELECTRIC POWER amounting to 6000 in has been applied for in Little Butte Creek by Malcolm D. W. Greene, to be applied to mining property on Magalia Ridge. It is purposed to generate 1500 hp.

Eldorado County

LARKIN (Placerville)—Suit to quiet title decided in Superior Court in favor of Charles F. Lecker, who has been in possession for past five years. Property formerly controlled by Larkin Mining Co. Company trustees did not contest Becker's rights.

Inyo County

DARWIN DISTRICT has good prospect of development. Tex Hall and Frank Paul, of Ely, Nev., have 18 men employed sampling some of the mines.

ANTIMONY ORES amounting to 25 tons daily reported being shipped from Wild Rose Cañon. Ore is hauled by motor trucks to Trona, thence shipped east by rail.

CALMICH (Deadwood)—Development shaft will be sunk to 100 ft. Installation of hoist and other machinery contemplated if development should warrant.

BONNELLY GULCH (Lewiston)—New 5-stamp mill under construction at this mine near Deadwood. Property is owned by Wallick, Davis, Johnson and Blakemore, who are practical miners and mill men.

SKIDOO (Skidoo)—Preparations being made to install 44-hp. gas engine for auxiliary purposes. The 24-mile pipe line carrying water to the mill has required some repairs during hot weather. Mine in good condition.

AMERICAN (Zabriskie)—Reported that operations will be resumed by Harris, Gilbert and Baker, of Nevada and Zabriskie, who purchased property from estate of Andrew McShane, who located mine 17 years ago. Ore is said to be high grade.

McCAUSLAND (Zabriskie)—Increase in milling capacity from 40-ton Lane mill to 150 tons is contemplated. Series of veins from 2 to 6 ft. in width carries ore running from $12 to $200 per ton. Mill is operated below sea level. Ross D. McCausland is superintendent.

BISHOP CREEK (Bishop)—Ore averaging $13 per ton is being crushed, with approximate recovery of 84%. Installation of slimes table for making closer recovery is contemplated. Ledge shows average width of 17 ft. Low-grade ore running $7 per ton is held in reserve.

IBEX (Zabriskie)—Lead and zinc ore being extracted and shipped on burros 15 miles to Tonopah & Tidewater R.R. Lead ore is said to run about 38% lead and the zinc ore 8% zinc. Veins are parallel and ore comes from depth not greater than 75 ft. Twenty men are employed.

PAMLICO PLACER (Bishop)—Placers in Hawthorne district formerly owned by Burns, Blackburn & Schumaker taken over upon payment of $2,000 cash on purchase price of $20,000. Stated that gravel contains about $4 per yard. Company organized by Senator Key Pittman and H. S. Brady, of Nevada.

CERRO GORDO MINES (Keeler)—Lease held by Louis D. Gordon expired Sept. 15. Property taken over by company without change in operation, and with Mr. Gordon as manager. Production of zinc in August was 1,620 tons. In first half of September, or to Sept. 18, estimate is 1,200 tons of zinc and 200 tons of lead. Tramway from mine to Keeler is completed and handling 100 tons of ore per day. Company employs 150 men.

Madera County

DAULTON (Madera)—Copper ore that has lain on dump for several years will be treated in old smeltery which has been out of commission for 12 years. J. P. Pennell, of Fresno, has leased property from Walter Smith, of Madera. Leaching plant has been installed to treat 2,000 tons of sulphide ore.

Nevada County

MEADOW LAKE DISTRICT is becoming active. Mrs. Tolo Wyment has given bond on her property where number of men are improving road over mine to lake. John C. Clark is rebuilding road from Meadow Lake to Three John mine. Good strike of ore was recently made at Gold Dollar mine, which has encouraged new development.

NEVADA COUNTY MINES CO. (Grass Valley)—Company has taken over Union Mine on Banner Mountain. D. W. Shanks, formerly superintendent of Union Hill Gravel Mines in Trinity County and J. Nelson Nevius, mining engineer of Los Angeles, are organizers of company. Unwatering of 225-ft. shaft will begin immediately. Gasoline engine used to operate pump. Mine was an early-day producer.

Placer County

DREDGING ON BEAR RIVER below Dog Bar Bridge will be undertaken by Thomas Donahue and associates, of Seattle. Understood that California type bucket-elevator dredge will be installed, to cost $75,000.

HERMAIN (Westville)—Operation resumed and 10-stamp mill in commission. Large amount of supplies being taken in for winter which begins early; heavy snows prevent packing during that season.

Plumas County

ROBINSON (Quincy)—Posey and Miller, representing Colorado men, have taken bond on this quartz mine in Graham basin. Installation of roller mill is contemplated. It is also intended to build 6-mile road from basin to Junction House on Oroville road.

Siskiyou County

CHROME DEPOSITS at Dunsmuir recently purchased by Clarence M. Oddie, have been sufficiently developed to supply limited quantity of ore. Property was old producer, but is so situated that it cannot be economically worked in winter months.

HEAD WATER (Yreka)—J. E. McBride, of New York, who became interested in this property on north fork of Humbug Creek 16 years ago, recently made business visit and prepared for sinking shaft on ledge, which has been developed by assessment work.

DAVIS CONSOLIDATED (Happy Camp)—Property closed down for season on August 25, having had an average quantity of water. Before resuming operations on Nov. 1, sawmill 8 miles distant from mine will be overhauled and a supply of lumber cut. Main 30-in. pipe line on 2 grade will be extended west 400 ft.; 1,100 ft. of 22-in. pipe and two 300-ft. strings of 15-in. feeder pipe will be either relaid.

Shasta County

NOBLE ELECTRIC STEEL CO. (Heroult)—Second furnace blown in working on chrome ore mined at Lowery, Tehama County. Since resumption of operation company has

manufactured 600,000 lb. of ferromanganese. Fifteen carloads have been shipped to Eastern points in Illinois, West Virginia and Pennsylvania. Eighty-five men are employed. J. J. Cogan is superintendent.

Tuolumne County

CHILANO (Jamestown)—Charles Gillis, owner, reported to have interested men in this property which will be reopened.

RAWHIDE (Jamestown)—Reported that negotiations are in progress for purchase of this property by Nevada men. Rawhide was one of important mines operated by Captain Neville during his prosperous days of Mother Lode mining.

Yuba County

MOTHER LODE MINING CO. (Marysville)—Superior Court has made restraining order prohibiting the company from working property in Indiana Ranch district claimed by Red Ravine Mining Co.

COLORADO

Boulder County

AMERICAN (Gold Hill)—Is erecting 50-ton amalgamation mill below and adjacent to outcrops of numerous closely spaced, nearly vertical veins. Extensive prospecting by trenches, cuts and adits has proved wide belt of thoroughly oxidized siliceous free-milling material, worth about $4 per ton and which, it is believed, can be mined and treated for about $1.30 per ton. James H. Caldwell, of Denver, is president and manager.

Clear Creek County

COMMONWEALTH (Georgetown)—Imperial Mining Co. shipped lot running 2.74 oz. gold, 60 oz. silver, 22% lead and 9% copper.

NORMAN (Silver Plume)—Mine dump is being sorted and shipped by Lampshire & Co. to Mendota mill, where it is converted into good lead-silver concentrates.

CAPITAL (Georgetown)—Bruce & Co. and Hummer & Son are taking out very good gold-silver-lead ore. Mill is kept busy on ores produced by company and leasers.

MENDOTA (Silver Plume)—Chappell and Lyon make monthly shipments of lead-silver-gold ore worth about $60 per ton. Stephen Bros. are mining narrow vein of lead-zinc ore.

Gilpin County

GILPIN-EUREKA (Central City)—From 30 cords of ore mined by McCallister & Co. on 600 level, mill recovered retort weighing 54 oz., worth nearly $800.

INGALLS (Central City)—Leasing company has settled for 8 tons high-grade smelting ore at 5.20 oz. gold, 27.9 oz. silver and 5.65% copper, worth net about $115 per ton.

GILPIN-ONION (Central City)—Leasers' last shipment from 2-ft. vein—11 tons—was to Globe smeltery, Denver, and gave returns of 7.46 oz. gold, 10.0 oz. silver and 2.4% copper.

FRONTENAC (Russell Gulch)—Six sets of leasers are working in levels 5, 6, 7 and 8 and, during August, shipped 94 tramway carloads to Iron City mill, in addition to 2 railroad carloads of smelting ore sent to Denver.

BATES (Black Hawk)—Leasing company shipped to Denver for smelting 18 tons of ore running 1.16 oz. gold, 10.25 oz. silver and 1.7% copper. Carload lot of concentrate shipped to same works ran 0.87 oz. gold and 3.08 oz. silver.

OLD TOWN (Russell Gulch)—Hutchens lease shipped 24 carloads via Gilpin County tramway to Iron City mill, Black Hawk, and recovered retort weighing 24 oz. and 20 tons of concentrate assaying 1.90 oz. gold and 2.0 oz. silver. Tramway cars average about 8 to 10 tons of sulphide ore, their capacity being each one cord, the county's unit of measurement for mill ore.

COEUR D'ALENE (Central City)—William F. Gray, superintendent, states that most of his work done this summer in reopening this old property has been in main shaft and in levels 6 and 7. Five raises have been made to block ore and another crosscut is being driven to catch vein. Breast of 700 level shows 4 ft. of mill ore that is shipped to and treated in Buell mill, near Black Hawk.

PEWABIC (Russell Gulch)—All property of Pewabic Consolidated Mines Co. has been sold at auction by trustee of United States court of bankruptcy. Representing Eastern capitalists, William F. Gray secured entire holdings for $30,-500, a figure below value of machinery and buildings on mine. He thus acquired 25 unpatented and 11 patented claims, all buildings and machinery. This mine, adjacent to Old Town mine, was formerly active and prosperous.

PITTSBURGH (Russell Gulch)—Manager Auger makes shipments punctually every month, always marketing products in several lots representing different working faces. The five lots for August were not so large as usual. They varied in tonnage from 8 to 16 tons each and were settled at following minimum and maximum assays: Gold, 4.18 oz.—9.49 oz.; silver, 7 oz.—12.0 oz.; copper, 6.1%—17.2%. Three cords put through 5-ft. Ft. mill, Central City, yielded retort weighing over 7 oz. and 8 tons of concentrates running 1.85 oz. gold and 5.0 oz. silver. Eight cords treated in Iron City mill returned 15-oz. retort and 2 carloads of concentrates running 1.16 oz. gold and 7.15 oz. silver.

Lake County

EVENING STAR (Leadville)—Entire surface plant at No. 5 shaft was destroyed by fire that broke out in middle of night, entailing loss estimated at $10,000. George E. Cramer, leasing miner, believes fire of incendiary origin, similar fire having destroyed plant here almost exactly year ago.

AMERICAN SMELTING & REFINING CO. (Leadville)—Legal controversy instituted by this company against the county commissioners relative to its assessment has occupied several weeks of attention of Judge Cavender. County assessor McDonald had assessed Arkansas Valley smelting plant at a valuation of $503,000. Company sought a reduction of $147,000. Court decreed that assessment must be lowered $74,510 and that county must refund to smelting company tax already paid on this amount, together with interest on same. After this decision, company, through its tax agent, A. B. Teal, submitted petition to commissioners requesting reduction in assessment on its property listed as "stocks and securities," which are represented as worth $173,600. Warm arguments followed in which county officers made new demand for examination of the company's books, demand previously denied and again denied at this time.

HILL TOP (Leadville)—This mine is almost on ridge of Mosquito range, on opposite side from its headquarters. About 50 men are employed developing and mining good tonnage of lead-zinc-silver ore that is shipped via South Park branch of the C. & S. Ry. Owing to high altitude with adverse climatic conditions and to somewhat heavy water handicap, property remained idle for two years until George B. Berger and associates of Denver resumed operations last spring, when prices for zinc became attractive.

San Miguel County

COLORADO MANGANESE (Norwood)—Has shipped five 25-ton carloads of rich manganese ore that is sold to chemical trade. It runs but 0.43% iron and sells for $65 per ton, f.o.b. cars Placerville.

Summit County

KING SOLOMON (Breckenridge)—Daniel Davidson, et al, leasers, have vein 6 to 40 in. thick from which they have shipped 11 carload lots running about $40 per ton in gold and lead.

MONTEZUMA MINES & MILLING CO. (Montezuma)—This company, with the technical guidance of James M. McClave, of Denver, has made extensive flotation tests on the complex ores of this abandoned district and has remodeled mill (erected two years ago to operate by dry concentration) into flotation plant. Silver Wave mine has been provided with an aërial tram 6,880 ft. long to this mill, and machinery is being placed on Silver Princess mine. With recent demonstration on large scale of success of oil flotation on these ores, this region has taken on real activity after almost complete idleness for nearly 30 years. Originally this district was prosperous while mining lead-carbonate ores rich in silver and gold. When sulphides of lead, iron, copper and zinc were encountered, they were accompanied by gangue of baryta that precluded clean separation by gravity methods of that time.

IDAHO

Shoshone County

CONSTITUTION (Kellogg)—This Pine Creek property has shipped two cars of first-class zinc ore and will ship third soon.

RAY-JEFFERSON (Wallace)—According to announcement of D. C. Smith, president of the Ray-Jefferson, group of larger stockholders have subscribed loan of $200,000 for further developing mine and building mill.

SUCCESS (Wallace)—This company has announced monthly dividend of 6c. per share, payable Sept. 23, and amounting to $90,000. Product mainly zinc with a little lead. Parallel oreshoot has recently been discovered which have been proved from 500 to 900 level and which may duplicate one now being mined.

CLARK COONEY (Burke)—Old Mark Cooney property near Burke, consisting of four claims and three fractions, all patented, has been sold to M. Neary, of Spokane, for $150,-000, of which $25,000 was paid in cash. There are three tunnels, each about 200 ft. long. As soon as machinery and other equipment can be landed, the new owners will start driving 500-ft crosscut to develop vein at greater depth.

IDORA (Wallace)—Option on this property held by P. J. Dwyer, of Missoula, Mont., for $150,000, expired on Sept. 15. Company plans further development under management of C. O. Mallette, of Spokane. Company owns 100-ton mill on Beaver Creek, now under lease to Tuscumbia with provision to treat Idora ore when needed.

KILL BUCK (Wallace)—This property, owned by ex-Senator Clark, of Montana, is to be developed at once by extending Vulcan tunnel, which will explore Kill Buck 600 ft. below present workings. Considerable ore shipped from Kill Buck in early days. Claims patented and property long been idle. Located mile and half west of Wallace, on Lake Gulch. Vulcan tunnel one-half mile further west and near railroad.

CHICAGO-BOSTON (Wallace)—Announced this week that parallel vein had been found on Chicago-Boston ground and crosscut at depth of 125 ft. shows 12 ft. commercial lead-silver ore, with considerable clean shipping grade. Ore in original vein is gray copper running high in silver. Property is on Lake Gulch, adjoining Kill Buck on east and second vein is supposed to be identical with Kill Buck vein. Report that properties will be consolidated and developed through Vulcan tunnel.

REX (Wallace)—M. J. Sweeny, manager of the Rex Consolidated company, which recently took bond on Rex mine, states that restoration of plant which was partially destroyed by fire recently will be completed about Sept. 20, when unwatering mine will be begun, which will probably require 30 days. Property is under bond for $200,000, payable in five years, or $150,000, payable within one year. Recent information is to effect that company is preparing to pay for it on last-named terms.

HYPOTHEEK (Kellogg)—Drifting from 1,100 level to vein, approximately 160 ft. Probably cut vein in less than a week. Encountered stringer of clean galena a foot thick, and numerous other stringers of quartz with more or less ore. Oreshoot down to 900 level almost all carbonate, and management hopes to find shoot changed to galena on 1,100. Occurrence of carbonate at that depth unknown in any other mine of district. Company shipped first car of crude ore this week. Plans being prepared for mill.

MICHIGAN

Copper

MASS (Mass City)—Production, including unusually large amount of barrel and mass stuff that goes directly to smeltery, now keeps one of furnaces at Quincy smelting plant in operation almost continuously.

ALGOMAH (Houghton)—Has resumed sinking from third level. This was not accomplished without considerable difficulty. Unwatering was troublesome and then it was necessary to lay skip road to third level, nearly 100 ft.

HANCOCK (Hancock)—Opening of No. 7 shaft, which is to be worked jointly by Quincy and Hancock companies, will be in shape to figure on actual mining of rock by Oct. 1. Repair crew going through shaft expects to reach bottom before that date. Quincy company will, of course, be able to commence hoisting rock soon after for reason that it has its old workings at depth and it will need comparatively little cleaning up to get into vein rock. On the other hand Hancock will have to do certain amount of underground exploration work to develop mineral on its property immediately adjoining.

TREMONT-DEVON (Hancock)—Diamond-drilling work on property in Ontonagon may be resumed within a month. Officials of company have such plans under consideration but as yet no definite decision has been reached. Lands comprise 680 acres. Desultory work was done on property before combination of two organizations as now in effect. Present company purposes to drill land thoroughly and in addition to open further some of pits sunk in early days when rock running more than 25 lb. refined copper was extracted. Land is in vicinity of Victoria, apparently in line of Keweenawan formation. Charles Smith is president; F. H. Begole, vice-president; and C. H. Hanchette, secretary and treasurer.

FRANKLIN (Houghton)—Conglomerate rock is making best showing of anything that ever has been taken out of this mine. In the 33rd stope, rock is averaging above 40 lb. copper. This is such unusual showing that miners are enthusiastic about it. Indicative of assurances for the future of this Allouez conglomerate on Franklin property, it might be stated that company has drills at work on 11 levels and on 10 of these are in good average commercial rock. Last week shipments of rock to mill showed substantial increase in amount of Allouez conglomerate and consequent decrease in amygdaloid. Change resulted in mill return of unrefined copper that was particularly satisfactory and better than anything in recent past. Mine is making money on its present tonnage; has sufficient reserves to maintain tonnage or increase it; and Franklin has best chance of its life to become profitable producer.

QUINCY (Hancock)—Is continuing to maintain daily rock tonnage of 4,000 tons. Average copper content is little better than average for recent years. Mesnard shaft showing is improving in most northerly openings which is further assurance relative to rock in newer Pontiac shaft, which was closed down when strike of 1913 began and has never been reopened. It has been rumored at various times that this shaft would be reopened. As matter of fact it was well opened underground, some connections with Mesnard were made and depth continued to practically capacity of temporary hoist. Foundations for permanent hoist and compressor plant were put in before strike. Some of machinery had arrived, but no construction work was attempted, presumably because it was realized that this work must necessarily be expensive and with no immediate return in copper. Quincy management desires first of all to build up its surplus to its accustomed strength and maintain its dividend at same time.

Iron

CRYSTAL FALLS—The operators in this district have granted increase in wages of 10%. This will place wage scale back where it was prior to last fall.

PEWABIC (Iron Mountain)—Hoisting and shipping now being done from four shafts. One shovel loading from stock. Walpole again in operation. More men added to the pay roll.

BATES (Iron River)—Became shipper last week for first time this season. Stock of 40,000 tons will be loaded and shipped. The work of putting down the shaft deeper is completed. Great deal of development work is being carried on underground. Mine is just getting good start and will be larger producer in 1916.

BRISTOL (Crystal Falls)—Contract let to Hicks & Barber to change course of Brier Hill Creek and clear large piece of ground. New orebody has been found underneath. Water would be hindrance to underground operations. Sinking operations will start as soon as contract is completed. Two four-compartment shafts will be sunk 300 ft. Ore deposit was located by drills.

WAKEFIELD (Wakefield)—Ore sales from here this year amount to 625,000 tons. Three shovels and five locomotives are kept busy in pit. One shovel is stripping and two loading. Stripping will be continued all winter. Mine will probably be called upon to deliver large tonnage next year. Shipments are averaging 5,000 tons daily and will continue at that rate until close of navigation.

MINNESOTA

Cuyuna Range.

ADAMS (Oreland)—Mine will be unwatered immediately upon receipt of electrical pumping equipment now ordered.

IRON MOUNTAIN (Manganese)—Company has sold 8,000 tons of manganiferous material to Pittsburgh Steel Co., and tonnage is going forward at rate of 4 or 5 cars daily.

ONAHMAN IRON CO. (Crosby)—This company, heretofore operating on Vermilion Range, has closed deal for Duluth-Brainerd mine in manganiferous belt of the Cuyuna district. Mine has been renamed "Ferro." Property is served by Northern Pacific Ry. and has complete surface equipment although but little underground work has been done.

Mesabi Range

LA RUE (Nashwauk)—Mine will start shipping after long idleness.

MAHONING (Hibbing)—Ore shipments are averaging 450 cars per day. Mine will be one of heaviest Mesabi shippers this season.

HULL-RUST (Hibbing)—This property is sending out about 700 carloads per day. Cars average 45 tons each. Missabe road is handling about 1,500 cars daily from Hibbing district.

CHISHOLM—Shovels are working off and on at Glen Allen, Chisholm and Myers properties. Most of ore in stock has been moved. All of ore that is hoisted is going forward to docks.

DUNWOODIE (Chisholm)—Winston-Bear Co. has about completed its contract here for Arthur Mining Co. Two shovels will be removed from pit next week. Arthur Mining Co. has one shovel at work now, stripping for permanent approach.

SECTION 27 (Chisholm)—First shipment of ore was made from here last week. It consisted of 11 cars. Underground work is progressing slowly. It was not thought when shaft work was started some months ago that any shipments would be made this year.

LEONARD-BERT (Chisholm)—One shovel is now working two shifts loading ore. Another is loading rock that is being used to make stocking ground at Section 27 property. It is necessary to remove rock and lean ore in order to get at better-grade ores farther on.

QUINN-HARRISON (Nashwauk)—One unit of washing plant now operating declared to be successful. At full capacity plant will handle 8,000 tons of ore per day. It is third washing plant to be erected on Mesabi range. One now under construction at Crosby mine, Nashwauk, will be working next month.

SHENANGO FURNACE (Chisholm)—Notice has been given to 40 house owners to remove their property from company's forty directly north of Monroe mine. Land is to be stripped this season. Most of structures are merely shacks but some are fairly respectable dwellings. Large deposit of ore is known to exist on this forty.

BUTLER BROS. (Nashwauk)—New type of steam shovel has arrived for this firm. It is now being assembled. It will be used in stripping Mace No. 2 mine. It weighs 315 tons. It is similar in some respects to shovels used in coal fields in Kansas. Dipper has capacity of 5 cubic yards. Dipper stick in transit occupied two flat cars. Boiler is elevated 25 ft. Shovel has circular base and swings on roller bearings; can be worked from any position.

MISSOURI, OKLAHOMA AND KANSAS

FAIRCHILD AND MATHIAS (Joplin, Mo.)—Will drain their lease on Rex land; are installing an Emerson pump, which will drain ground to 130-ft. level.

BIG SQUAW (Lincolnville, Okla.)—Will rebuild mill at old mine; most of machinery which has been removed will be replaced with new; work will be conducted at 140 level.

OWASSA (Duenweg, Mo.)—Is to build new mill of 250 tons capacity on its lease on Mercantile land south of Duenweg. Plant will be equipped with two Hodge tables, and air compressor. Will install gas engines for power.

CHAS. EARKHEART (Galena, Kan.)—Is to build large plant to handle tailings only from Squires mill; will have novel system of roughing, cleaning and finishing tables, and will be operated by gas engines. Mill will handle 400 tons every 10-hr. shift.

GALENA ROYALTY & MINING (Galena, Kan.)—Has struck another good prospect in drilling on one of leases south of Galena. Company has several hundred acres leased for mining purposes, it drills and prospects land and leases it out to mine operators to develop and mine on royalty. Have 40 acres already drilled and leased out.

MONTANA

Silver Bow County

BUTTE & LONDON (Butte)—Unwatering of the Butte & London shaft was completed Sept. 11 and sinking was started Sept. 13. New electric pump has been installed at the 1,100 station and small pump at 800 has been disconnected. It is expected to make 10 ft. per day in sinking and that 1,600-ft. point will be reached in November, when station will be put in and work on crosscutting property both north and south will be started.

BULLWHACKER (Butte)—Has again been shut down, and negotiations are on for resumption of operations with leaching plant, which was installed some years ago. Experts who have examined plant claim that with few changes plant can be made to work successfully. With completion of acid-producing plant at Washoe smeltery it will be possible to purchase acid for leaching purposes at less than half what it formerly cost Bullwhacker and Butte Duluth companies.

NORTH BUTTE (Butte)—The output is now in excess of 2,000,000 lb. of copper per month, and from present indications the output for the year will far exceed that of 1914, when the total production was 18,421,761 lb. of copper, 1,092,200 oz. of silver and 1,107 oz. of gold. While production during first 7 months of present year was only 50% of normal, it has been steadily increasing until at present time it is close to capacity of the mine. Between 750 and 800 men are employed as against less than 500 six months ago. Daily tonnage is about 1,200 tons and from this about 80,000 lb. of copper is recovered. New Granite Mountain electric hoist is working splendidly and has enabled North Butte company to make a big reduction in cost of production. Production is not yet back to the average of 1913, when ore hoisted averaged 1,342 tons per day and more than 28,000,000 lb. of copper was produced for year. At that time average number of men employed was 800.

BARNES-KING (Butte)—Is still negotiating with Kendall company for settlement of disputed orebody in North Moccasin ground, from which Barnes-King has been mining for long time, but no settlement has yet been reached. Idea of purchasing all of the Kendall company's holdings has been abandoned because of excessive price placed on its property. While controversy exists Barnes-King company has stopped operations in all disputed ground, although greater part of orebody is recognized as belonging to Barnes-King company. As consequence of dispute August output of North Moccasin mine dropped to $14,500, whereas former months yielded

about $32,000 in bullion. Only 1,464 tons of ore were mined in August from the North Moccasin mine against former average production of about 5,000 tons per month. At Piegan-Gloster property, in Marysville district, considerable improvement is noted. The receipts from the mill were $16,000 from 1,500 tons of ore. Tonnage is still far below the capacity of mill. Good progress is being made in developing the Shannon property, and showing in shaft being sunk from tunnel level is so good that company, it is understood, is seeking to acquire some more property adjoining Shannon.

BUTTE & SUPERIOR (Butte)—Blackrock mine of Butte & Superior company was closed for four days last week to permit of some needed repairs and suspension will probably result in decrease in September spelter output of company. It had been more than year since last repairs were made in shaft and some trouble was experienced recently. Mine had been run at capacity for many months and no opportunity given to make needed repairs so that it became necessary to close mine for several days, which was done when Labor Day holiday came around. With repairs just completed company will make another long run. Production of spelter last month was about 14,500,000 lb., or nearly 1,000,000 lb. in excess of any previous month. This big output was made in spite of fact that tonnage of approximately 45,000 tons of ore mined and milled was not up to July tonnage. "The improvement in the recoveries and grade of concentrates was brought about largely through the greater efficiency of the new machines," says Manager J. L. Bruce. "The adjustments are better in the flotation plant now and the results are showing what improvements have been made recently." Recoveries averaged 93%, while the grade of concentrates was 56% against 51% in former months. In regard to report that large body of copper glance has been found in Black Rock mine, Mr. Bruce said: "There is no truth in that report. Such reports have been circulated from time to time, but there is little or no foundation for them. Once in a while a body of copper glance will be run into in certain parts of the mine, but there is no evidence that our zinc ores are giving way to copper in the districts where we are mining." The same is true about reports that an unusual strike of zinc ore had been made. Nothing new has been found. By an order of district court few days ago $1,000,000 mortgage on Butte & Superior property was cancelled, mortgage having been satisfied by exchange of bonds for stock in company. Shaft sinking is going on in the Black Rock shaft, which has now reached depth of 1,750 ft. and station is being cut at 1,700 ft.

SOUTH DAKOTA

Custer County

FAIRVIEW MICA (Custer)—Property has been purchased by Salt Lake parties, who have commenced operations.

Lawrence County

TROJAN (Trojan)—Equipment for fine grinding will be installed at early date.

WASP NO. 2 (Flatiron)—Production of wolframite continues; recent shipments were sold for $15 per unit of tungstic acid. Mill is operating steadily on maximum tonnage—500 daily—of $2 gold ore.

ECHO (Maitland)—Small boiler is being installed to furnish steam for sinking pump. Shaft, 175 ft. deep, will be continued to 200 ft., station and sump cut at that point, and extensive lateral work done. Station pump will be electrically driven.

RATTLESNAKE JACK (Galena)—Milling has been suspended until arrangements can be made to dispose of tailing in some other way than running into creek. An Oliver filter has been ordered, with intention of using it as dewaterer before stacking tailing. Plant is fine grinding with cyanidation by Trent process.

Pennington County

HOME LODE (Silver City)—Company is operating plant of 25 tons daily capacity, treating ore containing free gold, jamesonite, pyrite, and some lead and copper. Fine grinding in slow-speed Lane mill is making large percentage of the gold amenable to amalgamation. Good separation of antimony mineral is made on Deister tables. Further concentrating equipment is to be installed at once.

UTAH

Beaver County

PALOMA GOLD & SILVER (Milford)—Company has made a trial shipment of copper ore that averaged 18% Cu, and 11 oz. Ag. A recent silver-lead shipment ran 22% Pb., 17 oz. Ag., and 2% Cu. Shaft will be deepened to 500 ft. Compressor and drills being installed.

Juab County

BECK TUNNEL (Silver City)—Drifting is being done south on 1,100 level, with view to prospecting ground, on which only small amount of work has been done.

TINTIC (Silver City)—Work on company's mill is progressing satisfactorily, and it is expected that operation will begin Jan. 1, with an initial capacity of 200 tons daily. Ore from Knight and Dern properties will be treated.

SCOTIA (Eureka)—About 1,000 tons of lead ore have been hoisted, and as soon as new traction engine—expected at mine soon—has been put in operation, about 23 tons of ore daily will be hauled to railroad at Jericho, 18 miles from property.

YANKEE (Eureka)—Recent strike near surface is opening up satisfactorily. Shaft has been sunk 60 ft. from surface, 40 ft. of this being in ore. Raise is being sent up from lower tunnel to connect with it. Drifting will be undertaken later.

UTAH MINERALS CONCENTRATING (Eureka)—It is stated that this company, which has been doing experimental work on low-grade ores from Chief Consolidated is preparing to start active operation. Other ores beside those of Chief will probably be treated.

Salt Lake County

MICHIGAN-UTAH (Alta)—It is announced that this company has been financed for active development work, to be started in near future. Shipments are being made from Grizzley workings by leasers, whose lease expires Oct. 7. After that date work in this section will be taken over by company. City Rocks vein above Cleaves tunnel is being worked by Triangle Mining Co., employing 30 to 40 men.

ALBION (Alta)—Large flow of water has been tapped recently in Albion drift being driven from Quincy tunnel of South Hecla. This has prevented Albion miners and leasers on Kate Hayes fissure from going to work. Flow was knee deep in Quincy and on Sept. 13 was estimated at 5,000 gal. a minute. Carbon-dioxide gas accompanied or followed the flow and two men equipped with oxygen helmets went into drift to do some work on air line. Both were overcome by gas, the helmets evidently not working properly. One was rescued but other, James Hendrickson, was found dead day following.

Tooele County

THE DRY CANON DISTRICT is active. Other properties producing are Wandering Jew, from which a car was shipped recently, and the Hidden Treasure, where a considerable force is working.

QUEEN OF THE HILLS (Stockton)—Carbonate zinc ore of good grade is being produced from this property, under lease to Big Four Exploration Co.

MONO DEVELOPMENT (Stockton)—Leasers are mining silver-lead ore, and as soon as installation of new compressor has been completed, production will be increased.

CANADA

British Columbia

FRENCH ZINC PROCESS—The provincial government has promised to aid financially in the providing of an experimental plant to further demonstrate this electro-chemical process.

BLUE GROUSE (Vancouver Island)—Six men are engaged in driving tunnel on recent discovery, which is situated near Cowichan Lake. An oreshoot 300 ft. in length has been exposed by surface stripping, varying in width from 15 to 36 ft. and averaging between 4 and 5% copper.

DELLA (Vancouver Island)—An electric hoist is being installed by Pennsylvania people who have this property under bond. Group is located 11 miles from Great Central Lake, in interior of island. Sinking is proceeding by two shifts on quartz vein 6 ft. wide that outcrops for a length of 2,000 ft. Gold occurs in ore in association with zinc blende.

Ontario

McINTYRE (Porcupine)—On 600 level has cut 6-ft. vein assaying $30 per ton.

SHAMROCK (Cobalt)—Mine has been unwatered and crosscutting started on 400 level.

HOLLINGER RESERVE (Porcupine)—Dominion Reduction Co. has dropped its option on this property.

DOBIE (Munro Township)—Vein, which was 1 ft. wide at depth of 11 ft., has widened to 3 ft. at 100-ft. level.

DOME (Porcupine)—Will add new equipment to mill that will bring capacity up to 50,000 tons per month.

BUFFALO (Cobalt)—Mill has closed down, but development work is being continued.

HOLLINGER (Porcupine)—In sinking new main five-compartment working shaft a new vein has been cut, which shows 10 ft. of $8 ore.

DOMINION REDUCTION (Cobalt)—Has taken an option on 400 acres, including 8 Bowser claims and 2 Brennan claims in Goodfish district.

CREIGHTON (Sudbury)—Made record production in August when it hoisted 73,000 tons. At Crean Hill and No. 2 mines 17,000 tons were raised, giving total production for the month of 90,000 tons. New five-compartment shaft at Creighton, 32x8 ft., was sunk 135 ft. in granite during July.

TOUGH OAKES (Kirkland Lake)—Has been temporarily closed down, owing to shortage of electric power. Winze has been completed to 400 level and is in rich ore, 5 ft. in width, averaging $70 per ton.

KING DODDS CLAIMS (Kowkash)—These three claims, on one of which original Kowkash discovery was made, have been taken over on working option by syndicate of American and Canadian capitalists, headed by John L. Orn, of Buffalo, and C. M. Forbes, of Lanark, Ont.

NIPISSING (Cobalt)—During August estimated value of ore mined was $179,048, and bullion from Nipissing and customs ore estimated value of $118,047 was shipped. Arrangement has been made with O'Brien company to coöperate in development of adjoining territory.

BEAVER (Cobalt)—Report for quarter ending Aug. 31 states that main shaft is down 1,100 ft. and that sinking will be continued until lower contact between diabase and Keewatin is reached. Promising orebody was encountered in drifting on 300-ft. level. There was $116,017 cash on hand and bullion and ore amounting to 314,511 oz.

TECK HUGHES (Kirkland Lake)—At annual meeting formally turned over property to Buffalo Mines of Cobalt, which has purchased outright two-thirds interest. Working capital for further development and for building mill, will be supplied by bond issue of $150,000, which will be taken up by Buffalo. Mine has $350,000 worth of ore developed.

Quebec

EUSTIS (Sherbrooke)—Fire has totally destroyed mill. Loss, $50,000.

The Market Report

Metal Markets

NEW YORK—Sept. 22

The copper market was fairly active and advanced slightly. The markets for lead and zinc were dull, but toward the end of our week of record exhibited a stronger tone. Tin was stationary, almost no business being done.

Copper, Tin, Lead and Zinc

Copper—At the beginning of our week of record copper was freely available from first hands at 17¾c., regular terms, corresponding with 17.55c., cash, New York. All of the American producers offered freely in Europe at £86, and made sales at that figure. What such sales would realize in cash in New York was problematical, depending on the rate of exchange and the freight rate, both of which are very uncertain factors at present. Some producers have old contracts for freight which enable them to send copper abroad for c.i.f. charges of about 40c. per 100 lb., while others have to reckon 50@60c., freight alone being 30@40c. at current rates. Probably about 17.45c., New York, was the mean equivalent of £86. On Sept. 20 the market abroad improved materially, and £86½@86¾ was realized on export sales, and on Sept. 21 and 22 business was done at £87. The price asked of domestic consumers was 18c., regular terms, right along by the principal producers. Other producers who had previously been offering at 17¾c. raised their asking price to 17⅞c. on Sept. 20. Domestic consumers were, however, conspicuous by their absence up to Sept. 22, when one of the wire drawers contracted for a round lot. For this order there was sharp competition.

A fairly large business was done during the week, the aggregate being estimated at somewhere between 20 and 35 million pounds. This was almost entirely for foreign account, France especially being a large buyer, while Great Britain and Russia took smaller quantities. The demand was chiefly for immediate delivery, out of warehouse on the other side if possible, otherwise for prompt shipment from here. Domestic consumers appear to be acting in concert in staying out of the market, a feature of their policy that is becoming increasingly prominent. The natural result is that when they make up their minds to buy they have to do it all together and produce a sharp advance on themselves. It is believed among producers that the domestic manufacturers of copper goods are bound to cover large requirements for copper during the last quarter of the year.

The matter of freight rates and freight space for shipments of metal from the United States to European ports is causing a good deal of concern among shippers.

Copper Sheets are quoted about 23c. per lb. for hot rolled and 24c. for cold rolled, with usual extras. Wire prices are unsettled; quotations may be put at 19½c. per lb. at mill. The chief maker does not quote base price.

Copper Exports from the United States, week ended Sept 4, are reported by the Department of Commerce at 4,003,092 lb., the chief items being 1,782,452 lb. to France and 1,343,162 lb. to Great Britain. Imports for the week were 2,751,200 lb. metal and 1,433,955 lb. in ore and matte; 4,185,155 lb. in all, chiefly from Canada, Cuba and Chile.

Visible Stocks of Copper in Europe on Sept. 15 were: Great Britain, 22,350; France, 5,177; afloat from Chile, 2,675; afloat from Australia, 2,550; total, 32,152 long tons, or 72,020,480 lb. This is a decrease of 1,962 tons from the Sept. 1 report.

Tin—This market was dull and about stationary, almost no business at all being done. At the close there was a rather weaker tone, reflecting the decline in London.

Production of Banka tin in June is reported at 16,111 pikuls. Stocks of Banka tin on Aug. 31 were 905 tons. Stocks of Billiton tin at same date were 30 tons.

Lead—At the beginning of our week of record there was a little wavering of the price, some sales of domestic lead for export being made at a little below the price of the A. S. & R. Co. However, the market soon steadied itself and later became rather stronger, without any further advance in price, however. A large tonnage of domestic lead, destined for export, was sold in New York on Sept. 22 at the full price.

Spelter—At the beginning of our week of record, a rather large tonnage of spelter was sold, chiefly for export. After that the market became peculiar, as it has many times before in this remarkable year. Spelter for prompt and early delivery became almost unprocurable, while for the later months it was unsalable. In the latter half of the week some small sales of spelter for spot and prompt delivery were made at about 13½c., and the price for following months up to the end of the year was about ¼c. less per month. A considerable quantity of spelter was sold during the last week on long-range contracts, such as October-June, December-June, and January-March. This business was done at prices of 10@11 cents.

Zinc Sheets—Business has been more active, but with no change in prices. The base price for carload lots is $16 per 100 lb. f.o.b. Peru, Ill., less 8% discount.

DAILY PRICES OF METALS IN NEW YORK

Sept	Sterling Exchange	Silver, Cts. per Oz.	Copper Electrolytic, Cts. per Lb.	Tin Spot, Cts. per Lb.	Lead New York, Cts. per Lb.	Lead St Louis, Cts. per Lb.	Zinc St. Louis, Cts. per Lb.
16	4 6800	48½	17.45 @ 17.55	33	4.45 @ 4.50	4.30 @ 4.35	12.50 @ 13.00
17	4 7100	48¼	17.45 @ 17.55	3	4.45 @ 4.50	4.30 @ 4.42½	12.50 @ 13.00
18	4 6850	48¼	17.45 @ 17.55	33	4.50 @ 4.42½	4.35 @ 4.42½	12.50 @ 13.00

22	4 4700	49¼	17.50 @ 17.80	2¼	4.50 @ 4.42½	4.35 @ 4.42½	12.75 @ 13.50

The quotations herein are our appraisal of the average markets for copper, lead, spelter and tin based on wholesale contracts for the ordinary deliveries of the trade as made by producers and agencies; and represent, to the best of our judgment, the prevailing values of the metals, reduced to basis of New York, cash, except where St. Louis is given as the basing point. St. Louis and New York are normally quoted 0.17c. apart.

The quotations for electrolytic copper are for cakes, ingots and wirebars. Electrolytic copper is commonly sold at prices including delivery to the consumers and is subject to discounts, etc. The price quoted for copper on "regular terms" is the gross price including freight to the buyer's works and is subject to a discount for cash. The difference between the price delivered and the New York cash equivalent is at present about 0.20c. on domestic business. The price of electrolytic cathodes is 0.05 to 0.10c. below that of electrolytic. Quotations for lead represent wholesale transactions in the open market for good ordinary brands. Quotations for spelter are for ordinary Prime Western brands. Only the St. Louis price is herein quoted, St. Louis being the basing market. We quote the New York price at 17c. per 100 lb. above the St. Louis price.

Silver quotations are in cents per troy ounce of fine silver.

Some current freight rates on metals per 100 lb. are: St. Louis-New York, 17c.; St. Louis-Chicago, 6.3c.; St. Louis-Pittsburgh, 13.1c.

LONDON

Sept	Silver	Copper Standard Spot	Copper Standard 3 Mos.	Copper Electrolytic £ per Ton	Copper Electrolytic Cts. per Lb.	Tin Spot	Tin 3 Mos	Lead £ per Ton	Lead Cts per Lb.	Zinc £ per Ton	Zinc Cts per Lb.
16	23 7/16	69½	70½	86½	18.05	153¾	154	22 11/16	4.79	68½	14.20
17	23 7/16	69	70	86½	18.12	152½	153¾	22¼	4.77	66	13.91
18	23½										
20	23 7/16	69½	70½	87	18.17	152¼	153¼	23	4.81	65	13.58
21	23½	70½	71½	87	18.25	153	153¾	23¼	4.87	65	13.58
22	23½	70½	71¼	87	18.21	152	152½	23¼	4.90	63	13.16

The above table gives the closing quotations on London Metal Exchange. All prices are in pounds sterling per ton of 2240 lb., except silver, which is in pence per troy ounce of sterling silver, 0.925 fine. Copper quotations are for standard copper, spot and three months, and for electrolytic, prices for the latter being subject to 3 per cent discount. For convenience in comparison of London prices, in pounds sterling per 2240 lb., with American prices in cents per lb., the following approximate ratios are given, reckoning exchange at 4.80: £15 = 3.21c.; £20 = 4.29c.; £30 = 6.43c.; £40 = 8.57c.; £60 = 12.85c. Additions, £1 = 0.21c.

Other Metals

NEW YORK—Sept. 22

Aluminum—The market is still quite active, and supplies not large. Prices continue about the same, 45@50c. per lb. being asked for No. 1 ingots, New York. The American producer is reported willing to contract for 1916 business at lower rates, but will not confirm or deny the statement.

Antimony—The market has been quiet, with hardly more than a retail business doing. Chinese and other ordinary brands are quoted at 28@29c. per lb., while 43½@45c. is named for Cookson's. There are some large inquiries for export, but they depend upon the outcome of pending financial negotiations.

Nickel—Quotations for ordinary forms are 45@50c. per lb., according to size and terms of order. A premium of 3c. per lb. is charged for electrolytic nickel.

Quicksilver—Business has been fair and the market has been rather more active. Prices are generally steady. New York quotations are $89@90 per flask of 75 lb. San Francisco prices are reported by telegraph at $85@90 per flask. Some dealers report large sales, but others are less active. London price is unchanged at £16 10s. per flask, second hands quoting full price.

Gold, Silver and Platinum

NEW YORK—Sept. 22

Gold—More gold is reported on the way from England, the amount not being definitely stated. How much more may come depends largely upon the negotiations now in progress over credits or note issues.

Platinum—The market is quite uncertain, owing to short supplies and the cessation of imports from France and Russia. This is about the season when supplies are looked for in the jewelry trade, but none are available. Transactions have been small. Dealers are asking $50 per oz. for refined platinum and $56@57 for hard metal. The market is very uneasy, and any considerable supply from abroad would send prices down; but no such supply is expected at present.

Iridium—Like platinum, supplies are short with no increase in sight at present. Quotations are $75@80 per oz., nominally, but each transaction stands by itself. **Palladium** is also scarce and brings about $60@65 per oz., New York.

Silver has advanced in London to 23¾d., the highest point recently reached. Purchases by the United States Government have had the effect of stimulating the Continental demand, while the supplies put on the London market have been rather limited; for this reason the undertone to the market is considered good.

Zinc and Lead Ore Markets

PLATTEVILLE, WIS.—Sept. 18

The base price paid this week for 60% zinc ore was $70@74 per ton, for medium grades, $65@70 per ton. The base price paid for 80% lead ore was $50 per ton.

SHIPMENTS, WEEK ENDED SEPT 18

	Zinc Ore, Lb.	Lead Ore, Lb.	Sulphur Ore, Lb.
Week	4,741,040	80,000	440,200
Year	138,642,120	4,543,160	19,640,910

Shipped during week to separating plants, 2,838,800 lb. zinc ore.

JOPLIN, MO.—Sept. 18

Blende, high price, $82.90, base per ton, 60% zinc, premium ore, $78; medium, $73@77; lower, $70@73, with a few cars at 75 calamine base, 40% zinc, $70@73.50; average, all grades of zinc, $77.02 per ton. Lead, high price, $55; base price, $50@52 per ton of 80% metal content; average, all grades of lead, $50.[illegible] per ton.

SHIPMENTS, WEEK ENDED SEPT. 18

	Blende	Calamine	Lead	Values
Totals this week	9,562,290	675,750	2,107,600	$447,090
Totals this year	1,146,850	32,667,290	63,402,110	17,855,100

Blende value, week, $372,810; 38 weeks, $15,445,070.
Calamine value, week, $21,480; 38 weeks, $740,260.
Lead value, week, [illegible]; 38 weeks, $1,669,770.

Seven inches of rain fell in six hours, general over the entire district, Tuesday after midnight, the effect of which was slight to some, though an injury to all, and a positive blight to a number of mines, some of which were inundated. As a camp, Galena, Kansas, suffered most; Alba-Neck, Granby and Aurora seriously for several days. The result is estimated at a restriction of 15% in output. As the effect of the enormous volume of water became felt in the mines a demand increased for the ore in bin, and week-end purchases were sharply enlarged, about 6,000 tons being purchased Friday and Saturday.

Reports received in Joplin today confirm a rumor prevalent for some time that A. O. Ihlseng, of New York, would engage in the smelting of zinc ores. Mr. Ihlseng and a Mr. Johnson of California have purchased 20 acres of land at Pittsburg, have surveys under way for tracks from two railway systems, and have much of the material ordered for the four-block smelter to be erected.

Iron Trade Review

NEW YORK—Sept. 22

There has been no material change in the iron and steel markets during the week, the situation remaining about the same.

The strong demand for steel for export has kept up prices of bars and other forms. An increase in the demand for structural steel from domestic buyers has been quite in evidence. The scarcity of crude steel is also a feature of the market, and mills using purchased billets are hunting for supplies.

Pig iron has been generally strong, but without any general advance in prices. Foundries are beginning to look for first quarter iron, and basic is in demand.

PITTSBURGH—Sept. 21

With what appears to be only an ordinary flow of business, chiefly in the form of specifications on contracts, with occasional new buying, the steel mills are falling farther behind in deliveries although they are crowding for output and are shipping more steel than ever before in their history. They already have actual shipping orders entered for almost as much steel as they can make and ship the remainder of the year. It is the common statement that if there were a normally full demand for steel from domestic sources, for instance for railroad material and structural purposes, there would be an unprecedented famine in steel. Prospective railroad requirements cannot yet be estimated, but there has been an increase in railroad buying, 75,000 to 100,000 tons of rails for spring rolling having lately been put under contract, while bids are going in on at least 10,000 freight cars. Car shortages are beginning to appear in the steel industry and a general car shortage is predicted for next month as the crops come to be moved.

Steel prices continue to show an advancing tendency. Effective yesterday the American Steel & Wire Co. advanced wire products $2 a ton, the independents immediately concurring, the new prices being: Plain wire, 1.[illegible] c.; wire nails, $1.75; galvanized wire, 2.30c.; painted barb wire, 1.90c.; galvanized barb wire, 2.60c. Plain wire is now up to the maximum price since 1910. Mills have made some contracts for bars, plates and shapes for first quarter at 1.40c., but are reserved about selling even at this figure. The market for earlier delivery, at mill convenience, is strong at 1.35c. The National Tube Co. today announced the withdrawal, Sept. 30, of all special prices on oil-country goods, the demand for which is showing considerable improvement.

The Shelby Steel Tube Co. announces that it will double the finishing capacity of its seamless-tube plant at Ellwood City, Penn., adding two electrically driven piercing mills, with the necessary attendant equipment, to have an annual capacity of 60,000 tons of finished tubes, 2-in. to 8-in., at the same time building an electrically driven continuous bar mill to reduce blooms to rounds, with an annual capacity of 175,000 tons, this to replace the present mill.

Pig Iron—The market has been quiet but prices are firmly held and it is suggested that the quietness is due largely to furnaces being reserved about selling, because they expect higher prices. The stack of the Sharpsville Furnace Co. is going into blast, and Alice, Ella and Fannie, all in the Shenango Valley, are likely to blow in shortly. We quote: Bessemer, $16; basic, $15, both for early delivery; foundry and malleable, $14.50@15, gray forge, $14.25@14.75, the higher being for next year's delivery, at Valley furnaces, 95c. higher delivered Pittsburgh.

Ferromanganese—A few contracts have been entered for ferromanganese by domestic producers since their recent announcement of a price of $115. English producers continue to quote $100 on contract, delivery being very uncertain. Spot lots command $100@115 according to supplies from day to day. The consumption of 50% ferrosilicon as a scavenger, to reduce the quantity of ferromanganese needed in soft-steel making, is reported to be increasing rapidly. Prices on 50% ferrosilicon are the same as before the war, $71 in 600-ton lots, $72 in 100-ton lots and $73 in carload lots, delivered east of the Mississippi.

Steel—The market for basic openhearth billets is all of $26, Youngstown, with only occasional lots to be picked up at this figure. Bessemer could probably be had at about $1

a ton less. Pittsburgh prices are Youngstown prices plus the freight of $1.05. There is no market for sheet bars as sheet and tin mills are covered and in any event could not afford to pay the prices that would be asked. With the advance in wire products rods become quotable at $30, Pittsburgh, but it is difficult to find sellers at any price.

Exports and Imports of those iron and steel products for which tonnages are given in the reports are stated by the Department of Commerce as below for July and the seven months ended July 31, in long tons:

	July		Seven Months	
	1914	1915	1914	1915
Exports	114,790	368,893	959,825	1,676,485
Imports	24,958	20,857	167,210	124,636

Exports for the seven months show an increase of 716,660 tons, or 74.7%; while imports decreased 42,574 tons, or 25.5%. The larger items of exports in 1915 were 241,348 tons wire and wire products; 263,985 tons billets, ingots and blooms; 219,371 tons steel bars; 126,394 tons steel rails.

Exports from Baltimore for the week included 2,234,540 lb. tin plates to Glasgow. Other exports included 6,171,387 lb. bars, plates, wire rods, wire, etc. to Great Britain.

FERRO-ALLOYS

Ferromanganese is quoted at $110@112.50 per ton for domestic 80% material. **Spiegeleisen** has been sold at $27 per ton for 20%, at furnace.—**Ferrosilicon,** 50%, is quoted at $75 per ton at Pittsburgh. Bessemer ferrosilicon is from $20 per ton for 10% up to $24 for 14%, all at furnace.—**Ferrotitanium** is 8@12½c. per lb., according to size of lots and delivery.—**Ferrovanadium** is $2@2.25 per lb. of contained vanadium.—**Ferrotungsten** is quoted in London at 78.@7s. 6d. per lb.—$4@90c.—for alloy 75@80% tungsten.—**Ferromolybdenum** is quoted in London at 18s.—$4.32—per lb. for 75% alloy.

FOREIGN IRON

Pig-Iron Production in Germany in July is reported at 1,064,899 metric tons, which is 75,022 tons more than in June and 197,045 tons less than in July, 1914. For the seven months ended July 31 the production was: Foundry iron, 1,382,946; forge iron, 173,727; steel pig, 913,566; bessemer pig, 98,329; Thomas (basic) pig, 4,031,068; total, 6,599,236 metric tons, which compares with 10,850,140 tons in 1914; showing a decrease of 4,250,904 tons, or 39.2%, this year.

Pig-Iron Production in Manchuria is being pushed. The Penhsihu Mining & Colliery Co. is turning out about 130 tons a day from its blast furnace. The iron is of good quality, very low in phosphorus and sulphur. The company has contracts to furnish iron to the Osaka Iron Works in Japan and to the Japanese navy.

IRON ORE

Some more sales of Lake iron ore in the East are reported, including a large lot of silicious Marquette ore at about 7c. per unit delivered. Some other blocks of Old Range ore are reported engaged for Eastern furnaces.

There is already talk of Lake ore prices for next season, and it is expected that buying will begin early in view of the great increase of activity in the iron trade. The general expectation is that prices will be at least 50c. a ton higher than this season.

British Imports of Iron Ore, eight months ended Aug. 31 were 4,002,044 long tons in 1914, and 4,239,167 tons in 1915; an increase of 237,123 tons this year.

OTHER ORES

Tungsten Ore is still in demand and supplies are not large. A recent sale reported is of a small lot of concentrates, running about 60%, which brought $35 per unit WO_3, for spot delivery. This is a considerable advance over the latest previous sales reported.—**Molybdenite,** 80% MoS_2 is reported sold at $1.25 per lb., New York.

A cargo of **Manganese Ore** from the newly opened deposit at Brigus, Conception Bay, Newfoundland, has been shipped to Pittsburgh. Others are expected to follow.

COKE

Coke production in the Connellsville region for the past week is reported by the "Courier" at 387,703 short tons; shipments, 388,862 tons. Production of Greensburg and upper Connellsville districts, 44,978 tons.

A Cincinnati dispatch says: "The Kentucky Solvay Coke Co., Ashland, Ky., has sold to the Marting Iron & Steel Co., Ironton, Ohio, furnace coke requirements of 150,000 tons annually for five years. This sale, which is one of the largest made in the history of the pig iron market in this territory, is on a sliding-scale basis."

Connellsville Furnace coke contracting for the first half of 1916 is still in abeyance, but buyers and sellers seem to be getting nearer together. Two or three sliding-scale contracts recently made are hardly representative of the market, and it is possible business will be done at that prices after all. For deliveries late in the current year $2 and $2.25 have both been paid, according to quality, etc. Spot furnace coke is $1.65@1.70, and thus slightly firmer.

British Coal Production for the first half of the year is estimated by the Board of Trade as below, in long tons:

	1913	1914	1915
Coal mined	145,923,000	140,274,000	127,826,000
Coal exported	37,279,000	36,390,000	23,595,000
Steamer coal	10,087,000	10,182,000	7,400,000
Total exports	47,366,000	46,572,000	30,995,000
Balance	98,557,000	93,702,000	96,821,000

The steamer coal is fuel furnished to steamships engaged in foreign trade. The production for the second half of 1914 was 125,369,000 tons, or 2,457 tons less than in the first half of the current year.

Fuel Exports of Great Britain, eight months ended Aug. 31, in long tons:

	1914	1915	Changes
Coal	41,257,161	29,522,179	D 11,734,982
Coke	691,061	573,218	D 117,843
Briquettes	1,324,937	864,503	D 460,434
Steamer coal	13,249,027	9,657,927	D 3,591,100
Total	59,525,186	40,620,827	D 18,904,359

The steamer coal is coal sent abroad for the use of steamships in foreign trade.

Coal Production of Austria-Hungary, years ended June 30, in metric tons:

	1913-14	1914-15	Changes
Coal	16,514,000	14,821,000	D 1,693,000
Brown coal	26,570,000	21,685,000	D 4,885,000
Coke made	2,615,000	1,788,000	D 827,000
Briquettes made	431,000	448,000	I 17,000

Of the briquettes reported last year 241,000 tons were made from brown coal, or lignite.

Chemicals

NEW YORK—Sept. 22

The general market is still rather quiet and irregular in some lines.

Arsenic—The demand is moderate and supplies are sufficient. Prices are unchanged, about $3.50 per 100 lb. for large orders, and $4 for smaller lots.

Copper Sulphate—Business has been rather quiet and sales moderate. Prices are easier, $6.75 per 100 lb. being asked for carload lots and $7 per 100 lb. for smaller parcels.

Nitrate of Soda—Business is quite active for the season. Prices are steady at 2.42½c. per lb. for spot and 2.45c. per lb. for futures.

Pyrites—Imports at Baltimore for the week included 7,628 tons pyrites from Huelva, Spain.

Chrome Ore—The chrome-ore mines in the neighborhood of Black Lake, Quebec, are being reopened and considerable shipments are being made to the United States. These mines have been closed for some time owing to the competition of ores from Turkey, Greece and Rhodesia, which had cheap water freights. The war in Turkey and the high ocean rates from South Africa have cut off those supplies.

PETROLEUM

Shipments of crude petroleum from Tampico, Mexico, to the United States in August were 1,281,593 bbl.; in addition 70,144 bbl. were shipped to the Panama Canal Zone, making a total of 1,352,027 bbl. Shipments from Tuxpam in August were 859,054 bbl., making a total of 2,211,091 bbl. for the month.

Exports of mineral oils from the United States in July were 215,595,691 gal., being 15,673,794 gal. less than in July, 1914. For the seven months ended July 31 the total exports were 1,348,173,539 gal. in 1914, and 1,286,660,756 gal. in 1915; a decrease of 61,512,783 or 4.6%, this year.

Under an imperial decree dated Aug. 18, 1915, the Austrian Government has, as from that date, taken possession of the present and future production of crude petroleum in Galicia and of all stocks of oil belonging to business organizations owned in whole or in part by citizens of countries at war with Austria-Hungary.

The Engineering and Mining Journal

VOLUME 100 OCTOBER 2, 1915 NUMBER 14

Roosevelt Drainage Tunnel, Cripple Creek, Colorado

By T. H. Sheldon*

SYNOPSIS—The present tunnel, about 3 mi. long, will be extended about 2 mi. farther and is expected to drain Vindicator, Golden Cycle and other mines beyond a nearly vertical syenite dike, which being impervious, prevents these mines benefiting from drainage now afforded mines on the other side of the dike. Estimated cost $200,000: time to complete, 2 yr. The work, which will be undertaken immediately, is in strong hands.

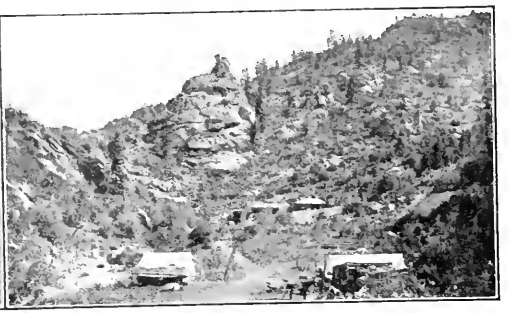
On July 26 and 27 a meeting of the board of directors of the Cripple Creek Deep-Drainage and Tunnel Co. was held in Colorado Springs for the purpose of filling vacancies in the board caused by the death of Frank F. Castello, of the Mary McKinney company, and the resignation of Allen Burris, of the El Paso; also for formulating plans to insure the continuance of the Roosevelt drainage tunnel to the eastern end of the district. The vacancies were filled by the election of Adolph J. Zang, of the Vindicator company, and Richard Roelofs, of the Cresson.

The executive committee, in charge of the work, was increased from three to five members by the addition of Irving T. Snyder, secretary of the Golden Cycle Mining and Reduction Co., and Mr. Roelofs. The other members of this committee are James F. Burns, of the Elkton company, chairman; Irving Howbert, of the Portland, and John Tait Milliken, of the Cycle company. Mr. Snyder is also general manager of the Vindicator company; therefore the addition of these two new members to the executive committee should remove any doubts as to the completion of the tunnel past the Cresson to the Vindicator and Golden Cycle mines, which will benefit also the Portland, Independence and Strong mines.

The board of directors passed a resolution commending the work of Mr. Burns, chairman of the committee, in pushing the tunnel through during the past year in the face of unusual difficulties. A good deal of loose ground was encountered, making the progress slow and requiring a great amount of expensive timbering. The work was suspended for about five months while the El Paso surface plant, destroyed by fire on Nov. 4, was being rebuilt, all the work of excavation being carried on through that shaft.

BATTLE MOUNTAIN, CRIPPLE CREEK DISTRICT

The view includes the Strong, Ajax, Independence and Portland mines and Portland mill



CAMP AT SITE OF THE ROOSEVELT TUNNEL

The entrance to the tunnel is at 8,033 ft. elevation. Present flow from tunnel, 11,000 gal. per min.

On Aug. 16 Mr. Howbert resigned from the board, his place being filled by Mr. Peck, president of the Portland company. A. E. Carlton was elected chairman of the board, and he appointed Mr. Snyder chairman of the executive committee, to take the place of Mr. Burns, who tendered his resignation at that time.

With this reorganization of the executives the work of the tunnel extension is expected to be pushed vigorously and without interruption.

The expense of driving the original Roosevelt tunnel was defrayed by the various larger companies of the district. For the extension, which has been financed in the same manner, $200,000 has been [illegible], the

*Vindicator Consolidated Gold Mining Co., 603 Symes Block, Denver, Colo.

heaviest contributors to this fund being the Portland, the Vindicator and the Cresson—the mines most vitally interested in this work. The distance yet to be driven is a little over 10,000 ft.—about 2 mi.; but as the formation is all breccia and spongy eruptives which can be easily drilled and broken, it is expected that progress will be more rapid and the expense correspondingly less than when the tunnel was being bored through solid granite. The cost of this new work is estimated at $20 a foot.

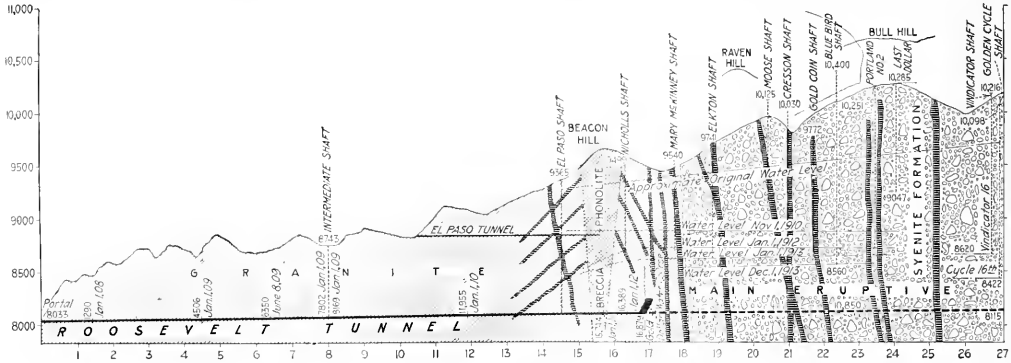
The tunnel extension will pass largely through ground owned by the contributing companies. Right-of-way will be granted by lease, and any veins or orebodies that may be encountered will be worked under these leases.

Even at the risk of repeating what may already be known to some *Journal* readers, a brief sketch of the work of draining the Cripple Creek district may not be out of place at this time. In the earlier days of the camp the water question was not a serious one; but as the more important shafts increased in depth the seepage began to be very troublesome, and below 500 ft. from the surface, operations were greatly hampered by the flow of water. The original water level was about 9,500 ft. above sea level on the western side of the district and 9,700 ft. on the eastern side, the drainage roughly following the contour of the country in its slope from the top of Pike's Peak southwest to the valley of the Arkansas River. The first mines to feel discomfort were those in the southwestern corner of the district, being lower in elevation, especially the El Paso and Elkton.

At first each mine installed its own pumping plant; but as the depth of the workings increased, the unwatering of the mines became so expensive and the outlay of capital for plants adequate to handle the flow of water so enormous, that the mine operators began to consider ways and means for unwatering the entire district by a central pumping plant, or two or three such plants, supported by all the mines interested. This plan was rejected because the benefits to be derived were not considered commensurate with the expense. Several joint pumping plans were tried, but none was particularly successful.

Among the larger individual pumping plants may be mentioned the one at the Portland mine. The first large pump at this mine was a Snow duplex compound condensing unit, installed in 1897 on the 800-ft. level. The dimensions of the steam cylinders of this pump were 18¼ and 34 in.; the plunger, 9¼ in.; the stroke, 36 in.; and the capacity, 1,000 gal. per minute at that depth. A year or two later a Knowles triple-expansion condensing pump was installed on the 900-ft. level. The size of this pump was 18&28&42x10 in., by 36-in. stroke, and the capacity, 1,200 gal. per minute. In 1908 the Snow pump was moved from the 800-ft. to the 1,500-ft. level of the No. 2 shaft, and the water was pumped from that level to the 900 and sluiced over to the No. 1 shaft, where the Knowles pump delivered it to the surface. Water-tight dams were placed in the adjacent old workings on the 900, making an underground reservoir of 400,000 gal. capacity. By this means the Knowles pump could be run 16 hr. a day, while the Snow pump on the 1,500 was working continuously. The cost of operating this plant was about $3,000 a month, handling 525 gal. per minute. The entire cost of the installation was not less than $50,000.

In the meantime the El Paso mine was bending its efforts toward a tunnel to drain its lower workings; and



CROSS-SECTION OF CRIPPLE CREEK DISTRICT TAPPED BY ROOSEVELT TUNNEL

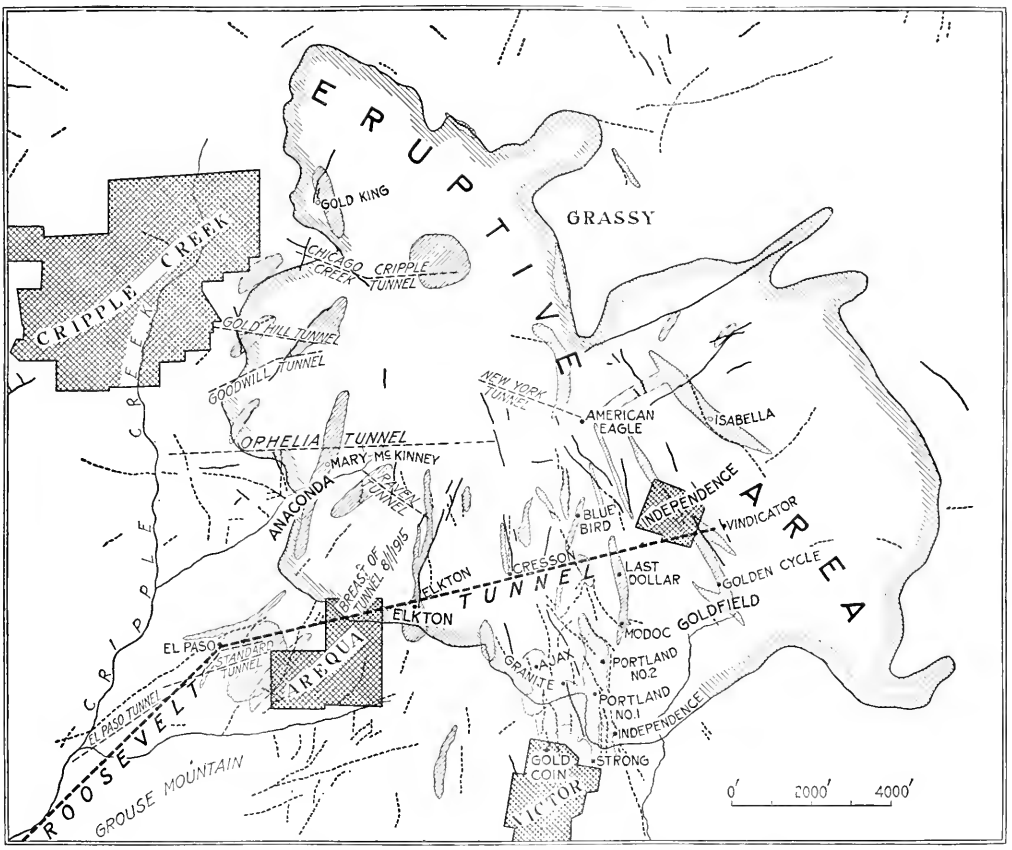
while this was not the first tunnel for drainage only, its success and that of other similar attempts led the mine operators to abandon the plans for pumping and to concentrate on the tunnel project. Financing this undertaking was no mean task and the choice of location no small problem. Every 100 ft. added to the depth of drainage meant 1,000 ft. added to the length of the tunnel to be driven, $30,000 to the capital to be raised, and six months to the time of waiting for the relief from the seemingly constant water level. Finally, however, the money was all pledged and the present Roosevelt tunnel, which is the only concerted effort at the drainage of the entire district to a great depth, was decided upon.

Among the former drainage-tunnel projects may be mentioned the Blue Bell, at 9,350 ft. elevation above sea level; the Ophelia, at 9,300 ft.; the Standard, at 9,050 ft.; the Newell, at 8,941 ft.; and the El Paso, at 8,800 ft. These tunnels, with the exception of the Newell, which does not tap the mineral-bearing area, all produced a heavy discharge of water, which continued until the level was lowered to their respective elevations.

The theory upon which the drainage-tunnel idea is based is that the mineralized area of the Cripple Creek

district is a more or less spongy eruptive formation surrounded by impervious Archean rock, which holds a supply of water like a reservoir; that tapping this crater would drain the entire district; and that this drainage would be permanent because of the relatively light rainfall. This theory was opposed by some engineers, who maintained that the crater is composed of a series of watercourses having no connection with one another, and that tapping one would by no means drain any of the others. This opposition delayed the financing of the Roosevelt tunnel to a considerable degree; and indeed it was not without grounds, for the Vindicator and Golden Cycle mines have not been drained at all, while all the rest of the district has been benefited, until now these two mines are the only ones that find it necessary to pump in order to keep their lower levels dry. But if the theory of separate watercourses were entirely true, the whole district, with the exception of the Vindicator and Cycle, would not be so well drained from one point as it now is; and the lack of drainage in these two mines is thought to be caused by an impervious syenite dike just east of the Last Dollar mine. Piercing this dike is expected to relieve the situation, and is one of the reasons for the extension of the tunnel; more rapid drainage of the mines already benefited being another.

Work on the Roosevelt tunnel was started in June, 1907, at a point in Cripple Creek Cañon about five miles below the city of Cripple Creek and at an elevation of 8,033 ft. above sea level. After several months' effort a contract for the completion of the tunnel was let to A. E. Carlton, president of the First National Bank of Cripple Creek, under whose energetic management the tunnel was driven 14,167 ft. at an average cost of $27.27 per foot. The first eruptive formation was struck Nov. 19, 1910, and with it a flow of water of more than 10,000 gal. per minute. The tunnel, however, was continued to the El Paso shaft, then deflected toward the east until the Gold Dollar watercourse in Arequa gulch was struck in March, 1912, when work was discontinued. About a year ago it was resumed under the direction of Mr. Burns, who drove the tunnel 970 ft. toward the Elkton shaft, the flow of water increasing by about 2,000 gal. per minute as a result of this extension. In the meantime a churn-drill hole was driven from the bottom of the El Paso shaft to the tunnel, quickly and effectively draining this mine. The shaft has since been sunk to the tunnel level. The so-called Fuller crosscut to the north was also driven to intersect the C. K. & N. watercourse. The total length driven is about 17,000 ft., or a little over three miles.



MAP OF CRIPPLE CREEK DISTRICT TAPPED BY ROOSEVELT TUNNEL

The following figures giving the elevations of the water level in the Portland No. 2 shaft show the effect the tunnel has had on the drainage of the eastern end of the district:

	El. Above Sea Level
Nov 3, 1910	8,858 95
Jan. 1, 1911	8,850 95
Feb. 1	8,843 29
Mar 1	8,837 29
Apr. 1	8,830 62
May 1	8,824 95
June 1	8,817 62
July 1	8,811 62
Aug. 1	8,806 95
Sept. 1	8,803 45
Nov. 1	8,794 45
Dec. 1	8,787 75
Dec 2	8,779 95
Shaft dry, drainage tunnel.	
May 2, 1913, water struck	8,606 00
Mar. 1, 1914, water struck	8,535 00
Jan. 20, 1915, water struck	8,425 00
Total drainage in 50 months	434 ft
Average drainage per month	8 7 ft

The driving of the drainage tunnel has presented no particular engineering difficulties, being more a test of financial strength and endurance. The section of the tunnel is 10 ft. wide by 7 ft. high, with a ditch on one side 3 ft. deep by 6 ft. wide, leaving a shelf 4 ft. wide on the other side for tracks and passage way. The grade is 0.3%. An intermediate shaft was sunk about

RECAPITULATION

Cost of portal work		$111,890 06
Contractor's percent		11,404 88
Total cost of portal		$123,294 94
Cost of shaft work		263,126 55
Total cost of tunnel		$386,421 49
Total number of feet driven		14,167 20
Average cost per foot of tunnel		$27.27

700 ft. to the level of the tunnel, and after October, 1908, work was carried on in both directions from the bottom of this shaft, simultaneously with the work from the portal. In July, 1909, a connection was made between the portal heading and the south heading from the shaft. Water-Leyner drills were used; and the haulage was done by mule-power. The average cost under the Carlton contract was, as has been stated, $27.27 per foot; the cost by months is given in the accompanying table:

The following itemized expenses are given for the month of July, 1908, in the portal heading, as a fairly representative month (from Bulletin 57, United States Bureau of Mines):

	Cost per Foot of Tunnel
Machinery and repairs	$0.61

PORTAL OF TUNNEL, 11,000 GAL. PER MIN. FLOWING

importance were encountered, and no water impeded the work until the main course was struck.

This year a great deal of interest on the part of mining men is being centered in the Cripple Creek district, and this interest has been stimulated in no small degree by developments on the lower levels of the larger mines, made possible by deep drainage. The only large mines not directly benefited by the drainage tunnel are the Vindicator and the Golden Cycle, both now owned by the Vindicator company, although they have contributed heavily to the drainage project. Pumping is now costing the Vindicator company about $4,000 a month to drain both mines. A battery of three triplex electric pumps,

each driven by a G. E. 150-hp. motor, is installed on the 18th level of the Cycle shaft, a depth of 1,900 ft. from the surface, or 8,173 ft. above sea-level—only 60 ft. above the level of the drainage tunnel when it reaches this mine. When lower levels are opened, in the future, it will be necessary to pump only up to this level. The pumps are now handling about 500 gal. of water per minute.

In order to avoid this heavy pumping expense, the Vindicator company is particularly desirous of seeing the drainage tunnel pushed through to its territory, although all the other deep mines in the eastern part of the district are also interested to no small degree, as the prosecution of the tunnel means more rapid drainage in their shafts.

The fulfillment of this desire seems only a question of time. The money has all been either raised or pledged. Charles H. Fuller, who did some very creditable work on the Carlton contract, will have charge of the underground work, and T. R. Countryman, of Cripple Creek, will be the engineer. It is estimated that two years and an expenditure of $200,000 will be required to complete the tunnel.

In connection with some of the facts and figures here given, I wish to acknowledge the assistance of Irving T. Snyder, A. E. Carlton and his secretary, Virgil H. Mann; and my indebtedness to T. R. Countryman for the use of the maps, and to Victor G. Hills' paper published in the Portland company's ninth annual report.

Steel Production in Canada

The details of the production of steel in Canada for 1914 and preceding years are given in the preliminary report of the American Iron and Steel Association, as below, in long tons:

	1912		1913		1914	
	Tons	%	Tons	%	Tons	%
Openhearth	645,062	75.6	768,663	73.7	549,716	79.2
Bessemer	207,569	24.3	273,391	26.2	144,447	20.8
Other	400	0.1	449	0.1	284	...
Total	853,031	100.0	1,042,503	100.0	694,447	100.0

The total in 1914 included 675,691 tons ingots and 18,756 tons direct castings. In that year there were 4,800 tons of alloy-treated castings and ingots included.

Finished Iron and Steel

The production of finished rolled iron and steel in Canada for four years past has been, in long tons:

	1911	1912	1913	1914
Steel	695,541	752,212	871,216	612,210
Iron	86,383	109,012	95,881	47,309
Total	781,924	861,224	967,097	659,519

The production in 1914 included 218,125 tons plates, sheets, bars, etc.; 59,050 tons structural shapes and wire rods; 382,344 tons rails. Of the rails 211,490 tons were over 50 lb. and less than 85 lb. per yard; 149,549 tons 85 but less than 100 lb.; 21,305 tons over 100 lb. per yard. Included in the total were 1,548 tons of alloy-steel rails.

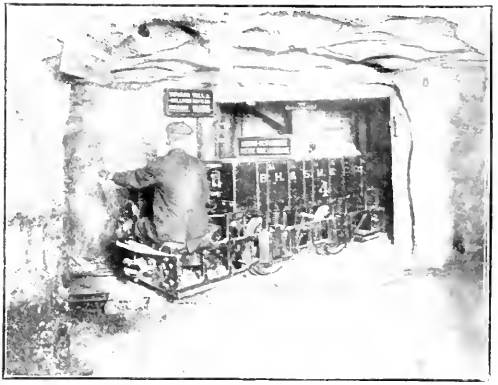
Miscellaneous Production

The total production of iron and steel cut and wire nails in Canada in 1914 was 1,144,000 kegs of 100 lb. each, which compares with 1,520,000 kegs in 1913. The output of finished splice bars, other rail joints and fastenings, not including spikes and bolts, in 1914 was 34,165 long tons, as compared with 51,839 tons in 1913. The make of forgings was: Iron, 1,792 tons; steel, 6,346 tons; total, 8,138 tons, a decrease of 15,267 tons from the preceding year.

The Mine at the Panama-Pacific Exposition

It is peculiarly fitting that the mining industry should be unusually well represented at San Francisco, because of the important part that mining has played in the development of the resources of California. So today the visitor at the Panama-Pacific Exposition has an opportunity to see practically at first hand the development of one of our greatest assets—our underground wealth—and at the same time inspect a mine without any of the discomforts usually attending such a visit. The Bureau of Mines of the Department of the Interior has, through the active and unselfish coöperation of a number of manufacturers and operators of mining equipment, established an exhibit that easily ranks as one of the most interesting of the exposition. Quoting from a pamphlet issued by the Bureau of Mines describing the exhibit:

"This exhibit, as its name implies, is an actual reproduction of full-size entries, drifts, stopes and rooms,



IN "THE MINE," PANAMA-PACIFIC EXPOSITION

elected from typical mines in various parts of the United States. In the several rooms of 'The Mine' are installed the appropriate machinery and appliances used in the modern mines. Visitors who expect to see in the mine ancient appliances famed in story, as the mine mule, the gray-bearded miner with pick and candle, black blasting powder and unventilated working places will be agreeably disappointed to find here a model mine, designed and operated under such modern working conditions as are believed calculated to assure the safety and health of the miners as well as efficiency of operation.

"The mine may be entered either by way of a cage down the shaft or by walking down the slope. The former is a realistic representation of a mine cage descending the shaft. The visitor enters through a typical headframe and sees a panoramic effect of neighboring mines and settlements. As the cage door is closed he experiences the sensation of descending the mine, slowly at first, then faster until full speed is attained. Cribbing, timbers mixed with lagging, then rock strata, and deeper and darker are

seen two entries with miners working. The illusion is produced by the canvas walls of the cage being caused to move past the occupant, and the illusion of rapid descent is greatly accentuated by means of a current of air blown upward through the cage, both the panorama and the blower being operated by a 5-hp. Westinghouse motor. Finally, the cage appears to slow down and then stop, whereupon the opposite door to that which the visitor entered is opened and he is allowed to leave and proceed through a darkened tunnel to the mine under the impression that he has descended to a considerable depth, while as a matter of fact he leaves on the same level as he entered.

"Once in the mine, there is a vast number of interest-compelling exhibits. Ore brought from its native state and the setting reproduced at great pains and expense make the visitor feel as if he were really in a mine. Great credit is due to some of the operating companies for their hearty coöperation in making this exhibit one of the features of the exposition. Some of these have expended large sums of money and the services of expert engineers in reproducing sections of mines on their properties with great accuracy and detail. The timbering used was all taken from actual service in different mines—not 'made for the occasion'—and it bears the earmarks of years of good service. Space does not permit a description of all the exhibits in the mine, but a few of the more important may be mentioned: Mining in the gold mines of Nevada; at Lead in South Dakota; silver in Idaho; copper in Arizona and iron ore in Minnesota are among the representative operations shown."

*

American Mining Congress in San Francisco

The probability of the United States becoming the leading radium producer of the world and of reduction from the present price of $160,000 a gram to $40,000 was announced Sept. 20 by Van. H. Manning, director of the United States Bureau of Mines, speaking at the opening session of the American Mining Congress in the Civic Auditorium. In part he said:

The only fields of carnotite ore known today are in Colorado and Utah. These fields are not inexhaustible, and it is highly desirable that the Government take action that will prevent so much of this ore as now remains in its possession from being wasted or monopolized.

He also stated that in the West losses through wasteful methods in the mining of zinc were startling, but that through investigations of the mining bureau many undeveloped fields can now be operated at a profit. He also predicted the mining of tin as a new industry for California, Idaho, Washington, Wyoming and Alaska.

Dr. George Otis Smith, director of the Geological Survey, delivered a plea for "Plain Writing" in the preparation of scientific papers, and said that it is now the spirit in Washington to prepare Government reports in the "language of the people."

A message from President Wilson expressing regret at his inability to attend the Mining Congress, was read. Among the delegates who spoke before the convention were: Prof. Charles F. Willis, of Arizona; Dr. William B. Phillips, president of the Colorado School of Mines; Gardner F. Williams, of Washington, D. C.; John P. Reece, of Illinois; R. C. Allen, of Michigan; Otto Ruhl, of Missouri; Henry L. Day, of Idaho; George H. Utter, of New Mexico; Dr. J. E. Talmage, of Salt Lake, and Judge J. H. Richards, of Boise, Idaho.

Memorial exercises in honor of the late Dr. Joseph A. Holmes, director of the United States Bureau of Mines, were held on Tuesday morning, Sept. 21.

Among the prominent mining men who spoke in praise of Doctor Holmes were: Carl Scholz, of Chicago, president of the American Mining Congress; Van. H. Manning, director of the United States Bureau of Mines; William L. Saunders, of New York, president of the American Institute of Mining Engineers; M. L. Requa, of the Mining and Metallurgical Society of America; John P. Reece, of Illinois, president of the American Mine Safety Association; Herbert M. Wilson, president of the National Safety Council; Hennen Jennings, of Washington, D. C.; J. F. Callbreath, secretary of the American Mining Congress; Charles L. Dignowity, of Boston; Joseph Hyde Pratt, of North Carolina; E. L. Bartholomew; Dr. J. E. Talmage, of Salt Lake City, and J. W. Paul and George S. Rice, of Pittsburgh, Penn.

At the regular morning session of the Mining Congress in the Civic Auditorium an address was delivered by Rush C. Butler, of Chicago, on the subject, "Constructive Regulation of Business," which topic was discussed in detail by the delegates. The afternoon session was taken up with an address on California's water-infiltration law, by Fletcher McN. Hamilton, state mineralogist of California, followed by a technical discussion.

The following directors were elected to serve three-year terms at the evening session, held at the Palace Hotel: Dr. J. E. Talmage, of Salt Lake; Charles M. Moderwell, of Chicago; Harry L. Day, of Idaho, and Dr. W. B. Phillips, of Colorado. It was decided to hold the next annual convention of the Mining Congress in Chicago. A banquet was held Tuesday evening at the Palace Hotel by the congress as a testimonial to Van. H. Manning, director of the United States Bureau of Mines.

The Wednesday session brought out more lively discussion than did those of the preceding days.

Harry L. Day, of Wallace, Idaho, president of the Federal Mining and Smelting Co., declared that two-thirds of mine accidents are due to the "criminal carelessness" of workers. Dr. Frederick L. Hoffman, the insurance-company statistician, well-known to *Journal* readers by his many contributions, said that the mine operator is responsible in the last analysis for most accidents and disease-spreading conditions.

Herbert M. Wilson, of Pittsburgh, Penn., director of safety for the Associated Mining Companies, agreed with Dr. Hoffman, who recommended an investigation into underground sanitary conditions of mines on the Mother Lode of California with the view of combating the hookworm disease.

A resolution was adopted protesting against the restrictions imposed by the Department of the Interior in granting rights of way over public lands.

The following program was carried out:

Report of committee on freight and ore treatment rates by Imer Pett, chairman, of Salt Lake City; address, "The Future of the American Zinc Industry," by Otto Ruhl, of Joplin, Mo.; "The Development of Mine Taxation in Arizona," by G. H. Dowell, of Bisbee, Ariz.; "The Need of Better Mining Education," by Prof. Charles F. Willis, of Tucson, Ariz.; "Workman's Compensation Insurance and the Coal Mining Industry," by Herbert M. Wilson, of Pittsburgh, Penn.; "The New Plan of Mining Insurance," by David Ross, of Springfield, Ill., and "Mining Hazards of the Pacific Coast," by Dr. F. L. Hoffman, of Newark, N. J.

Some Points in the Economics of Zinc Metallurgy*

SYNOPSIS—A comparison of the chief differences between American and European practice in so far as the main economic points are concerned. The powerful effect of the great supply of Australian zinc ore upon the spelter industry of the world. Prospects for zinc smelting in remote countries.

Even before the war began, the zinc industry of the world was experiencing radical changes. The effect of the war will be to produce more changes, whereof no man can yet clearly foresee the nature and scope. Looking backward, we can now perceive that 1896, when the Wilfley table was introduced, was a historic date in the metallurgy of zinc. Making possible an improved concentration of mixed ores requiring fine grinding, the first step in the solution of the long-baffling mixed-ore problem had been taken and the smelters were offered a new and bountiful supply of lead-bearing zinc ore, often high in iron, to which they had to adjust their metallurgy. Another important step in the separation of mixed ores occurred subsequently, with the introduction of Wetherill's system of magnetic separation and Blake's system of electrostatic separation, but the climax occurred with the successful introduction of the flotation process at Broken Hill.

Effect of Flotation at Broken Hill

The development at Broken Hill had at least three great consequences: It standardized smelting practice in Belgium and Germany; it compelled nearly all of the smelters of those countries to go on a zinc-lead basis; it showed that mixed ores could be profitably treated and caused a search for them to be made in all parts of the world, which within a few years resulted in the development of such mines as the Butte & Superior, of Butte, Mont.; the Bawdwin, of Burma; and the Riddersk, of Siberia, to mention only three of the first order.

Let me be more explicit respecting these statements. The total zinc production of the world in 1913 was about 1,000,000 metric tons, of which Belgium, Holland and Germany produced about 500,000 tons. Broken Hill in 1910-12 produced an average of 450,000 tons of blende concentrate per annum, averaging 46 to 47% zinc, which may be roughly calculated as equivalent to a yield of 170,000 tons of spelter, or about 35% of the total of Germany and the low countries.

The Market for Broken Hill Concentrates

The immense Australian ore supply was contracted to the three great German metal-merchandising firms, which distributed the ore among the smelters of Germany and Belgium. Those smelters coming thus into possession of so large, so uniform and so regular a supply of ore, the like of which in none of those respects had ever previously been experienced in the zinc industry, were able to standardize their smelting practice, not only as to a single works, but also as to many works, which was metallurgically beneficial.

Leady Zinc Ores Now a Matter of Course

The Broken Hill zinc ore was rather high in lead. In previous times zinc smelters generally were averse to smelting ore containing more than 2 or 3% of lead, although there were a few smelters who made a practice of treating ores relatively high in lead and recovering a considerable proportion of the lead therefrom. With the advent of the Broken Hill ore, the recovery of lead as a byproduct in zinc smelting became the regular thing; and in fact, the smelters of Belgium and Germany went practically upon a zinc-lead basis and even became insistent upon having a percentage of lead present in their ore that was far above what in earlier years had been regarded as permissible.

Zinc Smelting Becoming a Widely Distributed Industry

Another radical change in the zinc industry, that was in progress previous to the war, involved the establishment of new loci of zinc smelting and was rather directly connected with the Australian development. The art of zinc smelting is one of a multiplicity of details in which the part played by many workmen spells the difference between success and failure. No matter how careful the plans of the engineer may be, they are likely to come to naught unless there be good workmen to carry them out; and the making of good workmen requires long training. The possession of a class of workmen which has been engaged in zinc smelting during several generations is one reason why Belgium continued to be a great zinc-smelting country long after its own resources were exhausted. And because of the absence of such a class of smelters, it has been universally the experience that the inauguration of new zinc-smelting enterprises in new regions has been attended by difficulties which generally have wrecked the adventurer. With the advent of the great Australian ore-producing interests, however, there entered into the zinc industry a group of concerns with financial resources that enabled them to build zinc-smelting works in any logical location and with equanimity to carry them through the period in which the native population had to be taught how to smelt zinc ore. Thus we have already witnessed the erection and operation of two zinc smelteries in Australia, we have seen the foundations laid for a great zinc smeltery far away in Siberia, and we have reason to believe that ere long a zinc smeltery may be erected at some seaport of India. In the meanwhile, the Japanese, with their extraordinary adaptiveness, have inaugurated zinc smelting within their empire. There were, therefore, plans on foot that promised to make the art of zinc smelting one of far wider application than it had ever been during the century of its commercial history. These conditions were fully in evidence before the war began.

Germany, by virtue of its own great deposits of zinc ore in Upper Silesia and its contracts for the Broken

*A paper entitled "Some Main Points in the Metallurgy of Zinc," by W. R. Ingalls, presented at the International Engineering Congress, San Francisco, Calif., Sept. 20, 1915.

Hill ore, was the great purveyor of spelter to the rest of Europe, especially to England. The first great consequences of the war were to suspend, to a major extent, the production of zinc ore in Australia, there being insufficient surplus smelting capacity outside of Germany and Belgium to receive it, and to throw a large part of the spelter requirements of Great Britain, France and Russia upon the United States, the result of which was to raise the price for spelter to a figure not previously recorded in many years. What other major and minor effects the disturbance of the war may have upon the spelter industry lie within the sphere of prophecy. I will venture no more than the suggestion that they will be profound.

The world's great districts of zinc smelting have heretofore been Upper Silesia and Rheinland-Westphalia, in Germany; the valley of the Meuse and the Campine, in Belgium and Holland; and Kansas, Oklahoma and Illinois, in the United States. The art of zinc smelting was first introduced (from China) into Great Britain, but the British smelters have not, during the last 100 years, been leaders in the art, nor has zinc smelting attained great magnitude in their land.

During the last 50 years, there have been three types of zinc smelting (the earlier English and Carinthian processes having disappeared), which are known as the Silesian, Belgo-Silesian, and Belgian. In recent years, the Belgo-Silesian method has become known as the Rhenish, and this has shown a strong tendency to displace the Belgian process in Belgium and an even stronger tendency to displace the Silesian process in Silesia. The reasons for this are discussed in the metallurgical treatises, of which zinc smelting has recently acquired a rich literature. They may be summarized as a superior economy, as compared with the Belgian furnace; and, in Silesia, a change in the character of the ore which causes this method to be better adapted than the Silesian furnace. In the United States, the method of smelting is essentially the Belgian, which has been modified to conform to peculiar conditions.

Variations in American and European Practice Due to Labor and Material Prices

Considering the art of zinc smelting upon its broadest lines, the variations between European and American practice are explained by variations in fundamental conditions, which may be summarized in the statement that in Europe labor is cheap and coal is dear, while in the United States coal is cheap and labor is dear. Thus we find American smelters striving ever for mechanical substitutes for hand labor and European smelters aiming always to reduce coal consumption. There have been other determinative factors, the differences among which are, however, tending to disappear. One of these is permanence of the smelting districts. Another is scientific attention to the art.

Zinc smelting was begun in Upper Silesia in 1798 and on the Meuse in 1807, and ever since those dates has been conducted in those districts. Their metallurgical stability has induced operators to build substantially. From an early date, moreover, the smelting was directed by educated metallurgists, and both in French and German is there a literature extending backward for a century. In the United States, on the other hand, only two works—those at La Salle and Peru, in Illinois—have a long history and in the main the zinc-smelting industry has been characterized by shifts and uncertainties that stifled ideas of permanent building. About 1871 zinc smelting was begun at Pittsburg, Kan., and for 30 years was conducted with an absurd disregard of scientific control. Not until about 1898 were chemists employed, even to assay the ores bought and smelted. Ore was cheap, and for three decades the precept was "better butcher the ore than butcher the furnace." About 1901 most of the smelteries in this district were scrapped and the Iola district, where natural gas occurred, became paramount. Ten years later Iola was the scene of deserted works and the star of Bartlesville and Collinsville, in Oklahoma, was ascendant, but even now it is waning and the great locus of zinc smelting is becoming the coal fields of Illinois and further eastward. With this last move zinc smelters show that they are building for permanent business, not merely to reap some ephemeral natural advantage, and with the utilization of the services of metallurgists (which has been general only within the last 10 or 15 years), certain differences between European and American results are tending to disappear.

Sulphuric-Acid Recovery More Marketable Abroad

One other basic condition requires mention. European smelters operate generally in highly developed industrial regions affording a market for sulphuric acid and rendering the free discharge of sulphur smoke unpermissible anyhow. Therefore European smelters long ago began to make sulphuric acid as a byproduct of blende roasting. American smelters, on the other hand, were able to emit their smoke without doing great harm and had no market for acid. Consequently they did not make it. This condition, also, is undergoing radical change. Every smelter of blende east of the Mississippi River now makes acid.

In many respects the development of the American zinc-smelting industry has exhibited absence of initiative and curious contradictions. Our two great names are Wetherill and Hegeler. The former invented the process of making zinc oxide direct from ore. The latter introduced the first successful mechanically raked muffle furnace for blende roasting, modified the Belgian distillation furnace and introduced many mechanical contrivances. The best American zinc-smelting practice of the present day follows very closely in Hegeler's footsteps, with certain improvements borrowed from Belgium and Germany.

Early Introduction of Mechanical Roasting

During the last 20 years the vogue of the mechanical furnace for blende-roasting, in the United States has become all but universal. At the present time our works have capacity for roasting about 800,000 tons of blende per annum, and only two or three examples of the old hand-roasting kilns survive. Yet, of our mechanical furnaces, the Hegeler dates back to 1884, and during the last 15 years there has been no introduction of any new type—an emphatic commentary upon the absence of originality that has heretofore characterized zinc smelting in America. In the meanwhile the Germans have exhibited much alertness in developing and adopting mechanical roasting furnaces in spite of their lower rates of wages and consequent lack of incentive to substitute machines for men.

I may best elucidate further comparisons between European and American practice by sketching the principal parts of a modern zinc-smelting works. In all of what follows in this paper I have in mind only the smelting with coal-fired furnaces, dismissing from attention the smelting with natural gas in the United States, which is on the wane. Nor are the figures that I give intended to represent the practice with Silesian furnaces in Upper Silesia, Germany.

The ore is delivered into the works in railway cars, from which it is unloaded directly into the storage bins. The means for unloading, sampling, storing and reclaiming have, heretofore, been rather crude in many of the American works, but recently there has been an increasing tendency to adopt the superior methods that have long obtained among lead and copper smelters.

The ores coming to the zinc smelter are classified as calamine and blende. In Europe the former is still calcined. In America the calcination of calamine was abandoned by the smelters may years ago, the advantages being pronounced unequal to the cost. Blende, of course, must always be roasted. In America we use the Hegeler furnace if sulphuric acid is to be made; otherwise, simpler forms of mechanical furnace. Our object is mainly to save labor. In Europe hand-raked furnaces of the Rhenania, or the later Delplace, type are commonly employed, which are both designed and operated to save coal. The dead-roasting of blende has been regularly effected with a coal consumption of only 10% of the weight of the ore, a lower figure than has ever been achieved in the United States. However, there is a growing usage of mechanical roasting furnaces in Europe and an adoption of such new and excellent types as the Merton and the Spirlet, which American smelters have not yet ventured to try.

The roasted ore goes to the mixer, where it is united with the proper proportion of reduction coal. Mechanical mixing and careful attention to this important part of the process were early practiced at La Salle, but elsewhere in the United States this was generally done in ways far below European standards until recently. However, we are no longer subject to such a reproach.

Variations in Design of Works

Following European practice, our distillation furnaces are now commonly built entirely above the ground, the unclean, uncomfortable and unsanitary subterranean galleries of old being abolished. The Europeans are still ahead of us, however, in ventilation of the furnace houses. The Europeans generally lay out their furnaces in line. We lay them out in rows. The Europeans commonly employ recuperative (both reversing and counter-current) furnaces—again with view to economy of coal—and succeed in smelting a ton of ore with as little as a ton of coal. In the United States we use mostly the long Hegeler furnace. With natural gas firing there is no heat recuperation. With coal firing the economizing of fuel takes the form of generating steam from the waste gases. The long furnaces and the steam-boiler accessories are distinctly American, and both are due to Hegeler. To Hegeler also is due the charging car, metal-drawing car and other mechanical contrivances in aid of the work about the distillation furnaces. The only successful mechanical chargers, however, are of European origin; but a recent American invention of some promise is a mechanical discharger. A distinctive feature of American distillation-furnace practice is the use of blowers for the delivery of the combustion-air to the furnaces.[1]

In the manufacture of retorts the hydraulic press, which originated in Belgium, is now commonly employed both in Europe and America. However, the Europeans give more attention to the manufacture of their retorts and unquestionably make a better retort than we do.

In the handling of material in the works the modern American plants are as well equipped with tramways, elevators, etc., as are lead smelteries of corresponding size. In this respect our best American plants are in no wise inferior to the best European.

European smelters have long recovered lead and silver from their retort residues. American smelters now do so to a considerable extent, but the treatment of lead-bearing ores and recovery of the lead is less a feature of American practice than it is of the European. American zinc smelters pass the whole of their residue to the lead smelters. European zinc smelters commonly concentrate it by jigs and tables and deliver a lead concentrate for smelting.

European Distillation Temperatures Higher Than American

Metallurgically, the essence of zinc smelting is the temperature of distillation. Speaking generally, the higher the temperature the better is the extraction of zinc. But with bad ores and bad practice high temperature is infeasible; for the furnaces and retorts will not stand it. A bad ore may be smelted with but little trouble, at a relatively low temperature, but the extraction of zinc will be poor. The aim of the zinc smelter is to smelt a bad ore and obtain the maximum possible percentage of zinc out of it.

In general, the Europeans excel the Americans in this respect. They mix their ores more scientifically, they make better retorts and they build stronger furnaces, all of which contribute to an ability to drive their furnaces at higher temperature than Americans have yet attained, and at the same time they manage with ores that are rather high in lead. In so smelting, they make a leady spelter, but a simple refining in a reverberatory furnace removes the excess lead. In only one American works is that practiced.

European smelters also generally recover blue powder as a commercial product. This is obtained from the prolongs, which condense a proportion of zinc that would otherwise be lost. American smelters do not use prolongs. Although in trials of them, an additional 1 or 2% of the zinc has been obtained, they have found it to be unprofitable—this again reflecting the difference in labor conditions.

I have outlined the main differences between European and American practice in zinc smelting. The [illegible] explained by the reasons previously mentioned. [illegible] ton of raw sulphide ore the American smelter uses about 2 to 2½ tons of coal and 2 or 3 man-days of labor, and extracts about 84 to 88% of the zinc that is in his ore;

[1]Let it be noted that in offering these broad [illegible]izations of comparative European and American practice [illegible] is well in mind that there are representatives of several [illegible]ve types in the United States. Thus are to be found [illegible]-Belgian furnaces at Peru and Depue, Overpelt-Rhen[illegible] furnaces at Pueblo, and counter-current recuperative furn[illegible] at Palmerton.

if he treats lead-bearing ore, he may recover 50 to 60% of the lead.[2]

The European smelter uses about 1¼ to 1¾ tons of coal and 3 to 3½ man-days of labor, and extracts 88 to 90% of the zinc that is in his ore, and about 50 to 70% of the lead.

I hope to disarm criticism of these figures by stating that such figures properly should be accompanied by qualifications and explanations that would run to pages in length and would constitute a condensed treatise upon the metallurgy of zinc; and that I offer the figures that I have used merely as broad generalizations for the purpose of exhibiting, in tabloid form, the lessons deduced from the differences in the art as practiced in Germany and the low countries and in the United States. They mean that the Europeans, with the aid of better furnaces and superior technical direction, are able to smelt more refractory ore than we Americans, and yet extract a higher proportion of the valuable metals. They have built more substantial plants—secure from fear of geographical migration of their industry—for the sake of increased durability and maximum economy of fuel. While the rates of wages are higher in the United States than in Europe, American zinc smelters have not been able to offset that by the development of superior efficiency in the ways that the copper and lead smelters have done. Man for man, the German and Belgian smelter does as much work as the American. Thus the attendance of the distillation furnaces in Rheinland and Belgium requires 1.75 to 2.5 man-shifts per ton of roasted ore, while in America the requirement is 1.75 to 2.25. The difference in labor in roasting is insignificant when mechanical furnaces are employed. Such economies in labor as America has effected have been chiefly in the handling of material, which, in zinc smelting, is a relatively small part of the process.

Zinc Smelting Not So Backward as Supposed

Before concluding this paper I am bound to refer to certain misconceptions that continue to exist respecting the status of zinc smelting and the possibilities of any radical changes happening in this art, such as have happened in lead and copper smelting.

The art of zinc smelting is far from being at a standstill. When we find 1,000 kg. of ore requiring 1,000 calories of heat being distilled with 1,100 kg. of coal equivalent to 8,000 calories, as is done in the best practice, we are observing a thermal efficiency of 12½%, which compares favorably with good steam practice. When we find a ton of ore being smelted with 2½ man-days of labor, and consider that we are dealing with a concentrated product, and reflect that the total weight of material handled is relatively small and that the work on it from step to step is often more cheaply done by a man than by a machine, we do not feel unduly mortified by our results. Nor does the extraction of only 85 or 90% of the zinc content of the ore shame us very much when we reflect upon the peculiar and troublesome metallurgical properties of zinc.

The Complex-Sulphide Problem

The so-called problem of the mixed sulphide ores that has engaged so much attention during 50 or 60 years is not a question of how such ores can be treated—for means have been known for a long time—but, rather, is it a question of how may such ores be treated with sufficient cheapness. This problem has been solved to a large extent by the improvements in the art of mechanical concentration (especially the flotation process) and the improved ability of the zinc smelter to treat plumbiferous and ferruginous ore. Yet there are still ores whereof the beneficiation is highly unsatisfactory, such, for example, as those ores which contain fluorite and those ores which are a crypto-crystalline mixture of the component sulphide minerals. The present treatment of zinc ores that are high in silver leaves much to be desired. For some of these ores it is possible that hydrometallurgical or hydrometallurgical-electrometallurgical processes may be useful in certain cases. There has been a commercial hydrometallurgy of zinc for many years, but it has not been extensive, simply for the reason that most ores could be more profitably treated in other ways. The precipitation of zinc from solutions by electrolysis used to be troublesome and unsatisfactory, but now that seems to have been mastered.

Electric zinc smelting, which has engaged a good deal of attention during the last 15 years, is metallurgically of the same nature as ordinary smelting; the main difference is that in one case the zinc is distilled by the heat of the electric arc or the heat of electric resistance, while in the other case it is done by the combustion of coal. So far, electric smelting has become an art only in Sweden and Norway, where several thousands of tons of spelter are annually produced by this method. The smelters in Sweden and Norway enjoy very cheap power, whereby they have been able to overcome, or at least meet, the main obstacle that has heretofore prevented electric smelting from becoming a commercial art elsewhere.

*

Ontario Mineral Production in First Half of 1915

Supplementing the figures given in the *Journal* of Sept. 25, 1915, on Ontario mineral production for the first half of 1915, the following additional information is given. The quantity of nickel-copper ore raised was 548,579 tons, and the quantity smelted, 550,870 tons.

The chief outlet for cobalt oxide—the ceramic works of Europe—has been closed by the war. Consequently the shipments from the silver refineries have been greatly reduced, falling off in value 85%. Some consignments have been made to Great Britain and the United States. Metallic cobalt is now being produced both at Deloro and Thorold and is finding a use in the manufacture of high-grade and high-speed tools, also for the plating of metallic objects, replacing nickel for this purpose.

[2] The matter of lead recovery can be but vaguely stated, it being so intimately related with the original content of the ore and the character of effecting the recovery. The main sources of loss are (1) by volatilization during roasting; (2) by volatilization during distillation, a portion of which may be recoverable by condensing the spelter; (3) in the tailings of the mill, dressing the retort residues; and finally there are (4) the ordinary losses in the lead-smelting furnace. As a debit against any lead that may be recovered under (2) is the cost of refining the leady spelter. Process (3) is a source of large loss and may be omitted; but then there is an increased weight of material to be treated by the lead furnaces and therefore a higher cost of smelting. Yet, here again there may be an offsetting condition, namely, the residues may be high in iron and the lead smelter may need iron. These few remarks will give an idea of the complexity of this subject, which is indeed incapable of accurate generalization. The only answer is that which is expressed in dollars and cents in each case. What applies to lead also applies to silver. In my generalizations of the requirements of coal and labor in zinc smelting, I have not included anything involved in the refining of spelter or in the treatment of residues remaining after zinc extraction.

Tin-Ore Dressing at Llallagua, Bolivia—III

By Durward Copeland* and Scovill E. Hollister†

SYNOPSIS—The grade of tin "barrilla" made affects markedly the profit of the Bolivian producers, on account of the high freight and smelting charges. The tenor of various products of the Llallagua company is shown in an accompanying diagram. The cost of different operations and of supplies is also given in considerable detail.

The tin concentrates of Bolivia are shipped to Europe for smelting. Freights and smelting charges are heavy so the grade of the *barrilla* is of the greatest importance. This point, in regard to concentrates made, is especially true in times of depressed prices for tin. In fact, when tin is selling for a low price the grade of *barrilla* made may easily determine whether there is a loss or a fairly large profit to the producer. The majority of the Bolivian producers are satisfied with a shipping product containing 60% tin. An average of 65% in the *barrilla* is not common. The idea prevails that any attempt to increase materially the percentage of tin in the concentrate would be accompanied by a loss that would more than overcome any benefits obtained.

An accompanying diagram shows the relation of the tin mineral to the minerals which do not contain tin, in the mine ore, the mill tailings and in the concentrates produced by the company at Llallagua. The mill tailings are at present, because of increased regrinding of jig tailings and better classification, considerably lower in tin than is shown in the diagram. It is true that the higher the percentage of tin in the concentrates the higher the tin in the tailings and the greater the loss, but it has been found that allowing the *barrilla* to contain 10% of minerals which do not contain tin and nearly all of which are lighter than cassiterite is enough to afford a good protection against loss. There is, with a reasonably well managed mill, little more loss when the nonstanniferous minerals in the concentrates are reduced to 10% than when there is allowed to enter the *barrilla* 23% of minerals other than cassiterite. This is the same as saying that there is little more loss when producing a *barrilla* with 70% tin than when making one with only 60%. Diagrams have been prepared to show that by making 12,860 quintals of 70% *barrilla* rather than 15,000 quintals of 60% (there are equal quantities of fine tin in the two cases), there is an extra profit of at least 55,000 bolivianos. With the monthly production mentioned, each increase of 1% in the *barrilla* grade results in an extra earning of 6000 bolivianos.

ANALYSIS OF LLALLAGUA "S.S." BARRILLA

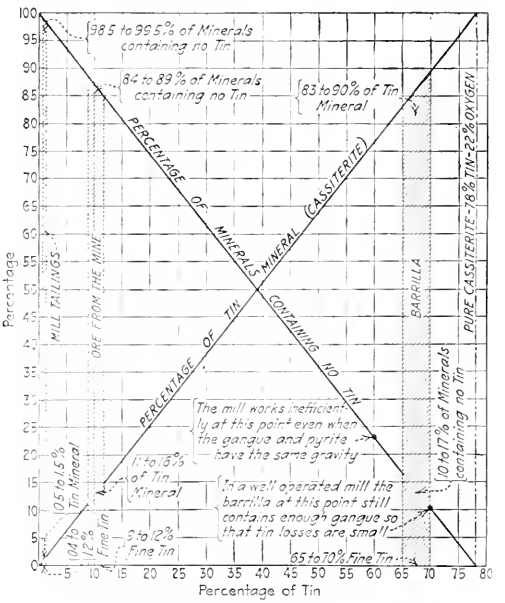
Tin oxide (68.32% Sn)	86.670
Iron	4.746
Nickel	0.023
Copper	0.060
Bismuth	0.360
Lead	0.070
Zinc	0.225
Silver	0.006
Titanium oxide	0.400
Tungstic acid	0.560
Calcium oxide	0.130
Silica	2.240
Sulphur	3.586
Oxygen and loss	0.924
	100.000

In an accompanying table are shown the results of a complete analysis made by Alfred H. Knight, of London, on a sample of *barrilla* of the class "S.S." This analysis was made in 1913 and represents the grade of concentrates as then made. With the present *barrilla*, averaging about 70% tin, the quantities of the metallic impurities are less than those shown in Mr. Knight's analysis.

Tin Assay by Cyanide-Fusion Method

In the making of uniformly high-grade concentrates, the various machines and sections in the mill require careful regulation. In order that this can be done effectively the company has a well-equipped laboratory. The substances in the *barrilla* of greatest importance in determining the profits to the company are the tin, sulphur, arsenic and copper, these being the elements upon which the smelting charges are based. Also, in the mines, payment to many of the contractors depends upon the percentage of tin in their ores, and these assays make [illegible] of the total work of the laboratory.

In Bolivia it is the practice to determine by the cyanide-fusion method, so the laboratory at Llallagua was



COMPOSITION OF LLALLAGUA PRODUCTS

Diagram showing percentage of fine tin, tin mineral (cassiterite) and minerals containing no tin in the ore, the barrilla and the tailings.

*Metallurgist, Cia. Estañifera de Llallagua, and professor of metallurgy, Missouri School of Mines, Rolla, Mo.

†Mill superintendent, Cia. Estañifera de Llallagua, Llallagua, Bolivia.

equipped to make the tin assays in this manner. In the cyanide-fusion assay the sample, after the soluble iron and other impurities which might enter the tin button have been removed by the use of acids, is mixed with "98%" potassium cyanide in crucibles and fused in a coke furnace for half an hour. The fusion being complete the crucible is removed, cooled and broken open, the tin button cleaned and weighed. At Llallagua a 10-gram sample mixed with 20 grams of cyanide is the charge. This is fused in a No. 6 Battersea crucible. On *barrilla* this method gives results uniformly 2% lower than those obtained by the smelters in Europe.

As Llallagua is so far from the markets (Europe and the United States) which can supply chemicals and laboratory equipment, it is necessary to keep on hand at least a year's supply of materials. By the time the freights and duties have been paid, any chemical, piece of glassware or apparatus we use has about four times the value it would have in the United States. This makes the cost of assays very high.

During the first eight months of 1914 an average of 1152 tin assays were made monthly at a cost per assay of 2.40 bolivianos ($0.83). Of this cost 8.8% was for crucibles, 43.2% for cyanide and acids, and 48% was for labor. This last item includes the cost of taking the samples and of preparing them for the laboratory. The cost to the laboratory of the various chemicals and materials is shown in the accompanying table:

MATERIALS USED IN LABORATORY IN AUGUST, 1914

Quantity	Article	Price	Value
1350	Crucibles No. 6	@ $0 07	$94.50
10	Scorifiers, 2½ in.	@ 05	.50
54 kg.	Nitric acid	@ 1 90	102 60
45 kg.	Hydrochloric	@ 1 71	76.95
31 kg.	Potassium cyanide	@ 1 59	49 29
2 reams	Paper for samples	@ 3 28	6.56
2 cans	Paraffin	@ 2 72	5 44
1 drum	Benzine	@ 17 24	17 24
1230	Sample sacks	@ .01	12 30
35 quintals	Coke	@ 2 07	72 45
15 liters	Alcohol	@ 35	5 25
5 liters	Ammonia	@ 1 55	7 75
All other chemicals			6 90
Office supplies			6.90
Total			$463.63

The assays for copper, arsenic, sulphur, and any special analyses for any of the departments are made by the methods employed in common laboratory practice. The one point worth noting is that these analyses cost as much proportionally as the tin assays.

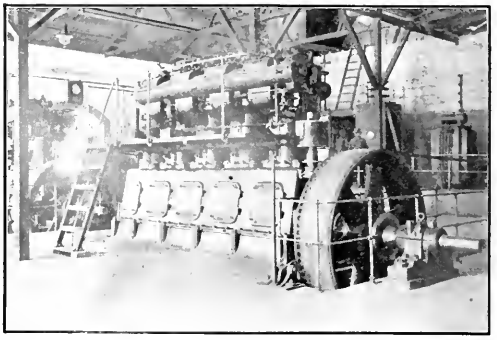
Three Power Sources

The power for the mine and mill is supplied from three power units. A hydro-electric plant capable of generating 800 hp. supplies that amount during nine months of the year, but is not in operation the other three months because of lack of water for the turbines, when power is supplied to the mine by two Diesel engines generating 400 hp. and the mill is run by a 200-hp. Deutz gas engine belted directly to the main transmission line. Power for the roaster-separator plant, machine shop and other power installations at the mill plant is supplied by a second Deutz motor. The entire electric system is connected through a central switchboard and current from any of the three sources can be supplied to any part of the system.

The first estimate of cost for building a 60-m. dam and equipping a hydro-electric plant to develop 450 hp. was 400,000 bolivianos ($138,000). By the end of 1914, because of washouts during construction and landslides into the river below the turbine house, the first cost for dam, overflow tunnels and an 800-hp. installation will amount to 1,350,000 bolivianos (about $470,000). By figuring the life of the mine as five years, a reasonable estimate, and charging 10% on the money invested, the first cost can be paid off in five equal yearly payments of 360,000 bolivianos. Calculating 600 hp. for 12 months (800 hp. for 9 months) the charge per horsepower-day for the first cost is $0.58. Operation and repair costs are as follows: Attendance, $0.025; repairs, $0.002; other costs, $0.002; total operating, $0.029. This makes a total cost for hydro-electric power of $0.58 + $0.029 = $0.61 per horsepower-day, which is 2.54c. per horsepower-hour. After five years, should the mine still produce, this power would be much cheaper, since the first cost of the installation would have been paid.

Diesel Engines at 13,000 Ft. Altitude

The Diesel oil-engine plant is rather interesting in that it affords some data on the operation of Diesels at high altitudes. The two engines installed at the elevation of the mill, 13,000 ft., are each rated at 300 hp. at sea level. The makers, Sulzer Brothers, Winterthur, Switzerland, would guarantee for them but 150 hp. at the elevation of the mine tunnel, 1000 ft. above



SULZER-DIESEL ENGINES AT LLALLAGUA

the point of their installation. At the beginning of the revolution of the Diesel engine the cylinder is filled with air at atmospheric pressure. This air is compressed to not less than 45 atmospheres and then fuel oil is forced into the cylinder. The temperature of the air due to the compression is so high that the oil immediately ignites. The amount of oil that can be burned at one revolution depends upon the weight of oxygen in the compressed air. Since the barometer here reads only about two-thirds as much as at sea level, one would expect the same engine running at the same rate to burn in a given time only about two-thirds as much oil and hence to develop not more than two-thirds as much power as at sea level. Our engines will each give about 200 hp. at this altitude. On actual tests made we have found that, using Peruvian crude oil of about 11,000 cal., the engines will produce when fully loaded 1 hp.-hr. with a consumption of 210 grams (0.463 lb.) of oil. For low fuel consumption the engines must be fully loaded. Using 210 grams of oil per horsepower-hour, the engines have a heat efficiency of 28%. Figuring that the first cost and interest on the investment at 10% should be charged off in five years, as in the case of the hydro-electric plant, with the difference

that we will say the Diesels produce 100 hp. 12 months of the year—since they can do so if necessary—we get the following:

The total cost of the Diesel engine plant, including the engines, generators, building, foundations (containing 200 bbl. of cement), freights and erection, was $52,000, of which the factory cost of the engines was $29,000. With interest at 10%, the principal and interest to be paid in five equal yearly payments, the annual charge will amount to $14,000. This is a cost of 9.6c. per horsepower-day. The operation and fuel costs for the Diesels are as follows: Fuel oil, $0.521 per horsepower-day; attendance, $0.016; cylinder oil, 36 kg. per day, $0.025; cleaning, $1.10 (extra) per month; repairs, $8.60 (extra) per month or $0.001 per horsepower-day; other costs, $17.20 (extra) per month or $0.001 per horsepower-day; cooling water, supplied by gravity; total operating, $0.564. The total cost for power from the Diesel engines from the above figures is 9.6 + 56.4 = 66c. per horsepower-day, which is 2.75c. per horsepower-hour. If the Diesel plant should be used after the five years, the cost per horsepower-day would still be at least 56.4c., the present operating cost.

Cheap Power from Deutz Gas Engines

The Deutz engines use gas generated from anthracite coal and produce power at a total cost of 3.8c. per horsepower-hour. Anthracite costs, at Llallagua, about $50 per ton. These engines were the first power units installed by the company that used anything but *taquia* for fuel and they have been giving excellent service for the last four years. They require cleaning only once in 60 days, and 12 hr. is sufficient for this operation.

Power costs being so high at Llallagua, some modifications are made in the methods of doing things. A horsepower-day developed by the Diesels costs more than the shift's wage of a laborer. It is poor economy to put in a machine needing 5 hp. to do the work that could be performed by two laborers per shift, for the company must have an investment in the machine and must pay for repairs, while the laborer represents no investment. When considering our automatic-roaster, magnetic-separator plant in comparison with the older hand furnaces and buddles, we always have to remember that the 20 hp. used in the new installation would pay the wages of more than 20 laborers (men and women) in the old plant.

The Cost of Doing Things

All machinery and nearly all mining supplies have to be brought to Llallagua from the United States or from Europe. Freights are a big part of the first cost of both machinery and supplies. The gateway to this section of Bolivia is Antofagasta, Chile, and from this port a 30-in.-gage railroad runs to Oruro. The nearest railroad station connected to Llallagua by a good cart road is Challapata, 60 miles from the mine. Ocean freights are cheap. On *barrilla* the rate per ton from Antofagasta to Europe is about £3 and it is expected that the freights through the Panama Canal to the United States will be lower. The rates on large shipments from Europe to West Coast ports are not nearly so high as £3. Considering the mountainous nature of the country and the high fuel cost the freight rates on the Antofagasta & Bolivian R.R. are reasonable, the cost per quintal from Antofagasta to Challapata, a distance of 500 miles, being about 2.80 bolivianos ($21 per ton). To bring material from Challapata to the mine when the weight is too great (that is, more than 100 lb.) for a llama, mule carts are used, and the cost per quintal varies from about 2.25 bolivianos ($15.50 per ton) for pieces of ordinary bulk and weight up to a much higher figure for articles which are especially heavy or bulky. Carts bringing in freight must be given *barrilla* for outgoing cargo even though rates for the same work by llamas are less. The cost of shipping on llamas is now cheap, it being possible to send a quintal of *barrilla* from the mine to Challapata for 1.10 bolivianos ($7.60 per ton). The carts make the 60-mile trip in three days. Llamas require five days for the journey from the mine to the railroad station.

Mining costs in many parts of Bolivia are dependent on freight rates. An instance is our cost of power from the Diesels. Of the total power expense 75% is for freights on the fuel oil and 10% is the cost of bringing the oil barrel from Antofagasta and returning it to the coast. It would make little difference in our power costs if the price of fuel oil at Antofagasta should go up or down 20%, since at Llallagua 80% of the final price is for freight.

Oregon lumber costs 35 centavos per board foot ($125 per M). A barrel of cement is worth 40 bolivianos ($14). Sheet iron costs 7c. per lb. An 18-liter can of Gargoyle lubricating oil has a value of 14.50 bolivianos or $5. We have a Hardinge mill. The first charge of pebbles came with the machine; these stones were valuable by the time they reached Llallagua.

Labor Now Plentiful

The price paid for labor in Bolivia varies greatly according to the place. In the last two years, because of high tin prices and great labor demand, the wages at Llallagua have constantly risen. A drill man received as high as 10 or even 12 bolivianos ($3.45 to $4.15) per 12-hr. shift and the average wage at the mine, including a considerable number of women ore pickers at 1.50 bolivianos and other cheap labor, was 6.30 bolivianos or $2.20. During the first part of 1914 the price of tin declined and with it the wage of the laborer. Then came the European war and practically no price for tin. Many small mines stopped operations. The nitrate fields of Chile curtailed. Railroad projects were stopped. Labor became plentiful and the average wage at the mine is now 3 bolivianos or $1, while at the mill it is about 1.98 bolivianos ($0.69) per shift of 12 hr. At ordinary times the labor is worth just about what we have to pay for it when the amount of work done for a dollar is compared with that performed for the same price in the United States.

The 12-hr. shift used at Llallagua and at Uncia does not mean 12 hr. of work. Custom rules in Bolivia and to the man who attempts to change things that are and have been, many things will happen. In occupations necessitating more or less strenuous work, such as shoveling, it is customary to set aside, each shift, three 20-min. periods for coca chewing. The coca-time is really a rest period as well and the laborer hunts a comfortable place to sit during the time. The custom of chewing the coca leaf is general. It should not cause more remark than the tobacco-chewing habit of the United States; it does not at all interfere with the pleasures of those who do not "chew." The coca seems to be exceedingly stimulating. An Indian eating a little grain and with coca to chew will run in a day distances almost incredibly great. In

traveling among the Indians in Bolivia the purchasing power of coca is more dependable than that of money.

The Bolivian laborer is usually contented and easy to handle. He will work hard and cheerfully. He would rather work for a small wage for a man he likes than for higher pay in the employ of a man he dislikes. He holds it an honor to have served one company for a long time. To his superior he is very respectful and often brings his domestic troubles to his employer for solution. When in charge of Bolivian labor it should always be remembered that, the men having been made to realize that you can be firm, all acts of kindness shown will be returned many-fold.

The costs for operating mine and mill are given in the accompanying table. The figures given are taken at times before the reductions of wages caused by the war were in full effect. With the present labor price the costs will be lower.

COSTS AT LLALLAGUA DURING JUNE, JULY AND AUGUST, 1914*

Item	Per Quintal of Barrilla Produced			Per Ton of Ore Milled			Per Ton of Rock Broken		
	June	July	Aug.	June	July	Aug.	June	July	Aug.
Mining Exploitation:									
Payroll	$1.90	$2.05	$1.81	$6.48	$6.41	$4.98	$2.59	$2.57	$1.99

* In these months approximately 40% of the ore broken and brought to the surface was sent to the mill.

One of the costs of mining in Bolivia which should not be overlooked is the export duty imposed on metals and concentrates, which for the most part go to other countries for use. One of the important incomes of the Bolivian Government comes from the duties charged on such exports. The duty on copper when the market is at 15c. a pound (£69 2s. 0d. per ton) amounts to $0.004 per pound on metal. Copper concentrates pay duties at the rate of 60% of those on the metal. Copper minerals which have not been concentrated pay 25% of the metal duty. This would appear to be an attempt on the part of the Government to discourage home concentration, although undoubtedly such is not the intention.

For wolfram the export duties are from 1.00 to 3.20 bolivianos per metric quintal when the London price per ton, with the basis of 60% tungstic acid, is from 20s. to 10s. per unit.

In the case of the duties on tin metal, they seem to be figured on the assumption that the amount of tin in a quintal of concentrates is two-thirds of that in a quintal of the metal and charges are made accordingly. This method of charging duties takes no account of the grade of the concentrates. When the price of tin in London ranges from £100 to £300, the export duties in Bolivia range from 2 to 14.55 bolivianos on concentrates and from 3.25 to 20.05 bolivianos on tin metal. The prices of the various metals in Bolivia are announced every 15 days by the government official with the title *Ministro de Hacienda*. The law of Dec. 1, 1911, which places a duty of 3% on the profits of all mining companies in Bolivia has been cancelled.

Investment Chances in Bolivia Good

Bolivia needs foreign capital for the development of its mining industry. The impression seems to prevail that money invested in Bolivian mines has not sufficient security and that it may be subjected to a multitude of actions at law. The fact is that where the titles of property are carefully secured, as would be the case in the United States, no trouble of lawsuits need be expected.

No large mining ventures have been started within the past five years. The country is well settled and in a way has been prospected by the Indians. Old workings of the Spaniards are found in many places. The system of Indian slavery practiced by the Spaniards permitted the working of deposits more cheaply than would at present be possible. There is in Bolivia good opportunity for North American investors. The chances for profit appear to be particularly good in the development of small mines, requiring but a moderate outlay of capital.

The Position of Tungsten

The following communication of W. A. S. Hellvar recently appeared in the London *Financial Times* on the subject of the scarcity of wolfram ores in the British Isles:

I have read the letter of O. J. Stannard in the "Times" of Sept. 4, and, as the part owner of a wolfram mine in Cornwall and a director of a tungsten-powder factory in London, I am perhaps qualified to offer some assistance to your correspondent in his dilemma when he states that he cannot "see why there should be this shortage of wolfram ore."

The ore is rarely produced free from tin, the output of a great number of producing mines containing up to as much as 10% of the latter commodity. Prior to the war 80% of the ore produced in or coming into Europe was consigned to Germany, including the whole of the tin-wolfram ore, for the reason that the Germans were the only people able to separate the tin from the wolfram. To be more explicit, Krupps, of Magdeberg, who were the makers of the Ullrich electromagnetic separator (a German machine), were open to buy tin-wolfram ore just as readily as they would take tin-free ore.

After the outbreak and as a consequence of the war there was no sale for mixed ore containing over 2% of tin, with the result that a large quantity of small native-owned mines in Burma closed down, and have not since restarted. At the present moment, instead of there being a difference of 1s. a unit between high-grade ore and that containing tin as pertained before the war, you have a difference of from 20s. to 25s. a unit. Only a few weeks ago a parcel of 30 tons of ore containing 8% of tin was sold in London at 31s. a unit, at a time when tin-free ore was fetching anything up to 60s. Metallic tin in tungsten is nearly as fatal as carbon.

What is required to solve the difficulty is a cheap and effective separator.

The Virginia-Carolina Chemical Co. reports for the year ended May 31, 1915, net earnings of $4,979,949, after deducting $1,476,126 for repairs and maintenance and setting aside $673,821 to reserve for doubtful debt. From this, interest and discount of $1,265,741 was deducted, leaving net profit for the year of $3,714,209.

Details of Practical Mining

Concrete Underground Ore Pocket at Copper Queen

By Fred M. Heidelberg*

It was the desire of the management to have the 260-ton ore pocket on the 400-ft. level of the Sacramento shaft designed with a barrel, a chute and a neck. The barrel was to contain the 260 tons of ore; the chute was to have the ore fed into it and in turn supply the ore to fill the cartridges; the neck, a necessary evil in this case, was to connect the barrel with the 400-ft. level.

The ore was to be fed into the chute from the barrel in a loose, unpacked condition. How to get the ore to feed in this condition was at first puzzling. A study was made of sand flowing through a hole in a tin can. The can was suspended about 2 in. above a table and sand was poured in. It flowed through the hole until automatically stopped by the sand-heap on the table rising to the hole. Some of the heap was then removed from beneath the can, from which the sand again flowed until stopped as before. It was evident that the [illegible] in the can exerted very little pressure on that which had piled up on the table. It was believed that the [illegible]ation of

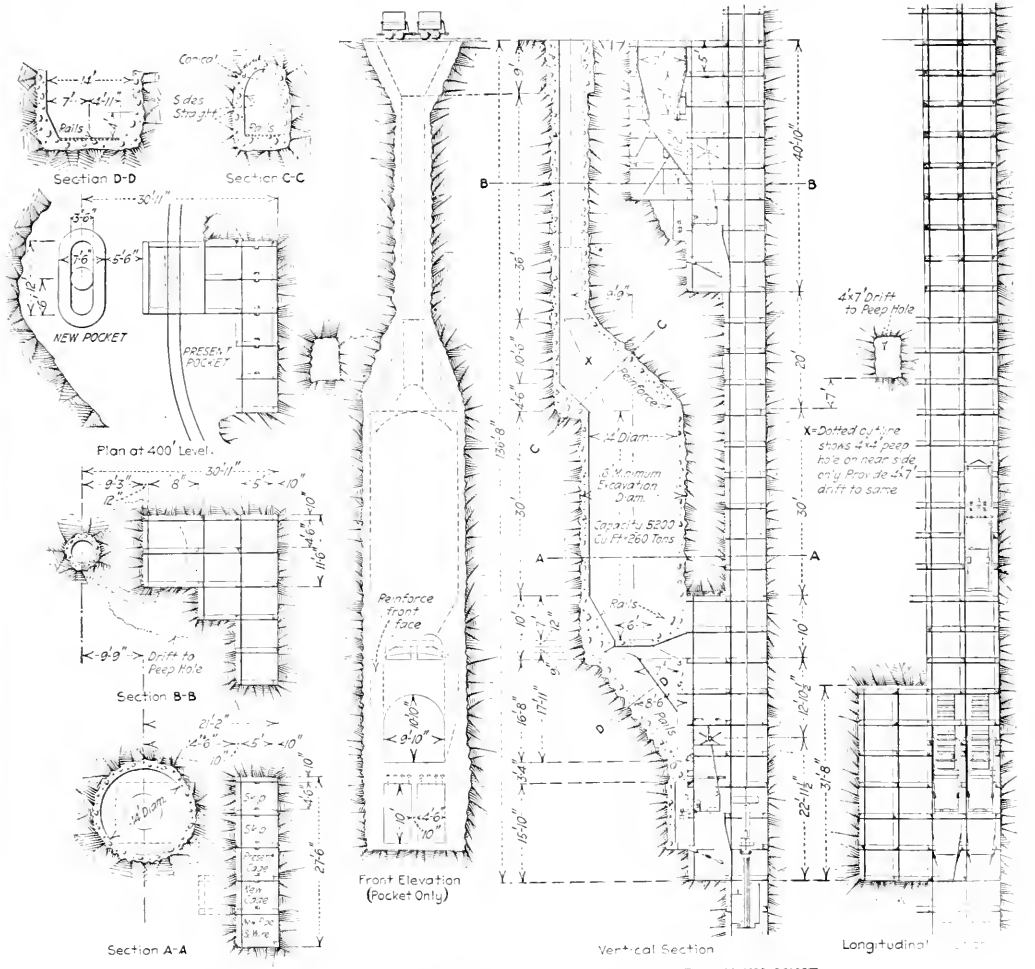

FIG. 1. DETAILS OF 250-TON ORE POCKET AT COPPER QUEEN MINE

*Box 1179, Bisbee, Ariz.

this principle would be most likely to give the results sought. The bottom of the barrel was therefore made in the shape of an inverted frustum of a cone. A diameter of 6 ft. for the opening in the frustum was decided upon as probably being best adapted to feed the ore in the manner desired and not allow it to arch in the barrel.

The long neck was provided to obviate taking out much rock around the old wooden pocket, which would have tended to weaken the pocket and the shaft. On account of the long drop from the level to the barrel, the neck was offset from the barrel so that the fall of the ore would be broken by the shelf before entering the barrel. Had the ore been allowed to fall directly into the pocket undoubtedly it would have packed and caused trouble in emptying the pocket. It will be noted that, had the proper conditions existed, the neck could have been omitted, the length of the pocket thus shortened, and the ore dumped directly into the barrel.

Keeping the ore from packing in the chute was carefully looked after. A razor-back (not shown in the design) was placed against the column in the center so as to divide the ore to the doors; 8-in. channel grizzlies were provided in the front, to allow for punching the ore should it hang up. Circular doors were called for at the end of the incline of the chute.

The cartridge- and skip-loading system, while not a part of this design, are shown. The working of the system can easily be seen from the design. The cartridge is filled and when the skip is in place the bottom of the cartridge is dropped and the ore falls into the skip.

A 4x7-ft. drift was provided from the pipe compartment to a peep hole placed just above the barrel of the pocket. This peep hole was to furnish the means of investigating the condition of the pocket when desired. A small 12x24-in. peep hole (not shown in the design) was provided where the inverted frustum and the barrel joined.

On the level where the cars dump, the neck was flared out to a funnel shape. It was made large enough to allow two cars to dump at the same time. A grizzly of 90-lb. rails, spaced 12 in. centers, was put across the funnel as a safety device.

The concrete in general was to be 1 ft. thick, reinforced where deemed necessary, and protected by 25-lb. rails where excessive wear was likely.

In constructing the pocket the design was followed faithfully except that the pocket was put on the side of the shaft opposite to that on which it is shown. The mining or excavating was done as a raise. Just as soon as enough ground had been taken out, a chute and door were put in so that the blasted rock falling down into the chute could be loaded directly into cars and hoisted to the surface. This little device saved quite a bit in the cost of excavating. Throughout, 10x10-in. timber was used. In the barrel a tower 8 ft. square was first formed, and then short stulls were put into the rock. In concreting, when the short stulls were taken out, the tower served to support the forms.

The manner of making the forms is worthy of attention. The regular 5-ft. long by 2-in. thick mine lagging was used altogether; and when the job was finished it was possible to return all but a small percentage of it to the mine for further use. From the opening in the inverted frustum to the top of the neck the lagging was nailed to 3x3x¼-in. angle-rings bent to the proper diameter. These rings and lagging constituted the forms. The inward thrust was taken up by the 8-ft. tower left in the center. The 3x3x¼-in. angle-rings had two sets of ¾-in. holes punched 1½-in. centers, staggered, with gages ¾ in. and 2¼ in. This left 1½ in. between the rows of holes. For the barrel four sets of rings were used. The cycle consisted in first spiking the lagging to a ring at the bottom of the form; at the top of the lagging another ring was spiked. In this top ring the bottom row of holes was used and the end of the lagging allowed to stick up only half way between the two sets of holes, so that when the form was filled with concrete the bottom of another set of lagging could be butted on the lower forms and the top row of holes in the angle could be used to spike through. In this way 5 ft. was concreted on some days and 10 ft. on others. The same method was used in the neck. At the junction between the neck and the barrel a combination of the rings for the barrel and the neck was used with success.

The concrete was conveyed to the pocket from the surface through a 6-in. pipe, placed in the pipe compartment. From a hopper at the subway station it extended downward 400 ft., then bent and went horizontally

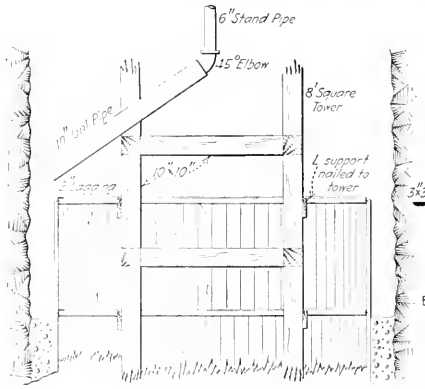

FIG. 2. DETAIL OF CONCRETING AROUND FORMS

to a hopper in the funnel of the neck of the pocket. This hopper was connected to a 6-in. pipe running down to the bottom of the pocket. On the end of the pipe was a 45-deg. elbow, over which was hung a 10-in. galvanized-iron spout which allowed the placing of the concrete wherever desired. As the concreting progressed, a length of 6-in. pipe was taken out, the 45-deg. elbow and galvanized-pipe spout fastened on and the work continued.

Since the quantity of concrete was small, no attempt was made to install a money-saving plant. The concrete was mixed with a mixer just outside the subway entrance, wheeled to the shaft and dumped into the hopper.

Fig. 2 is a section through the barrel. It shows the 8-ft. square tower, the method of using the forms, and the manner in which the concrete was placed by means of the galvanized-iron spout, which could be swung about the pipe as a center.

For dry sulphide ore the pocket worked admirably. The ore could be taken out faster than the conveying system could handle it. Although the pocket was intended for sulphide-ore storage, the management deemed it wise

to try the wet oxide ore also. This ore caused some trouble. The first time the pocket was filled the ore arched in the barrel and stuck to the concrete between the rails in the chute. The pocket was emptied, the 6-ft. hole in the inverted frustum was made 16 in. larger in diameter, and the chute was lined with boiler plate. A spray was also placed at the top of the incline of the chute so that it would keep the sheets wet. The second time the pocket was filled the ore did not arch in the barrel and its passage down the chute was quickened by the spray and the boiler plate. This pocket now works better than any other pocket in the mine handling this class of ore.

Under no circumstance is the ore taken out below the inverted frustum of the cone, for several reasons. The wear on the face of the frustum would be excessive; if the ore fell directly into the chute from such a great height, it would tend to pack there, thus defeating the original purpose of the design. As a matter of fact, through carelessness, the train attendants did fill the pocket several times up to the track on the 100-ft. level; but no trouble was experienced in emptying the pocket.

There was 361 yd. of concrete placed. The maximum progress for concreting in the barrel was 10 ft. per day, while 20 ft. was the maximum reached in the neck. The total cost of the pocket, including excavating, timbering, concreting, cartridge and loading devices, did not amount to $10,000.

Gerald Sherman, superintendent of the mine department; J. P. Hodgson, superintendent of mines, and George Mieyr, master mechanic, were active in working out the idea of the pocket, while the writer acted in the capacity of designer. Mr. Mieyr and Joe Lutz, the shaft boss, successfully carried on the construction.

*

Single- and Double-Hand Drilling Contests at Boulder

The Boulder County Metal Mining Association was sponsor for a successful Labor Day picnic at Boulder, Colo., participated in by both metal and coal miners. The most interesting events of the day were rock-drilling contests by hand. In the single-hand affair, Fred Dopp, of Jamestown, defended and retained his title as state champion and this despite his lack of recent practice. He drilled 17⅝ in. in solid granite in 10 min. In the double-hand contest, Dopp was paired with Roy Peterson. When it was announced, at the completion of their hole, that it was $23\frac{7}{16}$ in. deep, the spectators felt these men had won; but when the Brown brothers next took the stand and started their drilling, it became evident that something was happening. They started in with accurately timed and absolutely square blows that varied throughout the period only in their steadily increasing intensity. The Browns struck exactly one blow per second. Changes of position from striking to turning and changes of steels by the turner were made without the interruption of a single stroke. They drilled $24\frac{3}{16}$ in., Dopp and Peterson taking second place. Dopp has never been defeated in single-hand drilling, and an effort is being made to send him to San Francisco to compete for the world's championship.

Another feature of the day was a first-aid contest between drilled teams from several coal mines in this county. In this the prize, a silver cup, was taken by a team representing the Simpson mine at Lafayette. This picnic was managed by L. E. Girard, of Salina, who states that its most important result was the elimination of "an undercurrent of distrust and unfriendliness" between the men engaged in the industries of metal mining and coal mining.

*

Hand-Drilling Contest at Virginia City

Two contestants in a single-hand drilling contest on Labor Day at Virginia City, Nev., made the following record, the time allowed the men being 15 min. for drilling down holes: Mike Grivic drilled $32\frac{1}{8}$ in.; William Berry, 29 in. Berry got a good start and drilled steadily, but toward the end lacked force. Grivic was the speedier and is estimated to have struck from 95 to 100 blows per minute. His third or fourth drill stuck once, but he lost very little time. George Dewar was judge of the contest. Some money changed hands on the result, but the betting was light. The purse was $100.

*

Mother Lode Drilling Contest

Five teams of Mother Lode miners entered a drilling contest at the union picnic of the California State Federation of Labor at Jackson, Amador County, Aug. 15. One of the teams, Voyivich and Vacilivich, of Jackson, broke one of the drills in the hole, so that their record was not available. Teams were allowed 15 min. Drilling was in Amador County granite. Payton and Dynan, of Amador City, took first prize, drilling 46½ in.; Marcus and Pedro, of Sonora, second, 46¼ in.; Zarkovich and Rupur, of Jackson, $13\frac{1}{8}$ in.; Burbank and Kerr, of Amador City, $33\frac{3}{4}$ in.

*

Hand Drilling at Butte

Sam and Will Roberts drilled $37\frac{3}{4}$ in. in granite in 15 min., working as a team, at an exhibition at Lake Avuca, Butte, on Labor Day. It had been announced previously that two two-men drill teams, the contestants averaging 170 lb. each, would compete, but only one team was on hand.

*

Miami Hand-Drilling Contest

Double-hand drilling contests were held in Miami on Labor Day, the rock being local granite and the time the usual 15-min. period. The first prize of $250 was won by William Gholson and Jess King, who drilled 36½ in. The second prize of $100 was won by Tony Obad and Christ Palovich, who drilled 35¼ in.

*

Jamestown Hand-Drilling Contest

Three teams entered the rock-drilling contest at the Labor Day picnic at Jamestown, Calif. Drilling was in hard granite. Wilson and Kahl took first prize, drilling $32\frac{3}{8}$ in. Burbank and Kerr, second, $32\frac{1}{8}$ in. Marcus and Pedro made 31¼ in., but broke a drill steel and did not complete the contest. Time, 15 min.

Details of Milling and Smelting

Bradford Selective Flotation

Leslie Bradford, of Broken Hill, Australia, has patented a process of preferential flotation for the treatment of mixed sulphides, adding certain mineral salts such as thiosulphates to the water used in the flotation cells. The *Australian Statesman and Mining Standard,* of July 22, 1915, states that the distinguishing feature of the method consists in treating the ores or ore products in a medium which wets zinc sulphide and does not wet lead sulphide or pyrite and therefore leaves the last-named sulphides flotable while rendering the zinc sulphide temporarily immune to flotation. The lead sulphide and any pyrite are thus obtained first as float concentrates; thereafter the residues comprising gangue and zinc sulphide are treated for the separation of the zinc sulphide from the gangue.

This "wetting" effect, according to the patent specification, is procured by adding to an acid flotation solution a limited quantity of a substance which is decomposed by said solution, and produces in this decomposition a reducing gas which is more or less soluble in the solution. Notably thiosulphates, sulphites and bisulphites are so decomposed in a solution of sulphuric acid with the production of such a gas (sulphur dioxide). With substantially equal result, sulphur dioxide may be introduced directly into the solution, either as gas brought into it in a current or added in solution. The like effect is obtained by means of another reducing gas, sulphureted hydrogen, which may be similarly introduced into the solution or may be produced in it by adding sulphides or polysulphides which the solution is capable of decomposing.

In practice a limited quantity of such a reducing agent is introduced into the solution, prior to flotation treatment of the ore therein, with the object of procuring this zinc "wetting" effect. The reducing agents preferred by the inventor are thiosulphates, sulphites and bisulphites—as they are usually more effective than those belonging to the second group.

In the actual application of the invention to a Broken Hill mixed-sulphide ore containing zinc and lead sulphides, the flotation operation is considered in a plant of the type described in two previous Commonwealth patents, using the flotation boxes set in series, and treating ore at the rate of 25 tons per hour. No serious difficulty is experienced in correctly proportioning the sodium thiosulphate (the blende "wetting" agent) so as to insure the rapid floating off of the galena substantially pure or as a high-grade concentrate rich in silver, and to leave the residue in a condition suitable for further flotation treatment for the recovery of the zinc sulphide therefrom.

The flotation treatment is preferably conducted according to the froth-flotation principle; the procuring of the effect aimed at is dependent upon the presence of a frothing agent in the flotation medium, only when a reducing gas is introduced into the medium; it is not dependent upon the presence of a frothing agent in the flotation medium when a reducing gas is generated in the flotation medium by reaction of a substance introduced into it. In some cases enhanced results are obtained by digesting the ore with sulphuric acid and the reducing agent in a thick pulp, prior to subjecting the same to a flotation operation.

*

Chart for Determining Plies of Conveyor Belts

The accompanying chart,[1] drawn by J. D. Mooney and G. L. Darnell, of the B. F. Goodrich Co., Akron, Ohio, offers the means of quickly determining the correct number of plies for conveyor belts operating under various conditions. The calculations are based on the average safe strength (factor of safety, 15) of various standard rubber conveyor belts, and assume maximum loading conditions; that is, the belt is considered as carrying the greatest load it will handle without spillage at ordinary belt speeds. This not only produces the most economical operating condition, but also the maximum tension in the belt. The chart is a graphical representation of the formula:

$$p = k\,g\,W\,(L + 10\,H)$$

where

p = Correct number of plies;
k = A constant depending on the type of drive;
g = Weight in pounds per cubic foot of material handled;
W = Width of the belt in inches;
L = Length of the belt in feet (approximately twice the center distance);
H = Difference in elevation between the head and the tail pulleys in feet.

For a simple drive with a bare pulley, k equals $\frac{1}{250{,}000}$. For a simple drive with a rubber-lagged pulley, k equals $\frac{1}{300{,}000}$. For a tandem drive with bare pulleys, k equals $\frac{1}{375{,}000}$. For a tandem drive with rubber-lagged pulleys, k equals $\frac{1}{455{,}000}$.

The chart is drawn for a simple drive with the bare pulley $\left(k = \frac{1}{250{,}000}\right)$; therefore the number of plies obtained from the chart should be multiplied by the factor 0.83 or $\frac{5}{6}$ for simple, lagged drive; the factor 0.67 or $\frac{2}{3}$ for tandem, bare; and the factor 0.55 or $\frac{11}{20}$ for tandem, lagged drive.

To find the correct number of plies for a conveyor belt, knowing the width, the length, the difference in elevation between the head and the tail end and the kind of mate-

[1] "Bull. of A. I. M. E.," September, 1915.

rial to be handled, proceed as follows: Start with the width given at the top of the chart and move down until this line intersects the line corresponding to the proper length factor ($L + 10\,H$); then move either right or left until the line corresponding to the given material is met; then move down again to the scale of plies where the next largest figure will give the correct number of plies.

For example: To find the correct number of plies for a conveyor belt 36 in. wide and 300 ft. long, with 20 ft. difference in elevation, handling sand and gravel—follow the line from the 36-in. width downward until it intersects the 500 length-factor line; then follow to the right until the sand-and-gravel line is intersected; then down to the ply scale, where the ply will be found to be 7.

The formula $p = k\,g\,W\,(L + 10\,H)$ has been developed mathematically from the following formulas

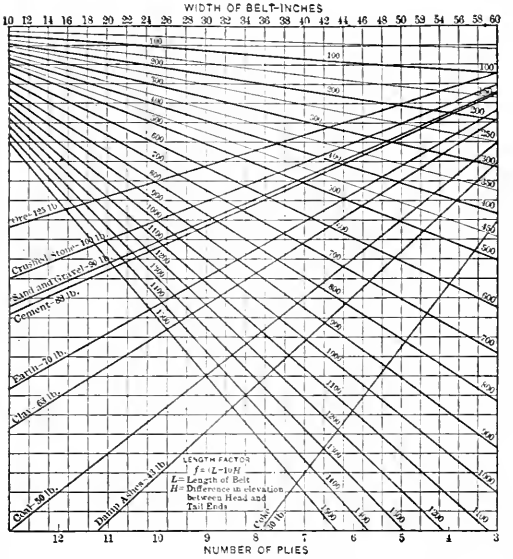

FIG. 1. CONVEYOR BELT CALCULATING CHART

which have been found to work satisfactorily in average practice:

$$U = \frac{0.08\,W^2 S g}{5{,}000} \qquad HP = \left(\frac{0.02\,l}{100} + \frac{0.01\,H}{10}\right) U$$

$$T = \frac{U \times HP}{S} \qquad p = \frac{T}{24\,W}$$

where

U = Capacity in tons per hour;
W = Width of belt in inches;
S = Belt speed in feet per minute;
g = Weight per cubic foot of material handled;
HP = Horsepower developed in driving conveyor belt;
l = Length of conveyor in feet (approximately one-half L);
H = Difference in elevation between the head and tail pulleys in feet;
T = Total tension in the belt in pounds;
p = Correct number of plies; C = The constant of the drive.

For a simple-drive, bare pulley, $C = 600$. For a simple-drive, rubber-lagged pulley, $C = 500$; for a tandem-drive, bare pulleys, $C = 400$; for a tandem-drive, rubber-lagged pulleys, $C = 330$. The length factor f equals $L + 10\,H$, represented on the chart by the lines 500, 600, 700, etc., is a developed factor equal to the sum of the length of the belt and 10 times the difference in elevation between the head and tail pulleys.

Hall Smelting Process to Eliminate Sulphur Dioxide

William A. Hall, of New York, has been granted a patent (U. S. pat. 1,133,637) for a process to prevent the escape of noxious gases in smelting, particularly of SO_2 commonly produced in the focus of the blast furnace. This is accomplished by maintaining at the top of the charge a temperature below that at which free sulphur will ignite and by spraying the top of the charge with a liquid containing water, thereby producing sufficient hydrogen sulphide to reduce the sulphur dioxide in the furnace gases. Spray pipes are placed in the furnace stack, and as the water percolates downward it keeps the top layer of the ore much cooler than in ordinary smelting of sulphide ores. When the water has reached a point where the temperature is high enough to convert it into steam, the latter reacts with a certain amount of sulphide ore and the evolution of H_2S results. This combines with the SO_2 to form water and elemental sulphur, the latter passing upward in the form of vapor and being condensed in the dust chambers. The reaction may not be completed in the furnace stack, but may proceed in the fume-settling system. A high-ore column and the exclusion of false air in the upper part of the stack are recommended.

Rapid Test for Fineness of Paint Pigments

The Multi-Metal Separating Screen Co., of New York, has succeeded in making 350-mesh screens (122,500 apertures per sq.in.) of vanadium-bronze wire about 0.001 in. diam., with which different operators, using different screens, can obtain concordant results, according to C. D. Holley and J. C. Brier, *Oil, Paint and Drug Reporter*, May 10, 1915; abstr. *Journ. Soc. Chem. Ind.*, June 15, 1915. These screens have proved of value for testing the fineness of pigments. The particles passing through can be ground economically in a paint mill, but those retained on the screen, even when present in relatively small amounts, rapidly reduce the efficiency of the mill. The sample (25 grams) is washed through the screen by means of water, using a soft brush to break up lumps. Calcium and manganese oxides, as used by varnish manufacturers, can be tested in a similar manner, using naphtha instead of water. The results obtained with consignments of various commercial pigments varied greatly in many cases from those yielded by the small sample used as a basis of purchase.

E. Laugguth States in a Patent Specification (German, 282,131, Oct. 8, 1913) that when mixed sulphide ores are being treated by the oil flotation process, a solution of zinc chloride acidified by chlorhydric acid, added after the oil, causes the sulphides of zinc and lead to sink while other ores float.

American Institute of Metals

The first technical sessions of the Allied Foundrymen's Organizations were held at Atlantic City, N. J., on Tuesday, Sept. 28. The headquarters of the meeting was at the Traymore Hotel.

A joint opening session of the American Institute of Metals and the American Foundrymen's Association was held in the morning, the papers relating exclusively to foundry practice. In the afternoon the American Foundrymen's Association held a session on Young's Pier, while the American Institute of Metals held a technical meeting at the Traymore. At the latter, the first paper presented, "An Investigation of Fusible Tin Boiler Plugs," by G. R. Burgess and P. D. Merica, was discussed by the latter, who gave some supplementary data. He said that in the case of some boiler plugs which had been overheated, but did not blow out, investigation showed that the metallic tin had been partly transformed into the oxide, the latter having a melting point of about 1,600° C. against 320° C. for pure tin. Oxidation began on the water side of the plug and progressed in the form of a complicated network of fine veinlets, utterly destroying the utility of the plug.

It was also shown that a small percentage of zinc in the tin destroyed its value as a safety plug by changing the melting point. Analysis of various plugs showed that many contained from 0.3% to 1% Zn, while pure Banca tin should not contain more than 0.01% to 0.03% Zn.

The next paper was on "The Influence of the Impurities of Spelter on the Cracking of Slush Castings," read by the author, Gilbert Rigg, of the New Jersey Zinc Co. This paper elicited considerable discussion. The fact was brought out that even small quantities of impurities, among which cadmium was prominently mentioned, tended to produce cracking, often microscopic, which lowered the value of the castings. Incidentally it was brought out that the reasons are the same which have made it necessary to use highest-grade spelter for making brass to be utilized in munitions of war. Small proportions of iron harden the brass, while cadmium has a general deteriorating effect, although the speakers could not definitely name its activities.

The two papers announced to follow—"Cobalt in Nonferrous Metals" and "Furnace Methods for Pure Castings"—were not presented, their preparation having been interferred with.

Doctor Rawdon's paper on "Standard Test Specimen of Zinc Bronze" was read and explained by Dr. G. K. Burgess. The 88:10:2 mixture was discussed at length. One of the points brought out was in response to a question asked as to whether the bad effects of oxidation in this mixture were due to furnace practice or to pouring practice; if the former, a remedy might be found in the electric furnace with its reducing atmosphere. Doctor Burgess was of the opinion that furnace practice was largely responsible.

As to deoxidizing agents, phosphorus, manganese and barium were recommended as the most promising. Little was to be expected from calcium or silicon, since their use introduced features antagonistic to good results.

Doctor Hoyt's paper on copper-rich kalchoids was presented by the secretary, but provoked no discussion. The members attended a theater party in the evening. G. H. Clamer presided at these sessions, W. M. Corse, secretary.

British Mineral Production

The mineral production of Great Britain from mines coming under the Coal Mines and Metalliferous Mines acts was given in the *Journal* for July 3, p. 6. The statement is now completed, the British Government having just issued the statistics covering the production from workings under the Quarries act, which covers all quarries and openpit workings.

Quarry-Production Quantities

The production from these workings in 1914 included 2,342 tons bog ore; 100 tons chromite; 21,363 tons coal; 39 tons copper ore; 9,128 tons fluorspar; 45,269 tons gypsum; 5,561,336 tons iron ore; 25 tons lead ore; 11,845,236 tons limestone; 1,150 tons dressed tin ore.

The most important item of quarry production was iron ore. The total ore mined in Great Britain in 1914 was: Coal mines, 7,241,481; metal mines, 1,743,011; quarries, 5,561,336; total, 14,745,828 long tons, which is a decrease of 1,251,500 tons from 1913. The small quantity of coal from open workings makes the total production of Great Britain 265,664,393 tons in 1914; a total decrease of 21,766,080 tons from the preceding year.

Number of Employees and Accidents

The total number of persons employed at quarries and open works under the Quarries act was 78,908, of whom 50,074 worked inside the actual pits or excavations, and 28,834 outside. Compared with 1913 there is a decrease of 1,192 inside workers, and of 809 outside workers, making a total decrease of 2,001 in the number of persons employed at quarries. The persons employed occasionally at quarries are not included in the above figures.

There were 95 persons killed, or 1.20 per 1,000 employed; the rate for inside workers being 1.54 and for outside 0.62 per 1,000. As compared with 1913 there was an increase of 10 persons killed, but a decrease of 576 in the number injured.

Molybdenite Production in New South Wales

A report on the probable output of molybdenite in New South Wales made by Arthur D. Pedley for the government gives the following estimate:

There are several works for the treatment of molybdenite in Sydney, and several of the mines treat their product in the country.

As to production, there was a letter in the London "Times" on, I think, Apr. 6, stating that the production of molybdenite from that date to June 30 next would be 100 tons. Whoever wrote that letter must have known such would not be the case. It would be impossible. When the statistics are available, it will be found that instead of 100 tons the amount will prove about 10 tons—and perhaps a little under.

As to the future export—say from July to December inclusive—I think it will prove about 60 tons. Any sensational increase or decrease is not to be expected. More than half the amount quoted will come from old dumps that have been left lying on the surface for years; the other half will come from mines now working.

A good many molybdenite mines are now coming to light, but the statements as to their value are inflated. It will require more than present prices to make them pay in most instances.

The ore is found in pipes and not in lodes or reefs; in consequence, a mine may last for a year or two or the pipe may come to an end in a week's time without any previous indication, and thus it is a precarious industry.

Correspondence and Discussion

Mining-Stock Brokers

The editorial on "Mining-Stock Brokers" in the *Journal* of Sept. 4, 1915, not only does an injustice to most of the brokers of the Salt Lake Stock and Mining Exchange, but also states as facts reports which the editors have of course read or received from their correspondents, but concerning which they have been somewhat misinformed.

The brokers of the Salt Lake City Exchange did not "suspend a regular session in order to congregate in the so-called Gold Room of the Commercial Club in order to do honor to a notorious exponent of the black art who was warmly welcomed and feasted" because he was "going to foster a boom in the Alta stocks," nor did they suspend any session, nor extend any official notice of his presence. A luncheon was given for him to which some of the brokers were invited, and when the time arrived for the opening of the exchange one of the members of the exchange proposed that the time of the second call, which usually begins at 1:30 p.m., be postponed until the luncheon was over, and it was postponed for those present. A dinner was also given for him here by some of his business associates and a number of the brokers were invited, but only a small percentage of the members of the exchange attended, and they were well outnumbered by the business men of the city. The editorial written at the time concerning the dinner was certainly approved by a large majority of the members of the Salt Lake Stock and Mining Exchange to whom I showed the article.

This "Alta boom" was not fostered nor matured here but in the city of New York. Practically all the Salt Lake brokers warned their clients of its danger, and those who had Eastern connections warned them as well.

The *Journal* speaks of our Utah Copper Co. in a complimentary way in its editorial and the legitimate speculation in its shares. Every producing mine in Utah which was financed here is, I believe, listed on the Salt Lake Mining Exchange. They were not invited to list their shares, but an application had to be made by each company with a statement showing who the officers were, what the financial condition of the company was at the time of listing, and a fee of $100 was paid by each company upon the acceptance of its application. Surely if the Salt Lake Exchange were "cheap and contemptible," as the *Journal* leads one to infer when it states that nearly all the interior exchanges are, then such men as manage the Silver King Coalition, the Daly Judge Mining Co., the Silver King Consolidated Mining Co., the May Day Mining Co., the Eagle and Blue Bell Mining Co. and many others equally well managed would withdraw their listing from the Exchange. It is not generally known, but is a fact, that the Salt Lake Exchange was one of the very few in the world that did not have to close its doors a year ago.

It will be found on investigation that not only did the majority of the Salt Lake brokers oppose the late "Alta boom" but also that the public of Salt Lake used the opportunity to liquidate practically all their holdings in the manipulated stocks.

I have read the *Journal* many years and know that it would not knowingly misrepresent any circumstances for any purpose. I trust therefore that it will at least correct the misstatements contained in its editorial, even though it is considered that the general tone of the editorial is warranted.

JAMES A. HOGLE.

Salt Lake City, Utah, Sept. 18, 1915.

Cost of Winter Construction

In the *Journal* of Aug. 28 I have noticed an article entitled "Cost of Mill Construction," by Harry T. Curran. Any description of methods of using concrete is interesting to me, but I must take exception to some of the recommendations which Mr. Curran makes in that portion of his article under the heading, "Difficulties of Winter Construction."

While I realize, of course, that the increased cost of concrete work done in cold weather may range within wide limits, I question whether the statement that such increased cost will easily reach 50% over costs under favorable conditions is true. In fact, where such results follow, I question whether the conditions would be such as to warrant undertaking the construction, from the standpoint of safety as well as other standpoints.

Furthermore, I question the statement that "after 12 hr., freezing can only retard the final set but cannot injure the concrete," especially in view of the fact that later on in Mr. Curran's discussion he advocates the use of integral salts, either calcium or sodium chloride, to lower the freezing point of concrete.

All experience in concrete construction in winter points to the desirability of heating aggregates and mixing water, and so effectively protecting freshly deposited concrete that early hardening will be hastened as much as possible under favorable conditions, which means in the presence of heat and moisture. Adding integral salts defeats these desirable ends. Furthermore, if any portion of the construction is eventually to be exposed to view, there will develop in the course of time more or less unpleasing efflorescence.

In view of the fact that cold weather is approaching and it will be necessary, perhaps, to complete some unfinished concrete work under less favorable conditions than when such work was started, I believe it is well to call attention to methods that have proved best and to emphasize these methods rather than confuse the worker with a lot of possibilities, some of which had now better be avoided, when it is generally such an easy matter to arrange for heating the materials and doing the work in the best way.

H. COLIN CAMPBELL.

Timbering in the New York Subway

By Percy E. Barbour*

SYNOPSIS—An analysis of conditions that brought about the recent subway disasters in New York City, which resulted in a tie-up of many car lines and much street traffic and in considerable loss of life, and how the accidents could have been avoided by proper mine timbering.

During the last four days of the past week there were two serious accidents in the New York subways under construction, resulting in the killing of nine persons and the injuring of a great many more, besides the tying up of many blocks of New York's already congested streets. These subways are being constructed with as little interference to surface traffic as possible. This is accomplished by digging up the surface of the streets, laying heavy timbers and on top of these placing heavy planking, and then, in effect, stoping out the ground underneath these timbers and catching them up on vertical bents or sets with long vertical legs. These excavations vary in depth, and in the two sections where these accidents have occurred they were from 30 to 36 ft. below the surface of the street. Were it not for the fact that street traffic is allowed above excavations, it would simply be an opencut proposition, but with the load being carried on the timbers above it is strictly analogous to underground stoping, with the hanging wall flat but offering very little weight, not nearly so much as would be the case in any ordinary mining operation requiring timbering. The height of this excavation would not be greater than an ordinary four- or five-set stope.

*Mining engineer, editorial staff of the "Engineering and Mining Journal."

The first accident occurred Sept. 22 on Seventh Ave. between 24th and 25th St. It was caused by shooting a round of four holes, "one 10-ft. hole and three others," which was done by electric battery. Some of the timbers were shot out, and the entire supporting structure for a distance of about 300 ft. went down like a row of dominoes, carrying with it a loaded street car, several vehicles and many pedestrians.

The rock being blasted is a hard but brittle rock which breaks short and, being traversed by joint planes, close together—breaks "blocky," as a miner would say. The shooting out of a timber or a set of timbers is a forgivable thing, either in a mine or a New York subway, but if a light blast such as was used in this subway work resulted in the destruction of an entire stope, the mining engineer would not consider the matter excusable.

The *Engineering News* in describing the accident says:

> There is no longitudinal diagonal bracing in either upper or lower tier of posts. Although the posts—considering the whole height from floor to street—are virtually jointed in the middle by the interposition of the 24-in. I-beams (with flanges 7 in. wide), the framework is held firm under normal conditions by its continuous connection to some abutment at the extreme forward and rear ends of the work.
>
> As a precautionary measure since the collapse, longitudinal diagonals have been bolted to the lower tier of posts at intervals in the remaining timbering of this contract section.

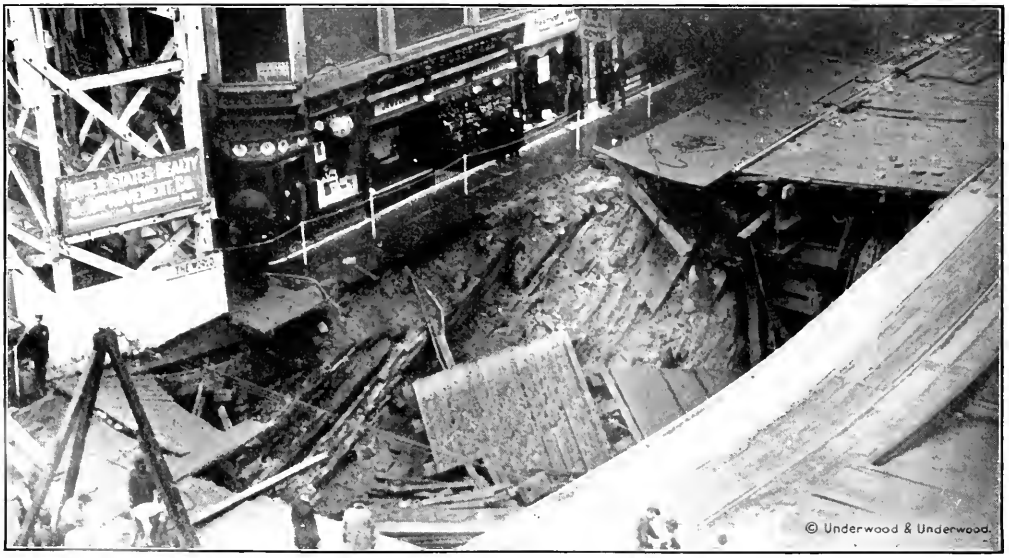

FIG. 1. CAVE AT CORNER OF BROADWAY AND 38TH ST. AND STEEP WESTERLY DIP OF SCHIST

The second accident occurred Sept. 25 at the corner of Broadway and 38th St., when a fall of rock from the western wall of the excavation wrecked some of the timber supports and caused the collapse of the supporting structure and the sinking of the street for its entire width and for a distance of 70 ft. along Broadway.

One pedestrian was killed and several were seriously injured. The point of collapse is directly in front of a

theater, and four or five other theaters are within a radius of 300 ft. Had the collapse occurred half an hour later the results would have been more serious.

Method of Timbering Used

Fig. 2 shows a cross-section looking north, taken just south of where the cave occurred. The original timbering is shown in full lines and the dotted lines represent the timbers which have been added for safety since the cave-in. The rock at this point is Manhattan schist, dipping in a westerly direction about 60 deg., as can be plainly seen in the illustration (Fig. 1). On the east side, or right-hand portion of the cut, this schist slabbed off to such an extent and so frequently and caused such inconvenience and danger that dowel pins were put in the rock, being long iron bars driven into drill holes and grouted in with cement. These were supposed to pin the slabs to one another and to solid rock beneath.

These pins did not prove fully efficacious and blocking was later resorted to. Almost the entire length of the east side of this excavation shows that a large amount of this slabby material has had to be removed, either before it fell into the cut or afterward, and there is a large opening generally at the top of the timbering along this east side. The work done here and the precautions taken indicate that the slabby nature of this ground was perfectly well known. On the west side of this excavation the schist of course is "dipping into the ground." One of the engineers in describing it said that "on this side it dipped the wrong way," and his tone implied a helpless, grieved feeling because the problem presented was not as easily solved as that on the right side.

Explanation of Fall of Rock

In discussing bedding, schistosity and cleavage, Spurr* says:

"When any rock, but particularly a shale, is exposed to pressure by the movements of the earth's crust it is apt to break easily into sheets along certain planes determined by the direction of the applied forces. These planes are called cleavage planes. They may lie at any angle to the bedding planes, or may even coincide; they may be straight while the bedding planes are folded; in short, the two sets of parting planes have no relation to one another.

"A rock may not split at all along its true bedding planes, while it may separate perfectly along cleavage planes which run across the stratification; but the cleavage must not for that reason be mistaken for bedding."

Therein lies the explanation of the rock slide so variously attributed by different investigators to "soft pockets," "unknown seams," "rotten rock" and other mysterious causes. The west side of the excavation being insufficiently timbered, the schist slabbed off in blocks determined by these planes. The planes are not lines of dangerous weakness when the opening is adequately timbered. They are so common in mining that no special consideration is given them, except to timber such blocky ground properly.

The timbering, as shown in Fig. 2, was put in at intervals of 10 ft. The posts were very infrequently and insecurely blocked against the ground and no lagging whatever was used.

*"Geology Applied to Mining," pages 32 and 33.

It is an axiom of mine timbering to prevent the rock in place from moving, not to hold it after it has started to move, because then an easy problem becomes difficult.

It is evident from looking at the sketch that this timbering was not put in with any idea of following mining methods. As originally placed these bents had no transverse or longitudinal bracing, with the exception of the member marked *A*. Just why this member was put in the original scheme is not apparent.

The diagonal added at *B* since the accident happened is of practically no use, but the diagonal at *C*, of which three were put in, in the three bays immediately south of the cave, is a good "stull" and its use recognizes the fact that the rock on the west side needs and can be supported. The timbering at *E* is of more than doubtful value, even as a precautionary measure. The longitudinal bracing at *D* was placed after the accident, to prevent any likelihood of these bents "dominoing" as did those in the Seventh Ave. section.

The timbering was put in for either or both of two reasons—to support the street load above or to support the side walls and preventing their caving. If put in for the former reason alone, there was grave fault in not providing for the second; and if put in with any thought of the

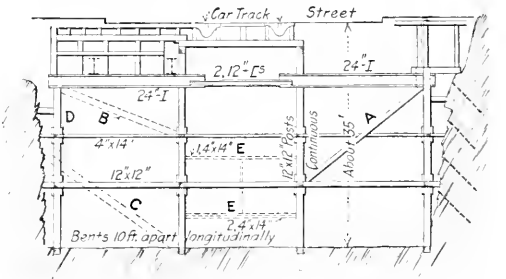

FIG. 2. SKETCH OF TIMBERING BROADWAY SUBWAY SOUTH OF 38TH ST.

second purpose, the inadequacy of the timbering for that purpose is, to a mining man, manifestly evident.

In Fig. 3 is shown the method of square-set timbering developed on the Comstock lode more than 40 years ago, which has been widely used throughout the mining world ever since. This method is used in all kinds of ground, heavy or otherwise, and regardless of the dip of the strata. In square-set timbering, in ground which presents any difficulties, kneebraces or diagonals are commonly used. It is not usual to have the greatest dimensions of any set more than 8 ft.

The timbering as shown in Fig. 2 cannot be said to approach square-set timbering in any way, but it does indicate that square-set timbering could have been used without any inconvenience to subsequent construction—in the way of putting in concrete piers or erecting the steel work for the permanent structure. This would have afforded complete security against the fall of rock which caused the second accident and would have prevented the collapse of the entire structure if it had been used at the time of the first accident.

Thus two serious accidents causing much damage and loss of life have occurred through overlooking the precautions taken by the miner in his every-day work when confronted by similar problems.

A special committee has been appointed to investigate subway conditions. An effort was made to reach D. C. Jackling, failing which John Hays Hammond was invited to serve, but declined, suggesting B. B. Thayer,

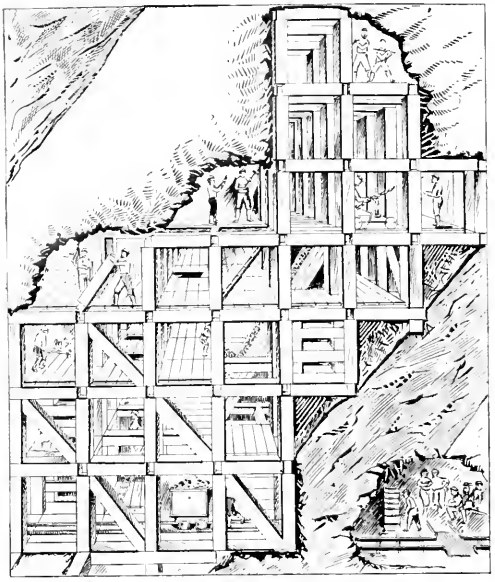

FIG. 3. AN EXAMPLE OF SQUARE-SET TIMBERING

of the Anaconda. A wise but belated move on the part of the Public Service Commission, this consulting the mining engineer.

Forfeiture of Co-Owner's Interest in Claim

By A. L. H. Street*

The Federal statutes relating to the forfeiture of a mining claim on failure of claimant to perform labor or make improvements to the value of at least $100 annually, until patent has been issued, provide that upon failure of any one of several coöwners to contribute his proportion of such expenditures, the coöwners who have performed the labor or made the improvements may, at the expiration of the year, give the delinquent coöwner personal notice in writing or notice by publication at least once a week for 90 days in the newspaper published nearest the claim. If, at the expiration of 90 days after such notice, the delinquent fails to contribute his proportion of the expenditure, his interest becomes the property of his coöwners who have made the required expenditures.

This provision has just been applied by the United States Circuit Court of Appeals, Ninth Circuit, in the case of Thompson vs. Pack, 223 Federal Reporter, 635. The parties were coöwners of 175 mining claims, upon which, under the law, $17,500 assessment work was required annually. Defendant served notice that for two years he had expended $5,600 for labor and improvements, and this notice was asserted as the basis for forfeiting plaintiff's interest. In deciding that the notice was insufficient, the Circuit Court of Appeals says:

> The only labor or improvement required by the statute which will entitle a coöwner doing the work or making the improvement to forfeiture from a delinquent coöwner of his interest is the expenditure of the full sum required by the statute, namely, not less than $100 for each claim. In order that the interest of a delinquent coöwner may be forfeited, it is essential that the entire work shall be performed by one or more of the coöwners claiming the forfeiture. . . . The notice did not claim that the entire work required by the statute had been performed for the years 1911 and 1912. On the contrary, it conclusively appears from the notice that only a small proportion of the work required had been performed, and if the amount stated in the notice was all the work that had been performed on all the claims, and it is so stated in the notice, they were then all subject to relocation, and no interest was saved by a partial compliance with the statute. The notice being insufficient on its face to entitle the defendant to claim a forfeiture of the plaintiff's interest in the mining claims mentioned therein, and this also appearing by direct and positive allegations of the complaint, the court below was right in issuing its temporary injunction suspending defendant's forfeiture proceedings until the actual facts can be ascertained and the questions involved determined upon the merits.

*Attorney, St. Paul, Minn.

Imports and Exports of Metals

Advance reports from the Department of Commerce just issued give the imports and exports of the principal metals in detail for the month of July. These are of especial interest at the present time.

Imports and exports of copper in July are given as follows, in pounds:

	Imports	Exports
Ore and matte, contents	11,302,587	339,342
Unrefined, bars, etc	17,742,587	200,071
Refined, bar, plates, wire, etc	4,253,889	46,561,376
Scrap and clippings	991,950	106,355
Totals	34,291,013	47,207,144

For the seven months ended July 31 the total imports of copper were 73,944 long tons; exports, 177,842 tons.

Imports of lead in all forms in July were, in pounds:

Lead contents of ores	2,024,488
Lead in bullion and base bullion	5,057,234
Lead, metallic	9,375
Total	7,091,097

Of the total imports 6,719,991 lb. came from Mexico and 248,315 lb. from Canada. For the seven months ended July 31 the total imports of lead reported were 34,692 short tons.

Imports and exports of zinc in July are reported below, the figure being in pounds:

Imports	
Zinc contents of ore	9,813,820
Zinc, metallic	119,593
Total imports	9,933,413
Exports	
Pigs, bars, plates, etc	15,914,602
Zinc dross	791,175
Zinc dust, re-exports	22,400

Of the metallic zinc, 3,752,248 lb. is reported as produced from foreign ores. The tonnage of ore imported was: Canada, 324; Mexico, 3,353; Japan, 1,011; Australia, 5,808; total, 10,496 tons. The total exports of metallic zinc for the seven months ended July 31 were 77,976 short tons.

Aluminum Manufacture in Russia is said to be probable. The British Aluminium Co. has secured control of some large bauxite deposits in that country, and plans are being prepared for a plant. The location is uncertain as yet, but it will be in the brown-coal district of South Russia, or near the Imitra Falls, where a large waterpower can be utilized.

Editorials

Subway Cavings in New York

The caving of portions of the subway under construction in New York has been locally the absorbing theme of the day. The municipal authorities, the Public Service Commission and the public generally have given a disagreeable exhibition of loss of both nerve and common sense. The redeeming feature has been the soberness and good judgment of the better class of the daily papers.

In the first cave, Sept. 22, many persons passing upon the street dropped into the hole when the street fell from under them and several were killed. The second cave occurred Sept. 25, about half a mile from the first, and one of the persons who fell in with the street was killed. It is significant that both of these accidents occurred in portions of the subway that are being built by one contractor.

There is no use in going into hysterics over these particular accidents. In the construction of any big piece of work—a skyscraper, a subway or a canal—there is inevitably a certain toll of human life. It is part of the expense. The subway construction in New York—a work performed under singular difficulties—has been on the whole remarkably free from disasters. This is no excuse, however, for accidents outside of the ordinary ones that are bound to happen in doing any work. The most unfortunate thing about the recent events was that the fatalities were of citizens walking the streets, where they had a right to be, not of men engaged in the work, who might be more or less responsible for what befell them.

The subway construction in New York is being done by what is called the "cover-and-cut" system; that is, the street is planked over and the earth and rock are undercut, the planking being supported by beams and posts in order that street traffic may proceed as the subterranean work goes on. The process is therefore analogous to many operations in mining.

An investigation of the places of the recent disasters by the *Journal* has convinced it, however, that no such methods of supporting the ground were in use as would be in ordinary mining practice. The problems confronting the subway engineers were no different from what the mining engineer has to meet all the time. Indeed they were of very ordinary character. The technical points are described and discussed elsewhere in this issue.

Summarizing, any mining engineer would pronounce the recent subway caves to be due in one case to "shooting out timbers" and in the other to "run of ground," both resulting in disasters owing to "bad timbering." In the case of the second accident, the subway trench was being cut through mica schist—not an especially treacherous rock—the sheeting of the schist passing diagonally through the trench. As the trench was excavated the schist had the natural tendency to slide off on one side and slab off and fall on the other side. This was recognized by the subway engineers, who tried to prevent the slides on one side by drilling holes into the rock and driving in steel bars—"lewie" pins, they called them—spiking down the rock, so to speak. On the other side (which was where the cave occurred) they did not apparently know what to do. The proper safeguard here—and on the other side as well—was adequate timbering.

The timbering that was done in these portions of the subway—in other portions there is similar work—was manifestly designed mainly with a view to holding up the roof. For holding back the rock at the sides there was neither timber enough nor was it properly placed, the imperfection of placing being more important, however than the deficiency of quantity. A mining engineer often accidentally shoots out a portion of his timbering or experiences a run of ground, but when either of those things happens he does not lose a whole stope and let the upper floor come tumbling down upon him.

As well as we can make out, the engineers of the Public Service Commission have left the matter of supporting the ground to the engineers of the contractors. All of them have manifestly proceeded on the theory that they were doing nothing more serious than digging a sewer. The services of mining engineers seem neither to have been solicited nor wanted. After the occurrence of these accidents, however, the Public Service Commission, in inviting a committee of three distinguished engineers to investigate and report, thought of having a mining engineer for one of the three. It probably would be better if they had thought of having mining engineers in a larger proportion, say two out of three, or three out of three.

If any blame is to be fixed for the two cave-ins, the *Journal* is of the opinion that it should fall upon the responsible heads of the Public Service Commission for not obtaining the assistance of some mining engineers when the subway work was begun. The engineers in actual charge of the work found themselves against problems for which they had no previous experience and simply did not know how to meet. In other portions of the subway there may be stretches of ground that also are treacherous and there may be stretches that would be safe without any timbering. The whole thing ought to be looked over by some mining engineers who are experts in timbering, not merely by mining engineers, for there are a lot of them who do not know anything about timbering. In the meanwhile it is ridiculous for Mayor Mitchel to be giving directions for more braces and having his orders carried out by somebody *spiking* on a few 3x10-in. diagonals with *four 60-penny nails* per end.

The Public Service Commission thought to obtain the advice of John Hays Hammond in this emergency. Mr. Hammond recommended them to draft B. B. Thayer. Nobody could be better. Mr. Thayer—the head of the Anaconda Copper Mining Co.—is not only a great engineer but also is one who worked himself up from the stopes, and during most of his long and active career he has had to do with the mines of Butte where the problems of timbering are of the first order of magnitude.

How Copper Is Bought

A characteristic of the copper market in recent years has been the buying of copper in great operations extending over a period of two or three weeks, followed by a period of two or three months during which the market is dull, relatively little business being done. With a production of refined copper at the rate of 150,000,000 lb. a month there must be sold about 6,000,000 lb. per day, or 36,000,000 lb. per week, on the average, to dispose of the output of new copper. Taking into account the reclaimed copper—the product of the junk smelters—and the speculative business, and occasionally the reselling by consumers themselves, the aggregate of transactions in copper exceeds an average of 6,000,000 lb. per day. With so huge a business it is unlikely that there is ever a day without some transaction by somebody, but with a total of three or four million pounds per day the market would doubtless be described as dull. After a long period of such a market there comes what we speak of as a "great buying movement," when during a week there may be sales of 100,000,000 lb. of copper, or in a fortnight twice as much. The buying in this way has been becoming more and more pronounced. What is the reason for it?

We may offer an explanation without getting at the reason. The explanation is that the American consumers have got the idea of acting in concert. They remain out of the market together and come in to buy together. More and more do they appear to be acting in concert. What is their reason will have to be surmised. Of course they figure on buying their copper more cheaply than otherwise—a matter that is well worthy of consideration; for has not Mr. Ryan pointed out several times that the American consumer has in the past paid considerably more for his copper than the foreigner? But do they figure that by their concerted abstention they will tire out timid producers and thus obtain cheap copper? It is certain on the other hand that when they try to buy at the same time they hoist the price up on themselves, perhaps 1c. per lb. between the opening and closing of a day, whereupon they accuse somebody other than themselves of rigging the market.

If consumers abandoned the idea of playing a speculative game, if each one bought his copper as he needed it, we fancy that things would be better for them in the long run. But while the present policy obtains we may look for periodic "buying movements," intermediate spells of dullness, slow declines in price and sudden, sharp upturns, and in general conditions more erratic than they ought to be.

⁂

Lead Smelting Developments in the Coeur d'Alene

Interesting news comes from the Coeur d'Alene, where the relations between the miners and smelters, especially the A. S. & R. Co., have been simmering for a long time. The mines of this district have heretofore been tied up with long-running contracts under which they have been restive. The pros and cons of this controversy need not now be discussed. The complaint was directed chiefly against the A. S. & R. Co., but there was competition in the district by other smelters—the International, Ohio & Colorado, United States and Pennsylvania. However, the terms offered by them have not differed greatly. Of course, the Coeur d'Alene ore has always been regarded by the smelters as a marginal ore—that is, one out of which they should make a profit—whereas in some other districts lead ores have been taken at a loss, the profit being earned from other classes of ore. Nevertheless, there are some features in the Coeur d'Alene contracts that have always seemed to us to be objectionable. Especially so is the arrangement whereby the price for lead is based upon a certain arbitrary figure, the difference between that price and the market-price, when the latter is in excess, being divided between miner and smelter on the basis of 50-50.

Anyway, the dissatisfaction of the mining interests expressed itself not long ago when certain stockholders of the Federal Mining and Smelting Co. brought suit against the A. S. & R. Co. for annulment of contract. This year the Hercules contract expired and the owners of that mine refused to renew. Through the Tamarack & Custer Mining Co., in which they are interested, they have acquired the old smeltery at Northport, Wash., which they are rebuilding, and hereafter they propose to do their own smelting there.

Now comes the report, officially verified, that the Bunker Hill & Sullivan company is going to do its own smelting. Whether this will be in the Coeur d'Alene or at some place on the Pacific Coast has not yet been determined. The controlling interests of this company have had experience in smelting, being formerly concerned in the Tacoma Smelting Co., which they sold out to the American Smelters Securities Co.

This is a more formidable insurrection in the lead-smelting business than the A. S. & R. Co. has ever had to face. Both the Hercules and the Bunker Hill & Sullivan companies possess ample resources and are well able to carry through anything they undertake. The Bunker Hill & Sullivan company is sure to be well advised, both technically and commercially. It is to be hoped that the Hercules people also will get the right kind of assistance. It is but natural that these big mining companies should want to do their own smelting. That they are taking steps in that direction is an interesting and healthful development.

⁂

The policy of watchful waiting for things to happen in Mexico still prevails, the present idea being evidently to wait for Carranza to get the upper hand and then recognize him. The stars of Villa and Zapata are waning unmistakably. Probably it was fear of further turbulence in the north, following the disruption of Villa's army, that inspired the new warning to Americans to leave Mexico. Shall we venture to hope for the peace of weariness? It looks as if that were the only kind of peace there would be, for Washington will not contribute toward anything else. Our Mexican policy is still an enigma. Poor little Haiti indulges in rioting and the Administration goes down there overnight, assumes a protectorate and does not turn a hair over the job. Is it merely a question of size, not of principle?

⁂

The sale of the Midvale Steel Works in Philadelphia, one of the three producers of armor-plate and heavy ordnance in this country, to a strong financial syndicate has started up again the reports of a new steel combination with rather more appearance of probability than before

PERSONALS

C. C. Semple has gone to Nacozari, Mexico, expecting to remain for several weeks.

George P. Wilson, of Salt Lake, was in San Francisco at the Engineering Congress meeting.

E. Norris Hobart has recently been examining lead-silver prospects in the Alamo District of Texas.

Prof. T. L. Walker, of Toronto University, recently spent a week in Kootenay district of British Columbia.

C. H. Poirier is consulting engineer for Dominion Gold Mines, Ltd., operating in Munro Township, Ontario.

W. L. Cumings, of the Bethlehem Steel Co., is in Chile from which he expects to return in November or December.

W. H. Wright, of the Malm-Wolf Co., has completed placer xaminations in northern Idaho and has gone to Seattle.

J. M. Bidwell, manager of the Murray plant of the American Smelting & Refining Co., is visiting San Francisco.

Albert G. Wolf has completed mine-examination work in northern California and western Nevada and has returned to Denver.

J. H. Stovel, of the Mond Nickel Co., formerly in charge of the Frood Extension, is opening the Bruce Mine for the Mond company.

Corey C. Brayton has returned to San Francisco after a summer's work examining dredging ground in the Lowe District in Alaska.

Charles J. Harrah, for many years president of the Midvale Steel Co., has retired from that position, having sold his large interest in the stock.

J. H. Curle has been detached from field service in the British Army and has been detailed as assistant to the Parliamentary Savings Committee.

John W. Swift, auditor of the Bureau of Mines and acting secretary to Director Manning, is in San Francisco to assist in he field meet under the auspices of the Bureau.

Justin S. De Lury, a graduate of the University of Toronto, and for some years on the staff of the University of Idaho, has accepted a position as lecturer in geology at the University of Manitoba.

Capt. John L. Retallack, of Kaslo, B. C., long actively connected with mining in Ainsworth and Slocan mining divisions of British Columbia, is now in England with other soldiers from that province.

Karl Eilers, member of the executive committee of the American Smelting & Refining Co., in charge of the metallurgical department in the Western states, is visiting the Panama-Pacific Exposition.

George S. Rice, chief mining engineer, and J. W. Paul, chief rescue engineer, of the Bureau of Mines, are in San Francisco at the Panama-Pacific Exposition in connection with the first-aid and rescue demonstrations.

H. B. Zeller, assistant superintendent of the coke plant of the Republic Iron & Steel Co. at Youngstown, has resigned to become superintendent of the new byproduct plant of the Toledo Furnace Co., Toledo, Ohio.

Chas. A. Banks, general manager of the Jewel-Denero Mines, Ltd., has returned to the Jewel mine, near Greenwood, B. C., from a trip to Cobalt and Poreupine districts and thence to Chicago, St. Louis and Salt Lake City.

S. I. Silverman, of Spokane, Wash., is arranging to send into the Stikine mining division of British Columbia supplies for a party of men who will spend some time in prospecting and developing mineral claims in that country.

J. H. East, foreman miner, K. H. Chism, first-aid miner, and C. J. Roberts, engineer, are at the Panama-Pacific Exposition with the new rescue car which is on the Exposition grounds used in connection with the demonstration of first-aid and rescue work.

C. J. Hicks, formerly assistant to the president of the International Harvester Co., has been appointed executive assistant to President J. F. Welborn, of the Colorado Fuel & Iron Co. His duties will relate to social and industrial betterment of the company's employees.

Harold C. E. Spence returned recently from Europe where he has been associated with various oil-shale interests and is now directing development and distillation at the oil-shale enterprises in Newfoundland and Nova Scotia. His present address is New Glasgow, Nova Scotia.

G. H. Dowell, assistant general manager of the Copper Queen Consolidated Mining Co., Bisbee, Ariz., attended the conventions in San Francisco and visited the Exposition where his company is represented in "the mine." Mr. Dowell addressed the Mining Congress on the "History of Mine Taxation in Arizona."

J. H. Farrell has resigned the position of consulting engineer to the Yellow Aster Mining and Milling Co. In April, 1914, Mr. Farrell completed a geological report upon the Yellow Aster mine and was subsequently retained during the initial period of new work planned as a result of the examination.

OBITUARY

Paul Gottheil died in New York, Sept. 21. He had been for 42 years connected with the firm of Funch Edye & Co., beginning as office boy and rising gradually by capacity and hard work to be head of the firm. His death is mourned by the metal trade, which for many years had dealings with him as agent for the Rotterdam Line, to which port heavy shipments of copper have been constantly made. In shipping circles he was regarded as one of the leaders and was frequently called upon by the Government as a shipping expert.

Andrew Gordon French died on Aug. 16 last at Glasgow, Scotland, at the age of 78. He was well known in Nelson, B. C., where he spent several years working on the French process for the treatment of complex ores. Mr. French, who was a metallurgical chemist, spent most of his life in the study of the treatment of complex ores. While in Swansea, Wales, he invented a process for the treatment of the Constantine zinc ores, which are mined in Algeria. He spent several years in Australia studying the treatment of the complex ores of that country and was associated with the Broken Hill Proprietary Co. in New South Wales.

Ralph Baggaley died in Pittsburgh, Penn., Sept. 23, aged 68 years. He was born in Allegheny, Penn., was educated in the schools there and at Dresden, Germany, where he remained two years. He was a man of great activity of mind and marked business ability, and was interested in many enterprises in the course of his active life. His first business connection was with the firm of Bollman & Co. Later he joined George Westinghouse, who was then working on his invention of the air brake. Mr. Baggaley took the business side of the enterprise and organized the Westinghouse Air Brake Co. which he brought into a prosperous and successful condition. Later he reorganized and successfully managed the Westinghouse Manufacturing Co. About 1875 he went into the newspaper business and bought the Pittsburgh "Telegraph" and "Chronicle," consolidating the two papers and managing them for some years. After the panic of 1873 he had bought some large tracts of land in the Lake Superior country, but he never mined there, and later sold his properties, which are now operated by the Oliver Iron Mining Co. In 1880 he bought coal lands in the Connellsville region and organized the Hostetter-Connellsville and the Puritan Coke companies, which subsequently became interested in mining coke combination. About 1901 he became interested in mining property in Butte, Mont., and organized the Pittsburgh & Montana Mining and Smelting Co. While managing that company he became interested in new processes of smelting and converting and took out a large number of patents for processes and machinery. Of recent years he has not been active in business except in connection with the United States Glass Co. In 1879, with the late Henry W. Oliver, Mr. Baggaley organized the Duquesne Club. He was also a charter member of the Pittsburgh Club. Mr. Baggaley was also a life member of the American Association for the Advancement of Science, of the Strollers' Club of New York, the Art Society of Pittsburgh, the American Institute of Mining Engineers and the American Society of Mechanical Engineers. He was also a member of Franklin Lodge, F. & A. M. He leaves a widow, two sons and four daughters.

SOCIETIES

American Institute of Mining Engineers The October meeting of the Montana Section will be held [illegible] at the Silver Bow Club, Butte, Mont. A technical session will be held immediately after the dinner. The following paper will be read and ample time provided for discussion: "Preliminary Outline of Paper on Mines in the Boulder Batholith." By J. A. Grimes and Paul Billingsley.

Editorial Correspondence

SAN FRANCISCO—Sept. 22

Highgrading at the Empire Mine in Grass Valley has been exposed by the arrest and alleged confession of A. H. Coggins, formerly employed as specimen boss at the Empire. It was reported that the cache contained $35,000 worth of high-grade and specimen ore alleged to have been stolen from the Empire mine. Coggins was a trusted employee of the Empire and probably would not have been suspected had not the other men given the information.

A Lead-Smelting Plant will be built by the Bunker Hill & Sullivan Mining and Concentrating Co. F. W. Bradley, president of the company, is authority for the statement that ample funds have been accumulated and saved for this purpose and that the engineering and construction work will be done by the firm of Bradley & Labarthe. The plant will be located either at the mine or on the Pacific coast, according to which point affords the most favorable operating and transportation facilities.

Production of Petroleum in all fields in California in August totaled 7,680,047 bbl. Midway-Sunset field produced 3,334,516 bbl.; Coalinga, 1,148,678 bbl.; Whittier-Fullerton, 1,053,375 bbl; Kern River, 791,445 bbl. All the other fields produced less than 500,000 bbl. each. Total shipments from fields in August amounted to 7,924,656 bbl. The total crude stocks on hand Aug. 31 were 60,162,277 bbl. Only 12 wells were completed in August. This is the lowest record of new wells in any month since February, 1907. It is plain evidence of the inactivity in the fields. The small decrease in production in August as compared with July, amounting to 58,596 bbl., is merely added evidence of the necessity for curtailing production until the market conditions caused by the war have been improved. The operators have the satisfaction of knowing that the oil is still in the ground.

DENVER—Sept. 23

Ore Buyers in This State have suddenly realized the existence of a law passed last winter by the legislature. In an effort to stop the practice of highgrading—especially in the Cripple Creek district—the lawmakers made it compulsory upon all purchasers of ore (of any sort) to fill out a prescribed document and to pay the secretary of state an annual license fee of $100. This official has announced that he has set Nov. 1 as the date after which this law will be rigidly enforced.

United States Reduction & Refining Co. Officials believe the bill of complaint filed some time ago by the New York Trust Co. was a direct attempt to remove them from competition in the ore-purchasing business. The Golden Cycle company operates its big mill at Colorado City close to the disused plant of the United States company. Judge Lewis, of the United States district court at Denver, on Sept. 11, overruled the United States company's motion to dismiss the case. J. Arthur Connell was named receiver, it being proved that the Reduction company had defaulted in the payment of interest on bonds held by the Trust company. The Reduction company was given 10 days in which to answer this action, after which the original case will be held on its merits.

Defunct Mining Companies in Colorado—Secretary of State Ramer has gone over his records and has declared the following corporations defunct and inoperative and no longer competent to transact business within the state of Colorado. The list may prove of interest to readers who have stock or other interests in these corporations whose activities were in mining, metallurgical and allied branches. Almont Mining Co.; Amphitheater Gold Mining Co.; American Consolidated Gold Mining Co.; American Gold Standard Mining Co.; American Ozokerite Mining Co.; American Star Mining and Milling Co.; Anderson-Halter Mines Co.; Annamosa Mining Co.; Arcade Mining and Milling Co.; Argentine Milling Co.; B. & O. Mining, Milling and Manufacturing Co.; Badger Mines Co.; Barnes Mining Co.; Bernadette Tunnel Mining and Milling Co.; Berthoud Mining Co.; Beam Converter Mill Co.; Belvidere-Leadville Mining Co.; Big Six Mining Co.; Big Five Tunnel, Ore Reduction and Transportation Co.; Brandon Gold Mining Co.; Bright Star Mining and Milling Co.; Buckley Mining Co.; Burns-Moore Stockholders Leasing Co.; Boston & Cripple Creek Gold Mining Co.; British American Mining Co.; Cashen Mining and Leasing Co.; Cosmopolitan Mining and Leasing Co.; Cripple Creek Free Gold Mining and Milling Co.; Cripple Creek Mining and Leasing Co.; Diamond M. Leasing Co.; Champion Mining and Milling Co.; Clear Creek Mining and Leasing Co.; Cloud City Mining Co.; C. M. S. Mines Co.; Cottonwood Mining and Milling Co.; Colorado Apex Mines Co.; Colorado Fluorspar Mining Co.; Colorado Gold Mining and Investment Co.; Colorado Gold Reserve Mining Co.; Colorado-Idaho Mining and Exploration Co.; Colorado-Idaho Mines and Development Co.; Colorado Molybdenum Co.; Colorado Smelting and Mining Co.; Colorado-Toledo Mining Co.; Conniemac Mining and Realty Co.; Continental Consolidated Mines Co.; Copperfield Reduction Co.; Creede United Mines Co.; Creede Local Mining Co.; Crown Lode Mining Co.; Curtis Dry Placer Machine Co.; Development and Mines Co.; Deerfield Mining and Milling Co.; Deadwood-Dallas Placer Co., Delmas Mining and Milling Co.; Denver Leadville Mining and Tunnel Co.; Denver Mining and Reduction Co.; Denver Mining Investment Co.; D. Pendon Leasing and Mining Co.; Earle Concentrator and Manufacturing Co.; Eagle Mining Co.; East Bellman Mining Co.; East Lake Mining Co.; El Valle Mines Co.; Emery Baryta Mining and Separating Co.; Empire Mines Co.; Excelsior Consolidated Gold Mining Co.; Excelsior Drill and Manufacturing Co.; Federal Graphite Co.; 4-C Mine, Mill and Tunnel Co.; Frisco Mining, Milling and Development Co.; Francesca Mining and Leasing Co.; Fredonia Mine and Milling Co.; Frisco Milling Co.; Gilpin Mining and Leasing Co.; Gladys Gold Mining and Development Co.; Globe Mining, Milling, Power, Lighting, Drainage and Tramway Co.; Gold Divide Mining, Milling and Tunnel Co.; Gold Hammer Mines and Tunnel Co.; Gold Ledge Mining Co.; Gold Queen Mining, Milling and Development Co.; Goldwin Mining and Milling Co.; Golden Amethyst Mining Co.; Golden Age Mining and Reduction Co.; Great Nevada Mining and Milling Co.; Great Western Copper Mining Co.; Guerrero Mining and Exploration Co.; Gypsy Mines Co.; Hawkeye Consolidated Mines Co.; Hanna Mining and Milling Co.; Handies Peak Gold Mining and Milling Co.; Hibbs Mining and Milling Co.; Howard Mines Co.; Horn Rotary Slime Concentrator Co.; Ida Mining and Milling Co.; Incidental Gold Mining Co.; Independence Placer Mining Co.; Interstate Mining and Milling Co.; Jewell Mining and Milling Co.; Kerns Colorado Mining Co.; Kings Phillips Mining Co.; Laurium Mining Co.; Last Chance Mining, Milling and Tunneling Co.; LBS. Mining and Leasing Co.; Lenawer Mining, Milling, Tunnel and Transportation Co.; Leadville Smelting and Reduction Co.; Lilly Levy Mining and Milling Co.; Little Muggins Mining Co.; Lotta J. Mining Co.; Lucky Strike Gold Mining Co.; Mammoth Gold Mining Co.; Mackey Gold Mining and Milling Co.; Manhattan Placer Mining Co.; Marks Pulverizing Mining and Milling Machinery Co.; Mary Jane Mining and Milling Co.; Mary Ellen Gold Mining and Leasing Co.; Melba Mines Co.; Meriden Mining Co.; Miami Mines Co.; Mono Baltic Mining and Smelting Co.; Montezuma Chiefs Mines Co.; Mountain Peak Gold Mining Co.; Mountain Mining and Investment Co.; Murray Mining, Milling and Leasing Co.; Muscovite Mining Co.; McCulloch Mines Co.; McNulty Gulch Mining and Milling Co.; McQuarrie Creek Placer Mining and Prospecting Co.; Navarrio Mining, Milling and Tunnel Co.; National Mining and Investment Co.; New England Gold and Copper Mining Co.; Newark Gold Mining Co.; New England Mining Co.; North American Smelter and Mines Co.; North Creede Mining Co.; North American Ore Purchasing Co.; Nellie K. Gold Mining, Milling and Leasing Co.; Northwestern Leasing, Mining and Milling Co.; Occidental Exploration Co.; Oklahoma and Colorado Mining and Milling Co.; Ophir Tidal Wave Mining Co.; Oriole Mining Co.; Onida Gold Mining Co.; Pine Twentieth Century Manufacturing and Reduction Co.; Pittsburgh-Ely Copper Co.; Plymouth Ring Mining and Milling Co.; Prussian Gold Mines Co.; Princess Alice Gold Mining and Milling Co.; Providence Mining and Milling Co.; Protection Mining Co.; Quaker Mining and Milling Co.; Raymond Tunnel and Mining Co.; Red Mountain Gold Mining Co.; Red Cloud Gold Mining and Prospecting Co.; Reinforced Cement Mining Timber Co.; Reliance Gold Mining Co.; Reinert Gold Mining Co.; Recovery Concentrating Milling and Mining Co.; Red Oak Gold Mining and Milling Co.; Rexall Gold Mining Co.; Rhyolite Placer and Mining Co.; Ridge-Mexico Mining and Milling Co.; Rosebud Gold Mining and Milling Co.; Rocky Mountain Rare Metals

Co.; Rockyfellow Mining and Milling Co.; Rocky Mountain Mine Development Co.; Saratoga Mining Co.; Sand Mountain Mining, Leasing and Industrial Co.; Silver Wave Mining Co.; Silver Princess Mining Co.; Silver Horn Mines Co.; South Homestake Mining Co.; Spanish Basin Gold Mining Co.; Square Deal Mining, Milling, Drainage, Tunnel and Transportation Co.; St. John Extension Mining and Power Co.; Stahler Concentrator Co.; Swedish-American Gold Mining and Milling Co.; Treasure Mining and Reduction Co.; Tasmania Copper Mining and Milling Co.; Teal Brothers Mill and Mines Co.; Ten Spot Mining, Milling and Leasing Co.; Thomson Mining and Milling Co.; Tomahawk Mines Co.; Two Brothers Gold Mining and Milling Co ; Two Thousand Two Gold Mining Co.; Uncle Sam Gold Mining Co.; Union Consolidated Mining and Milling Co.; United Mines Corporation; United Colorado Mines Co.; United States Mining Corporation; U. S. Smelting and Refining Co.; Walter A. Weber Mining Co.; Western Ore Reduction Machinery Co.; Western States Mining and Milling Co.; Western Investment Co.; Western Ore Reduction Co.; Whale Mining and Developing Co.; Whitepine Mining Co.; Woods Investment Co.; World's Fair Gold Mining and Milling Co.; Wynn Gold Extraction Co.; Yellow Medicine Gold Mining and Milling Co.; Yellow Metal Gold Mining, Milling, Water, Irrigation and Power Co.; Yreka Mining and Milling Co.

In addition to the above Colorado corporations, the following corporations of so-called "foreign" standing have been declared debarred from doing further business in this state: Alameda Gold Mining and Milling Co.; Anaconda Mining Co.; Argonaut Gold Mining Co.; Burns Moore Mining and Tunnel Co.; Buckeye Gold Mining, Milling and Tunnel Co.; Colorado Ore Reduction Co.; Dorex Mining and Milling and Tunnel Co.; Elkhorn Tunnel and Mining Co.; Futurity Mining and Milling Co.; F. M. & D. Copper Mining Co.; Gold Issue Mining and Milling Co.; Governor Mining Co.; Huntington Gold Mining and Milling Co.; Kansas City Tunnel Site Mining Co.; Mines Intersection Syndicate, Ltd.; Mineral Point Gold Mining Co.; Mines Developing Co.; Prize Mining Co.; Refractory Ores Recovery Co.; Retla Mining Co.; Rhyolite Beacon Gold Mines Co.; Shenandoah Gold Mines and Smelting Co.; South Mosquito Mining Co.; Suffolk-Globe Mining and Milling Co.; St. Paul Mining, Milling and Investment Co.; Teutonic Consolidated Gold Mines Co.

SALT LAKE CITY—Sept. 23

The Magna and Arthur Mills of the Utah Copper Co. are now treating 30,000 tons of ore daily; 18,000 tons going to the Magna, and the remainder to the Arthur. Some ore running 3 to 4% copper is being handled. There are now employed at the mine and mills about 3,300 men.

The Fatal Accident in the Alblon at Alta, mentioned in the news item of the "Journal" last week was due, not to the failure of the oxygen helmet as at first supposed, but to the fact that the men wearing the helmets remained at their work too long and the 30-min. supply of oxygen was exhausted, after which they were overcome by the carbon-dioxide gas. The two men wearing the helmets were both experienced. One of them was Captain Andrew E. Eikram of the Salt Lake Fire Department, a veteran "smoke eater," and the other was James Hendrickson, a mining engineer of experience, formerly employed in mine-rescue work by the United States Government. The oxygen helmets were borrowed from the Salt Lake Fire Department. The work of rescuing the body of James Hendrickson who was suffocated was accomplished by A. O Jacobson with a party of five experienced miners of his selection. Instead of equipping his men with oxygen helmets he gave each man a hammer and a steel punch. They advanced into the workings and every four feet a man punched a hole in the air pipe. In the meantime air was forced into the pipe line at the highest pressure possible. By tapping the pipe at frequent intervals the rescue party was well supplied with fresh air and reached the body of Hendrickson who had been dead for several hours.

SEATTLE—Sept. 22

Another Third Beach Line has been uncovered on the Seward Peninsula, this time at the original delta of the Solomon River, five miles east by north of the present mouth of that stream and 35 miles from the great beach at Nome. News of the discovery similar to that at Nome which produced $20,000,000 has caused a wild stampede from the Nome district and everything for miles around the new discovery has been staked. The new beach is at the Nome level and was uncovered by H. G. Harvey and Otto Halla. A cross-cut made shows that the beach deposit is nearly 275 ft. wide, carrying pay 5 ft. deep. The theory advanced and generally accepted at Nome for several years that the beaches are all on the east and west course are entirely upset by this discovery, the course there being northwest and southeast. It forms, in fact, a half-moon bay. Search for such a beach has been in progress since the discovery of Nome and immediately after the discovery of the third beach line at Nome which turned out such enormous profits, prospecting activities were carried on at nearly all the larger streams on the peninsula emptying into Bering Sea and notably on Solomon. A beach was found near Pine Creek but this proved to be barren of gold. Enough information was gained to establish the fact that there were three beach levels on the Solomon River but following the discovery of a high gravel bank carrying little gold it was presumed that the beaches would not produce much and active prospecting was abandoned. These same gravel banks under the prospecting of Harvey proved to be the delta of the ancient Solomon River and formed the bed of the stream, the surf washing and concentrating the gold up the hillside. The discovery has caused the biggest stir in the Seward peninsula since the discovery of the third beach line at Nome.

Chisana Development is Active and a good production is being made considering the fact that the season has been backward and water has been scarce. Some exceptional cleanups have come from Bonanza Creek which contained considerable coarse gold. On Bonanza Creek, Briggan & Hocker, with a crew of 5 men, is working on the lower end of No. 7 and John Ludwig and partner are sluicing on No. 7 Fraction which was worked successfully last season by William Taylor. The ground on No. 9 is being stripped with a hydraulic nozzle by Billy James, the discoverer, and his brother. F. T. Hamshaw has a crew of 12 men at work on the lower end of No. 5 in ground that is still frozen at bedrock. He also has a crew at work on No. 6. Good results are reported by Max Altman's crew on the upstream end of No. 6, where they have taken out a number of cuts. On Johnson Creek, Hawkins & Dahl has made good progress on the claims between the town of Chisana and Bonanza. On Little Eldorado, Johnson & McGovern is working on No. 1 on the left limit at the upper end and taking out rich dirt. Carl Whitham is sluicing on No. 2 and W. McLennon is sluicing on No. 3. W. E. Nelson is working on No. 3 Snow Gulch and Eagan & Co. is sluicing on No. 1 Coarse Money Creek. On Big Eldorado cleanups are made regularly on 4 below upper discovery. The flume now supplying a number of the operators is being extended by James & Nelson and will enable Bob Clark and his partners on the lower end of No. 10 to carry on greater sluicing activities. Wright & Anderson on the upper end of No. 11 Fraction has a small crew sluicing good ground. Considerable prospecting is going on on various creeks in the immediate neighborhood, notably on Lucky Pup and Cañon Creek, Shamrock Creek and Coarse Money. Pay is now being taken out and regular cleanups being made by about 150 operators, the greatest number working in the district since its discovery, and the output is expected to be much greater than in 1914.

SPOKANE—Sept. 22

"Both Plants of the Granby company are running at full capacity and between them turning out copper at the rate of 3,500,000 lb. per month, or 42,000,000 lb. per year," said Frank M. Sylvester, general manager of the Granby Consolidated Mining, Smelting and Power Co., while in Spokane this week, after his return from a visit of inspection to both Anyox and Grand Forks, B. C. "The Grand Forks smelter has eight furnaces in operation, treating 100,000 tons of ore monthly. At Anyox, the fourth furnace was blown in about Aug. 15. The tonnage of ore treated there averaged 62,500 tons monthly during May, June and July. In August, 75,000 tons were handled. The working force at Anyox, where there is more or less construction still going on, is between 850 and 900 men. About a year ago the company added the Bonanza mine on Granby Bay to its holdings, but we have done nothing yet toward putting it in shape for production, as we do not need the ore. We also acquired some idle and supposed-to-be worked-out mines on Prince-of-Wales Island, Alaska. We have been taking a little ore out of them, mainly from the Mamie, worked at one time by Sam Silverman. The Midas mine, at Valdez, Alaska, we have put into shape to ship, but we have had no ore from it yet, owing to the scarcity of boats in those waters. We have plenty of work in sight to keep one steamer busy, so we may be forced to buy one. We are encouraging miners in northern British Columbia and Alaska to the best of our ability, but not much custom ore has come to us yet. About the only considerable shipper has been the Rocher de Boule mine, near Hazleton, B. C., which has sent us 6,000 tons in the last two months."

The ore from the company's mines near Anyox averages from 1.4 to 2.2% copper and the gold and silver amounts to about 30c. per ton.

GOLDFIELD, NEV.—Sept. 25

Conditions in the Goldfield Camp would seem to be pretty well reflected by the dismal aspect of the city as compared to what it was five years ago. Numerous vacant stores and buildings, with "For Rent" or "For Sale" signs displayed, rows of houses in a dilapidated condition, and the conditions of the streets themselves bespeak the departure of the prosperity they once enjoyed. The Goldfield Consolidated is of course treating more ore per day now than it did formerly, the amount averaging over 1,000 tons per day; some work is being done by the Merger company, by the Jumbo Extension, Kewanas and a few other properties, but despite this, evidences of healthy activity are not apparent. Business is dull, and one hears a good deal of conversation about whether Goldfield can "come back" or not. Others look forward to better things this autumn, but generally admit that such betterment will come rather from strengthening of the stocks than from improvements in the mines. The impressions of a visitor to the camp are, however, that it needs the stimulus of an important discovery to revive it from its present torpidity.

Tonopah Conditions, despite the low price of silver, are in strong contrast with those obtaining in Goldfield. The larger companies such as the Tonopah Mining, Tonopah-Belmont, Tonopah Extension and West End are running at the full capacity of their mills, while the many properties that operate no treatment plants but dispose of their ores to the other companies, are for the most part keeping up production, and none of that laxity is apparent that in some places gives a "run-down" impression not always merited. The town seems fairly busy and prosperous, a healthy tone being maintained, perhaps due as much to activity in camps adjacent to Tonopah as in the place itself. Several miles out from Tonopah, recent work has disclosed the existence of good-grade ore containing silver, gold, copper and lead. Several such disclosures have been made but apparently little has so far been done toward determining their worth. Leasers seem to be numerous and generally report satisfactory results; leasing, apparently, being on the increase. Considerable interest is being taken in the camp of Manhattan where gold is being found both in placers and quartz veins. Tonopah people are interested, and there is a considerable amount of automobile traffic between Tonopah and Manhattan. The MacNamara mill has just been cleaned up for turning over to the company by Jones and Carpenter who had leased the plant to treat sweepings from the old tailings pond, it being stated that results were not financially successful. The Tonopah Mining Co. has now a full staff at its gold property in the Pis-Pis district in Nicaragua. This property, now known as the Eden, was originally the Panama mine which was developed by Philadelphia men. A larger proportion of foreign laborers is employed in the Tonopah mines now than formerly, but recently there has been quite an exodus of Montenegrins and Serbians who are returning home to go to war.

WALLACE, IDA.—Sept. 23

A Lead-Smelting Plant for the Coeur d'Alenes is assured since it is authoritatively announced that the Bunker Hill & Sullivan Mining and Concentrating Co. will build a smeltery to treat its own ores. The purpose of the company became known to the public through A. E. Goodell, formerly northwestern representative of the International Smelting & Refining Co., who it is now learned has been in the service of the Bunker Hill & Sullivan company most of the time since severing his connection with the International. Mr. Goodell is now engaged in securing easements from owners of land in the vicinity of the proposed plant a short distance below Kellogg, and upon his success depends the definite location of the plant. If he is successful in obtaining releases from possible smoke damages, the smeltery will be built a short distance from the mine; otherwise the company will select a site at some favorable place on the coast. No difficulty is anticipated, however, and it is practically certain that it will be located near the mine. The announcement that the Bunker Hill & Sullivan would go into the smelting business created almost a sensation in mining circles, following so closely the action of the Days in buying and rebuilding the old Le Roi smeltery at Northport, Wash. It will be recalled that on May 1 last the Hercules contract with the American Smelting & Refining Co. expired, and because the smelting company declined to renew it or to make satisfactory terms in a new contract, the Hercules mine, of which the Days are the controlling owners, closed down, and the next move in the controversy was their purchase of the Northport which is now being remodeled preparatory to handling the output of the Hercules and the Tamarack & Custer another Day-controlled mine. The fact that Harry L. Day is still retained as president and general manager of the Federal company, a subsidiary of the A. S. & R. Co., and the further fact that the A. S. & R. Co. is still treating Hercules ore pending the completion of the Northport plant, has created the impression that the American is in reality back of the Days in that enterprise. Assuming that this impression has a substantial basis, the action of the A. S. & R. Co. is explained by the terms of its contract with the Bunker Hill & Sullivan. The Bunker Hill contract is for 25 years and has 15 years to run, and it stipulates that it may be revised every five years to conform to the terms upon which "a majority" of the ores of the district are being smelted. By a significant coincidence the date for revision was on June 1, the day following the expiration of the Hercules contract, which represented "a majority" of the ores outside of the Federal company owned by the smelter. To renew the Hercules contract meant that the Bunker Hill & Sullivan would have to be given the same terms, or a reduction of $2 from the present rate of $16 per ton for freight and treatment, and the full New York quotation for 90% of the lead content. That it was to avoid making these concessions to the Bunker Hill & Sullivan, and also to the Stewart, is the basis for the belief that the A. S. & R. Co. is back of the Days in the Northport enterprise. This is also accepted as a reasonable explanation of the action of the Bunker Hill & Sullivan in deciding to smelt its own ores. It will also handle the output of the Caledonia, Ontario and Sierra Nevada, which are closely affiliated with the Bunker Hill either by ownership or lease. It is also believed that the new plant will handle the ore from the Hecla and Marsh upon the expiration of their contracts with the International.

METALINE, WASH.—Sept. 23

There is Considerable Activity in the Metaline mining district, Stevens County. The Metaline Oriole Mining Co. will start work on a 50-ton concentrating mill Oct. 1. The lumber has been contracted for. The capital stock of the company is assessable and the assessments will be continued until this mill is up and in operation; there is estimated to be $25,000 worth of ore now in sight. The Zinc-Lead Co. installed a 50-ton concentrating mill on its property this summer and has been running 60 days and is shipping a car load of concentrates every week. It is now making arrangements to install a ball mill and increase the capacity of the plant to 200 tons per day. The ore is averaging about 16% zinc. The Silver-Lead Co. will start work next week on its lead property just below the Falls. It will continue the lower tunnel which will cut the ledge in about 100 ft. It is rumored that the Sterling Silver Co. has bonded its property to some Spokane people, who are on the ground now and expect to put about 12 men to work immediately. The company is the owner of 16 patented claims. The Riverside property expects to start work early in October. The Proudy brothers will be in next month to work all winter. They have a very promising copper prospect. They will work four men. The camp in general is looking very good—much better than ever before. Every one seems to be very anxious to do much more than the usual assessment work and is making preparations now to do so. There is some chance of a several-million-dollar power plant going in at S Cañon. Hugh L. Cooper is now testing the ground for the big dam.

TORONTO—Sept. 25

The Northern Ontario Power Co. will increase the capacity of its power plants at Porcupine at a cost of over $500,000. The increased quantity of power is necessary to supply the growing demands of the Hollinger and the Dome and to take care of the future developments in the camp.

The Reported Discovery of Silver in the Fond du Lac District of Lake Athabasca has been reported on by Canadian Government geologists who were sent to investigate. They state that no minerals of economic importance have as yet been discovered in that country. There was a good deal of excitement last winter when high-grade silver was reported from Fond du Lac.

The David A. Thomas Interests, which for the last three years, have done extensive exploration work in the district to the north of Edmonton, Alta., have now begun active development. Three test holes for oil are being drilled at a point 3 miles above The Chutes, on the Peace River, near Fort Vermilion, under the direction of C. F. Law, of Vancouver, the Canadian representative of Mr. Thomas. Drillers have been brought from San Francisco with a modern plant capable of drilling 2,000 ft. Fifty men are engaged in the work of exploration. In order to provide adequate transportation on 2,400 miles of northern waterways, three large steamers are to be built and placed in commission north of Edmonton. The first of these is now under construction at Peace River Crossing by a force of 30 men brought from San Francisco

The Mining News

ALASKA

QUARTZ CREEK MINING (Valdez)—W. W. Getchel has taken an option to buy the two miles of ground owned by this company on Quartz Creek in Moose Pass district.

ALASKA TREASURE CONSOLIDATED (Juneau)—Union Trust Co., of San Francisco, through E. S. Heller, its representative at Juneau, has purchased this property for $374,500. Sale is result of judgment recently secured. H. A. Bishop is vendor.

ALASKA TREADWELL (Treadwell)—New shaft at central hoist will soon be in place and in working order, again permitting full operation for first time in several months or since break which has been most costly this company has experienced in several years. Shaft was 20 in. in diameter and 40 ft. long and had to be shipped from Pittsburgh.

ALASKA COAL (Seward)—Captain J. A. Herbert, who was one of the first men to secure lease of coal lands from government, has completed arrangements to furnish Seward with lignite coal from his mine near Seldovia. Coal has already been used to advantage in new town of Anchorage and by several canneries to westward. It will be laid down in Seward at little over one-half price charged for soft coal brought from Seattle. Capacity of mine is 40 tons a day at present, but this output can be increased whenever demand warrants.

ARIZONA

Greenlee County

THE STATUS OF AFFAIRS IN THE CLIFTON-MORENCI DISTRICT is quiet and unchanged. President Moyer, of the Western Federation of Miners, is quoted as advising the union to yield on the point of recognition of the union and to have its committee meet the mine operators to discuss the wage scale, which the union claims is lower at Clifton and Morenci than at Bisbee, Ray, Miami or Globe; the reinstatement of men discharged since Sept. 1 for agitating recognition of the Federation; and assurances that there will be no discrimination against men who have led the strike or who have held out for recognition for the union.

CALIFORNIA

Amador County

VOLCANO DISTRICT is attracting attention of placer miners. Joseph Garibaldi recently made shipment of $1,200, being result of placer cleanup on ground that had been previously worked.

CENTRAL EUREKA (Sutter Creek)—Ore of good grade has been disclosed on the 3,200 level about 100 ft. south of the orebody on 3,100 level. At present 30 stamps are dropping but it is expected that full 40 stamps will be in commission in about two weeks.

Calaveras County

UTICA (Angels Camp)—D. Castle, miner working at the winze at Cross shaft, fell into the skipway, distance of about 40 ft., and landed on skip. He was badly injured on head, face and body but it is believed will recover. Had the skip not been below him he would have fallen a distance of 800 ft.

MONARCH MINING (Valleeito)—George Morris, of Sonora, and associates, of San Francisco, have taken bond on the Ora Plata gravel mine. Company owns 70 acres adjoining and also has bond on Sloane property. Tunnel from Coyote Creek under old channel for purpose of handling water is contemplated. Handling of water in district is problem that has disturbed miners in past.

Placer County

PIONEER (Towle)—Forty men are employed and about 1,800 tons of ore extracted per month. Improvement in grade of ore is reported.

DEWEY CONSOLIDATED (Iowa Hill)—Tunnel driven in to rim of channel disclosed gold-bearing gravel. Drift will be continued across the channel to opposite rim before saving gravel will begin. Property consists of 137 acres, said to be crossed by Blue Lead channel.

BIG OAK (Colfax)—Mine is being unwatered by F. N. Hubble and associates, who have taken property on purchase option. Development consists of shaft 190 ft. deep and some drifting. Mine was closed down 21 years ago by litigation. Mrs. Rose Werry, of Colfax, and Mrs. T. B. Valentine, of San Francisco, are owners.

SLUICE-BOX MINING is in progress on middle fork of American River. Number of men are working with primitive methods and taking out from $3 to $12 a day each. One miner is operating with diving suit, taking gold from crevices in river bottom. His wife works with him and runs the air pump.

Siskiyou County

COPPER ORES from property east of Fort Jones are being shipped to Kennett for treatment at Mammoth smeltery. Ore is hauled by wagons to Southern Pacific R.R. at Yreka and Gazelle. Recent road improvement will add other shippers of base ores.

Tulare County

PORTERVILLE MAGNESITE CO. (Porterville)—Magnesite deposits included in 80 acres of land east of Porterville will be developed. Reported that the company has contracts for 100 tons per day, delivery to begin Nov. 1. C. F. Woody, of San Francisco, is manager; H. L. Doyle, superintendent.

COLORADO

San Miguel County

COLUMBIA (Telluride)—Recent development by leasers has opened pay ore. Shipments are being made to Durango smeltery.

STANDARD CHEMICAL (Placerville)—Development work is in progress on this company's property in Paradox Valley, under direction of John I. Mullen, manager.

SMUGGLER-UNION (Telluride)—Has taken over Ice Lake and is installing pipe-line to conduct water to Blue Lake, whence it will be used at Bridal Vein generating station.

LA SALLE MOUNTAIN MINING AND MILLING (Telluride)—This is new incorporation formed to take over and develop group of gold-bearing claims in La Salle Mts. Incorporators are Galloway brothers, W. E. Rice and Clark Akers. Capital stock is $50,000. Small force of men is at work on preliminary development.

PRIMOS CHEMICAL (Vanadium)—Shaft sunk on Bear Creek property is down 400 ft. On account of high cost of pumping, company has pulled pumps from this shaft and will continue development of property by driving tunnel from surface to tap bottom of shaft. This tunnel, which is now in progress, will be about 500 ft. long. Company is operating seven 6-horse teams from mine to mill, each team making three round trips a day. Hauling about eight tons per load.

HUMBOLDT (Telluride)—Three shifts are now employed in adit being driven toward Humboldt shaft, which must be advanced 700 ft. to make desired connection. All ore mined from property on Ouray side of range will be hauled through Sheridan adit to San Miguel County portal, whence it will be trammed to Pandora mills for treatment. Electric haulage will be installed in adit and electric hoisting equipment placed at shaft. As soon as tramway terminal is finished, boarding house large enough to house 125 men will be built near portal of adit in Marshall Basin.

BLACK BEAR (Telluride)—Development on third and fourth levels has opened an 8-ft. vein of silver-lead ore. Property is operated by Colorado-Superior Mining Co. Isaac Nevels has recently been appointed manager. During first six months of 1915 the company milled 16,366 tons of ore in the Smuggler-Union mills where it leases 20 stamps. Total recovery amounted to $75,201; operating expenses were $69,221; net profit, $5,980. During period under review boarding house earned $791, making a total profit of $6,771. About 50 men are on payroll. Zinc concentrate which is shipped to Blende is worth about $600 a car and gold-silver-lead concentrate which is shipped to Durango is worth from $2,000 to $3,500 a car, averaging about 30 tons per car.

San Juan County

LEE (Silverton)—This property being developed by the Silver Crown Mining and Milling Co., with option to purchase, under management of Jas. T. Burns. Breast of main tunnel is now in 3 ft. of high-grade ore.

MAYFLOWER (Silverton)—American Ore Flotation Co. has made payment of $3,000 on purchase price of this property in Arastra Gulch, formerly owned by Gus Malchus. Purchasing company is sinking winze on vein from upper workings. A 3-ft. vein has been opened which is almost solid galena. It is planned to drive crosscut at lower level for purpose of determining downward continuity of shoot.

IDAHO

Shoshone County

AMY (Kellogg)—Inclined winze following ore is being sunk 1,000 ft. from portal of tunnel. Company plans to construct mill soon.

INDEPENDENCE (Mullan)—Working small force on property between Morning and Hunter mines. Have 5 ft. lead milling ore in upper tunnel. Company understood to be under control of Stewart Mining Co.

RAINBOW (Little North Fork)—Recently struck 8 or 10 in. of practically clean zinc ore and face of drift is mixture of zinc, lead and quartz. Depth has been gained and surface showing indicates extensive orebody within 300 ft.

NELLIE (Osburn)—This old producer, lying in so-called "dry belt" between Wardner-Kellogg and Wallace, has been leased to Ernest Kelly and associates for three years. Ore is mainly tetrahedrite associated with silver.

CALEDONIA (Kellogg)—Raise to connect with the 75-ft. winze sunk from the main working tunnel last week encountered rich oreshoot which had been cut off by winze by fault. Ore is combination of lead and copper with very high silver content.

MAYFLOWER (Wallace)—This company, operating on Nine Mile, is encountering ore in lower tunnel being driven 300 ft. below No. 2, in which there is good body of shipping ore. Portal of lower tunnel is near railroad. Property has recently been equipped with modern compressor.

ST. LAWRENCE (Wallace)—This copper property is situated at head of Silver Creek near the Idaho-Montana boundary and is owned by Angus Sutherland, of Wallace. Work during past summer has consisted of driving main tunnel. First-class ore is being taken from upper tunnel and hauled to Saltese for shipment.

HIGHLAND-SURPRISE (Kellogg)—Has secured contract for entire output of lead and zinc concentrates and will

commence shipments at once. New mill, originally designed for 100 tons daily capacity, can treat 150 if crowded and is so constructed that it can easily be enlarged to 300 tons capacity. Raise is being driven on ore from Surprise drift to Highland Chief lower tunnel.

RICHMOND (Adair)—Planned to resume shipments from Richmond group of six claims lying 14 miles east of Mullan and 2 miles from Adair, Montana. Two cars are being loaded at Saltese. Fifteen men are employed at mine at present. Group was located 20 years ago by Charles Heidenreich and worked intermittently for number of years. In 1910 forest fires destroyed mine buildings and damaged timbering. Operations were resumed in 1914 and car of ore assaying 29.75% copper was shipped, but mine was again closed down. Gasoline engine is used for hoisting; drilling is done by hand. If developments are satisfactory aërial tram will be built from mine to Adair, with drop of 1700 ft. in 2 miles. There are three shafts on property, 50, 85 and 120 ft. deep. Crosscut adit taps vein at depth of 320 ft. Best showing is in 120-ft. shaft, where both drifts are in ore.

MONTANA

Silver Bow County

BUTTE & SUPERIOR (Butte)—August earnings, biggest for any month in history of company, were at rate of $4.50 per share, due principally to deliveries of spelter at higher prices during past few months.

BUTTE-DULUTH (Butte)—Federal court has not yet given decision in involuntary bankruptcy proceeding brought against Butte-Duluth Mining Co., but one is expected within week or ten days. Should decision be against bankruptcy petitioners, receiver, who was appointed before bankruptcy suit was brought, will resume operations at property, and he claims that he can, under present copper prices and lower price of acid, earn good profit on operations.

EAST BUTTE (Butte)—August production about 1,785,000 lb. of copper against 2,000,000 lb. in July. September will also show about latter figure, which was high production record for this company. June output was 1,500,000 lb. and May, 580,000 lb. In 10 weeks of operation company shows net profit of $303,000. Last year actual output of company was but 9,175,579 lb. of copper and in 1913 it was 14,401,108 lb., present production being at rate of 24,000,000 lb. per annum, and it is not unlikely that coming 12 months will show total of 25,000,000 lb.

DAVIS-DALY (Butte)—Find made by Davis-Daly on the 2,500-ft. level of Colorado mine is developing in importance. Drifting on vein has proceeded distance of 80 ft. and size of vein and quantity of ore is holding out well. For width of 10 ft. ore averages about 5% copper. It is claimed there are 3 ft. of copper glance in vein. Station is being cut at 2,500 and preparations are being made to stope ore. About 80 tons of ore per day are now being hoisted from Colorado. All this ore has been taken from sill floor in course of development work.

BOSTON & MONTANA DEVELOPMENT (Butte)—Good progress being made in two crosscuts from 2,040-ft. point of big tunnel, and it is expected that in about 40 days one of the large veins will be cut. Central, Park and Idanah veins will be intercepted by two crosscuts. A 10-ft. cross vein has been cut, and samples from it assay 1.6% copper, 2 oz. of silver and 23% zinc. Showing indicates that crosscut is approaching mineral zone and that values go down. The 10-ft. vein does not outcrop on surface, and is one of several such blind veins that have been encountered in big tunnel. Developments are confirming report and predictions made by Walter Harvey Weed, who made an exhaustive examination of the Boston & Montana properties and recently issued a supplementary report on them.

NEVADA

Storey County

COMSTOCK PUMPING ASSOCIATION (Virginia)—Enlarged drain and laid floor and track 174 ft. in old north drift on 2,700 level.

CROWN POINT-BELCHER (Gold Hill)—New pump started on 1,500 joint station. Water held at 125-ft. point below 1,500 station. Belcher 1,300 raise advanced 30 ft. and 86 cars of mill rock saved.

MEXICAN (Virginia)—On 2,700 level, east crosscut No. 3 shows porphyry and quartz of low assay value. On 2,500 level south drift, Nos. 3 and 4 from west crosscut extended through similar formation. Mill crushed 61 tons of Union ore assaying $7.92 per ton, and 83 tons of Mexican wedge rock.

UNION CON (Virginia)—On 2,500 level extracted 12 cars of ore averaging $29.28 per ton, and from southwest drift 4 cars averaging $35.75 per ton. Saved 45 cars low-grade ore in cutting out for timbers in north drift. Joint work with Sierra Nevada on 2,450 raise and reopening southwest drift to Union shaft continued.

CON. VIRGINIA AND OPHIR (Virginia)—Preparations being made for operating on 2,700 level. On 2,500 level in Ophir, raise made to third floor on the vein in southwest drift. Saved 14 cars of ore assaying $9.23 per ton. In Central tunnel, north drift extended 16 ft. Quartz in bottom assays from small amounts up to $10 per ton. Ophir saved 320 cars of ore from development and milled 275 tons.

SOUTH DAKOTA

Lawrence County

NORTH HOMESTAKE (Lead)—One shift of miners is employed in development work on 600 level of main shaft.

ORO HONDO (Lead)—Shaft is 1,700 ft. deep. Crosscutting is under way both easterly and westerly from 1,500 level. Rock continues hard in bottom.

GOLDEN REWARD (Deadwood)—Astoria roaster is being operated steadily, principally upon blue ores from Billy mine. About 75 tons daily being thus prepared for cyanidation. Deadwood mill makes 96% extraction on roasted product.

UTAH

Beaver County

LEONORA (Milford)—Drifting along east-west fissure is being continued, and it is expected that north-south fissure will be cut soon. Former fissure, which carries silver-lead ore, is growing wider.

PALOMA GOLD AND SILVER (Milford)—Progress of about a foot a day is being made in shaft sinking. Better progress will be made when compressor is installed early in October. Shaft is still in ore. Shipment of copper ore of good grade was made recently; also shipments of lead-silver ore.

Salt Lake County

OHIO COPPER (Bingham)—Mill at Lark is now treating 2,000 tons of ore daily.

WASATCH MINES (Alta)—High-grade shipment of silver-lead ore has been made from No. 2 workings on Brain fissure.

LOGGER MINING (Salt Lake)—Stringers of galena have been cut in face of this company's tunnel. Property is in Big Cottonwood. J. A. Maxfield is president.

PRICE MINING (Salt Lake)—Two-story bunk-house is being built for better accommodation of men at this property in Big Cottonwood.

MONTANA-BINGHAM (Bingham)—Tunnel is in 4,048 ft., face being in quartzite. Number of viens have been cut. Last fissure carried 2 ft. of pyritic ore, showing chalcopyrite and black copper sulphide.

AMERICAN CONSOLIDATED COPPER (Salt Lake)—Stock of this company, owning 16 claims in Big Cottonwood, was listed on Salt Lake Stock and Mining Exchange on Sept. 14. Capitalization is 500,000 shares, par value, $1. John E. Barnard is president.

Summit County

PARK CITY ORE PRODUCTION for week ended Sept. 18 totaled 1,727 tons, valued at $68,000, compared with 1,425 tons week previous. Four shippers.

SNAKE CREEK TUNNEL (Park City)—Tunnel is in more than 12,200 ft., with face still in diorite. Ground is getting softer, and flow of water is increasing.

NAILORIVER (Park City)—An assessment of 2c. a share has been levied, and it is expected that development work will be started shortly. Pipe-line is being laid, and surface equipment put in order.

DALY-JUDGE (Park City)—Building for new flotation plant is in process of construction. Shipments for week ended Sept. 18, amounted to 1,133,650 lb. of ore and concentrates. Development is being kept up, and new orebodies opened.

WASHINGTON

Ferry County

KNOB HILL (Republic, Wash.)—Car of 75,299 lb. of ore sent to Trail smeltery yielded 2.4 oz. gold and 7.2 oz. silver per ton. Gross value was $1,837 and net profit was $1,545. "There are nine cars now en route to the smelter that probably will run about the same," states Mr. LaRue, a heavy stockholder. "The net earnings for August are estimated at $12,000, and the average monthly profit for the current year probably will be not less than $10,000."

King County

ANTIMONY SMELTING AND REFINING CO. (Seattle)—This company, with a capital of $200,000, has been formed by W. D. Wood and H. M. Grifith, who have taken over the sewer-pipe manufacturing plant of the Denny-Renton Clay Co., at Van Asselt, and will convert same into a smeltery for the treatment of antimony ores. The plant covers several acres and has fifteen 20-ft. furnaces with several smaller furnaces, an ore-grinding plant and laboratories.

WISCONSIN

Zinc-Lead District

ZINC HILL (Platteville)—Charles Wolfe and associates of Davenport, Iowa, have struck good ore in number of drill holes on Charles Harris and Felix Murphy farms, four miles south of Platteville.

VINEGAR HILL ZINC (Platteville)—Plans are made for big surface equipment on Blackstone property adjacent to Champion mine at New Diggings.

GRANT COUNTY (Platteville)—Kistler and Stephens have encountered big body of zinc ore in heavy sheet formation in old workings just unwatered.

POWDER MILL (Platteville)—Fritz Hoppe and others are developing promising prospect on old Powder Mill tract just west of city limits of Platteville. Ore was found at shallow depth of 11 ft. Makes in disseminated formation and will turn out high-grade zinc concentrate.

CANADA

Ontario

ORE SHIPMENTS over the T. & N. O. Ry. for the month of August, 1915, from Cobalt proper were: Chambers Ferland, 29 tons; Cobalt Comet, 64; Coniagas, 78; Crown-Reserve, 99; Kerr Lake, 57; La Rose, 131; McKinley-Darragh, 114; Mining Corporation of Canada, Ltd., Cobalt Lake mine, 86.20 and Townsite City, 138.62; Nipissing, 65; O'Brien, 32; Penn Canadian, 89; Peterson Lake—Seneca Superior ore, 65; Temiskaming, 41; from New Liskeard, Casey Cobalt, 39; from Elk Lake, Miller Lake O'Brien, 24; total silver ore shipments, 1,131 tons. From South Porcupine, Dome Lake (gold), 31 tons; from Schumacher, Porcupine Vipond (gold), 1 ton; from Porquis Junction, Alexo mine, (nickel), 767 tons.

CUBA

McLAUGHLIN BROS. (Bayamo)—Have discontinued work on their matte-smelting plant on account of excessively rainy season

The Market Report

Metal Markets

NEW YORK—Sept. 29

All of the principal metals were stronger during the last week, with the exception of tin, which was dull and stationary.

Copper, Tin, Lead and Zinc

Copper—The improvement noted in our last report continued and at the beginning of our week of record, sales began to be made more freely at 18c., regular terms, equivalent to about 17.80c., cash, New York, although there was a little shading of that price in some quarters. It was noteworthy, moreover, that the buyers were now principally domestic manufacturers, whereas in the previous week the sales had been chiefly for export. By Sept. 25, the principal producer had sold all it wanted to at 18c., regular terms, and then it raised its asking price to 18¼c., expecting the market to rise to that figure, which, however, has not yet transpired. On Sept. 27, the market was rather irregular, considerable sales being made at a variety of prices ranging from 17.95c. to 18⅛c., both regular terms. Apparently the market had not become firmly established on the 18c. basis, although more than one of the large producers had raised their asking price to 18¼c., and some sales were actually made as high as 18⅛c. Perceiving this situation, other sellers apparently became more liberal in their offers to furnish supplies at 18c., and at the close a good deal of copper was still available at that price.

Sales for export were made right through the week at £86½@87, c.i.f., London, Havre, etc.

The buying in this market was chiefly by domestic brass makers. There seemed to be rather more inquiry for wire bars. On the other hand, the demand for cakes was rather light, the business of the rolling mills still being slack. The striking feature of the domestic copper buying last week was that the consumers did not exhibit the signs of acting in concert that they have upon previous occasions. The aggregate of the transactions during the week was fair, but the total did not attain any such proportions as to excite special comment.

Some relatively cheap copper appears to be available as the result of arbitrage transactions between prompt and future deliveries. Purchasers of such copper for prompt delivery are naturally willing to sell it at a slight advance. Some profitable business also appears to be done in sales of refined against purchases of crude copper from foreign sources.

Copper Sheets are quoted about 23c. per lb. for hot rolled and 24c. for cold rolled, with usual extras. Wire prices are unsettled; quotations may be put at 19½c. per lb. at mill. The chief maker does not quote base price.

Tin—The market was very quiet with but slight changes of price. The deliveries in September have been very large and the opinion is expressed in the trade that the market is becoming overstocked.

Lead—Good business was done right through the week, and it was anticipated in several quarters that the A. S. & R. Co. would advance its price. It did not do so, but continued to sell freely at 4½c., New York. Its competitors supplied their regular customers with lead at that price but some of them seemed to be averse to selling anything they did not have to. One large producer sold out its October production, and on Sept. 28 began to talk about 4.75c. In the St. Louis market, the price advanced right through the week, and toward the close became established at the list price of the A. S. & R. Co., which is above the ordinary differential. Some sales of lead for export were made.

Spelter—This market has worked itself into a more peculiar position than ever. A rather large tonnage was sold during the week and the curious thing is that this was mostly for delivery in the first quarter of 1916, while there was but relatively little business done for prompt delivery or for deliveries anywhere during the last quarter of 1915. Considering the latter as the market for ordinary contracts, prices ranged from 13@14c. in the latter part of the week, which was a slight advance from the beginning. Business done for the first quarter of 1916 was at prices from 10½@11½c. The orders for this spelter came from abroad. But little domestic business was done during the whole week. Indeed, consumers might be characterized as apathetic. On the other hand, producers evinced no eagerness to sell, although the supplies available are not, perhaps, so small as is represented.

Rapid progress is being made at Donora. The pottery is now in operation and it is expected that spelter will be produced before the middle of October.

Exports from Baltimore for the past week included 394,384 lb. zinc dross and skimmings to Liverpool. Imports at Baltimore included 4,122 tons zinc concentrates from Port Pirie, Australia.

Zinc Sheets—Business has been active, and sales good. Prices are unchanged. The base price for carload lots is $16 per 100 lb. f.o.b. Peru, Ill., less 8% discount.

DAILY PRICES OF METALS IN NEW YORK

Sept	Sterling Exchange	Silver, Cts. per Oz.	Copper: Electrolytic, Cts. per Lb.	Tin: Spot, Cts. per Lb.	Lead: New York, Cts. per Lb.	Lead: St. Louis, Cts. per Lb.	Zinc: St. Louis, Cts. per Lb.
23	4 7125	49⅛	17 60 @ 17 80	32¼	4 50	4 35 @4 42½	12 75 @13 50
24	4 7050	49⅜	17 70 @ 17 80	32¼	4 50	4 35 @ 4 42½	13 00 @13 75
25	4 7075	49⅜	17 70 @ 17 90	32½	4.50	4 37½ @4 42½	13 00 @13 75
27	4 7063	49¼	17 80 @ 17 90	33	4.50	4 40 @4 42½	13.00 @14.00
28	4 7050	49⅛	17.80 @ 17 85	33½	4.50	4 42½ @4 42½	13.00 @14 00
29	4 7200	49¾	17 80 @ 17 85	33	4 50	4 42½	13 00 @14 00

The quotations herein are our appraisal of the average markets for copper, lead, spelter and tin based on wholesale contracts for the ordinary deliveries of the trade as made by producers and agencies; and represent, to the best of our judgment, the prevailing values of the metals, reduced to basis of New York, cash, except where St. Louis is given as the basing point. St. Louis and New York are normally quoted 0.17c. apart.

The quotations for electrolytic copper are for cakes, ingots and wirebars. Electrolytic copper is commonly sold at prices including delivery to the consumers and is subject to discounts, etc. The price quoted for copper on "regular terms" is the gross price including freight to the buyer's works and is subject to a discount for cash. The difference between the price delivered and the New York cash equivalent is at present about 0.20c. on domestic business. The price of electrolytic cathodes is 0.05 to 0.10c. below that of electrolytic. Quotations for lead represent wholesale transactions in the open market for good ordinary brands. Quotations for spelter are for ordinary Prime Western brands. Only the St. Louis price is herein quoted, St. Louis being the basing market. We quote the New York price at 17c. per 100 lb. above the St. Louis price.

Silver quotations are in cents per troy ounce of fine silver.

Some current freight rates on metals per 100 lb. are: St. Louis-New York 17c.; St. Louis-Chicago, 6.3c.; St. Louis-Pittsburgh, 13.1c.

LONDON

Sept	Silver	Copper: Standard Spot	Copper: Standard 3 Mos.	Copper: Electrolytic £ per Ton	Copper: Electrolytic Cts. per Lb.	Tin: Spot	Tin: 3 Mos.	Lead: £ per Ton	Lead: Cts. per Lb.	Zinc: £ per Ton	Zinc: Cts. per Lb.
23	23⅜	69⅜	70½	87	18 30	150	150¼	23½	4 94	63	13.25
24	23¼	69¼	70⅜	87	18 27	151¼	152	23⅝	4 96	63	13 22
25	23½										
27	23¼	70⅛	71⅛	87½	18 38	152½	153	23¼	4.99	63	13 23
28	23⅜	71	72	87½	18 37	153¼	154	23¾	4 98	63	13 22
29	23⅜	71¼	72¼	87½	18 44	153	154	23¾	5 00	63	13 27

The above table gives the closing quotations on London Metal Exchange. All prices are in pounds sterling per ton of 2240 lb., except silver which is in pence per troy ounce of sterling silver, 0.925 fine. Copper quotations are for standard copper, spot and three months, and for electrolytic, price for the latter being subject to 3 per cent discount. For convenience in comparison of London prices, in pounds sterling per 2240 lb., with American prices in cents per pound the following approximate ratios are given, reckoning exchange at 4.80: £15 = 3.21c.; £20 = 4.29c.; £30 = 6.43c.; £40 = 8.57c.; £60 = 12.85c. Variations of £1 = 0.213c.

Other Metals

NEW YORK—Sept. 29

Aluminum—Spot supplies are still scarce and prices firm. Sales of No. 1 ingots have been made at 47@50c. per lb. The American manufacturer has not advanced its prices, nominally, but is unable to make deliveries on new business for several months.

Antimony—The market has been quiet, with only the usual small jobbing trade, and no large business reported. Chinese and other ordinary brands are quoted at 28@29c. per lb.; while 43@45c. is asked for Cookson's.

Nickel—Quotations for ordinary forms are 45@50c. per lb., according to size and terms of order. A premium of 3c. per lb. is charged for electrolytic nickel.

Quicksilver—The market is firmer, demand being good and stocks only moderate. New York quotations are $89 per flask of 75 lb. for large lots, $90 for smaller orders. San Francisco reports by telegraph a firm market at $87.50@90 per flask. London price is £16 per flask, with no discount from second hands.

Minor Metals—Current quotations for **Bismuth** are $3 per lb., New York.—**Cadmium** is quoted at 7s. per lb. in London; $1.75@1.90 per lb., New York.—**Chromium** metal, 75c. per lb., New York.—**Cobalt** metal, 97% pure is sold at $2 per lb.—**Magnesium**, pure, has gone to a high price, $6 per lb. being asked.—**Selenium** varies from $2.50@3 per lb., New York, for large lots; $4.50@5 for retail quantities.—**Tellurium** is quoted at 8os. per lb. in London.

Gold, Silver and Platinum

NEW YORK—Sept. 29

Gold and Silver Movement in the United States eight months ended Aug. 31 as reported by the Department of Commerce:

	Gold		Silver	
	1914	1915	1914	1915
Exports	$135,769,576	$10,902,690	$33,030,463	$32,195,543
Imports	37,180,356	223,796,660	15,927,273	22,489,419
Excess	E. $98,589,220	I. $212,893,970	E. $17,103,190	E. $9,706,124

Exports of merchandise for the eight months are valued at $2,232,758,886; imports at $1,150,784,196; excess of exports, $1,081,974,690. Adding the gold and silver gives $878,786,844 as the net export balance.

Iridium—This metal is in rather short supply and prices are at a high level. About $75@80 per oz. is quoted nominally, but purchases are subject to negotiation.

Platinum—Prices remain high and irregular, and transactions have not been large. The market is uneasy and the future depends largely upon the possibility of new imports. Dealers ask $50@54 per oz. for refined platinum, while $56@58 per oz. is quoted for hard metal.

Silver has been steady for several days at 23⅝ to 23¾d. The tone of the market continues good. It is to be noted, however, that recently Indian orders have not come to London, and it is probable that they have been filled from China, as the stock in Bombay has increased.

Zinc and Lead Ore Markets

JOPLIN, MO.—Sept. 25

Blende, high price, $82.80; base per ton 60% zinc, premium ore, $80; medium, $79@77; lower, $75@73, with a few lots at $70, in car lots, while ton lots sold at $65; calamine base 40% zinc, car lots, $65@55, and ton lots down to $45; average, all grades of zinc, $75.82 per ton. Lead, high price, $55.50; base, $55@50 per 80% metal content; average all grades of lead, $49.34 per ton.

SHIPMENTS WEEK ENDED SEPT 25

	Blende	Calamine	Lead	Values
Totals this week	14,299,130	267,390	1,939,530	$600,090

Iron Trade Review

NEW YORK—Sept. 29

The market continues strong and active, with but little change. It is largely dependent on export business, though domestic trade is improving.

The pig-iron market is in good condition and demand is heavy for basic pig. Foundry iron is a little slower, especially for 1916 business.

The greatest sensation in the trade is the purchase of the Midvale Steel Works by a syndicate of which W. E. Corey, formerly president of the Steel Corporation, is head, and in which Standard Oil interests are reported to be prominent. The transfer has been made by the purchase of the stock, which was owned chiefly by Charles J. Harrah and the Sellers family. The purchase was made through Philadelphia bankers, the reported price being $185 per share.

The Midvale plant is at Nicetown, Philadelphia, and covers about 52 acres. The company's latest balance sheet valued this plant at $11,743,782 and showed total assets of $15,551,504. The business dates back to 1866. The Midvale is one of the three armorplate manufacturing companies in the United States. It also makes ordnance, heavy steel forgings and locomotive tires. About 5,500 men are employed now, the works running to capacity. The new owners, it is understood, will increase the capital and enlarge the works.

This transaction has started up again the talk about the sale of the Cambria and the Pennsylvania steel works and the possibility of a new combination. Thus far, however, this is mainly in the air and there is nothing definite known.

PITTSBURGH—Sept. 28

The volume of steel business has increased in the past week. Domestic consuming industries generally are increasing their specifications, and the railroads are actively in the market. They have made fairly large purchases of bars and plates for their car repair shops, and of plates and shapes for their fitting shops, while rail orders are being placed freely and there is heavier inquiry for cars. The New York Central lines have bought 2,500 cars for two divisions and are expected to buy shortly for other divisions.

Demand for war material seems still to be increasing, inquiry being particularly heavy for large forging billets, for making large shells. Another advance in wire prices is expected shortly, following that of Sept. 20, on account of the heavy export movement. Steel exports to neutral countries are now increasing sharply, having thus far been below the average for normally good times. Steel prices are advancing.

Pig Iron—Price advances seem to have halted. The steel mills are not actively in the market, while foundries are covered for this year and are showing little interest in next year's deliveries. Prices are firm but are not advancing and the fact that several idle furnaces would get into blast if they could sell a backlog of tonnage is probably assuring consumers that there will be no runaway market at any early date. In some quarters a general buying movement for first half is predicted before the middle of November. We quote: Bessemer, $16; basic, $15; foundry and malleable, $14.50@15; forge, $14.25@14.75, f.o.b. Valley furnaces, 95c. higher delivered Pittsburgh.

Steel—There is heavy inquiry for large forging billets and fairly insistent inquiry for rolling billets, sheet bars being neglected. Sellers are not making regular quotations. Openhearth billets are all of $26, Youngstown, with bessemer about $1 less, while prices delivered Pittsburgh are 50c.@$1 above Youngstown.

COKE

Connellsville—Spot furnace coke has advanced 10c. to $1.75@1.80, on account of decreased offerings rather than heavier buying. Negotiations on first-half contracts seem nearer the closing stage, minimum prices being between $1.75 and $2. Operators would quote flat prices of $2.40 or $2.50 but the sliding-scale basis seems to be preferred by both buyers and sellers.

Chemicals

NEW YORK—Sept. 29

The general markets are fairly active, and seem rather steadier than they have been.

Arsenic—The market is quiet and unchanged. Prices are $3.50 per 100 lb. for large lots, and up to $4 for smaller orders.

Copper Sulphate—Business is fairly steady and sales moderate. Quotations are $6.75 per 100 lb. for carload lots and $7 per 100 lb. for smaller parcels.

Nitrate of Soda—There is no change of importance in this market. Prices continue about 2.42½c. per lb. for spot and 2.45c. for futures.

The Mining Index

This index is a convenient reference to the current literature of mining and metallurgy published in all of the important periodicals of the world. We will furnish a copy of any article (if in print) in the original language for the price quoted. Where no price is quoted, the cost is unknown. Inasmuch as the papers must be ordered from the publishers, there will be some delay for foreign papers. Remittance must be sent with order. Coupons are furnished at the following prices: 20c. each, six for $1, 33 for $5, and 100 for $15. When remittances are made in even dollars, we will return the excess over an order in coupons, if so requested.

COPPER

1890—AFRICA—The Economic Resources of German South-West Africa. (Bull. Imperial Inst., Apr.-June, 1915; 27 pp., illus.) General article, 3 pages of which are devoted to copper.

1891—ALASKA—Gold, Silver and Copper in Alaska in 1914. Alfred H. Brooks. (Mineral Resources of the U. S., 1914, Pt. I; 19 pp.)

1892—CALIFORNIA—The Engels Mine and Mill. Thomas T. Read. (Min. and Sci. Press, July 31, 1915; 5 pp.) 20c.

1893—CHILE—Bosquejo del Estado Actual de la Industria Minera del Cobre en el Estranjero i en Chile. Javier Grandarillas Matta. (Bol. Soc. Nac. de Mineria, May-June, 1915; 26½ pp.) Continuation of article previously indexed.

1894—CHILE—Early History of Braden Mines. (Eng. and Min. Journ., Sept. 4, 1915; 2¾ pp.) From article by William Braden in "Teniente Topics." 20c.

1895—EASTERN STATES—Gold, Silver, Copper, Lead and Zinc in the Eastern States in 1914. J. P. Dunlop. (Mineral Resources of the U. S., 1914, Pt. I; 30 pp.)

1896—ELECTROMETALLURGY—Neuerungen in der Elektrometallurgie des Kupfers. Franz Peters. (Glückauf, Aug. 14, 21 and 28, 1915; 17 pp.)

1897—FLOTATION at Washoe Reduction Works, Anaconda. E. P. Mathewson. (Min. and Sci. Press, Aug. 28, 1915; 3 pp., illus.) 20c

1898—JAPAN—Metallurgy of Copper in Japan. Rokusaburo Kondo. (Advance copy, Internat. Eng. Congress, Sept., 1915; 17 pp., illus.)

1899—LEACHING—The Electrolysis of Copper Sulphate Liquors, Using Carbon Anodes. Lawrence Addicks. (Advance copy, A. I. M. E. and Am. Electrochem. Soc., Sept. 17, 1915; 29 pp., illus.)

1900—LEACHING PLANT at Ludwig, Nev. (Nevada-Douglas). George Westby. (Salt Lake Min. Rev., Aug. 30, 1915; 1¼ pp., illus.) 20c.

1901—METALLURGY—Progress in Copper Metallurgy. Thomas T. Read. (Advance copy, Internat. Eng. Congress, Sept., 1915; 3½ pp.)

1902—NEVADA-DOUGLAS—Description of Mine and Mill of Nevada-Douglas Consolidated Co. (Salt Lake Min. Rev., Aug. 30, 1915; ⅔ pp., illus.) 20c

1903—ORE HANDLING by the Magma Copper Co. (Min. and Eng. Wld., Sept. 11, 1915; 2 pp., illus.) 20c.

1904—PHYSICAL PROPERTIES of Copper. Carle R. Hayward. (Advance copy, Internat. Eng. Congress, Sept., 1915; 24 pp., illus.)

1905—REFINING—Solution Stratification as an Aid in the Purification of Electrolytes. Francis R. Pyne. (Advance copy, A. I. M. E. and Am. Electrochem. Soc., Sept. 17, 1915; 6 pp., illus.)

1906—TRAMMING AND HOISTING at Copper Queen Mine. Gerald F. G. Sherman. (Bull. A. I. M. E., Sept., 1915; 48½ pp., illus.) 40c.

1907—VENTILATION of the Copper Queen Mine. Charles A. Mitke. (Bull. A. I. M. E., Sept., 1915; 17½ pp., illus.) 40c.

GOLD AND SILVER—GEOLOGY

1908—CALIFORNIA—Pocket Deposits of the Klamath Mountains, California. Henry G. Ferguson. (Econ. Geol., Apr.-May, 1915; 21 pp., illus.) 60c.

1909—COLORADO—Ores of Gilpin County, Colorado. Edson S. Bastin. (Econ. Geol., Apr.-May, 1915; 30 pp., illus.) 60c.

1910—NEVADA—Geology and Mineral Deposits of the National Mining District, Nevada. Waldemar Lindgren. (Bull. 601, U. S. Geol. Surv., 1915; 58 pp., illus.)

1911—ORE DEPOSITS—Experiments in the Enrichment of Silver Ores. Louis C. Ravicz. (Econ. Geol., June, 1915; 22 pp.) 60c

GOLD DREDGING AND PLACER MINING

1912—BRITISH COLUMBIA—Placer Mining in the Okanagan Valley. E. A. Hoggan. (Min. Eng. and Elec. Rec., July, 1915; 1 p., illus.) 20c

1913—GOLD RECOVERY at Placer Mines. D. F. Carver. (Eng. and Min. Journ., Sept. 18, 1915; 1¾ pp., illus.) 20c.

1914—KLONDIKE—The Water-Supply for the Klondike Hydraulic Mines. H. H. Hall. (Min. and Sci. Press, Aug. 28, 1915; 3 pp., illus.) 20c

1915—RUSSIA—Dredging on the Amur. K. I. Hlebnikoff. (Min. and Sci. Press, Aug. 21, 1915; ¾ p., illus.) 20c.

1916—TAILINGS—Elevating Placer Tailings with a Hayward Bucket. Hubert I. Ellis. (Eng. and Min. Journ., Aug. 21, 1915; ½ p.) 20c

GOLD AND SILVER CYANIDING

1917—PRECIPITATION—Zinc-Dust Precipitation Tests. Nathaniel Herz. (Bull. A. I. M. E., Aug., 1915; 7 pp.) 40c.

1918—SOLUTIONS—A Convenient Alkalinity Table. P. W. Avery. (Mex. Min. Journ., June, 1915; ¾ p.) 20c.

GOLD AND SILVER—GENERAL

1919—ALASKA—Cost of Mining in Alaska. (Eng. and Min. Journ., Sept. 18, 1915; 1¼ pp.) From annual reports of Alaska-Treadwell, Alaska United and Alaska Mexican companies. 20c.

1920—EASTERN STATES—Gold, Silver, Copper, Lead and Zinc in the Eastern States in 1914. J. P. Dunlop. (Mineral Resources of the U. S., 1914, Pt. I; 30 pp.)

1921—MEXICO—Chontalpan Mine, Guerrero. (Mex. Min. Journ., Aug., 1915; 2 pp.) 20c.

1922—MILL—The Rochester Mill, Nevada. G. W. Wood. (Min. and Sci. Press, Aug. 28, 1915; 3 pp., illus.) 20c.

1923—QUEENSLAND—Mount Mascotte Gold Mine, Yungaburra. E. Cecil Saint-Smith. (Queensland Gov't Min. Journ., Aug. 15, 1915; 2¾ pp., illus.) 60c.

1924—REFINING—Treatment of Silver-Furnace Fume by the Cottrell Process. Charles H. Aldrich. (Advance copy, Am. Electrochem. Soc., Sept. 17, 1915; 8 pp.) Description of work done by Raritan Copper Works.

1925—SURFACE EQUIPMENT of the Sons of Gwalia Gold Mine, Describing Recent Additions Thereto. A. Wauchope. (Monthly Journ. West. Aust. Chamber of Mines, June 30, 1915; 6 pp., illus.)

IRON ORE DEPOSITS, MINING, ETC.

1926—CUBA—The Geology of the Iron-Ore Deposits in and near Daiquiri, Cuba. James F. Kemp. (Bull. A. I. M. E., Sept., 1915; 36 pp., illus.) 40c.

1927—ELECTRICAL PLANT of the Wakefield Iron Co. Holman I. Pearl and Joe Green. (Eng. and Min. Journ., Aug. 28, 1915; 2¾ pp., illus.) 20c.

1928—GEOLOGY—Some Problems in Iron-Ore Geology in Sweden and in America. Per Geijer. (Econ. Geol., June, 1915; 31 pp., illus.) 60c.

1929—INDIA—The Ancient Sedimentary Iron Ores of British India. C. M. Weld. (Econ. Geol., July-Aug., 1915; 18 pp., illus.) 60c.

1930—MICHIGAN—The Opening of the Wakefield Mine. W. C. Hart. (Advance copy, Lake Superior Min. Inst., Sept., 1915; 8 pp.)

1931—MINING—Rock Drifting in the Morris-Lloyd Mine, the Cleveland-Cliffs Iron Co. J. E. Hayden. (Advance copy, Lake Superior Min. Inst., Sept., 1915; 6 pp., illus.)

1932—MINING METHODS on the Gogebic Range. O. E. Olson, C. M. Schaus and Frank Blackwell. (Advance copy, Lake Superior Min. Inst., Sept., 1915; 10 pp., illus.)

1933—MINNESOTA—Manganiferous Iron Ores of the Cuyuna Range. Edward F. McCarty. (Eng. and Min. Journ., Sept. 4, 1915; 2 pp.) 20c.

1934—MINNESOTA—Some Aspects of Exploration and Drilling on the Cuyuna Range. P. W. Donovan. (Advance copy, Lake Superior Min. Inst., Sept., 1915; 16 pp., illus.)

1935—SCHOOL—The Mining School of the Cleveland-Cliffs Iron Co. C. S. Stevenson. (Advance copy, Lake Superior Min. Inst., Sept., 1915; 14 pp.)

1936—SHAFT SINKING—Sinking New "C" Shaft at the East Norrie Mine, Ironwood, Mich. B. G. Best. (Eng. and Min. Journ., Sept. 11, 1915; 1 p., illus.) 20c.

1937—SHAFT SINKING—Sinking of the Woodbury Shaft at the Newport Mine, Ironwood, Mich. J. M. Broan. (Advance copy, Lake Superior Min. Inst., Sept., 1915; 16 pp., illus.)

1938—STOCKPILE TRESTLE—New Stockpile Trestle, Colby Iron Mining Co., Bessemer, Mich. G. S. Barber. (Advance copy, Lake Superior Min. Inst., Sept., 1915; 4 pp., illus.)

1939—VIRGINIA—The Oriskany Iron Ores of Virginia. C. M. Weld. (Econ. Geol., July-Aug., 1915; 23 pp., illus.) 60c.

IRON AND STEEL METALLURGY

1940—ALLOY—The Iron-Cobalt Alloy, Fe_2Co, and Its Magnetic Properties. Trygve D. Yensen. (Gen. Elec. Rev., Sept., 1915; 6 pp., illus.) 40c.

1941—ALUMINUM IN STEEL—Note on the Determination of Aluminum Oxide and Total Aluminum in Steel. F. O. Kichline. (Journ. Ind. and Eng. Chem., Sept., 1915; ¾ p.) 60c.

1942—AUSTRALIA—Smelting Works in Australia. Donald MacLaren. (Min. and Eng. Wld., Aug. 28, 1915; 2 pp., illus.) 20c.

1943—BLAST FURNACE—Chemical Principles of the Blast Furnace. J. E. Johnson, Jr. (Met. and Chem. Eng., Sept. 1, 1915; 6½ pp., illus.) 40c.

1944—CALIFORNIA—The Pacific Coast Iron Situation. The Iron Ores of California and Possibilities of Smelting. Charles Colcock Jones. (Bull. A. I. M. E., Sept., 1915; 12 pp., illus.) 40c.

1945—CARBON DETERMINATION—Platinum Boats for Carbon Determination by the Direct Combustion Method. H. F. Siever. (Met. and Chem. Eng., Sept. 1, 1915; ¾ p.) 40c.

1946—CASTINGS—Iron and Steel Castings. John Howe Hall. (Advance copy, Internat. Eng. Congress, Sept., 1915; 12 pp.)

1947—DESULPHURIZATION in Cupola Practice. (Iron Age, Aug. 26, 1915; 1¾ pp.) From "Stahl u. Eisen"; a series of German experiments to determine the extent to which sulphur may be removed by various chemicals or operating changes. 20c.

1948—DESULPHURIZATION AND AGGLOMERATION, Rotary Kilns for. Samuel E. Doak. (Bull. A. I. M. E., Sept., 1915; 6 pp.) 40c.

1949—DUPLEX PROCESS of Steel Manufacture. F. F. Lines. (Advance copy, Internat. Eng. Congress, Sept., 1915; 3 pp.)

1950—ELECTRIC FURNACE—Steel Making in the Electric Furnace. James H. Gray. (Advance copy, Internat. Eng. Congress, Sept., 1915; 5 pp.)

1951—ELECTRIC FURNACES—Les Nouveaux Hauts Fourneaux Electriques des Usines Electrométallurgiques Suédoises. (Génie Civil, Aug. 28, 1915; 2 pp., illus.)

1952—ELECTRIC STEEL COSTS. F. T. Snyder. (Advance copy, Am. Electrochem. Soc., Sept., 1915; 10 pp., illus.)

1953—ELECTRIC STEEL FURNACE, Heat Losses from an. W. H. Wills and A. H. Schuyler. (Advance copy, Am. Electrochem. Soc., Sept., 1915; 10 pp.) Investigations of furnace at plant of Treadwell Engineering Co., Easton, Penn.

1954—GALVANIZED SHEETS AND WIRE—Testing Spelter Coating in France. Charles Coulon, with discussion by J. A. Aupperle. (Iron Tr. Rev., Aug. 26, 1915; 1 p.) 20c.

1955—HARDENING—The Recent Progress and Present State of the Technical Application of the Case Hardening of Steel. F. Giolitti. (Advance copy, Internat. Eng. Congress, Sept., 1915; 50 pp., illus.)

1956—METALLOGRAPHY and the Hardening of Steel. Albert Sauveur. (Advance copy, Internat. Eng. Congress, Sept., 1915; 8 pp.)

1957—PIPING—Methods of Preventing Piping in Steel Ingots. Emil Gathmann. (Advance copy, Internat. Eng. Congress, Sept., 1915; 4 pp., illus.)

1958—REFRACTORIES—Selecting Refractories for the Foundry. Walter H. Keiley. (Chem. Engr., Aug., 1915; 2¼ pp.) Abstract of paper before Am. Foundrymen's Assn. 40c.

1959—SOUND STEEL—Making Sound Steel Commercially. Edward F. Kenney. (Iron Tr. Rev., Aug. 26, 1915; 3¾ pp., illus.) Paper before Am. Iron and Steel Inst. 20c.

1960—TITANIUM—Effect of Titanium Alloys on Steel. George F. Comstock. (Iron Tr. Rev., Aug. 26, 1915; 5¼ pp., illus.) Paper before New York section, Society of Chemical Industry. 20c.

LEAD AND ZINC

1961—ANALYSIS of Spelter. (Eng. and Min. Journ., Sept. 11, 1915; 1½ pp.) From report of a subcommittee, approved by the Supervisory Committee of the American Chemical Society on Standard Methods of Analysis. 20c.

1962—EASTERN STATES—Gold, Silver, Copper, Lead and Zinc in the Eastern States in 1914. J. P. Dunlop. (Mineral Resources of the U. S., Pt. I; 30 pp.)

1963—IDAHO—New Developments in the Cœur d'Alenes, Idaho. Hubert I. Ellis. (Eng. and Min. Journ., Aug. 28, 1915; 3½ pp., illus.) 20c.

1964—JOPLIN DISTRICT—Sheet-Ground Mining in the Joplin District, Missouri. Edwin Higgins. (Advance copy, Lake Superior Min. Inst., Sept., 1915; 15 pp., illus.)

1965—METALLURGY—Some Main Points in the Economics of the Metallurgy of Zinc. Walter Renton Ingalls. (Advance copy, Internat. Eng. Congress, Sept., 1915; 11 pp.)

1966—ORE DEPOSITS—The Formation of the Oxidized Ores of Zinc from the Sulphide. Yinchang Tsenshan Wang. (Bull. A. I. M. E., Sept., 1915; 54 pp., illus.) 40c.

1967—ORE DRESSING AT CLAUSTHAL. E. Mackay Heriot (Eng. and Min. Journ., Sept. 11, 1915; 4½ pp., illus.) 20c.

1968—SMELTING—Lead Smelting at El Paso. H. F. Easter. (Bull. A. I. M. E., Aug., 1915; 13½ pp.) 40c.

1969—WISCONSIN ZINC DISTRICT. H. C. George. (Eng. and Min. Journ., Aug. 28 and Sept. 4, 1915; 7½ pp., illus.) Conclusion of article previously indexed. 20c.

OTHER METALS

1970—ANTIMONY—Electrolytic Antimony Refining. Anson G. Betts. (Advance copy, Am. Electrochem. Soc., Sept. 16-18, 1915; 13 pp., illus.)

1971—BAUXITE AND ALUMINUM—The Production of Bauxite and Aluminum in 1914. W. C. Phalen. (Mineral Resources of the U. S., 1914, Pt. I; 30 pp., illus.)

1972—MANGANESE—The Production of Manganese and Manganiferous Ores in 1914. D. F. Hewett. (Mineral Resources of the U. S., 1914, Pt. I; 18 pp.)

1973—NICKEL—Electrodeposition of Nickel. C. W. Bennett, C. C. Rose and L. G. Tinkler. (Advance copy, Am. Electrochem. Soc., Sept., 1915; 6 pp., illus.)

1974—PLATINUM—The Search for Platinum. G. S. Scott. (Min. and Sci Press, Aug. 21, 1915; 2¾ pp.) 20c.

1975—QUICKSILVER—New Almaden Quicksilver Mine. Richard G. Place. (Eng. and Min. Journ., Sept. 18, 1915; ½ p., illus.) 20c.

1976—RARE METALS—Monazite, Thorium and Mesothorium. Karl L. Kithil. (Tech. Paper 110, U. S. Bureau of Mines, 1915; 32 pp.)

1977—TASMANIA—Tin-Wolfram Ores, Avoca, Tasmania. (Min. and Eng. Rev., July 5, 1915; 1 p.) 40c.

1978—TIN—A Trip Through Bolivia. S. C. Bullock. (Eng. and Min. Journ., Sept. 11, 1915; 3½ pp., illus.) 20c.

1979—TIN—Copy of a Contract for Tin Ores Between European Smelters and Bolivian Miners. (Min. and Sci. Press, July 31, 1915; 1½ pp.) 20c.

1980—TIN—La fundicion de Estaño de Chile. (Bol Soc. Nac. de Mineria, May-June, 1915; 3¾ pp.)

1981—TIN-ORE DRESSING at Llallagua, Bolivia—I. Durward Copeland and Scovill E. Hollister. (Eng. and Min. Journ., Sept. 18, 1915; 4 pp., illus.) 20c.

1982—VANADIUM from Oxide to Steel. Warren F. Bleecker and Walter L. Morrison. (Met. and Chem. Eng., Aug., 1915; 2½ pp.) 40c.

NONMETALLIC MINERALS

1983—BORAX—The Production of Borax in 1914. Charles G. Yale and Hoyt S. Gale. (Mineral Resources of the U. S., 1914, Pt. II, 8 pp., illus.)

1984—DIAMONDS—Mining Methods at Kimberley. Gardner F. Williams. (Min. Mag., July, 1915; 9 pp., illus.) 60c.

1985—GRAPHITE—The Production of Graphite in 1914. Edson S. Bastin. (Mineral Resources of the U. S., 1914, Pt. II; 18 pp.)

1986—GYPSUM—Miocene Age of Dodge Gypsum, Iowa. Charles R. Keyes. (Eng. and Min. Journ., Sept. 18, 1915; ½ p.) 20c.

1987—GYPSUM INDUSTRY in 1914. G. F. Loughlin. (Mineral Resources of the U. S., 1914, Pt. II; 12 pp., illus.)

1988—MAGNESITE DEPOSITS at Atlin, B. C. (Min., Eng. and Elec. Rec., July, 1915; 1¼ pp.) 20c.

1989—NITRATE DEPOSITS in Southern Idaho and Eastern Oregon. G. R. Mansfield. (Bull. 620-B, U. S. Geol. Surv., July 26, 1915; 30 pp., illus.)

1990—POTASH from Pacific Coast Kelp. Thomas H. Norton. (Min. and Eng. Wld., Sept. 4, 1915; 3 pp.) 20c.

1991—POTASH SITUATION, The. Edward Hart. (Journ. Ind. and Eng. Chem., Aug., 1915; 1¼ pp.) 60c.

1992—SAND AND GRAVEL, The Production of, in 1914. G. F. Loughlin. (Mineral Resources of the U. S., 1914, Pt. II; 15 pp.)

1993—SLATE—The Production of Slate in 1914. A. T. Coons. (Mineral Resources of the U. S., 1914, Pt. II; 16 pp.)

1994—SULPHUR, Pyrite and Sulphuric Acid in 1914. W. C. Phalen. (Mineral Resources of the U. S., 1914, Pt. II; 19 pp.)

PETROLEUM AND NATURAL GAS

1995—CALIFORNIA—Regulation of Oil and Gas Wells in California. Lewis H. Eddy. (Eng. and Min. Journ., Sept. 4, 1915; 1 p.) 20c.

1996—CALIFORNIA—The Cost of Maintaining Production in California Oil Fields. M. E. Lombardi. (Bull. A. I. M. E., Sept., 1915; 5½ pp., illus.) 40c.

1997—MEXICAN OIL FIELDS, The. L. G. Huntley. (Bull. A. I. M. E., Sept., 1915; 5½ pp., illus.) 40c.

1998—MEXICO—The Oil Region of Northeastern Mexico. V. R. Garfias. (Econ. Geol., Apr.-May, 1915; 30 pp.) 60c.

1999—NATURAL GAS—Inflammable Natural Gas as an Economic Mineral. J. A. Leo and W. H. Henderson. (Bull. 131, I. M. M., Aug. 19, 1915; 5 pp.) Author's reply to discussion.

2000—OKLAHOMA—The Loco Gas Field, Stephens and Jefferson Counties, Oklahoma. Carroll H. Wegemann. (Bull. 621-C, U. S. Geol. Surv., Aug. 30, 1915; 16 pp., illus.)

2001—OKLAHOMA AND TEXAS—The Oil Pools of Southern Oklahoma and Northern Texas. James H. Gardner. (Econ. Geol., July-Aug., 1915; 12 pp., illus.) 60c.

2002—TEXAS—A Reconnaissance in Palo Pinto County, Texas. Carroll H. Wegemann. (Bull. 621-E, U. S. Geol. Surv., Sept., 1915; 9 pp., illus.)

2003—VALUATION of Oil Lands and Properties. M. E. Lombardi. (Advance copy, Internat. Eng. Congress, Sept., 1915; 45 pp., illus.)

2004—WATER IN OIL AND GAS SANDS—The Role and Fate of the Connate Water in Oil and Gas Sands. (Bull. A. I. M. E., Sept., 1915; 34½ pp.) Discussion on paper previously indexed.

ECONOMIC GEOLOGY—GENERAL

2005—ANHYDRITE—Notes on the Occurrence of Anhydrite in the United States. Austin F. Rogers. (Sch. of Mines Quart., Jan., 1915; 19½ pp., illus.) 60c.

2006—ARIZONA—Ground Water in Paradise Valley, Arizona. O. E. Meinzer and A. J. Ellis. (Water-Supply Paper 375-B, U. S. Geol. Surv., July 14, 1915; 28 pp., illus.)

2007—CANADA—Structural Relations of the Pre-Cambrian and Palæozoic Rocks North of the Ottawa and St. Lawrence Valleys. E. M. Kindle and L. D. Burling. (Can. Dept. of Mines, Geol. Surv., Museum Bull. No. 18, July 23, 1915; 23 pp., illus.)

2008—CONNECTICUT—Sulphide-Bearing Rocks from Litchfield, Conn. Ernest Howe. (Econ. Geol., June, 1915; 18 pp., illus.) 60c.

2009—CRYSTALLOGRAPHIC INTERGROWTHS—The Origin and Occurrence of Certain Crystallographic Intergrowths. Julius Segall. (Econ. Geol., July-Aug., 1915; 11 pp., illus.) 60c.

2010—ORE DEPOSITS—Origin of "Sandstone" Ore Deposits. Chester T. Kennan. (Min. and Eng. Wld., Aug. 7, 1915; 2 pp.) 20c.

2011—PENNSYLVANIA—A Peculiar Oolite from Bethlehem, Penn. Edgar T. Wherry. (Proc. U. S. Nat. Mus., Aug. 13, 1915; 8 pp., illus.)

2012—SIBERIA—Some Topographic Features of Siberia. C. W. Purington. (Econ. Geol., July-Aug., 1915; 12 pp., illus.) 60c.

2013—STONE—A Study of Some Heating Tests and the Light They Throw on the Cause of the Disintegration of Granite. W. A. Tarr. (Econ. Geol., June, 1915; 32 pp., illus.) 60c.

2014—UTAH—Processes of Mineralization and Enrichment in the Tintic Mining District. Waldemar Lindgren. (Econ. Geol., Apr.-May, 1915; 18 pp., illus.) 60c.

2015—WASHINGTON—Petrology and Economic Geology of the Skykomish Basin, Washington. Warren S. Smith. (Sch. of Mines Quart., Jan., 1915; 32 pp., illus.) 60c.

MINING—GENERAL

2016—ACCIDENTS—Monthly Statement of Coal-Mine Fatalities in the United States, June, 1915. Albert H. Fay. (U. S. Bureau of Mines, 1915; 15 pp.)

2017—BACKSTOPING with Breast Holes in Mine No. 1, American Zinc Co. H. K. Sherry. (Eng. and Min. Journ., Aug. 28, 1915; ½ p., illus.) 20c.

2018—BOLIVIA—A Trip Through Bolivia. Stanley C. Bullock. (Eng. and Min. Journ., Sept. 11, 1915; 3½ pp., illus.) 20c.

2019—ECONOMIC AND SOCIAL INFLUENCE of Mining with Special Reference to the United States. William H. Shockley. (Advance copy, Internat. Eng. Congress, Sept., 1915; 66 pp.)

2020—EXPLOSIVES—Production of Explosives in the United States During the Year 1914. Albert H. Fay. (Tech. Paper 107, U. S. Bureau of Mines, 1915; 16 pp.)

2021—FINANCE—European Mining Finance. J. L. Gallard. (Advance copy, Internat. Eng. Congress, Sept., 1915; 15 pp.)

2022—GUNITE—The Use of Gunite in a Steel Shaft and in an Underground Pump House on the Goegebic Range. Stephen Royce. (Advance copy, Lake Superior Min. Inst., Sept., 1915; 11 pp., illus.)

2023—HEADFRAME—The Steel Headframe at No. 9 Shaft, Republic Mine, Vulcan, Mich. Floyd L. Burr. (Eng. and Min. Journ., Sept. 4 and 11, 1915; 9 pp., illus.) 20c.

2024—HOISTING ROPES—Der Tragkraftüberschuss der Schachtförderseile. D. F. Baumann. (Glückauf, Aug. 14, 1915; 4 pp., illus.) 40c.

2025—LABOR—Miners' Unions in Canada. (Can. Min. Journ., Sept. 1, 1915; 4 pp.) Continuation of article previously indexed. 20c.

2026—MEXICO—The State of Sinaloa. (Mex. Min. Journ., June, 1915; 2¾ pp., illus.) 20c.

2027—MINE ROOF—The Stresses in the Mine Roof. R. Dawson Hall. (Advance copy, A. I. M. E., Sept., 1915; 8 pp., illus.)

2028—PROSPECTING in the Eastern Tropics. Gilmour E. Brown. (Min. Mag., July, 1915; 5 pp., illus.) Hints to travellers in Eastern countries such as the Malay Peninsula and East Indies. 40c.

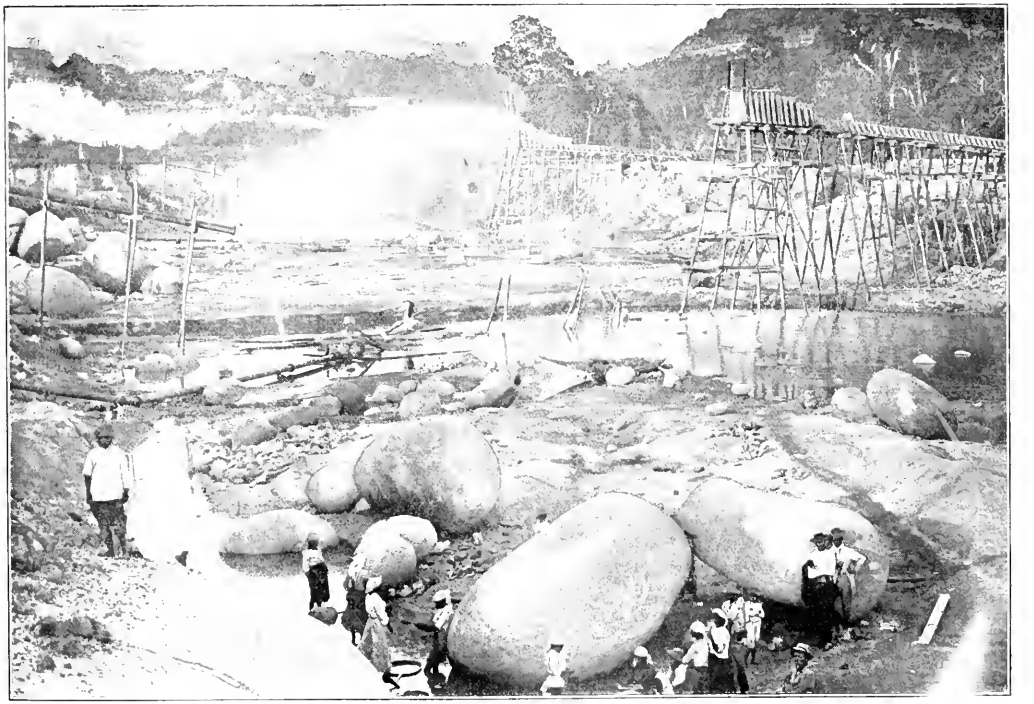
Placers of Antioquia, Colombia

By Ralph W. Perry

SYNOPSIS—Practically all the river gravels in the department of Antioquia, Colombia, are gold-bearing, but the greater part of the gold production comes from a few districts, especially from the Porce, Nare and upper Nechi valleys, where enrichment has been marked. Increased gold output may be expected during the next few years.

In speaking of the placers of Antioquia, Colombia, it is commonly said that there is not a stream in the department that is not gold-bearing; and while there are a few exceptions, this statement is practically true. The bulk of the gold, however, has been derived from a few of the many districts or from the rivers running through them. In other parts of the department, while "colors" can be obtained nearly everywhere, the deposits are not large enough to warrant work on a commercial scale, and these are either residual deposits or local concentrations of them. The majority of these deposits were worked out years ago, but some work is continually being done on streams in which the supply of gold is renewed each rainy season from the residual deposits.

The distribution of the profitable placer mines has been to a large extent determined by the past history of the country and its relation to the present topography and drainage. The original source of the gold has also been an important factor in this distribution, or rather in the relative richness of the deposits. The placers of Antioquia can be divided into four classes—(1) [illegible] placers; (2) recent placers derived to a large extent from [illegible] class 1; (3) recent placers having no connection with [illegible] 1; (4) residual deposits.



LA CLARA HYDRAULIC MINE, OPERATED BY McGUIRE BROS., ON PORCE RIVER, COLOMBIA

*Mining engineer, 84 William St., New York.

To class 1 belong the gravels of the Cauca River above Valdivia; also the old gravels occupying a considerable area in the central part of the department to the east and north of the City of Medellin. This area, at one time perhaps continuous, is now divided by the Medellin River.

These old gravels are now found around the towns of Rio Negro to the east of Medellin and Santa Rosa, Anorí and Amalfi to the north. Their former extent can only be conjectured, but there can be no doubt of their great size. The town of Santa Rosa is built on a small mesa made up of these deposits, and the small rivulets flowing from the town after a heavy rain carry gold in paying quantities. These deposits are generally low-grade, but there are some areas that would pay to work if water could be obtained, although most of them lie at a higher elevation than the present streams.

By some these old beds have been attributed to glacial action, but there seems to be no good reason for this belief, as there are no signs of glacial action and this area apparently has no relation to the region to the south where glacial action may have taken place. In Santa Rosa where the deposits are most extensive, they are stratified over a large area, and large portions of this area are composed of very fine material alone. The commonly accepted local belief is that this area was formerly a lake bed, and that the detached areas were river deposits derived directly from the erosion of the surrounding country and formed in rivers occupying courses somewhat different from those of the present streams.

The deposits near Anorí and Amalfi, which are now being exploited on a considerable scale, occupy depressions back of the ridges bordering the Porce River on both sides. Some are being worked by driving a tunnel from the Porce Valley and sluicing the gravel through this tunnel. Some of these deposits cannot be reached in this way, and it is hard to see how they can be worked, since they occupy depressions in the mountains where dumping ground cannot be obtained and are too deep for dredging, being 160 ft. thick in places.

They apparently have their gold distributed from the surface down, as the natives have washed much of the gravel near the surface. It is claimed that these gravels run from $0.30 to $0.50 per yard. Some of the basins contain as much as 35,000,000 cu.yd. and others, not measured, much more. A cross-section through some of these deposits near Amalfi shows their structure and relation to the Porce River.

The old gravels of the Cauca Valley occupy the present valley of the Cauca above Valdivia, extending to the vicinity of Xerá. These beds are extensive and of great thickness (200 ft. or more) in places. They are poor, especially in the lower end of this area, but there are probably parts of the area that can be profitably dredged.

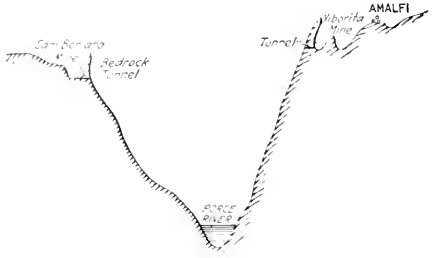
Origin of Source of Cauca Gold

The deposits of the Cauca have apparently derived their gold from a source distant from the present situation of the placers and entirely distinct from the area in the central part of the department. It is likely that the source of the Cauca gold must be sought in the country surrounding Manizales and the Quindio mountains to the south, before the eruptions of the Quaternary period buried that part of the country with the eruptives that are now found there. For this reason, the placers of class 2 on the lower Cauca have not been enriched by additions of gold from any other source.

The old placers in the other area were formed in the immediate vicinity of the source of the gold. This part of Antioquia is highly mineralized, having large areas with stringers and lenses of gold-bearing quartz so close together that they have formed residual deposits of sufficient importance to be worked on a large scale, where favorably situated in regard to water for hydraulicking. All of the small streams in this area carry appreciable quantities of gold, and it is the addition of this gold that has greatly increased the richness of the Nare and Porce Rivers in comparison to the Cauca.

Recent Placers Derived from Old Gravels

In class 2 are the mines of the Cauca below Valdivia and those of the Nare, Porce and Nechí Rivers. These mines on the Cauca are amenable to dredging, but no exact information concerning their value has been obtained except by the few companies that have drilled some areas there. Much time and money have been spent in drilling the lower parts of both the Cauca and Nechí Rivers. None of the companies seem to have taken into consideration the fact that gold is seldom found far from its source except in streams of considerable velocity. If there was any good reason for believing that the lower parts of these rivers had formerly had a greater gradient than at present, there would be some ground for seeking



ANCIENT PLACERS AND THE PRESENT PORCE CHANNEL

gold there, but as both rivers have a comparatively steep gradient down to Caceres on the Cauca and Zaragosa on the Nechí, it is most probable that the amount of gold found below these towns will diminish. Moreover, as the gold in these valleys has been derived from the reconcentration of the old deposits, it is inconceivable that the whole extent of this gravel could be enriched beyond its original content.

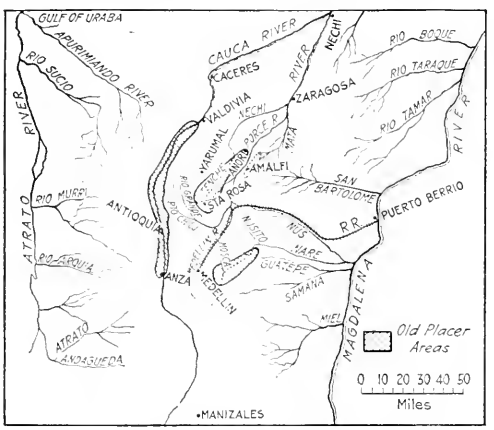
The fall in the Cauca River from Caceres (El. 205 m.) to Nechí, where the Nechi River joins it, is 50 m. in approximately 150 mi. Between Valdivia and Caceres, the Cauca receives numerous small tributaries that are gold bearing, and it is probable that these have played a part in enriching these deposits. They will also account for the variations found in the character of the gold at different points. Some of these streams furnish coarse gold derived from the quartz lenses in the schists which cover a large area there.

Porce and Nechi Rivers

The Porce and Nechi Rivers are treated as one since they both drain the Santa Rosa district, have their source there and join again a short distance above the town of Zaragosa, below which place they are called the Nechí. The Porce River is formed by the junction of the Medellin River and the Rio Grande. The Medellin River has

produced some gold in the past, but most of the gold of the Porce River has come through the Rio Grande. This river and its important tributary, the Rio Chico, are gold-bearing from their sources. Each has its source north of Santa Rosa and, after long circuitous courses, they come together south of Santa Rosa and flow north parallel with the Medellin River, finally joining it to form the Porce. The Rio Grande and Rio Chico rise at an elevation of 8,500 ft. and placers are found throughout the course of each wherever the gradient permitted them to form. These deposits have now been exhausted except in some places in the bed of the river. They were small but exceedingly rich. About 8 mi. above the mouth of the Rio Grande, at an elevation of 3,200 ft., begin the placers properly belonging to the Porce River.

Following the windings of the Porce River for a distance of approximately 25 mi. is to be found the richest placer ground in Antioquia. A conservative estimate of the amount of gravel in this area is 130,000,000 cu.yd. All of this gravel carries from $0.20 per yd. up, and the areas mined to the present time have averaged over $1 per yd. According to the indications in the mines worked,



PLACER DISTRICTS NEAR ANTIOQUIA, COLOMBIA

the richest part is in the present bed of the river. The ground in La Clara mine, which has been most extensively worked, has been better than this, but McGuire Brothers have not worked any more of the low-grade gravel than they could help. Neither have they mined more than a small portion of the river bed, and that near the banks. Preparations have been made this year, however, for the diversion of the river and mining the bed. Much poor ground has been mined in the search for the rich streaks. The average depth of gravel is 40 ft. In some places it is nearly 70 ft. deep. The bulk of the gold is found in narrow channels up to 25 ft. wide and within a few feet of bedrock. One peculiarity of these channels is that as bedrock rises they become poor; in other words, the richest spots are on bedrock sloping downstream. These gravels carry gold close to the surface and at a depth of 10 ft. generally carry $0.20 per yd. From this level there is little increase in value until a few feet above bedrock, and the existence of the rich channels is not indicated until they are reached. The bedrock over the entire area outside of the channels is generally rich enough to bring the average of the whole area to $0.50 per yd., exclusive of the contents of the rich streak. It is to be regretted that some accurate records of the contents of and costs of working these comparatively low-grade gravels have not been kept.

The operators of La Clara mine, which is the best equipped on the river, estimate that no ground running less than $0.50 per yd. can be handled at a profit. It would seem that this estimate is large, as it covers delays caused by working close to the river in pursuit of the best ground. Frequent periods of high water make work close to the river dangerous, and it is only successful in the dry seasons. The river can sometimes be crowded back by dumping the gravel elevated on the edge of the river and gradually forcing the river back. When successful the gravel mined has run several dollars per cubic yard, but the area mined has been small.

Rich Gravel in Gavino Mine

The Gavino mine just above La Clara was the richest mine worked on the river for its area, having produced over $200,000 from an area 300 ft. long by 200 ft. wide. About 75% of this production came from a narrow channel 15 ft. wide by 150 ft. long, the remainder of the ground mined not running over $1 per cu.yd. This mine was worked by natives, and the gravel was carried out by hand and washed in small, short sluices. A small elevator was used to pump out the water. The greatest depth to bedrock was 65 ft. Several years were spent in working this small amount of ground.

The reason against the use of dredges in this section of the river is the difficulty of moving them from one playa to another, as the playas are small, running from 2 acres, like the Gavino, up to 50 acres. They are generally separated by rapids. High water would also interfere with successful working. Otherwise the ground would seem to be favorable for dredging except where large boulders are encountered. Much of the gravel can be handled through an elevator with an 8-in. throat and the bedrock is a soft decomposed gneiss or granite. Power could be secured within short distances. Unless dredging is undertaken much of this area will never be worked, as it is impossible to secure water under sufficient head for elevators. Below here the Porce runs through a narrow deep valley until it approaches Zaragosa, although there are numerous deposits of gravel in this section that are large enough to work. These have the same characteristics as the deposits already described, and present the same difficulties, but they are more difficult of access.

In this part of its course, the Porce receives two important gold-bearing tributaries, the Guadalupe, which has produced much gold and has its source in the immediate vicinity of Santa Rosa, and the Mata River from the Amalfi district. The Guadalupe River has been worked in all its course, and washings are carried on every year in its bed as the gold contents of the bars are renewed each year. Most of this washing is done by women who make from 10c. up per day. Near the Porce, the Guadalupe makes a sheer descent of 1,000 ft. into the Porce Valley, and below this fall its course is comparatively level for several miles, until it flows into the Porce. This ground should be rich, but it has never been drilled and contains many large boulders. The Mata contains some large deposits and it has been claimed that they are of a grade that can be worked at a profit.

The Nechí River under the name of the Tenche rises a few miles northeast of Santa Rosa and flows north, receiving many gold-bearing tributaries from the towns of Angostura, Yarumal and Anorí. There has been much gold produced from this river in the past, and many of the mines have been extremely rich. I am not familiar with the lower part of this river, but I am told that there are deposits of gravel there of good size; they should be similar in contents to those of the Porce. It is below the junction of the Nechí and Porce Rivers that dredging operations have been undertaken profitably. Both dredges that have been installed there have been successful and the area that will be profitable appears to be big. Additional dredges are being installed. Most of the dredging ground will probably be found in the vicinity of Zaragosa, as drilling operations farther down near Nechí have not proved any good ground and the gradient of the river is too small to have transported much gold that distance.

Old Gravels in the Nare Valley

The Nare River also has a large part of its upper course in old gravel deposits, and next to the Porce is the most important source of gold in the department. Like the Porce it not only has received the benefit of the accumulated gold of the old placers, but it has been greatly enriched by numerous tributaries draining a highly mineralized country. Its most important tributaries are the Mosca, Conceptión and Nusito. Each of these streams has produced much gold in the past and formed large deposits at its mouth. These deposits have been worked out with the exception of that at the mouth of the Nusito.

In this part of the Nare River is found a deposit that is comparable in area and richness with that at the mouth of the Rio Grande. There is a great similarity in both the gold found in the Nare and Porce Rivers and in the distribution of the gold.

The Nare has the same rich narrow channels and about the same gold content in the rest of the playas. Here also the richest part of the deposits lies in the present river channel. The Nare has a wider valley than the Porce, and it is therefore more difficult to secure water with sufficient head for elevators. The river has a large production each year from bar workings, whenever low water permits. There has been little work done on this river in comparison with the Porce, but where bedrock has been reached good results have been obtained. The gravel has about the same average depth as that on the Porce River. The gold of the Nare and Porce is found in flattened grains ⅛ to ¼ in. diameter, but generally smaller. Its fineness runs from 820 to 840, and the gold from the Nare averages a little higher than that from the Porce. In the latter some platinum is occasionally found. This has come from the Santa Rosa district, where platinum has been found in some of the ore, according to Boussingault. Coarse gold is seldom found in either of the rivers, but is sometimes washed out of the banks of the Porce after a flood. Boulders are absent from the Nare gravels, except where dikes of hard rock are found cutting the gneiss and granite of the bedrock. The area at the mouth of the Nusito is probably more suitable for dredging than any area on the Porce. High water would be the only drawback.

Little drilling has been done on any of these mines, and it is doubtful if it has either proved or disproved the richness of these deposits, as closer drilling than is customary in a preliminary examination is necessary, or one of these channels would be missed and the whole drilling be without value. In fact, the operators of La Clara mine on the Porce place absolutely no confidence in drill results, but it would seem that close drilling would be of distinct advantage in locating these channels.

Placers of Recent Formation

In class 3—deposits having no connection with the old gravels—are included all the rest of the true alluvia of Antioquia, those of any importance being found on the San Bartolome, Nus, Samana, and Miel Rivers and the tributaries of the Atrato, which will not be considered on account of lack of knowledge concerning them.

The tributaries of the Samana and Miel have produced considerable gold in the past, but the deposits in the rivers themselves have never proved to be of much importance. These tributaries have their source in a country that is only slightly mineralized and characterized by an almost complete absence of gold-bearing stringers over any considerable areas. The one exception to this statement is the Guatepe River, but this stream flows into another river before it reaches the Samana, and it is doubtful if any of its gold has ever reached the latter river.

The Nus and the San Bartolome are the only two rivers of this class that are of any importance. The upper part of the course of each is through a country most favorable for the formation of placers, the Nus especially draining a district well known for its large residual deposits. The country drained by the San Bartolome is not so favorable, but it has the benefit of numerous tributaries larger than those of the Nus, and its gravel deposits are correspondingly larger and perhaps richer. The deposits of the Nus are shallow compared with the Porce and Nare, and the gold is more evenly distributed both vertically and horizontally. Water is generally available within reasonable distances and under sufficient head for elevators. These mines are worked by native methods, but with indifferent results. Not being as rich as the Porce or Nare, they attract little attention, although they should pay well with elevators. The Nus has few tributaries of any importance, the chief one being Las Animas, which has a good-looking deposit of gravel that pans well.

The San Bartolome has several important tributaries that have good deposits of gravel. Some of these have been highly productive, and others as good will doubtless be found. As in all of these streams, the only mines that have been worked have been those where water was easily obtained; and, with the exception of a few localities on the tributaries of the San Bartolome, it is difficult to obtain water with sufficient head. Dredging seems to be the only practicable method of working the mines on this river and some drilling of large areas to determine their value is now being done by Medellin men. The lower deposits of gravel will probably prove too poor to be worked, as those in all the other rivers have done; but the area in the vicinity of its tributaries will undoubtedly be worth developing.

There are numerous residual deposits scattered over the whole department, but the largest are found in the districts of Santa Rosa, Guarne on the Mosca River and in the Nus Valley. In these districts the deposits cover large areas and the aggregate quantity of gold produced

from them has been large. With the exception of those on the Nus, they are so situated that it is difficult to secure enough water to work them on a scale commensurate with their size. It is only during the wet season that water can be obtained, and after years of work the amount of ground washed has been insignificant.

A great many of the small quartz mills of the country are run on the ore left behind after sluicing these deposits. The small streams in the vicinity are steadily worked in the wet seasons and furnish a means of livelihood for thousands of people. Las Animas and Retiro mines at Providencia have maintained a steady output of gold for years and the creeks below their mills carry gold, but its fineness and the slime present have hindered all attempts to save the gold. In these mines the hills are sluiced away with water under no head, and the rock from the stringers and veins is collected and sent to the mill.

In a section 200 ft. wide, I have seen in the Retiro mine a dozen stringers of ore and two veins over 2 ft. wide. Not all of this ore carries gold enough to pay for milling, and only enough sluicing is done to keep the mills running. In the case of the Retiro mine, the sand from the creek below the sluices is collected and crushed again in a stamp mill through a coarse screen and a recovery running from $0.50 to $2 per ton is made. It is the steady addition of the gold resulting from the erosion of these residual deposits to that derived from the old gravels that has made the Nare and Porce Rivers much richer than the Cauca, whose original source of gold has been buried. The Cauca still has tributaries draining such sources of supply in the Quindio country, but if this gold ever reaches the Cauca River it is deposited in the upper parts.

Few Unexplored Areas in Antioquia

The only part of Antioquia where there is any chance of discovering new placers is on the tributaries of the Atrato, which region is comparatively unsettled on account of its climate. Even here it will be found difficult to locate mines, as most of the desirable ground has been taken up and would have to be purchased or leased. Practically the whole courses of the Porce, Nare, Nechí and Cauca have been titled, as well as the desirable deposits on the Nus and San Bartolome. There may be fractions of claims on these rivers that can be secured, owing to mistakes in the measurement of claims.

The small tributaries of these rivers have furnished the bulk of the placer gold produced in the department to date, but their production at present is small, most of the deposits of any importance having been worked out. It is generally a waste of time to examine any of the deposits on these small streams, even if they show no signs of having been worked previously. The old inhabitants of the department recall times when even rivers like the Porce carried so little water that work could be done in its bed, and while these larger streams with their deep bedrock could only have been worked to an insignificant extent, little gold has been left in the others. The work done in the rivers during the dry seasons has served to prospect them, and the native miners generally have a good knowledge of the situation of the richest ground.

All of the gravels on the lower Cauca, Nechí and San Bartolome are suitable for dredging and few of them can be worked in any other manner on account of the lack of water under sufficient head. The old gravel deposits of the Cauca River are generally too poor to be worked by any method, but there is one tract there covering an area of from 15 to 20 sq.mi. on which panning over a large part of this area has indicated a gold content running from $0.10 to $0.80 per cu.yd. There is sufficient water for dredging, and power could be obtained within reasonable distances.

The climate on all of these rivers is hot, and malaria is prevalent, but the fact that work is being steadily done there shows that the climate is not an insuperable obstacle. The mines on the upper Nare and Porce at an elevation of 3,000 ft. are afflicted to a less extent with malaria; the nights are cool and malaria can be avoided if ordinary precautions are taken.

There is no dredging ground on the Nus River, unless it be in its lower part, and I do not think there is gold enough present there for profitable operations. The dredging ground on the San Bartolome is somewhat difficult of access, and roads would have to be built for the introduction of machinery. This same condition is found on the Nare, but the best ground on the Nare is about 15 mi. from the railroad.

Abundant Water Power May Be Utilized to Pump Water for Hydraulicking

The most favorable tract on the Porce for dredging is the area at the mouth of the Rio Grande. This lies within a few miles of the railroad. These deposits so far have been worked only by hydraulic elevators, and this method will probably continue to be used. There is little water available and unless some of the smaller holdings can be consolidated to permit the construction of long ditch and pipe lines, they will remain idle for a long time. Ditch lines can be built cheaply but their maintenance is costly, on account of the nature of the ground, and the heavy rains.

Power can be developed cheaply from the river itself, and probably in the end these mines will be worked by means of heavy pumps and elevators. I see no reason why this method should not be successful, and undoubtedly it would require less capital than getting water on the mines through ditch lines.

All of the operators on the Porce and Nare have hopes of turning the flow through the ground worked out and thus being able to mine the bed of the river. If they succeed in doing this the yield will probably equal that of any ground ever mined in the department.

I would consider it a waste of time to investigate any mines that are not situated on the Cauca, Nare, Nechi, San Bartolome, Nus and Porce Rivers if one is looking for a large operation. Some of the tributaries of these streams offer good chances for the man with a small capital; but even there the best ground, situated where water could be obtained, has been worked. Regardless of new discoveries, the output of gold from Colombian placers will show a large increase in the next few years from the dredges near Zaragosa and the elevators now being installed on the Porce River.

The Deutsche Molybdänwerke at Teuschenthal near Halle on the Saale has been greatly enlarged and improved so that it will be able to supply the whole European steel industry with molybdenum metal and ferromolybdenum when peace is restored, according to "Zeitschrift für angewandte Chemie." The company owns mines producing an abundance of the raw material.

Geologic Conditions That May Confuse Oil Drillers

By Dorsey Hager*

Oil geology became a science only when the relation between underground and surface folding was clearly established; when it was found that surface folding reflected underground folding. This truth was arrived at by the plotting and the mapping of many well logs, and also by many observations taken in highly folded regions like California and Wyoming, where folding can be readily photographed and traced for depths of several thousand feet.

However, even though a geologist does find well-defined folds, there are a number of conditions under which the drill may fail to find oil, but which the geologist cannot foretell. A brief résumé of such conditions may lead to a clearer understanding of the geologist's limitations. The following factors all contribute to make oil-field work uncertain: (1) Faults; (2) unconformities—(a) angular, (b) erosional; (3) lensing—(a) due to thickening of beds in flat strata; (b) due to pinching out of sand; (4) hard spot or lack of porosity; (5) basalt intrusions; (6) water in anticline in place of oil; (7) shales at top of anticlines; (8) barren.

Hidden faults or breaks in the strata may make a region spotted. Where the strata have been broken, as in Fig. 1, wells Nos. 1 and 3 may carry oil, while Nos. 2 and 4 are barren. This faulted condition may not show at the surface, but drilling will in time prove its existence.

Angular unconformities (see Fig. 2) may result in a lack of production in a fold. Well No. 1 is barren; No. 2 is productive. Were No. 1 drilled first, the field would perhaps be abandoned. Were No. 2 drilled first, later developments at No. 1 would prove disastrous. Such a condition is the result of folding or tilting of the beds prior to the later deposition and folding.

In the erosional unconformity (Fig. 3) wells Nos. 1 and 4 are productive; Nos. 2 and 3 are barren. Such a condition is due to the erosion or washing of the earlier beds before the later beds were deposited upon them, leaving an island-like condition.

Lensing is the cause of uncertain conditions. Sands often change to shales, or *vice versa*. This may result in a humped condition, as shown in Fig. 4, in which the oil rises to the top of the lens or hump. Wells Nos. 1 and 3 may be practically dry, while No. 2 is a good well. Such a condition may account for oil in practically flat beds.

Fig. 5 shows the beds lying at an angle. The sand pinches out up the dip, resulting in an accumulation where there is no pronounced folding to break the normal dip. Wells 1 and 3 are barren. No. 2 is productive.

Fig. 6 shows the sand locally hard at the top of the fold. As a consequence well No. 2 is dry, though oil occurs on the slopes at Nos. 1 and 3. A similar condition may exist where the top of the structure carries gas and no oil. In Mexico dry spots are sometimes due to the occurrence of basalt intrusions. One drills into basalt as at well No. 2 and obtains dry holes, but in Nos. 1 and 3 oil is found.

Water may also occur at the top of the structure in place of oil. Shales may replace sands that one might expect on the axis of a structure, and one would find the fold barren. Again, there may be an excellent fold, but the age of the formation and its history are against its carrying petroleum. However, taking all adverse factors into consideration, one will find nine out of 10 folds in oil regions productive. Even though adverse conditions do exist, the tops of the folds are the best places to drill.

FIGS. 1 TO 7. GEOLOGICAL CONDITIONS THAT UPSET THE OIL-WELL DRILLER

*Petroleum geologist and engineer, Tulsa, Okla.

Cryolite Imports Into the United States in 1914 amounted to 4,612 long tons, as compared with 2,559 long tons in 1913, according to the U. S. Geological Survey. No cryolite is produced in the United States, the entire supply used in this country being imported from Ivigtut and Eskimo Hamid on the southern coast of Greenland.

Use of Coal Tar in Flotation

By William A. Mueller*

SYNOPSIS—Experiments have shown that coal tar, while not usually a good flotation agent, serves as an excellent base for use with frothing oils, reducing the required quantity of the latter. Coal tars differ, and some are of no use, while others are applicable only to certain kinds of ore. Experimental results and practical operations are discussed.

In this discussion of the use of coal tar as an agent for mineral flotation I do not wish to advocate its universal use but merely to state a few facts and give a few results that I have secured experimenting with it as a flotation agent with a porphyritic copper ore of the Southwest. Furthermore, all references made to flotation in this discussion apply only to the flotation of copper-bearing sulphide ores. No attempt is made to discuss the action of any others at this time.

Character of Oils Used in Flotation

Every flotation plant finds an oil particularly suited to the ore being treated. There seems to be no one oil that will give satisfactory results in every case. Coal tar may, however, become a universal oil when employed as a base for making good working mixtures of oils. I feel that a great many of the expensive oils now in service could be reduced in quantity if combined with a large part of coal tar.

The principal oils utilized for flotation in this country for copper ores, up to a year ago, were wood-distillation products and, at one plant, cresol. The price of cresol, about 30c. per gallon, made its use costly (even though only 2 lb. of oil per ton of ore was needed) as compared with coal tar, which costs only about 5c. per gallon. Later, other coal-tar products less expensive than cresol came into notice, and finally coal tar itself, aided by some frothing agent such as pine oil. The latter, however, is also very expensive, and subsequent experiments showed that coal tar with from 10 to 25% creosote gave equally good results. Until these experiments coal tar was not considered as a flotation agent in this country, nor ever experimented with here, so far as I could find out, although mentioned in some English patents. The experiments referred to led to its adoption in one large mill, and many others are now experimenting with it and getting good results.

Tars Are Products of Gas Works

There is a great deal of difference in the behavior of the different tars, and those used in these experiments, while classed as coal tars, are really gas tars or the tars resulting from the manufacture of gas. They are byproducts and can be had reasonably cheap. In the case of tar No. 1 (Table 1) no special heat treatment was followed, as it was a product made in a small iron retort for test purposes only, before other tars could be secured. In this case the coal was heated in the retort until no more gases came off, the volatilized products were passed through a condensing system and the gas allowed to escape. The total condensed liquids, including the water, were collected and called tar No. 1. No. 2 was the same as No. 1, except that the water was removed by settling and decantation. The other tars used were crude products, as far as I could ascertain, and all were classed as byproducts of gas or coke plants in different parts of the country.

No attention was paid to the manner of making the tar, as a byproduct as inexpensive as possible was wanted; hence the heat treatment of the coal from which the tar is a product was not considered, nor were some of the other facts entering into the making of coal tar as a byproduct. Of course by special heat treatment and attention a coal tar can probably be made that will suit the purpose of flotation better than the material now employed; but whether the extra cost would warrant such procedure is doubtful, particularly when the gas and coke problems are considered. As a matter of comparison of the various tars, a distillation test was made on the samples at hand. The results were noted in Table 1.

TABLE 1. DISTILLATION PRODUCTS OF VARIOUS COAL TARS

Distillate	Tar No. 1	Tar No. 2	Tar No. 3	Tar No. 4	Tar No. 5	Tar No. 6	Tar No. 7
20°C.–110°C., light naphthas and water			1.2% mostly water. Oil, light brown and thick.	2.8% oil, light brown and thick	None	None	None
110°C. – 170°C., light oils.			1.2% oil; yellow color	0.4% yellow color, very gummy	0.4% oil; clear, pale, yellowish green	0.3% solid; reddish color	2.0% light yellow-colored wax.
170°C. – 210°C., second light oils.			1.2% oil; yellow color	0.2% light-brown, solid	1.1% yellow solid	0.2% light-yellow solid.	1.0% yellow solid
210°C. – 240°C., carbolic oils.			7.5% yellow clear liquid	6.8% white crystalline	9.1% yellow solid	2.0% light-yellow solid.	3.2% yellow solid
240°C. – 270°C., creosote oils.			7.4% reddish-yellow liquid.	4.8% white solid	8.4% yellow solid.	6.0% yellow solid	8.1% dark reddish-brown solid.
270°C. – 360°C., anthracene oils.			24.3% yellowish-brown liquid to red-brown solid.	11.1% yellow solid to reddish-brown solid	25.9% yellow-brown to light-brown solid.	20.3% yellow to brown solid	23.5% dark reddish-brown solid.

Tars Nos. 1 and 2 were in small quantities, hence no test was run on them. Tar No. 1 was the same product as Tar No. 2, except that the latter had the water removed. Both tars were made from the same coal as was used for Tar No. 3. The analyses would in all probability be the same for Tar No. 2 and Tar No. 3. Tar No. 1, however, would give a larger amount of the first fraction because of excess water. Where the fractions became solid no condenser could be used in distillation, hence there was probably some loss by volatization.

Character of the Ore Used in Experimenting

The ore, as has been said, was of a porphyritic nature, carrying about 1.60% copper, mostly chalcocite, with some chalcopyrite, and about 0.15% oxide.

At times this ore carries more clayey material than at others, and this fact makes a big difference in the results obtained, since it tends to lower the grade of con-

*Inspiration Consolidated Copper Co., Miami, Ariz.

centrates as well as to raise the copper contents of the tailings. The reason for this is not altogether clear, but it is reasonable to say that the clayey material coating the mineral particles keeps the oil from adhering to them, hence preventing its flotation as clean mineral.

The ore for each test is ground in an Abbé porcelain ball mill for the time necessary to reduce it to a fineness of less than 1.5% on a 48-mesh screen. The oil can be added either before or after grinding, but it seems to do better when added before and ground wet with about

Copper	1.6%
Sulphur	2.0%
Lime + magnesia	0.7%

1 part ore to 1.3 parts water. Grinding with tar gives much better mixing and more intimate contact of tar and mineral than would otherwise be secured. If the tar is not thoroughly mixed with the ore, it will be found floating in globules on the pulp, and will not mix. Even agitation, unless very violent, will fail to break up the globules.

Method of Making the Flotation Tests

For the flotation a small two-compartment machine was used. One compartment comprised the agitation mechanism, which agitated pulp by means of a stirrer. This agitation compartment was connected with the other compartment (the spitzkasten) by a narrow slit near the bottom and a large opening near the middle. This enabled the aërated pulp to flow from the agitation into the next compartment, where no agitation took place. The froth rose to the surface and was skimmed off with a spoon or a spatula. The test was not complete until no more mineral-bearing froth was formed. The capacity of the machine was about 2,000 c.c.

For each experiment the time of flotation was noted, this being the period from the beginning of flotation until no more mineral-bearing froth formed in the machine. In all experiments the first product formed was called concentrate, and when this no longer came off, turpentine was added, and the next product was called middlings. This system corresponds to that followed when the ore goes through the Minerals-Separation type of machine, where concentrates are formed in the first few compartments, then turpentine added, and the later products taken off as middlings and retreated, either in the same machine or a similar one.

At the time of adding the turpentine the coal tar would often be brought to the surface in flaky particles which would sink later, but this made no difference, as the concentrates had already been taken off. The particles brought up appeared to be some of the insoluble portion of the tar, known as pitch, which does not have any apparent effect on the flotation when excessive. In some cases when tar was mixed with other oils the tar separated in the pulp before any flotation took place. This trouble, however, can be avoided by sufficiently grinding the pulp to the right consistency. The tar will be better mixed in a thick pulp than in a thin one. Whenever the tar separates there is a fault somewhere, the correction of which should prevent further trouble. A mixture wherein coal tar constitutes 80% of the whole now gives good results and separates very little.

Coal tar itself does not froth well. That is, the froth obtained from coal tar alone is very lean, although of good quality. For satisfactory results with coal tar alone the ore must be tied up in the machine for too long a period, and for this reason it is advisable to add a small amount of oil that has great frothing characteristics. Pine oil was the first to be employed for this purpose and has given satisfaction. The price of pine oil, however, is high and its use should be avoided when possible. Coal-tar products, such as cresol, creosote, etc., which formerly served alone, are now mixed with the coal tar to about 20%. The mixture thus obtained is excellent in both the pneumatic and agitation types of machine.

Coal tar alone gives low-grade tailings together with high-grade concentrates if the ore is treated long enough. Test B (Table 2) shows this. Here coal tar used alone, when floated for 45 min., gives concentrates assaying above 38% copper and tails 0.31% copper, of which 0.15% is oxide, thus leaving but 0.06% sulphide copper. In this case the concentrate plus the middling gave a product assaying 24%.

As a comparison with coal tar, the results of the same ore treated in exactly the same manner and under the same conditions (except cresol instead of coal tar) were used. Cresol was chosen only because it was the oil serving in the larger plant at the time the coal-tar experiments were made, and it was against this agent that coal tar was being tried out.

Of course all coal tars will not be found adapted to one ore, and there are probably some that are worthless for any ore. As the results show, some of the tars were useless, while others served admirably. Tars Nos. 1, 2 and 3 were from coals produced in the same field, the others being from coals of different fields, which fact may have some significance.

A tar may not give any results at all when used alone, but as soon as a very little of such an oil as pine oil is added, results are often obtained immediately. The amount of oil will vary according to the ore, grade of concentrates and tailings desired; 0.005% of it will work wonders on ore experimented upon. A large amount is beneficial to a certain point, when further addition is considered detrimental, as the grade of concentrates is lowered as the quantity of oil is increased. Of course the value of the tailings is lowered as well. It is a question of lost mineral against excess smelting charges on the concentrates.

Proportion of Tar Determined by Experiment

To produce good results both as regards concentrates and tailings, a certain amount of tar must be used, and this amount must be determined for each ore individually. More or less will be determined. For instance, Table 3 gives some idea of the proportion of tar to mineral that produces the best results. Other oils act in a similar manner.

In tests on three different kinds of tars we have, in Table 3, the comparisons of varying amounts of tar, the pine oil remaining a constant quantity with regard to its relation to ore. As the amount of tar increases in proportion to pine oil the amount of concentrate increases and the copper content of the tailing decreases. This may be on account of the proportion that coal tar bears to the mixture, or it may be because of the amount of oil resulting from increasing the amount of coal tar. In

every case the oils were introduced from a dropping-bottle and each drop meant about 0.005% of the weight of ore taken, so that as the mixture became richer in tar it also increased in bulk. To determine this fact the amount of coal tar was kept constant, while the quantity of pine oil was varied. This series of tests showed practically the same results as were secured by varying the tar; hence it must depend upon the amount of mixture employed. It seems to make no difference which we vary, so far as results are concerned, the prices of the products being the determining factors. The amount of oil required in every case is less than 0.1% of the ore, or a little less than 2 lb. per ton. These facts are confirmed in the commercial plant. More oil than this determined percentage leads to excess froth, which is hard to handle. Mixtures of coal tar with other frothing products have an effect similar to the pine-oil mixture. Along these lines there is a great amount of work being done, but until it is all ready for comparison there can be no comprehensive conclusions drawn.

Mohawk Mining Co.

The Mohawk Mining Co., Mohawk, Mich., for 1914 reports a profit of $132,053 from a production of 11,094,859 lb. of copper sold at 12.47c. per lb. Dividend payments amounted to $100,000, making a total disbursement of $3,275,000 in dividends to date. The company ended the year with a balance of quick assets amounting to $852,208. There were 665,852 tons of rock hoisted and 649,649 tons stamped. The production of concentrates amounted to 14,591,000 lb. The yield of the ore was 17.08 lb. per ton, or 0.854%. The total cost of producing copper was 8.58c. per lb., of which 0.35c. was for con-

struction and strike expense. The following table gives a record of the operations of this company for the last nine years:

Year	Tons stamped	Yield Lb Cu	Total Lb Copper Produced	Cost per Lb.	Profit	Dividends
1906	618,548	15 12	9,352,252	11.4c.	$763,302	$500,000
1907	640,777	15 77	10,107,266	11 6c.	398,405	900,000
1908	685,823	15 01	10,295,881	10 8c.	276,778	250,000
1909	819,019	13 73	11,248,474	11.2c.	223,691	300,000
1910	802,537	14 22	11,412,066	11 4c.	188,083	200,000
1911	802,548	15 07	12,091,056	10 4c.	269,506	175,000
1912	787,941	15 22	11,995,508	10 6c.	656,435	350,000
1913	866,458	15 76	5,778,235	13 2c.	123,839	500,000
1914	649,649	17 08	11,094,859	8 58c.	432,053	100,000

First Aid at Ray Consolidated

By J. T. More*

In keeping with the nation-wide impetus that is being given to first aid to the injured, the Ray Consolidated Copper Co., at Ray, Ariz., has instituted a regular course of training. This covers a period of six weeks, one lesson a week being given to each class. The course follows very closely that given by the United States Bureau of Mines. The first lesson covers a general discussion of first aid, its aim and scope; the bones of the body, illustrated with a skeleton; the circulation of the blood, arterial and venous bleeding, the location of "pressure points"; the respiratory system; the nerves; the muscles; "don't's" in first aid (under this head the men are impressed with what *not* to do—the rudiments of surgical cleanliness, don't wash or touch wounds); first-aid treatment for shock; the application of the triangular bandage. The second lesson covers strains, sprains and dislocations and the bandaging of breaks without splints, such as the lower jaw, shoulder-blade, collar-bone, ribs and pelvis. In the third lesson the splinting of broken bones is taken up and demonstrated. The fourth lesson is given up to the handling of injured persons; carries with stretchers—army and improvised; carries without stretchers. The fifth lesson covers artificial respiration, and the sixth is a general review. During the whole course the men actually perform first aid on a patient for supposed injuries. Upon finishing this course the men are given the Ray Consolidated Copper Co. diploma and a gold first-aid watch charm engraved with the owner's name.

Challenge Cup Stimulates Interest

The men are encouraged to organize first-aid teams, each to consist of a captain and five men. These teams compete in local contests for the "Ray" cup. This cup is held by the winning team and their names are engraved upon it. At the next contest it is again offered as award and so on until some one team succeeds in winning it three times, when it becomes the property of this team. The interest in these contests runs high and the competition is keen.

The first local contest was held May 5. Four teams entered. G. W. Sansbury, safety inspector of the United Verde Copper Co., Jerome, Ariz., acted as judge. Rules and discounts as outlined by the American Mine Safety Association were followed. No. 1 Team was composed of surface men, mostly machinists; No. 2 Team, miners representing No. 2 mine; No. 3 Team, Mexican miners from No. 3 mine; No. 4 Team, miners from No. 1 mine. The following is a list of the events:

One-Man Event—A man shoots in the face of a drift on going off shift. He is caught by powder smoke from the outside and is overcome. Falls and receives a severe laceration on the head. One man recover, carry 50 ft. and treat condition.

Two-Man Event—A miner is caught by a fall of rock. Two men working with him escape. They go back for the injured man and find that there are still dangerous slabs left in the back. Injuries sustained are as follows: Right ear scraped, right shoulder and right side of chest scraped with long shallow cuts and a simple fracture of the upper third of the right forearm. Two men recover patient and treat condition.

Three-Man Event—A mucker picks into powder in a muck pile in an openpit workings, exploding the powder. Injuries received are as follows: Face and both eyes filled with small rocks; right hand and wrist badly lacerated with severe bleeding; fifth and sixth ribs on the left side broken at the front and the right knee badly wrenched. Three men treat condition.

Team Event—A miner is working in a timbered stope. A rock falls from the back, breaking the flooring he is standing on and letting him drop two sets to a muck pile beneath. Injuries sustained are as follows: A fracture of the third, fourth and fifth ribs on the right side; a compound fracture of the lower third of the right thigh with severe bleeding; scalp wounds and the upper half of the right ear torn loose; small cuts about the right eye and a deep, short cut on the left thigh above the knee with severe bleeding; man unconscious but breathing. Team treat.

Mexican Team at a Disadvantage

The teams were given two minutes in which to discuss the problem at hand. No. 4 Team (R. T. Fees, captain; A. Anderson, D. Rebstock, J. A. McRae, H. C. Penney, E. R. Russell) won the contest with a score of 91.6%; No. 2 Team was a close second, No. 1 Team third and the Mexican Team fourth. There was but one man on the Mexican team with a thorough knowledge of English, and it was necessary for him to translate the problem and carry on the discussion in the two minutes. Under the circumstances this team did excellent work. In view of the fact that none of the teams had practiced more than three months, the showing made was very gratifying.

There were six teams entered in the second contest, held June 18. J. C. Roberts, mining engineer, United States Bureau of Mines, acted as judge. Due to the fact that it was impossible for a person to judge six teams at one time, the following method of procedure was adopted: The six teams were divided into two squads (*A* and *B*) of three teams each, this division being made upon a basis of time spent in practice; but two events were given, a two-man and full team; squad *A* performed first in the presence of squad *B*, then *B* worked a similar event in their presence; squad *B* then performed the full-team event first, squad *A* following with a similar problem; the highest team in the two events in each squad was given an elimination team event to decide the winner of the cup. These events were written in English and Spanish in an effort to overcome the handicap under which the Mexican team had worked in the first contest.

The *A* squad worked the following problem: Two-Man Event—Man caught by fall of rock. Scalp wound on top of head above right ear, severe bleeding. Compound

*Safety inspector, Ray Consolidated Copper Co., Ray, Ariz.

fracture of left forearm, midway between elbow and wrist, accompanied with severe bleeding. Fifth right rib broken, simple fracture. Patient is unconscious but breathing. Treat and carry 50 ft. without stretcher.

The *B* squad followed this with: Two-Man Event—Man caught by fall of rock. Left ear torn nearly off, bleeding. Compound fracture of right arm, midway between shoulder and elbow, severe bleeding. Bones of left hand crushed. Patient unconscious but breathing. Treat and carry 50 ft. without a stretcher.

Event for Full Team—*B* squad: Patient has cut fuse too short and blast occurs while he is going out. Air bad, candle will not burn. Patient is found 20 ft. from face of drift unconscious from bad air, not breathing. Back of head, ears, shoulders and back of arms badly burned. Compound fracture of right thigh just above knee. Treat and carry 50 ft. on stretcher.

Event for Full Team—*A* squad: Patient has cut fuse too short and blast occurs while lighting other shots. He is found near face of drift with the following injuries. Patient unconscious, not breathing. Severe burns on face, neck and arms (in front only). Simple fracture of right thigh, midway between knee and hip. Simple fracture of left leg, midway between knee and ankle. Air is bad in drift, candle will not burn. Treat and carry 50 ft. on stretcher.

Elimination Event—Man falls down 30-ft. winze. In bad air when found, unconscious (not breathing); candles will not burn. Suffers compound fractures of both thighs above knees. Right collar-bone broken. Treat and carry 50 ft. on improvised stretcher.

Close Scores by Leading Teams

The following will show the preliminary scores of the various teams: Squad *A*—Team No. 1 (No. 1 Mine, American), 92.2%; Team No. 2 (No. 2 mine, American), 93.2%; Team No. 3 (Surface), 83.0%. Squad *B*—Team No. 4 (No. 3 Mine Mexican), 89.0%; Team No. 5 (No. 2 Mine Mexican), 80.6%; Team No. 6 (Engineering), 92.4%.

The scores made on the elimination problem were: Squad *A*, Team No. 2 (No. 2 Mine American), 94.0%; Squad *B*, Team No. 6 (Engineering), 91.0%.

It will be noticed that Teams Nos. 1, 2 and 6 had scores almost identical although they did not all work on the same problems. No. 4 Team raised its score from 64.6% to 89.0% in six weeks' time, while No. 5 Team made a score of 80.6% at its first appearance on the field.

The men have shown their skill not only in contest work but also in actual service. By far the great majority of accidents, whether on the surface or underground, are given first-aid treatment before the patient is seen by the doctor. First-aid cabinets are installed in different sections of the mines and in centrally located points on the surface, and the 200-odd men, either wholly or partially trained, have at all times shown great willingness to help.

Costa Rica Now Imposes an Export Duty of 15% ad valorem on all gold bullion of Costa Rican origin. Each gold-mining establishment in the country must make a monthly report of production and must deposit with the Secretary of the Treasury bills of exchange sufficient to cover export duties, against which such duties will be charged. No exportation will be allowed until satisfactory deposits have been made.

Kowkash Gold District*

Kowkash station is 297 mi. west of Cochrane, Ont., on the National Transcontinental Ry. The recent gold discovery lies 9 mi. northwesterly from Kowkash station, near Howard Falls, on the Kawa-kash-kagama River.

The country is of low relief and consists of rocky hills up to 100 ft. or more in height, separated by large swamps, semi-muskegs and sand and gravel areas. The rocky hills are covered with a dense growth of small timber and moss and sometimes large loose boulders, which make prospecting somewhat difficult. The height of land at Redmond, 15 mi. west of Kowkash station, has an elevation of 1,122 ft. This northwest-and-southeast divide separates the waters of the Great Lakes from those of Hudson Bay.

History and Early Exploration of the Region

The gold discovery occurs on the river which the Indians call Kawa-kash-kagama, which signifies sparkling water. This name has been shortened to Kawashkagama by the Geographic Board. The National Transcontinental Ry. has further shortened the word by naming the station Kowkash, which the propectors have likewise done to the name of the river—hence the name of the new gold area.

The part of the Kowkash River near the gold find was examined by Dr. R. Bell and is described in the annual report of the Geological Survey of Canada for 1870-1; also by party No. 5 in a report entitled "Exploration of Northern Ontario," issued by the Ontario Department of Crown Lands, 1900, p. 156. In this report E. V. Neelands, geologist with party No. 5, blazed the way for the prospector when he stated "Huronian rocks, mainly chlorite and other soft green schists, occur on the Kawa-kash-kagama (Kowkash) River from about 4 mi. below the Wawong portage to the northern limit of exploration (Howard Falls). The most promising district is the country on the Kawa-kash-kagama River below the Wawong portage. Here Huronian exposures are numerous, mostly chlorite and other soft green schists. Several samples from small quartz veins in this district showed traces of gold, and it might be that careful prospecting in this district would be rewarded." W. J. Wilson and W. H. Collins' map. No. 964, published by the Geological Survey, Ottawa, which roughly outlines this Kowkash Keewatin area, is being much used by the prospectors at the present time.

E. W. King Dodds made his spectacular gold discovery on Aug. 21, 1915, when walking over the rocky hill below Howard Falls, which had been burned clean of moss and trees on the previous day. The news of the spectacular ore caused a rush of about 400 prospectors to the neighborhood, and about 75 to 100 claims were staked within three weeks.

General Geology of the Region

In the Kowkash area is a belt of Keewatin rocks 10 to 15 mi. wide and extending from the north end of O'Sullivan (or Sesekenaga) Lake in a southwest direction through Howard Falls and across the height of land at Redmond. This whole Keewatin area is worth prospecting for gold. For miles around this Keewatin belt are Laurentian granite and gneiss rocks.

*Abstract from a report by Percy Hopkins, Assistant Provincial Geologist of Ontario.

The Keewatin formation is largely massive, composed of fine-grained green chlorite and hornblende rocks, which are in places altered to schist. Some of the chlorite rock is altered diabase. Numerous exposures can be seen along the Kowkash River from 3 mi. below where Johnson Creek enters the Kowkash to within a mile of the driftwood portage. Altered basalts showing the pillow or ellipsoidal structure are common. They are well exposed from Howard Falls to beyond the Dodds gold showing, on the portage below Howard Falls and around O'Sullivan Lake. With the basalts are small agglomerate areas. Cutting these greenstones are numerous white-weathering quartz-porphyry dikes up to 30 ft. or more in width. They contain in a gray to green fine ground mass numerous white-quartz phenocrysts the size of peas.

Porphyry Resembles Porcupine Quartz Porphyry

The porphyry contains some quartz stringers, is schistose in places and resembles the quartz porphyry at Porcupine, Goodfish Lake and north of Schreiber. The main exposures seen extended for a mile eastward from Howard Falls and around O'Sullivan Lake. About 2 mi. below Howard Falls and one chain from the left bank is a large hill which has been recently burned. The south fringe of the exposure is a slate and conglomerate similar to the Timiskaming sediments in Porcupine, Kirkland Lake and Munro Township. The sedimentaries dip vertically and strike 25° north of east. The slate is very cherty. The pebbles of the conglomerate are drawn out and consist of chert, quartz porphyry, amygdaloidal basalt and gneiss. North of the sedimentaries is a large volume of massive pillow lava. Around the center portage between Abamasagi and O'Sullivan Lakes is a fine slate-like biotite and chlorite schist striking 35° east of north and dipping from 50 to 80° southeastward. This may be of sedimentary origin. At the last portage into O'Sullivan Lake is an actinolite rock, below which are numerous massive serpentine exposures. A gabbro and diabase, probably the youngest rock in the area, occurs about 300 yd. north of the Dodds gold find. Dikes a foot in width also cut the basalt on the Dodds claim. The direction of ice movement was 35 to 40° west of south.

Description of King Dodds' Discovery

Dodds' gold quartz vein, which is the only reported discovery up to the present, is ⅝ mi. below Howard Falls and 800 ft. north of the river. The vein strikes 8° south of east and appears to dip 75 or 80° to the north, thus conforming in strike and dip with the country rock. The vein, which is somewhat lenticular, is up to 4 or 5 in. in width and can be traced about 10 ft., ending in drift on either end. The quartz is glassy and largely free from sulphides. Spectacular gold was seen in place over an area about 5 in. long and 1 in. wide. This showing extended 5 in. along the hanging-wall side of the vein. Similar and richer specimens were reported to have been taken from the 4 or 5 ft. adjacent to the showing. On the hanging-wall side of the vein is a rusty schist band 6 in. wide and heavily mineralized with fine pyrite. The wall rock is pillow lava (basalt), which is altered to schist in places. A mineralized quartz-porphyry dike occurs about a chain southeast of the gold showing.

All the information on the area is being compiled by the Ontario Bureau of Mines, and a map will be published.

Engineering Congress Meetings in San Francisco

Editorial Correspondence

The mining industry is still the chief attraction in San Francisco and at the Panama-Pacific Exposition. The American Institute of Mining Engineers concluded its technical sessions on Sept. 18, and on Saturday visits were made to the deep gold mines at Grass Valley, the gold dredges at Oroville, the oil fields at Coalinga, with a yacht cruise on San Francisco Bay and a visit to the Selby smeltery. On Sept. 20 the American Mining Congress began its 18th annual session at the Civic Auditorium, closing on Sept. 22. The International Engineering Congress also met on Sept. 20, concluding on Sept. 25. The California Metal Producers' Association held its initial field meet for demonstration of first aid as taught by the Bureau of Mines, on Sept. 22. This will be the initial annual meet of California teams under the auspices of the Metal Producers' Association.

The third annual joint field meet of first-aid and mine-rescue teams under the auspices of the Bureau of Mines began on Sept. 23 and concluded on Sept. 24. During the two weeks there have been in attendance at the conventions and the demonstrations at the exposition a large number of mining men engaged in the various branches of the industry, from all parts of the United States and some foreign countries. Probably the number of mining men in San Francisco and visiting the exposition within this period is larger than has been assembled at any other point for a number of years.

Mineral Resources of Hunan

A report from United States Consul N. T. Johnson at Chingsha, China, after referring to the antimony mines of Hunan and stating that this business is again on a competitive basis, says that lead and zinc are being mined in the mountains near Sung Peh, on the Siang River, about 30 mi. south of Hengchow. A 3-mi. narrow-gage railway is used to carry the ore down to the river. The machinery is mainly of German origin, and it is understood that Carlowitz & Co. have invested about 600,000 taels in the mine and that they take most of its output. In the dressing plant 2,000 coolies are employed. Some of the mining is done in the old Chinese way; however, they are working four modern shafts, one being about 800 ft. deep. The mines, employing probably 5,000 men, are entirely under the management of two Cantonese, both trained in the coal mines at Ping Hsiang.

Saltpeter is found in Yung Hsunfu, Lung Shan, Sang Chih Shihmen and Tzu Li. Large quantities of firecrackers are manufactured in the neighborhoods of Siangtan, Changsha and Changteh, thereby creating a demand for this chemical.

Coal is found in the valley of the Siang and in the western part of the province about Shenchow and Yuanchow. That from the Tzu River, in the district about Paoking, finds its way down the river through Tungting Lake to Hankow.

Deposits of iron are worked by the natives at Chin-chou, near the southern border of the province. The mineral wealth of Hunan is just being tapped, and its possibilities are almost without limit.

American Institute of Metals

EDITORIAL CORRESPONDENCE

Among the interesting papers presented at the meeting of the American Institute of Metals, Atlantic City, on Sept. 29, was one treating of "The Effect of the Present European War on the Metal Industry," by T. F. Wettstein, of the United Lead Co., New York. In the discussion of this paper it was brought out that under normal conditions this country supplies its own demand of zinc, but leaves nothing much for export. The destruction of the Belgian and Silesian zinc industries then leaves a total of about 150,000 tons of the normal demand to be supplied for foreign nations. At the present time, because of its use in war, the demand for zinc is 10 times the normal amount. It was also brought out that the common grades of the metal have increased much more, comparatively, in price than the high-grade material. The premium on high-grade is normally up to about 40%, whereas at the present it is not over 30%. Some common grades of zinc are redistilled in order to secure a high-grade product, but redistillation does not affect the cadmium, which remains in the product. Cadmium runs up to 0.2, 0.3 and 0.4% in the redistilled material. The element is objectionable because it interferes with its utilization for many purposes.

A paper presented by Dr. S. Trood, of the United States Sherardizing Co., New Castle, Penn., on sherardizing methods, was one of wide interest, in that he described the necessity for the presence in the zinc thus used of a certain percentage of zinc oxide, not less than 8%, according to Doctor Trood; the service of the zinc oxide being to protect the zinc from melting and becoming a liquid and unmanageable mass under the required heat. Doctor Trood showed the possibility, owing to the presence of this oxide, of the passage of zinc from the solid to the gaseous state without passing through the liquid form. It was shown also that the continued re-use of zinc for sherardizing involved the accumulation in it of particles of iron, and these would rust upon exposure of the article to the air, forming an unsightly coating, although the protection to the iron of the article itself was no way impaired.

Papers on "Electric Furnace for Brass Melting" and "Substitutes and Alloys to Take the Place of Platinum" were not presented, and a paper on the "Alloys of Nickel, Chromium and Copper," by D. F. McFarland and O. E. Harder, of the University of Illinois, was read.

At the afternoon meeting an interesting paper on aluminum die casting was read by Charles Pack, of the Doehler Die Casting Co., Brooklyn, N. Y. The process of die casting was described, and the wearing effect upon the dies (for which a suitable metal is being sought) was discussed in detail. There was then read a paper upon the Manufacture and Use of Alumino-Vanadium, by William W. Clark, of the Seymour Manufacturing Co., Seymour, Conn.

D. V. Pannell, of the British Aluminium Co., Toronto, Ont., read a paper on "Recent Advances in the Manufacture and Uses of Aluminum." This process described the mechanical handling and working of aluminum, both as to drawing into wires and its use for other articles of commerce. In addition Mr. Pannell gave a thorough account of the requirements for welding aluminum, a process which is being practiced successfully by his company. A paper on "Aluminum-Bronze Alloys" was then read by W. M. Corse, of the Titanium Alloy Manufacturing Co., Niagara Falls, N. Y.

The papers listed for the Thursday meetings were as follows: "Development of an Acid-Resisting Alloy," by S. W. Parr, University of Illinois, Urbana, Ill.; "Methods of Analysis for Complex Alloys," by S. W. Parr, University of Illinois, Urbana, Ill.; "Effect of Zinc on Copper-Tin-Lead Alloys," by G. B. Clamer, Ajax Metal Co., Philadelphia; "The Advantages of a Standard Railway Journal," by Russell R. Clark, Pennsylvania R.R., Pittsburgh, Penn.; "Forging Manganese Bronze," by Jesse L. Jones, Westinghouse Electric and Manufacturing Co., East Pittsburgh, Penn.; "The Failure of Structural Bronzes," by Dr. P. D. Merica, Bureau of Standards, Washington, D. C.; "Experiences with Brass in Civil Engineering Work," by A. D. Flinn, Board of Water Supply, New York; "Stellite," by Elwood Haynes, Haynes Stellite Works, Kokomo, Ind.

Composition of Graywacke

Graywacke is a general term used in the field to designate certain obscurely bedded, in places much-altered, greenish rock, which ranges in texture from distinctly conglomeratic to aphanitic. Some of the finer-grained graywackes can with difficulty be distinguished from igneous rock. The result of field study led to the inference that the graywackes consist largely of igneous material worked over mechanically, but not greatly decomposed before deposition, and this inference is confirmed by microscopic study. Since their deposition, however, they have been in places greatly changed by shearing, brecciation and the development of secondary minerals. The degree of metamorphism necessary to convert a certain rock into a graywacke has not been determined or defined.

The United States Geological Survey[1] gives the following description of conglomeratic specimens of graywacke examined by it: The broken surface of the rock of one specimen, with the appearance of augite lamprophyre, showed bedding and pebbles. The slide showed the graywacke pebble to consist of fragments of augite, hornblende and feldspar in a dusty chloritic matrix. In some specimens the matrix is too fine-grained for determination. The material as a whole seems to be like that of broken-down, but not greatly altered, porphyry.

Another specimen, resembling basalt in appearance, was found to contain minute prisms of hornblende in a much finer-grained matrix; secondary hornblende and epidote were also found. Another specimen was described as dark greenish-gray, mottled with dark red, having a brecciated appearance. The microscope showed that the red patches were fragments of acid porphyries in which phenocrysts of feldspar were contained in a ground mass almost entirely calcite and chlorite. The matrix of the graywacke consisted of fragments of feldspar cemented by calcite and chlorite. Another specimen was a dark greenish rock, the only distinguishable structure being an irregular cleavage of hornblende and light aphanitic rounded or subangular patches. A weathered surface of this rock was light colored and chalky, with distinct fine-grained patches. Epidote and magnetite were abundant.

Details of Practical Mining

Shaft-Sinking with Jackhamers

By Leroy A. Palmer*

At the Black Oak mine in the "Soulsbyville granite" near the Mother Lode, jackhamers have replaced piston machines in shaft-sinking with a reduction of costs, air consumption, etc. Delay-action exploders have also been of assistance in sinking this shaft.

To the miner of the Mother Lode and the adjacent districts "Soulsbyville granite" conveys a meaning that cannot be amplified by a wordy description. Many of them know it from experience and all by reputation. It is the name given to the rock in the vicinity of Soulsbyville, Tuolumne Co., Calif., in what is known as the "East Belt," lying a few miles to the east of the Mother Lode proper. This rock is a typical gray granite, shading into grano-diorite and containing intrusions of diorite. It is extremely hard.

The Black Oak mine is situated a mile from Soulsbyville in this granite area and is operated through a shaft which has just reached the 1900 level, work on sinking the sump being now in progress.

The shaft was carried to the 1600 level with piston machines; then it was decided to try jackhamers. Inasmuch as a careful comparison of the work of the piston machines in sinking from the 1500 to the 1600 with that of the jackhamers in sinking from the 1600 to the 1700 was in favor of the latter, the work was continued with the lighter machines. The piston drill was a standard type of 3-in. machine.

Four men were used on a shift in each case—in the one, on two piston machines, and in the other, each with a jackhamer—and it was found that the daily progress was increased approximately 25% by using the jackhamers. No attempt has been made to formulate a comparison of the air used but it is known that the four jackhamers consume less than the two piston machines.

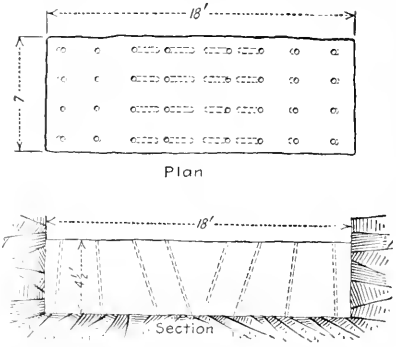
The shaft consists of two compartments and a manway, being 7x18 ft. overall and 5x15 ft. in the clear. It is on a very steep incline which averages from 65 to 70 deg. An ideal round, drilled to break 4½ ft., is shown in the illustration. It consists of 32 holes, two sets of cut-holes, eight to a set, and two sets of side rounds of the same number. The procedure is to put in the inner cut-holes, blast them and muck out before drilling the rest of the round. The outer cut-holes and the side rounds are then put down and if there is time, as is usually the case, another set of shallow cut-holes is drilled in the sump formed by shooting the first series of cuts. It has been found that this system of breaking the cut, then deepening the cut and shooting with the remainder of the round, has increased the progress of sinking about half a foot per round.

Drilling and mucking of the inner cut-holes is all done on one shift by four men. The next two shifts are given over to the muckers who clean out the shaft and get it ready for the drillers. The mucking shifts consist of two muckers and an engineer for the donkey hoist on each shift.

Of course the placing of the holes is varied to suit conditions as they are found in the shaft and it sometimes happens that as many as 35 holes are put down for the side rounds but the illustration shows a typical round. In all of the holes 60% dynamite is used.

The present arrangement of doing all drilling on one shift and mucking on the other two has been very satisfactory. It calls for a total of 10 men including an engineer on each of the two mucking shifts to hoist the broken rock from the bottom of the shaft to the 1600, where it is used for filling. The same headway has been made thereby as previously when there were four miners on each shift, drilling or mucking as occasion required.

The men are paid on a bonus system. The regular wages are $3.75 per day to one of the miners who acts as shaft



ARRANGEMENT OF HOLES IN BLACK OAK SHAFT

foreman, $3.50 to each of the other miners and the engineers, and $2.75 to the muckers. The miners each receive 25c. a day bonus for every month in which the shaft is sunk over 60 ft. and the muckers the same allowance for every day that they get the shaft cleaned out on time for the drillers to go to work.

During March, 1915, the shaft was sunk under the old arrangement of shifts, four miners on each shift drilling or mucking as the case might be. During this month the cost of sinking was $35.56 per ft. In April the shifts were rearranged, as noted, so that all drilling was done by miners on one shift and the shaft cleaned out by muckers on the following two shifts. For the first week under this arrangement of shifts the costs were brought down to $27.00 per ft. These are what the management refers to as "direct costs"; that is, cost directly chargeable to the shaft. They include timbering and hoisting from the 1900 to the 1600, but tramming on the 1600 is charged to stope filling. In view of the size of the shaft and the extremely hard rock in which it is sunk they can only be regarded as favorable.

*Mining engineer, 512 Custom House, San Francisco.

Several records have been kept of the progress in drilling with these machines. All measurements were taken during the regular progress of shaft-sinking and with one man doing all of the work in connection with his machine; in other words no attempt was being made to establish a record. Measurements taken in a very hard rib of grano-diorite in the south end of the shaft showed a drilling speed of from 1.09 to 2.13 in. per min. on holes from 2½ to 5 ft. in depth and at all angles from flat to nearly vertical; an average for four holes was 1.64 in. per min. Allowing 32 holes to a round, which is to break 4½ ft., it will be seen that with four machines there is ample time for shooting the center cut, mucking out, drilling the side rounds and shallow cut-holes. In this connection it should be borne in mind that the actual percentage of drilling time is greater with a machine of this type than with a heavier machine.

Of course it is understood that the efficiency of the jackhamer is not due to superior drilling speed but to the ease with which it is handled. Careful records made at the Buckeye-Belmont mine at Tonopah showed that the actual drilling time in sinking the shaft with piston machines was only 160 min. per 8-hr. shift. The men wasted no time but they spent two-thirds of the shift in getting ready to drill and then in getting ready to shoot. A certain percentage of this loss, such as connecting ventilating pipe, changing steel, loading, etc., will be practically constant under any conditions. But it will be found that the greater portion of the loss is chargeable to setting up, tearing down and shifting the machine from one set-up to another. All of this loss is avoided with the jackhamer, which weighs only 40 lb.; and when the shift is ready to shoot, each man simply takes his machine into the bucket with him and the whole lot is hoisted away.

At the Black Oak shaft, ventilation is accomplished by an 8-in. Sturtevant fan on the 1600 level and compressed air at 85 to 95 lb. by an Ingersoll-Rand two-stage compressor, 11x9-16 in., belted to a 150-hp. motor. Considerable water is found in the upper levels but the shaft is dry.

The Black Oak has also used the jackhamers to some extent for drifting. They were mounted on the shell of an old machine on a vertical bar. Two of them, with one man to each, made better progress with less air than two men with one 3-in. piston machine. Detailed records of these trials were not kept.

In connection with this shaft it is well to mention the use of delay-action exploders, to which the management is inclined to give much credit for the progress made, inasmuch as they have facilitated the firing of the shots. The "Ideal" delay-action exploder consists of a detonator, a time-fuse—whose length is chosen to suit the position of the hole—and an electric fuse-spitter to which is connected two copper wires. The detonator is placed in the cartridge in the usual manner and the copper wires attached to the fuses are connected in series, each end of the series being run to a wooden plug in a shallow hole at one end of the shaft. At these plugs connections are made with the two ends of an electric-light line brought down the shaft for this purpose. The exploder switch is in a locked box on the 1600 level, the key to the box being in the possession of the shaft foreman. There are no openings in the box for the wires leading down the shaft, so the door must be unlocked and opened before the wires are connected to their binding posts, and likewise they must be disconnected before the door can be closed. As a further precaution the switch is so arranged that the door cannot be closed unless the switch is open.

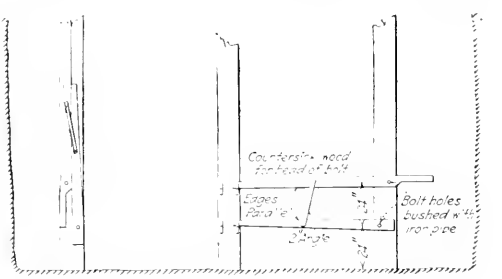
Thus the shaft men, after loading their holes and making the connections to the light line through the plugs, may leave the shaft leisurely. When the 1600 level is reached the shaft foreman goes to the switch box, opens it, connects the light-line wires to their binding posts and fires the round by closing the switch. Before he can close the door he must open the switch and disconnect the wires. Missed holes by this method are extremely rare; and it is certainly an improvement over spitting a round of holes with a candle or acetylene lamp, with the smoke so thick that one can hardly see, and then scrambling hurriedly into the bucket or up the ladder to reach a point of safety.

The writer acknowledges the courtesy of Roger Knox, superintendent, and J. H. Tate, engineer, of the Black Oak Mining and Development Co., in assisting in the collection of these notes.

Simple Folding Shaft Gate

By Fredlrick T. Teddy*

The simple shaft gate shown herewith has been in use for some time at the mines of the Tennessee Copper Co., Ducktown, Tenn. It has proved effective, as well as inexpensive in construction and maintenance. I suggested



A SIMPLE FORM OF SHAFT GATE

this gate as eliminating the undesirable features found in the usual gates that swing horizontally and others with counterweights that give more or less trouble.

The essential parts of this gate consist of two wooden rails and a short length of angle iron. The rails should be of hardwood, of 2x6-in. section, dressed on all sides and tapered to 3-in., one of the rails being longer, to provide a handle with which to raise the gate.

The gate is supported or hinged by means of lagscrews or bolts, and the bearing holes should be bushed with iron pipe. The diagonal tie iron should be a 2-in. angle section, and the spacing of the bolt holes in it must be the same as the straight-line distance between the supporting lagscrews. The corresponding holes in the bars must measure the same from the bushed bearings.

In erecting the gate it is preferable first to determine the position of the lagscrew or bolt for the top rail, and

*Mining engineer, Box 143, Ducktown, Tenn.

to swing the gate on it to the up position, bringing the lower bar parallel with the upper one, letting them incline backward a little. This fixes the position of the lower supporting screw. The gate may now be lowered and the brackets set in place.

Chart of Relative Values of Fuels*

In estimating the relative steaming values of fuels of different calorific values consideration must be given to the boiler and furnace efficiencies attainable. In any instance the equivalent evaporation in pounds of water evaporated from and at 212 deg. F. per pound of coal would be

B.t.u. per pound of fuel × *per cent. of efficiency* ÷ *latent heat of steam at 212 deg. F.*

The chart herewith has been prepared to save tedious calculations. Slanting straight lines represent the calorific value of fuel in thousands of B.t.u. per pound, each line being so drawn as to pass through points whose ordinates represent boiler and furnace efficiencies and whose abscissas represent the equivalent evaporation from and at 212 deg. F. per pound of coal.

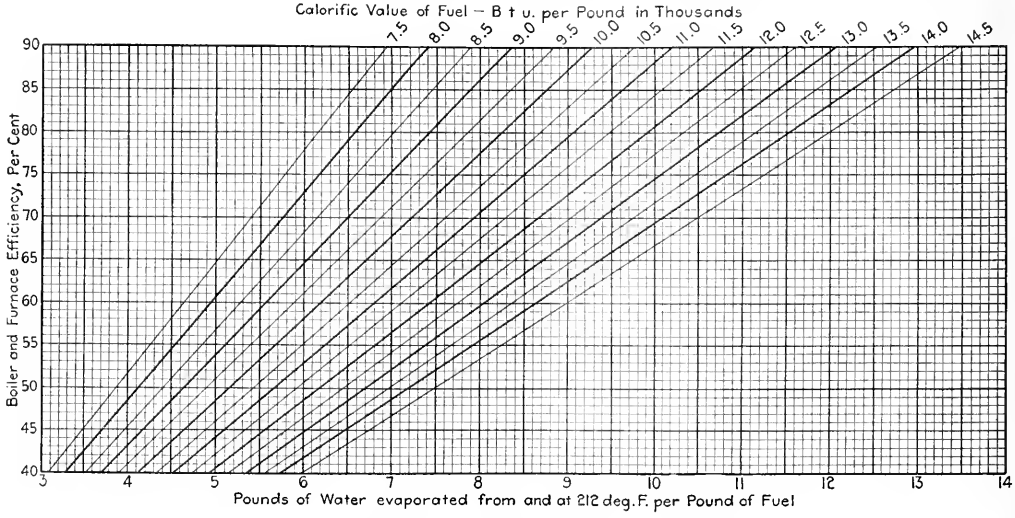


CHART FOR CALCULATING THE RELATIVE VALUES OF VARIOUS FUELS

To read the chart, start at the left-hand side at a given percentage of efficiency, as 70, and following along horizontally to the intersection with the inclined line representing the thousands of B.t.u. per pound of fuel, as 14, and then follow vertically downward to find the value 10.1 pounds of water evaporated from and at 212 deg. F. per pound of the coal, which for most practical purposes would serve the same purpose as the arithmetical solution,

$$\frac{14{,}000 + 0.70}{970.4} = 10.098$$

*By Richard A. Rover, in "Power" of Sept. 28, 1915.

Fuse Spitting with a Match

The following method of lighting a single black-powder time fuse is suggested by the United States Bureau of Mines as being more efficient than the old method of splitting the end of the fuse. The method is adopted when only one piece is to be lighted. It is not applicable when several pieces are to be lighted, as the time interval between ignitions would be too long.

A safety match is held against the powder core at the end of the fuse and the matchbox drawn across the match, causing the match and powder core to inflame immediately. It will be noted that this is just the reverse of the usual way of lighting a match—drawing the match across the box.

In case safety matches are not at hand, the ordinary household match can be used by placing one match against the powder core and then lighting another and quickly touching it to the first one.

It is believed that the method outlined, originated by W. C. Cope, of the explosives chemical laboratory of the bureau in Pittsburgh, as the result of experience obtained in the igniting of hundreds of pieces of black-powder fuse, will be helpful in quarrying and other outside work. It has the advantage of cheapness, as no fuse lighters are required.

Mullan Hand-Drilling Contest

The results of the double-hand drilling contest held at Mullan, Idaho, on Labor Day, were as follows:

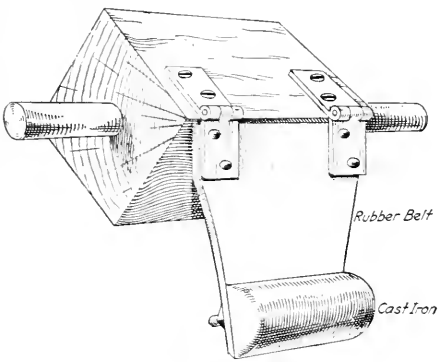
First place, Leaf and Kinsella, of the Tamarack-Custer mine, 30⅝ in.; second place, St. Germain and Stokes, of the Osborne, 28¼ in.; third place, Haff and Rosseman, of the Stewart mine, 27⅛ in.

The rock drilled in is granite. The first prize was $200. There are said to have been about 5,000 people in Mullan for the celebration.

Details of Milling and Smelting

A Simple Conveyor-Belt Cleaner

When ores are wet or when they are of a sticky, tenacious nature, they are likely to cause considerable annoyance by their tendency to cling to conveyor belts, refusing to be discharged at the proper point, but riding around on the belt in a continuous performance. A good many schemes have been tried in attempting to counteract this tendency—that is, to remove the ore from the belt as it passes the discharging point—but most of them have failed for one reason or another. Wire brushes have been tried, but they have a tendency to clog up and also to cut and destroy the conveyor belt. Scrapers are also dangerous, since they may occasionally catch in a small snag in the belt and are likely to ruin it utterly. At the Gold Hunter mill, near Mullan, Idaho, a contri-



THE CONVEYOR-BELT CLEANER

vance has been devised, however, which seems to have been entirely successful.

The appliance consists of a square wooden block with a hole through it, the block being mounted on a shaft and acting like a pulley. Fastened to one of the corners is a strap hinge with its free end bolted to a piece of rubber belt at the end of which is fastened a small half-circular iron casting. The idea is that this pulley revolves fast enough to keep the belt standing out from the pulley far enough to strike the conveyor belt at every revolution. The round casting face hits the conveyor belt a sharp rap, jarring loose whatever ore or clay may be sticking to it. Owing to the presence of the hinge, after striking the conveyor belt the piece of belting with its attached casting falls back against the square face of a pulley, avoiding all dragging or rubbing on the conveyor. Since the blow struck the belt is sharp and sudden and does not drag or wipe the belt, no damage results to it and there seems to be no objection whatever to its use. The appliance is mounted over the ore bin into which the conveyor belt discharges, thus insuring that all of the ore is delivered at the proper point.

Rotary Kilns for Desulphurizing and Agglomerating

Rotary kilns have been used for the preparation of iron ores for blast furnaces for a decade or more, but during the last few years they have been introduced also into copper metallurgy. The design and application of such kilns for the desulphurization and agglomeration of iron ores are discussed[1] by Samuel E. Doak, and while his remarks apply mainly to the treatment of pyrites cinder and other fine iron ores, they nevertheless contain a record of practice that might profitably be considered by the copper metallurgists.

In the case of lump or fine iron ores carrying not to exceed from 6 to 7% of sulphur, the desulphurization can be combined with agglomeration, provided the kiln is sufficiently large. The process is a simple roasting, with the addition, in the case of fine ores, of a nodulizing or agglomerating operation, performed near the discharge end of the kiln, at a higher temperature than is necessary for the desulphurization. If the kiln is not forced beyond its capacity, there is no difficulty in reducing the sulphur to less than 0.5% in the finished product. (In modern practice the sulphur content of the pyrites cinder is rarely as great as 6, and seldom lower than 1½%.)

As far as the desulphurizing action is concerned, the principal caution to be observed is not to allow the kiln to get too hot at the back end. To get a dead roast, the operation should be gradual and the heat should range from a barely perceptible dull red at the feed end to a bright yellow at the discharge end. When the ore is too hot in the center of the kiln, there seems to be a tendency to hinder desulphurization, probably on account of an almost imperceptible glazing of the particles, that renders them impervious.

For this reason it is important that the roasting should be complete before the nodulizing begins, since for the success of the latter the ore should be sufficiently pasty to ball up. This pastiness, however, should never be carried to a point where there is any flow of the cinder, and in fact should never be visible in the kiln. A bright-yellow heat is sufficient for the nodulizing, and it is well to keep the zone of agglomeration as near the discharge end of the kiln as possible, 15 ft. being sufficient length for the operation in any kiln not over 100 ft. long. For this reason a short flame is desirable. At present the rotary kiln owes what popularity it possesses to its nodulizing feature, in spite of the fact that it is a cheap and efficient roaster, and that it is much more successful as a roaster working on coarse than on fine ore.

The one great obstacle now in the way of continuous operation of rotary kilns, is the formation of rings caused by the cinder becoming hard enough to stick to the lining. The ring usually forms in the 15- or 20-ft. nearest the discharge end of the kiln and gets an

[1] "Bulletin of A. I. M. E.," September, 1915.

excessive amount of weight upon that end. Many devices have been tried to prevent the formation of the ring or to remove it without stopping the kiln, but none of them has been thoroughly successful. The best plan, according to Mr. Doak, is to shut down the kiln when the ring becomes too large, cool it off with water, and cut it out with bars and picks. The formation of the ring can be postponed by keeping the conditions of temperature, speed and feed from fluctuating. [Chains dragging in the kiln have also been used to prevent the formation of the ring.—EDITOR.]

Mechanical difficulties, so common when rotary kilns were first used for the treatment of iron ores, have been practically eliminated. The most important points to be observed to insure continuous operation are to make the kiln sufficiently strong (reinforcing it especially under the tires) and to keep the operating machinery well protected from dust. The tires should always be kept tight to the shell, since, if any play is allowed, the bolt holes will gradually become enlarged and the kiln will bear down hill so strongly that it will frequently break its thrust bearings. At least 1 in. of additional metal should be put around the shell under the tire. With the larger kilns, a 9-in. firebrick lining is used, while for kilns of 5 or 6 ft. diameter a 4½-in. brick is satisfactory.

The size and shape of the ore particles, the depth of bed, condition of lining and size of the kiln—all have an effect upon the speed or progression of the charge in the kiln. Any type of cinder can be treated satisfactorily in kilns from 80 to 100 ft. in length, turning at a speed of from 1 revolution in 60 sec. to 1 in 90. The greater length is safer in treating all fine high-sulphur cinders, since it greatly reduces the chances of a poor product through careless supervision.

CAPACITIES UNDER DIFFERENT CONDITIONS

The tonnage output of a kiln varies greatly with the kind of cinder charged. A kiln 60x5 ft. with 4½-in. lining will treat 1,500 tons a month of low-sulphur lump ore, while on high-sulphur fine it will with difficulty take care of 750 tons. A kiln 85x7 ft. will handle 3,000 tons of high-grade cinder per month and 1,500 tons of the poorest grade, while a kiln 100x8 ft. will treat from 4,500 to 2,500 tons, depending on the quality of cinder. A kiln 85x8 ft. could handle almost as much as the 100-ft. kiln, but at a greater fuel cost. In general the larger kiln will have the lower fuel cost, and the fine domestic ores will need less coal on account of their higher sulphur content. In a 60x5-ft. kiln the fuel consumption averaged for several months about 12% by weight of the roasted ore.

It has been the custom arbitrarily to connect a certain diameter with a certain length of kiln. A 60-ft. kiln is usually 5 ft. in diameter; 80- and 85-ft. kilns are 6 or 7 ft. in diameter, and a 100-ft. kiln is ordinarily 8 ft. in diameter; but it would frequently be more economical to proportion the kiln in a less haphazard way than by accepting the builder's standard design. The two determining factors should be the output desired and the quality of ore to be roasted. The output is dependent upon the dimensions of a cross section of the bed of ore that can be carried in the kiln, the speed of revolution and the slope of the kiln. The slope of the kiln can be left out of consideration, however, as good practice places it at ¾ in. per ft. Increased or decreased output can better be obtained by changing either of the other variables than by changing the slope of the kiln. Speed control is now a feature of the design of every kiln, so that this factor may be adjusted to the most satisfactory point after the kiln is in operation.

The question of output, then, so far as the kiln design is concerned, is determined by the width and depth of the ore bed. In general the latter can be increased with the length of the kiln, since the length of time it takes the ore to pass through the kiln will be greater as the kiln is longer, all other things being equal; but the increased capacity due to length will not be great, since without changing the diameter the ore bed cannot be increased to any considerable extent without harming the roasting process, for which a continual and complete stirring and overturning of the ore bed are necessary. Too great a depth of ore bed prevents this. It seems most reasonable to base the length of the kiln entirely upon the time necessary for desulphurization and agglomeration, and to control the output by the diameter.

OPERATING COST LARGELY RESULT OF LAYOUT

The cost of producing a ton of roasted ore, aside from the cost of the raw cinder, depends chiefly on labor. Two men on a shift should be able to take care of a well designed plant producing up to 100 tons in 24 hr., while in a poorly designed plant this number might easily reach 4 or 5. On a small kiln, 60x5 ft., the labor cost per ton on high-sulphur fine cinder averaged 40c. for several months, and with the same kiln using high-grade lump cinder this figure was reduced to 30c.; both figures, however, were excessive, not only on account of faulty design that made necessary 3 or 4 men on a shift, but also on account of a low output per man, because of the small size of the kiln. Repairs and supplies should not cost over 8c. per ton of roasted ore. The cost of operation of a rotary kiln will be determined almost entirely by the layout of the plant.

Hybinette Leaching Process for Copper Ores

In a recent patent (U. S. No. 1,122,359) covering the leaching of copper ores, N. V. Hybinette, of Christiania, Norway, states that sulphide copper is readily soluble in solutions containing 15 grams of ferric iron per liter, while it is insoluble in solutions containing under 10 grams per liter. At 15 or even 20 grams per liter the ferric compounds do not interfere so seriously as to necessitate using tanks with diaphragms. Mr. Hybinette, therefore, roasts the ore so that about 25% of the total copper is present as sulphide compounds insoluble in 5% HNO_3. A solution containing about 30 grams of total iron and 30 grams of copper as sulphates and about 60 grams of free sulphuric acid is provided. This solution continually circulates between the electrolytic cells and the leaching tanks. The cells are provided with lead anodes, but have no diaphragms. So long as the inflowing solution carries about 30 grams of copper per liter and the effluent about 20 grams, the ferric iron will be present in the proper amount. A portion of the solution is periodically withdrawn, completely precipitated, and discarded, so that the total iron may never rise above 35 grams per liter.

Company Reports

El Oro Mining and Railway Co., Ltd.

The directors of El Oro Mining and Railway Co., Ltd., report under date of July 24, 1915, that no accounts have been received from the mine for a long period, so that it is impossible to give the usual statement of the net realized profit for the year ended June 30. Owing to repeated occupation and evacuation of the town of El Oro, accompanied with more or less plundering each time, on Feb. 27 out of the normal population of 25,000 Mexicans, less than 100 remained. Consequently it was with difficulty that enough men were obtained to keep the mine pumps in operation. This, however, has been done, and the directors are advised that enough men have been available to keep the mine unwatered, to continue sinking the deep ventilating shaft and to maintain the various levels of the mine in good condition.

They are also informed that notwithstanding all disturbances no serious loss has been sustained and no material damage done to the mine and reduction works. On the other hand, the rolling stock of the railway has suffered somewhat and some looting has taken place among the houses of the company's staff, though this has not reached serious proportions. The directors say that they are unable to predict when operations at the mine will be resumed. At this time nothing of this nature can be contemplated. It is not, in their opinion, in the interest of the shareholders to order such resumption until they are fully satisfied that the works can be kept in operation without fear of further interruption.

Jumbo Extension

The Jumbo Extension Mining Co., Goldfield, Nev., for the year ended June 30, 1915, reports a profit of $339,373 from the treatment of 16,420 dry tons, averaging $45.76 gross value per ton. Of this tonnage 5,547 dry tons were milled, having an average gross value of $14.55 per ton; the loss in tailings was $8.53, and on concentrates 15c. per ton, making the net recovery $5.87 per ton on milling ore. Shipments to smelters aggregated 10,873 tons having a gross value of $61.58 per ton; smeltery losses were $4.71, making settlement on the basis of $56.87 per ton recovery. The average value realized on both grades of ore was $39.64 per ton, and all costs were $18.97 per ton, making the net realization from operations average $20.67 per ton. Costs consisted of the following charges: Mining, $3.12 per ton; development, $3.51; milling, including freight, royalties, and marketing concentrates, $1.05; freight and treatment on ore shipped, $7.29; freight and treatment on concentrates shipped, 24c.; general expenses, etc., $2.39; bullion taxes, 32c., and construction and equipment, $1.02 per ton.

The report states that the present exposures justify an estimate of 86,750 tons of ore in reserve. This estimate is made up of 19,500 tons of shipping ore, 35,750 tons of milling ore and 1,500 tons of mill ore on dumps. It is thought that the shipping ore should average about $11 by mine sample and the mill ore $7 by mine sample. The ore in the dump by mine sample runs $8.67 per ton. It is stated that the prospects for further development of ore are extremely good. The company had a cash balance of $120,533 on hand at the end of the year after paying $125,317 in dividends. The cash balance at the beginning of the year was $29,099. The company now has side-line agreements with the Booth, Goldfield Consolidated and Merger Mine companies. There are now 1,500,000 shares of stock issued.

Colorado Fuel and Iron Co.

The report of Colorado Fuel and Iron Co., owning coal and iron mines and lands in Colorado, New Mexico and Wyoming and steel works in Colorado, covers the year ended June 30, 1915. The fixed liabilities at the close of the year were $34,235,000 common stock, $2,000,000 preferred stock and $84,310,500 bonds. The only change from the previous year was a decrease of $83,000 in bonds.

The statement of production for two years past is as follows:

	1913–14	1914–15	Changes
Coal mined	2,428,992	2,329,069	D. 99,923
Coke made	535,274	520,261	D. 15,013
Limestone quarried	376,226	344,033	D. 32,193
Iron ore mined	614,039	441,026	D. 173,013
Pig iron made	268,883	286,661	D. 17,778
Finished iron and steel	352,929	324,600	D. 28,329

Of the coal mined in 1915, commercial sales took 816,228 tons; 561,775 tons were used at the company's plants; and 921,016 tons were used in making coke, showing a consumption of 1.77 tons to the ton of coke.

The earnings for the year were as follows:

	Earnings	Expenses	Net
Iron department	$10,885,451	$9,016,133	$1,869,318
Fuel department	5,692,589	5,796,848	*104,259
Total	$16,578,040	$14,812,981	$1,765,059
Total, 1914	17,803,025	16,729,255	1,073,770

*Deficit

Income from interest and other sources was $495,012, making a total of $2,261,101. The charges for interest and taxes were $2,319,121; sinking fund and miscellaneous, $122,146; equipment renewal, $80,000; insurance, personal injury and sociological work, $74,195; total, $2,595,762, leaving a deficit of $334,661 for the year.

President Welborn's report says:

The reduction in sales was due to a curtailment in the consumption of coal in all of that territory supplied from Colorado and to lighter purchases of steel by railroads. There is little promise of improvement in buying by railroads during the current fiscal year, and we do not anticipate a volume of rail business that will keep the rail mill operating to more than 50% of its capacity. The summer demand for coal has not been up to normal, and while some improvement is anticipated in the near future, it is not believed that the business will be such as to enable us to work all of our mines to their capacity, even during the winter months. During the period of reduced consumption of coal, extending now over two years, development of new coal properties in Colorado has

continued, with the result that the productive capacity of developed mines producing domestic coal in the state is at least twice the present demand and far in excess of the prospective demand for some years. Our coal properties have been kept in good physical condition and are able to respond to whatever demand may develop, though with the increase in the number of mines operated by others, our participation in the business offered will naturally be on a reduced basis.

A plan of coöperation between the company and its employees, providing for the adjustment of differences and the consideration of other matters of common interest, through representatives selected by the workmen, has been inaugurated at the coal mines. In its formative state this plan has proven to be mutually beneficial, and its further development is anticipated in the near future.

Continued attention has been given to matters affecting the working and living conditions of the employees. Additional safety devices have been installed, and constant vigilance is being exercised to prevent accidents. Many new houses of modern type have been built, and old houses repaired and repainted as needed. At most of the camps a large percentage of the houses have been fenced, inclosing ample yards, which many of the tenants have beautified with lawns and gardens; this work of fencing will be continued until, as far as practicable, all houses have been inclosed.

Tonopah Extension

The Tonopah Extension Mining Co., Tonopah, Nev., for the year ended Mar. 31, 1915, reports a profit of $596,891. Of this amount $283,026 was paid in dividends, $123,110 expended in additions to mill and mine plant and $190,755 added to the company's cash assets. There were mined and treated 11,882 dry tons of ore, containing 2,022,220 oz. of silver and 19,040 oz. of gold, or an average of 28.13 oz. of silver and 0.264 oz. of gold per ton. Of this metal content 1,790,031 oz. of silver and 17,584 oz. of gold were recovered. The receipts from the sale of this product totaled $1,285,508, with silver at 51.507c. per oz. and gold at $20.67 per oz. The following table gives the cost of production per ton of ore before crediting interest receipts and miscellaneous earnings:

Mining costs, including all development work	$5 191
Milling costs	3 753
Metal losses in milling	2.082
Marketing costs, express	.101
Marketing costs, refining	.349
Total cost	$11 476
Profit per ton	8 490
Gross value of ore per ton	$19.966

Development work amounted to 12,651 ft., making the total development in the mine to date 84,421 ft. The milling capacity was increased from 150 to 250 tons per day by the addition of 2 batteries of 5 stamps each, 2 tube mills with Dorr classifiers, 8 Wilfley tables, 2 Dorr thickeners, 5 agitators, and 9 zinc boxes.

Chief Consolidated

The report of the Chief Consolidated Mining Co., Eureka, Utah, for the half-year ended June 30, 1915, shows a net profit of $17,019 from operations after payment of all charges. A total of 11,865 dry tons of ore was shipped, which yielded $115,712 after payment of transportation, smelting and sampling charges. The average gross value of this ore per ton was $21.78; freight, smelting and sampling charges amounted to $10.65 per ton, and the net value per ton was $11.13. The metal contents of the ore consisted of 2,322,026 lb. of lead, 267,093 lb. of zinc, 112,011 oz. of silver and 2,669 oz. of gold. Development work for the period aggregated 2,629 ft., of which 1,902 ft. were drifts. The treasurer's report shows a balance of $211,953 on hand.

North Butte

The report of the North Butte Mining Co., Butte, Mont., for 1914 shows a production of 18,421,761 lb. of copper, 1,092,300 oz. of silver and 1,107 oz. of gold. These metals were produced from 337,372 dry tons of ore and 43 dry tons of precipitates. The following sales of metals were made during the year: 21,868,479 lb. of copper at 13.7436c. per lb.; 1,377,297 oz. of silver at 55.881c. per oz., and 1,107 oz. of gold at $20 per oz. During April and May a leaner grade of ore than had heretofore been mined was encountered, and following good mining practice, it was necessary to extract and treat this ore. This, together with labor troubles at Butte and the reduction of output at the beginning of the war, was the cause of a decrease in production as compared with 1913. The cost of producing copper was 11.505c., as shown by the following table:

COST PER POUND OF COPPER

	Cents
Mining and development	7.424
Construction	.016
Freight on ore	.224
Concentrating, smelting, freight on bullion, refining, selling, etc.	6.879
General miscellaneous expense and taxes	.257
Total	14.800
Less value of gold and silver and miscellaneous income	3.295
Net cost	11.505

The mine shipped 343,314 tons of wet ore and 71 tons of precipitates. The mine was operated 309 days, with an average of 767 men. An average of 1,111 tons was hoisted per day. The financial statements show that $558,215 was made as profit and that dividends aggregating $635,000 were paid.

Butte & Superior

The report of the Butte & Superior Copper Co., Butte, Mont., covering the quarter ended June 30, 1915, shows a profit of $2,107,152 compared with $1,163,156 earned during the first quarter of the year. The net value of the zinc concentrates at the mill was $2,509,229; net value of lead concentrates and residues at mill, $230,294, and miscellaneous income, $11,899—making the total net value $2,751,423. The operating costs were $644,270, leaving the profit as stated. These profits were calculated on spelter prices of 10.364c. per lb. for April, 12.106c. per lb. for May and 15.961c. per lb. for June, an average of 12.683c. for the quarter.

The mill treated 124,080 dry tons of ore, averaging 11.003% zinc and 8.067 oz. silver per ton. There were 35,840 tons of zinc concentrates produced, averaging 52.706% zinc, making 37,780,020 lb. of zinc in the concentrates. The average silver content in the concentrates was 22.714 oz. per ton. The mill recovery on the basis of total zinc recovered in the concentrates was 89.536%. The total cost per ton for mining and milling was $5.1924, made up of $3.3816 for mining and $1.8108 for milling. It is stated that new development work has blocked out new ore in an amount substantially equivalent to the amount mined. The company is now free from bonded indebtedness.

The Pioneer Consolidated Mines Co., Pioneer, Nev., reports that all is running smoothly at the mine and mill. Considerable new development work is being started and the mill will be operated 16 hr. a day. It is stated that the mine is in a position to produce an average grade of $10 mill ore.

Arizona Copper Miners' Strike

SYNOPSIS—The strike of operatives in the Clifton-Morenci district has developed into the usual exhibit of lawlessness. Three managers were arrested without any basis for real charges and through a process which was a travesty on law.

The strike of the employees in the mines and surface plants of the copper-mining companies in the Clifton-Morenci district of Arizona has progressed from a rather unpretentious beginning to a situation that at the present time is extremely serious. Becoming general on Sept. 12, the strikers tied up the mines and reduction plants of the district and violence has been unchecked. Agitators from the Western Federation of Miners have been largely instrumental in stirring up the men, while Mexican agitators have performed their share among those of their color.

According to the statement of Walter Douglas, general manager for Phelps, Dodge & Co., the strike was called on Sept. 11 by the Western Federation of Miners. "Bodies of men, principally Spanish and Mexicans, prevented the men that so desired from going to work. Pickets were immediately placed in mines, converters, power houses and smelters, and the companies' officers were refused permission to enter. The companies immediately withdrew all their watchmen and called upon the sheriff to protect their property. Only through direct orders from the state Corporation Commission to the sheriff was it possible to start up the electric plant to furnish light to the town, Morenci being in complete darkness for three nights.

"The strikers refused to permit mine pumps to be operated or drawn or to allow machinery to be cared for or belts taken off for their preservation. They even forbade the mules being fed or hoisted to the surface, until persuaded by the sheriff to allow them to be taken from the mines.

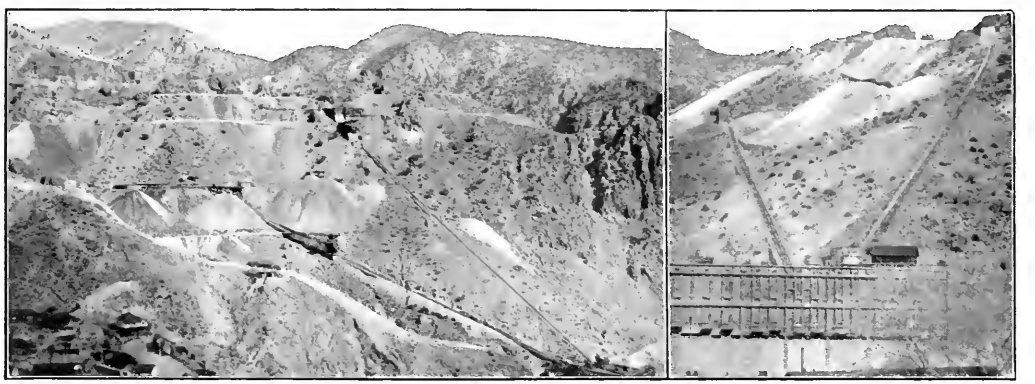
"The wage question is simply a pretext for the unionizing of a camp that in the past has never discriminated against any man on account of his affiliation. On the sliding scale introduced four months ago, labor of all classes has been receiving higher pay than ever before, nor has there been any grievance or complaint on this score.

"The Western Federation of Miners, aiming at political domination of the state, has introduced its agitators and organizers into the district, knowing that Mexican workmen are easily led and more easily intimidated, and has exercised its arbitrary and despotic methods to bring suffering and loss on a formerly happy and contented community.

"As regards the matter of wages, Americans, constituting about 30 per cent. of the employees and occupying positions of trust and skill, receive the same pay as in other mining camps of the Southwest, while miners and unskilled laborers are composed largely of Mexicans and Spaniards, whose wages exceed those paid for similar labor elsewhere.

"The Morenci-Clifton-Metcalf district comprises the highest-cost mines of the state, the copper of the largest producer costing nearly 13c. As the average price for copper for the last 10 years is less than 14c., it is obvious that they can hardly earn interest on their investments and equally obvious that it is commercially impossible to increase wages and continue operations."

In this connection it is interesting to note the accompanying table, which sets forth a comparison between the costs under the prices paid at the present time and the wage scale insisted upon by the Western Federation of Miners. It is to be remembered that the Western Federation of Miners bases its scale of wages on 13c. copper or lower. The present sliding scale is designed to prevail when copper is above 13c.



METCALF MINE OF ARIZONA COPPER CO., AT METCALF, ARIZ., SHOWING A PART OF THE DISTRICT WHERE STRIKE CONDITIONS NOW REIGN

DETROIT COPPER MINING CO. WAGE SCALE AND WESTERN FEDERATION OF MINERS' SCALE

Based on Wages Paid Last Half of July and First Half of August, 1915

	Detroit Copper Present, 13c. Cu	Western Fed. of Miners, 13c. Cu	Detroit Copper Present, 18c. Cu	Western Fed. of Miners, 18c. Cu
Mines	$58,462	$91,356	$67,091	$108,074
Concentrating	16,829	20,898	19,529	24,752
Smelting	7,944	10,057	9,092	11,897
Mechanical	7,749	8,925	8,[illegible]	10,558
Miscellaneous	4,518	4,876	4,943	5,052
Per month	$95,502	$136,112	$103,[illegible]	$160,303
Per year	$1,146,024	$1,633,344	$1,241,8[illegible]	$1,923,636
Difference per year	$487,320		$681,78[illegible]	
Difference between present 18c. rate and Western Federation of Miners' minimum per year				$318,492

According to these figures the difference per year for the entire district would be about $2,000,000.

The accompanying schedule shows the demands made by the Western Federation of Miners upon the copper companies operating in the district.

1. Reinstatement of all men discharged since Sept. 1, 1915.
2. Reinstatement of all men who went out on strike, with no discrimination because of membership in any society, association or organization, either now or at any other time.
3. Eight hours' pay per day.
4. Hospital board free to employees.
5. Wages asked for herein are based on 13c. copper or less.
6. Present sliding scale shall prevail when copper is above 13c.
7. Abolition of doctor's examination.

MINIMUM WAGE SCALE FOR CONCENTRATOR MEN

1. Construction department. Laborers, $2.50
2. Swampers in mill, screen men—wet and dry—sweepers in bins and crushing plant, $3.
3. Table operators, vanner operators, table repairmen, vanner repairmen, $3.50.
4. Sample men, $3.25.
5. General repairmen, $3.75. General repair helpers, $3.
6. Flotation machine operators, $3.50.

MINIMUM WAGE SCALE FOR SMELTER

Nothing Under $3 in the Mill

1. Skimmers, $4. Helpers, $3.25 Punchers, $3.25.
2. Electrical department: Cranemen, $4.25. Copper man, $3.
3. Slag engineers, $4.25. Copper weighers, $3.75.
4. Feeders, slag tappers, matte tappers, $3.50. Helpers, $3.25.
5. Repairman, $4.25. Helper, $3.25.
6. Converter punchers, $3.25. Crane swamper, $3.
7. Wheelbarrow men, $3. Slag-train brakeman, $3.
8. Other laborers, $2.50.

MINIMUM WAGE SCALE FOR MINES

Nothing Under $3 Underground

1. Miners, $3.50. Timbermen, $3.75. Shaft men, 50c. advance over scale.
2. Contract miners shall receive at least miners' wages.
3. Motormen, cagers, skip-tenders, $3.50.
4. Track men, $3.75. Tool nippers, $3.
5. Muckers, trammers, top-landers, and other laborers, $3.
6. Hoist men, single-drum, $4.25; double-drum, $4.50.
7. Pumpmen, $4. Tool sharpener, mine blacksmith, $4.
8. Samplers, $3.50. Surface laborers, $2.50.

MINIMUM WAGE SCALE FOR THE FOLLOWING CRAFTS

Machinists	Carpenters	Pipefitters
Boilermakers	Carmen	Power-house employees
Blacksmiths	Patternmakers	Electricians
Molders	Coppersmiths	Electrical operators

1. That $4.25 be the minimum wage for the following crafts.

Machinists	Coppersmiths	Carpenters
Boilermakers	Pipefitters	Electrical operators
Blacksmiths	Molders	

2 Boilermaker laying out the work to receive 5c. per hour more than the above scale.

MINIMUM WAGE SCALE FOR OTHER CRAFTS

Electricians, shift men	$4 75	Firemen	$3 50
Day electricians	4 25	Oilers	3 00
Electrician helpers	3 50	Patternmaker	5 00
Engineers	4 56	Car repairers	3 60
Switchboard operators	4 00	Wiper	2 50

3. A competent boiler-shop foreman.

MINIMUM WAGE RATING FOR HELPERS

Boilermaker helpers	$3 50	Machinist helpers	$3 50
Blacksmith helpers	3 50	Pipefitter helpers	3 50
Molder helpers	3 50	Car repairmen helpers	2 50

After considering these demands the companies, after consultation, decided to refuse them and the following letter was addressed to the strikers:

To the Committee representing the former employees of the Arizona Copper Co., Ltd., the Detroit Copper Mining Co. of Arizona, Shannon Copper Co.:

Gentlemen—In answer to your representations we beg to call your attention to the fact that these companies have seen their properties closed down and their operations tied up completely by a strike called by the Western Federation of Miners and this without any presentation of grievances. Our former employees have been persuaded by agitators of the Western Federation of Miners coming from outside of this district that the past pleasant relations and the present rate of wages should be radically changed.

In view of these facts and notwithstanding that the companies are convinced that a large number of their old employees desire to continue to work under the conditions formerly existing in this district, they realize that any attempt to recommence under such conditions would be to invite violence and intimidation. Therefore the managements of the Arizona Copper Co., Ltd., Detroit Copper Mining Co. and Shannon Copper Co. desire to notify the committees and the people of the Clifton-Morenci-Metcalf district that their mines and plants will remain idle indefinitely.

When it shall appear that conditions in this section warrant it and the companies are satisfied that the general sentiment of the community and their former employees is unanimously in favor of a resumption of operations on the basis of wages and conditions which have prevailed heretofore in this district, the companies reserve to themselves the right to decide whether or not they will again start up their plants.

Our attitude in this matter is based solely on the dominant influence of the Western Federation of Miners in this district at the present time, and when this influence is dissipated we may take a different view of the situation.

THE ARIZONA COPPER CO., LTD.,
By Norman Carmichael, General Manager.
THE DETROIT COPPER MINING CO. OF ARIZONA,
By M. H. McLean, General Manager.
SHANNON COPPER CO.,
By J. W. Bennie, General Manager.

After the receipt of this reply conditions continued to grow worse, violence being threatened on every hand by the strikers.

It is stated that Western Federation agitators had been trying to create a disturbance for some weeks prior to the calling of the strike, but with little success. To oppose these efforts, satisfied employees had circulated a petition announcing their satisfaction with conditions and asking that the camp be not unionized. Upon learning of this petition the Federation officials called the strike immediately, to forestall the submission of the petition which had already received about 600 signatures.

ACTIVITIES OF ARIZONA'S GOVERNOR

An interesting development was that after two days spent in Clifton and Morenci, taking testimony of mine managers and employees, Governor Hunt and Adjutant-General Harris left Thursday evening, Sept. 30, for Phoenix. The meeting was held late Thursday at Clifton, at which more than 300 persons were present. The announcement made by the governor afterward was: "I find conditions existing here that require adjustment. I feel that men who have charge of these great works will be amenable to reason, and I believe they will meet you on common ground. When I come back to this community and have to bring troops, the principal officers of the companies will be no different from the poorest Mexican they control. I hope all of you realize that I am going to have order if I have to call on every troop we have in Arizona. I do not want to come to this district except to bear the olive branch of peace, but if war comes you will have to abide by war. There never was a condition but that it could be improved, and I feel that employers and employees can get together, and if they cannot get together peacefully, they will have to get together some other way, because I am going to see you people get together some way, if I have to put every one of you in the bull pen."

After this remarkable effusion of frothy pother, the governor left the district, apparently assuming that he had settled the whole thing. The report is being circulated that the mine managers told the governor that as soon as the Western Federation organizers left the camp, there would be no difficulty in reaching an amicable agreement. There is no record, however, that the governor paid any attention to their remarks.

The change in conditions is shown clearly by the accompanying telegram, which was sent from Morenci Saturday evening: "Great demonstration in front of Norman Carmichael's office this morning. Master Mechanic Dawson was assaulted and made to march in front of mobs bareheaded. Dawson was very cool and was finally taken to jail by the sheriff. Mobs carried banners with violent inscriptions—'Down with the managers; they are too proud to be employees, but not too proud to lie to us;' 'We will fight before we starve;' etc. Strikers feel much stronger in their position since governor of Arizona's visit, which has had bad, very bad effects. Governor of Arizona's statement, which you have, was greatly tempered by newspaper reports, which beat him to it.

"We believe Norman Carmichael to be in great danger. On that account manager of Shannon Copper Co. proposes that managers leave district tonight. This will be done provided Carmichael can find opportunity to escape; demonstration in progress here now; about 2,500 men; banners more suggestive than those of this morning; am going to Clifton to insist that Norman Carmichael leave; will return to Morenci and arrange to leave myself a little later. There is not any mistake about danger to Norman Carmichael's life. Absolutely no protection for anyone."

(Signed) M. H. McLEAN.

The suggestion of the telegram, that the managers leave Clifton, was followed. They left on a blind locomotive and succeeded in reaching Lordsburg, N. M. Norman Carmichael, of the Arizona Copper Co., Milton McLean, of the Detroit Copper Co., and J. W. Bennie, of the Shannon Copper Co., were the three who escaped. Upon their arrival at Lordsburg they were immediately placed under arrest by Sheriff H. C. McGrath, Deputy Sheriff Joe Larrieu, of Clifton, swearing out a warrant charging them with being fugitives from justice. It was reported that Sheriff Cash, of Greenlee County, Ariz., was *en route* to Lordsburg, bearing a felony warrant. The managers expressed a desire to remain under the protection of the New Mexican authorities, fearing personal injuries at the hands of the strikers.

Mine Managers Reach El Paso

The warrant for the arrest of the three managers was sworn out by a Mexican laborer and the charge was inciting riot. A justice of the peace discharged them for lack of evidence.

The fleeing mine managers reached El Paso late Sunday and issued this statement:

"The incidents of the day and the temper of the strikers were such yesterday that the managers and disinterested observers were of the unanimous opinion that there would be bloodshed within 24 hr. if the managers did not withdraw themselves from the district; that their presence was a constant and increasing source of irritation to the strikers just as the presence of nonresident federation leaders was an irritation to the managers. Notwithstanding that the sheriff is carefully guarding the properties of the companies, the district is in the absolute and complete control of the Western Federation of Miners. Therefore there was nothing left for the managers to do and they could serve best their respective companies and the state by removing themselves from the district. Troops ought not to be needed now."

It is further stated from Phoenix, under date of Oct. 3, that Adjt.-Gen. C. W. Harris and 18 militiamen started at night for Clifton, to preserve peace in the strike of the miners there. The militiamen were ordered to Clifton by Governor Hunt on receipt of an appeal from Sheriff Cash, who said he feared the situation was beyond his control. Cash said the managers of the copper companies had abandoned the district and that the strikers were parading the streets and making demonstrations. He feared that serious trouble would result.

Thomas Simpson and Mike Penn, engineer and fireman respectively of the engine upon which Messrs. Carmichael, Bennie and McLean escaped from Clifton, were severely beaten by the mob upon their return from the trip. They escaped further punishment by getting away in a fast automobile.

A telegram received at New York on the morning of Oct. 6, from Milton McLean, manager for the Detroit Copper Co. is as follows: "Situation at Morenci steadily growing worse. Eight explosions of dynamite at Arizona Copper Co. mill last night. No damage reported. Terrifying town. 150 leaving tomorrow morning, 70 by order of men on strike and County authorities. The number steadily increasing. Western Federation of Miners leaders say explosions are work of company men. They will make their headquarters Hotel Morenci and say they will occupy my house. Arizona Copper Co. general office and drug store stoned. Stores promised protection which is doubtful."

New Jersey Iron Mines Prosper

Continued demands for munitions, according to the New York *Times*, have created a demand for products of the mines in Morris County, New Jersey, foremost among these being the Empire Steel and Iron Co. at Mount Hope and the Thomas Iron Co. at Richard Mine. The former is shipping about 17,000 tons of ore a month, and the latter about 6,000 tons. The Thomas Iron Co. has also purchased the stock on bank of the Hough Mining Co. at Wharton, and this is being shipped to the company's furnaces at Hellertown, Alburtis and Catasauqua, Penn.

Much of the ore mined by the Empire Steel and Iron Co. at Mount Hope is being shipped to the Bethlehem Steel Co. Notices were posted on Oct. 1 at the office of the Thomas Iron Co., advising the employees of a 10% increase in wages. The average wage before this morning's announcement was: For drill runners, $2.20; for pump men, $2, and for laborers, $1.93 for an eight-hour day.

Clifton-Morenci Wages

The Detroit Copper Mining Co. states that the wage scale as given in the *Journal* of Sept. 25, should be: For Mexican miners, $2.73 to $2.88 a day; American miners, from $3.30 to $3.78; Mexican timber-men, $2.88; the more skilled American timber-men, from $3.56 to $4.04 a day.

Boring for Petroleum is in progress at Kingston and Robe in South Australia, and the wells are now down about 1000 ft., with good prospects. G. D. Mendell, of Melbourne, is in charge of the operations. American drillers are working on the wells. Oil has been found in Papua and in several other islands on the north coast.

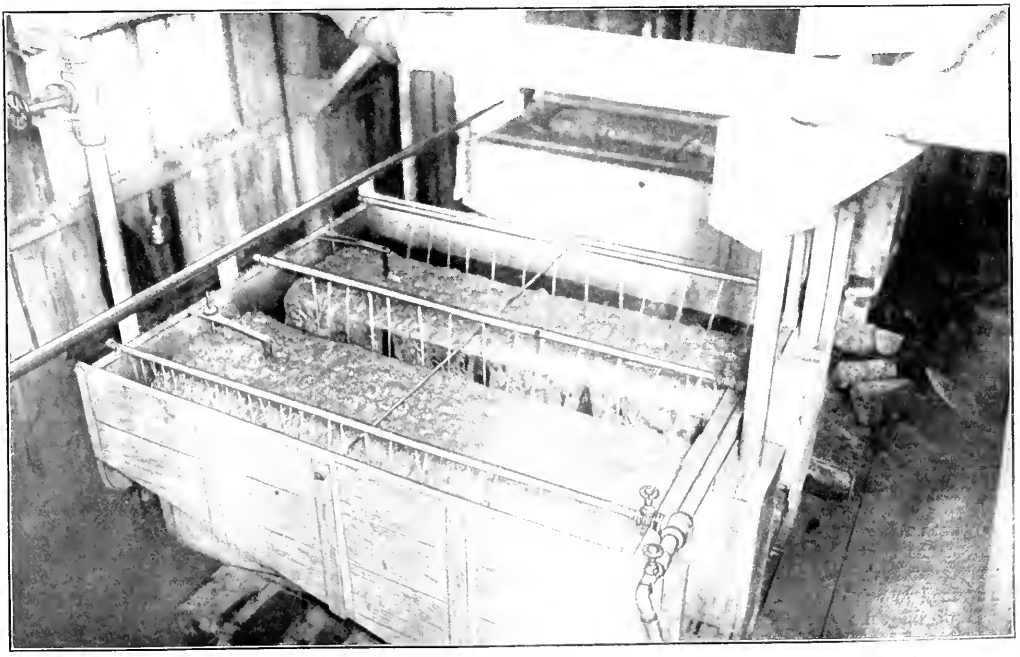
INTERSTATE-CALLAHAN MILL, NINE-MILE CANYON, NEAR WALLACE, IDAHO

This property entered the producing stage at the time when the highest prices for zinc ruled, due to war orders. Consequently the company earned a great deal of money, its July dividend amounting to $575,000, followed by one in August of $920,000. Standard systems of jig and table concentration are used, followed by an interesting variety of flotation equipment.



CALLOW FLOTATION PROCESS INSTALLED AT THE ANACONDA'S REMODELED CONCENTR

Flotation promises to be of great service in treating copper ores, so much so that leaching is thought danger of extinction in such plants.

Editorials

Clifton-Morenci Strike

The strike at Clifton-Morenci, which at first was not regarded seriously—at least not here—has developed into an extraordinarily bitter labor trouble, and it exhibits features that are unusually alarming. In the disorder and rioting and attacks upon mine officials, there is a resemblance to the Lake Superior strike of 1913. A further point of similarity is to be found in the prompt appearance on the scene of that stormy petrel, Moyer, who is always on hand in such affairs.

The elements of this strike are evidently the usual demands for increased wages and recognition of the union, the latter having been dropped, however, early in the negotiations. The miners of Clifton-Morenci have heretofore been paid on the sliding scale, governed by the price for copper, that now prevails as a system in most of the copper-mining districts west of the Rocky Mountains. However, the scale at Clifton-Morenci has been lower than at the other copper-mining districts of Arizona. The reason for this has been the relative inferiority of the class of labor available, the mining population at Clifton-Morenci being to a large extent Mexican, partly immigrants and partly descendants of the Mexicans that were living in that region when it was acquired by the United States. A large portion of these Mexicans are, therefore, naturally citizens of the United States, not merely naturalized.

Now it is pretty well established in mining that the laborer gets what he earns. The most efficient labor is always the most economical, and the big companies secure it by offering wages that are attractive. Thus the highest wages are paid at Bisbee and Butte, and the companies operating there enjoy probably the most efficient class of labor. When the supply of miners is short they may be obliged to hire inferior men, but when demand slackens the inferior men are promptly weeded out.

Something of this sort is exhibited in the economic conditions of the Clifton-Morenci district. The labor there is generally inferior. Consequently the rates of wages are lower than elsewhere. This manifests itself in the cost of producing the copper. The three principal companies of Clifton-Morenci—the Detroit, Arizona and Shannon—rank on the whole as high-cost producers, relatively speaking. The managers have pointed out that if the demands of the men were granted, the companies would be unable to make any money if copper were at its normal level, although of course they would still make some money with copper at the present high level.

So much for the merits of the case. In the development of the strike there were early manifestations of disorder, and the several companies felt themselves constrained to put their property into the hands of the sheriff of the county, making the state responsible for its safety. Then the governor of Arizona appeared on the scene, endeavoring to play the part of mediator. His actions were silly and his talk was mere flubdub. Both contributed to make matters worse. Indeed, it might not be going too far to characterize the governor's talk as inflammatory. The policy of the responsible authorities of the state, especially the governor, was manifestly to play politics and win the vote of the Mexican population of Arizona and unionized labor generally. Finally the turbulence increased to such an extent and the hostilities to the three mining managers became so virulent that they actually stood in danger of their lives. They remained at their posts longer even than they should have done, especially Mr. Carmichael. His associates had hard work to drag him away, but finally they succeeded in doing so, and the three managers escaped on a locomotive, which was driven over the line to Lordsburg, N. M., at night, without lights—a perilous journey. Arrived at Lordsburg, the three managers were arrested by the sheriff of Grant County on a warrant sworn out by a Mexican at Clifton, charging them with being *fugitives from justice*.

Respecting Subway Timbering

B. B. Thayer declined to serve on the committee of engineers to advise the Public Service Commission about the safety of the New York subways under construction, and the commission is therefore going ahead with a committee of two, of whom neither is a mining engineer. This is a pity.

In the last number of the *Journal* the system of timbering used in the New York subways was illustrated, and comparison with the original form of square-setting used in mines was made, a method of mine-timbering reproduced from a Comstock print of the '70s being shown. It was not the purpose to advise that this system of mine timbering should necessarily be adopted in the subways, but rather to indicate the radical difference in ideas.

The fundamental principle of mine timbering is not to hold up rock by trying to carry the whole load, but instead thereof to keep it in place, to prevent it from slipping. It is rare in underground work that a large block of ground comes down unless it be brought down intentionally, as in the caving system of mining. The great danger in mining from what are called "falls of ground" is the dropping or sliding of blocks and slabs relatively small. This is met by keeping the timbering wedged up tightly to the face of the rock. In narrow veins the support may be simple stulls. In large, cavernous openings it may be timbers arranged in square sets.

Now timbering is not necessary in all cases. There are kinds of rock in which large chambers may be opened deep in the bowels of the earth without a stick of timber having to be put into them. There are others in which the only precaution is to cut out the roof in the form of an arch. But there are others which must be filled with a timber structure.

In the last case the timbers, usually 10x10 to 12x12 in. in size, are built up in the form of skeleton cubes, usually

about 6x6x6 ft. and rarely as much as 8x8x8 ft. In certain cases knee braces (angle braces) are added. The several members of a set come together in butt joints. Respecting the manner of making these joints there is an extensive literature. For the framing of the timbers for this purpose there are special machines, although the work can be done by hand, and formerly was always done so.

The result of such timbering is that the "stope," or cavernous opening, is filled with a multitude of relatively small cells, just as a child builds a structure of blocks, but the framework is always kept close to the rock faces and wedged in. If the ground is loose the outside of the structure is inclosed by horizontal lagging, usually of rough, round sticks laid closely. Upon the horizontal members of the framework, plank are laid to form floors on which the miners may work.

When an underground opening is timbered in this way one or several of the sets may accidentally be shot out or may be crushed in, but nothing very serious happens. The trouble is distinctly localized.

Let it be noted that in mining the purpose is to extract material at the minimum of cost and often some very close figuring is necessary. In many mines the item of timbering is a relatively large one, and it may be accepted as an axiom that no mining engineer does any more of it than he has to. In the construction of the New York subways, which cost four million dollars or so per mile, there is not the same necessity for close figuring in this respect.

We are not to be understood as recommending that the New York subways during construction ought to be timbered by the square-set method. Without any doubt a study of the problem would result in the development of a special method, which might be a modification of the square-set system. It may be said confidently, however, that simple square-setting would permit the excavation of the ground as well as the method heretofore used, while with respect to the reclaiming of timber for reuse as the work progressed square-setting would be more advantageous. Although further discussion of this subject is likely to be of only academic interest, there would be some entertainment for mining engineers, during the winter evenings that are coming, in devising plans for timbering subways in cities as they ought to be.

A summary of the report of the committee of two inspecting engineers was published on Oct. 5. It indicates that they have no real comprehension of the problems of supporting ground from the standpoint of the mining engineer.

*

First-Aid Contests

The widespread interest in first-aid contests throughout the mining districts, not only of the coal fields of the East but also in the metal-mining regions west of the Rocky Mountains, is based no doubt upon the common desire of our people for a sport in which many may participate. The games of the East have never had any great vogue in the West. There is many a mining camp where there is not a level place big enough for a baseball diamond. One of the great sports of San Francisco in the '50s was running with the fire engine, and from there it was naturally transplanted to Virginia City and to the other great mining towns. As recently as the latter '80s the annual contest of fire-engine teams, coming from Aspen, Red Cliff, Gunnison, etc., was the great event of the year at Leadville, Colo. Drill contests never aroused the same interest. People want some sport that gives a chance for the development of teamwork. This is found in the first-aid work, which combines the opportunities for good teamplay with the interests and hazards of an obstacle race. It is a fine thing, for it is not only a subject of interest, but also it serves a highly useful purpose.

Waste of Hiring and Firing

The economic waste involved in the indiscriminate hiring and firing of employees has not been studied with care in respect to the mining industry, but a recent address on this subject confined to manufacturing lines forces some very startling conclusions. The figures given apply to 12 different establishments employing about 10,000 men, and the speaker estimated that the money lost in one year due to the problem of hiring and firing amounted to $831,030. He fixed the cost for the purely clerical work of hiring and recording discharge at 50c. per person.

Just how much parallelism there is between manufacturing and mining, in this regard, it is not necessary to discover for the purpose of emphasizing this point, so often overlooked. When a miner gets huffy and demands his time on the spot, the bother and inconvenience to the foreman and shift bosses and to the clerical force in the office are perfectly obvious, and are invariably resented in a psychological way, at least, and a money cost of the transaction might easily be figured, which does not come to mind when, for some equally trivial reason, the man may be handed his time.

Aside from the purely clerical cost of the hiring and the discharge, is the large economic waste involved in instructing a new man in his duties, if it be only to the extent of conducting him to his place of work and informing him where he will find the tools with which to work, and getting him acquainted with the system employed at that particular mine. If he is simply taken to the heading and turned loose on a drill, he is at a loss to know where his wrenches are, the air-pipe connection, the air valves and various other things, and he will lose a large amount of time ferreting out the knowledge he must have. While he is doing his best to acquire the information which should have been given him at the start, he may make some mistake that will get him an immediate discharge from an irascible foreman or superintendent. This is where the big item of waste in this problem comes in.

Next to the irascible superintendent, the new superintendent is the greatest offender in this regard. His strong point in his own mind when he first attains authority, is his willingness to exhibit the courage of his convictions by firing promptly any man who does not come up to the chalkmark of expectations. He calls it enforcing discipline. The inexperienced superintendent is wholly unaware of the long period his predecessor required to build up his organization, the paternal way in which he sometimes had to handle his men, and he has not yet learned that an efficient superintendent must know what not to see just as well as what he should see.

While he has probably never figured [illegible] cost in dollars and cents, the experienced handler of men, unless the cause is unmistakably flagrant, is rarely [illegible] on the trigger at discharging employees.

BY THE WAY

According to the *Evening Sun* a visitor filled out the form handed him by the office boy as follows:

Mr. Blank desires to see Mr. Marquis in regard to selling him stock in a false-teeth mine.

Well? We've seen stock in worse ones actually sold.

⁂

Sometimes ore representatives receive queer letters of instruction, of which the following is a sample:

i wil send to your smelting Co. a shiping of ore Nex week and a orden with it you to get your money out of it and you look out for the ore i let my Pardman look after the settle up of the last shiping and i thought everything was Punk.

JOE SMITH.

P. S. look out for the Nex week sure ore.

⁂

According to a Western journalist, Quong, the Chinese lawyer of Socorro, N. M., looking at $23,000 worth of Ernestine Mining Co.'s bullion stacked in front of the express office, computed in good pidgin English: "One high ball one bit, two high balls two bits. Good Godfley, one hundred eighty-four thousand high balls there!" and went musing down the street.

⁂

The Bureau of Mines has certainly justified itself if the newspaper report be correct that "embedded under 100 ft. of solid earth a silver vein more than a mile long and 7½ ft. wide, said to contain nearly $1,000,000 worth of pyrites silver ore, has been discovered on the United States Bureau of Mines site in Oakland, Penn., a suburb of Pittsburgh." However, we shall await further details before becoming excited.

⁂

Recent sales of Southern No. 2 foundry iron at $12.50 per ton, Birmingham, must be rather gratifying to two or three large speculators who bought quite freely of that grade at $9.50 some three months ago. The advance is not quite so spectacular as that of some of the "war babies" on Wall Street, but it is solid and seems likely to hold for a while. Makers who are delivering iron under the $9.50 contracts may take a different view of the situation.

⁂

Speaking of mining investments, we know of a young man who, desiring on occasion to make an impression on the mother of his best girl, borrowed from his numerous friends various quantities of stock in questionable mines to be returned forthwith. The array having been displayed with the telling effect intended, our friend was about to return his borrowed certificates when he became confused and was unable to tell which was which. He ingeniously overcame this difficulty by ingenuously asking each one how many shares he had borrowed from him, and then counting out to him the same number indiscriminately from his collection. The ingenuity of his decision and solution of his difficulty would seem to have been amply rewarded by the fact that he never had a single kick from any of the people with whom he had this stock transaction.

⁂

Speaking of the early days on the Comstock, Charles E. Van Loan describes interestingly in the *Saturday Evening Post* the exploits of the "bad men" of the period. But life in the '60s was not all violence and bloodshed; under the froth there was a solid citizenry. The miners—by far the largest single element in the camp—were a kindly people, and many of their customs might serve as models for any community. The entire city contributed liberally to the support of the widows and orphans, and when a man was hurt or killed in one of the numerous underground accidents it was the usual thing for every man working in the mine to chip in to the extent of one day's pay—four dollars. "If a man was sick," said one of the Comstock veterans to Mr. Van Loan, "the scene at his bedside was like a conference of the nations. Americans, Englishmen, Irishmen, Swedes, Germans, Mexicans, Bohunks—even the Chinamen—would drop in to see if there was anything they could do. They were the best and the biggest-hearted people in the world; nothing was too much trouble if a man needed help."

⁂

September Mining Dividends

Dividends disbursed in September, 1915, by 33 United States mining companies making public reports amount to $10,708,720, as compared with $3,280,058 in September, 1914. Industrial and holding companies allied to mining paid $6,900,586, as compared with $10,995,380, a year ago. Canadian and Mexican companies paid $784,380, as compared with $531,756 in September, 1914.

The totals for the first nine months of the year are as follows: Mining companies, $51,399,883, as against $45,690,640 in 1914; metallurgical and holding companies, $61,726,344, as against $68,603,024 in 1914; Canadian and Mexican mines, $6,082,120, as against $12,602,124 in 1914. The drop in the payments by industrials is entirely due to the passed dividends on U. S. Steel common.

United States Mining Companies	Situation	Per Share	Total

NEW PATENTS

United States patent specifications listed below may be obtained from "The Engineering and Mining Journal" at 25c. each. British patents are supplied at 40c. each.

ALLOYS—A New or Improved Process for the Preparation of Alloys Containing Copper and Lead. L. Sempell, Duisburg, Germany. (Brit. No. 28,492 of 1913.)

ALLOYS—Process for the Production of Alloys of High Melting Point Having Ductile Properties. Wolfram Lampen Akt., Augsburg, Germany. (Brit. No. 29,980 of 1913.)

BRIQUETTES—Machine for Making Briquettes. Ellsworth B. A. Zwoyer and Rolland A. Zwoyer, Perth Amboy, N. J., assignors to Zwoyer Fuel Co. (U. S. No. 1,152,468; Sept. 7, 1915.)

CEMENT—Method of Burning Portland Cement Clinker. Thomas A. Edison, Llewellyn Park, Orange, N. J. (U. S. No. 1,152,613; Sept. 7, 1915.)

COKE—Apparatus for Utilizing the Heat of Coke Cakes. Carl Semmler, Wiesbaden, Germany. (U. S. No. 1,153,453; Sept. 14, 1915.)

CONCENTRATING TABLES, Head Motion for. William Armor Stedman, Wonder, Nev. (U. S. No. 1,153,723; Sept. 14, 1915.)

CONCENTRATOR TABLES—Protective Covering for Concentrator Tables and Method of Applying the Same. Everest A. Baylis, Madera, Mexico, assignor to J. A. McMahon, El Paso, Tex. (U. S. No. 13,981; reissue Sept. 20, 1915.)

CONVERTER for Treating Matte. William H. Howard, Garfield, Utah. (U. S. No. 1,153,921; Sept. 20, 1915.)

CONVEYORS—Improvements in or Relating to Coal and the Like Conveyors. S. A. Ward, Sheffield, England. (Brit. No. 23,084 of 1914.)

CONVEYORS—Improvements of Jig Conveyors. H. Flottmann & Co., Herne, Westphalia, Germany. (Brit. No. 10,184 of 1914.)

COPPER—Improvements in and Relating to the Extraction of Copper. E. R. Weidlein, Pittsburgh, Penn. (Brit. No. 10,500 of 1914.)

CRUSHING—Ball Mill. Frank E. Marcy, Salt Lake City, Utah. U. S. No. 1,153,239; Sept. 14, 1915.)

CRUSHING—Lining for Pebble or Ball Mills. Hans A. Hansen and Joseph M. Schmueser, Smuggler, Colo. (U. S. No. 1,153,844; Sept. 14, 1915.)

CRUSHING—Screen Grate for Ball Mills. Frank E. Marcy, Salt Lake City, Utah. (U. S. No. 1,153,238; Sept. 14, 1915.)

CYANOGEN COMPOUNDS—An Improved Process for the Production of Cyanogen Compounds and a Furnace for Carrying the Same into Effect. A. R. Lindblad, Ludvika, Sweden. (Brit. No. 22,852 of 1914.)

DREDGES—Clam-Shell Dredger-Bucket Buffer. Peter Peterson, San Francisco, Calif. (U. S. No. 1,153,950; Sept. 20, 1915.)

DREDGES—Power Spud for Dredges. Earl W. Dotten, Aitkin, Minn. (U. S. No. 1,154,492; Sept. 20, 1915.)

DRILL CHUCK. William Farquharson, Greenock, Scotland. (U. S. No. 1,154,209; Sept. 20, 1915.)

DRILLING MACHINES—Improvements in Coal and Rock-Boring Machines. A. Berner, Nuremberg, Germany. (Brit. No. 18,404 of 1914.)

DRILLS—Improvements in Hydraulic Rock and the Like Drills. J. Hanson, Penrhyndendraeth, North Wales. (Brit. No. 17,689 of 1914.)

DRILLS—Rotating Device for Rock Drills. Charles Otis Palmer, Cleveland, Ohio. (U. S. No. 1,153,700; Sept. 14, 1915.)

ELECTRODE FURNACES—Improvements in Electrode Furnaces which Have an Arrangement for Automatically Mixing Up the Charge. E. Krupp Akt., Essen, Germany. (Brit. No. 742 of 1914.)

FLOTATION—Improvements in Separation of Mixed Sulphide Ores. Minerals Separation, Ltd., London, England. (Brit. No. 8746 of 1915.)

FOUNDRY—Apparatus for Drying Sand. James C. Davis, Hinsdale, Fred C. Henke, St. Louis, and William H. Hawley, Granite City, Ill., assignors to American Steel Foundries, New York, N. Y. (U. S. No. 1,151,667; Aug. 31, 1915.)

FURNACE-CHARGING APPARATUS. William F. Clark, Coraopolis, Penn. (U. S. No. 1,153,605; Sept. 14, 1915.)

IRON AND STEEL INGOTS, Improvements in Treating. B. Talbot, Middlesborough, England. (Brit. No. 2639 of 1915.)

JIGS—Discharging Means for Jigs. Samuel V. Tench, Lansford, Penn. (U. S. No. 1,153,527; Sept. 14, 1915.)

KILNS—Improved Lining for Rotary Kilns or Furnaces. Dynamidon G. M. B. H., Mannheim-Waldhof, Germany. (Brit. No. 11,824 of 1914.)

KILNS—Improvements in and Relating to Rotary Kilns for Burning Cement, Ores and Like Material. G. Polisius, Dessau, Germany. (Brit. No. 17,146 of 1914.)

LAMP—Miner's Safety Lamp. Martin Albrecht, Frankfort-on-the-Main, Germany. (U. S. No. 1,153,003; Sept. 7, 1915.)

METAL COATING—Apparatus for Melting and Spraying Fusible Substances. Franz Herkenrath, Zurich, Switzerland, assignor, by mesne assignments, to Metals Coating Co. of America, Boston, Mass. (U. S. No. 1,151,586; Aug. 31, 1915.)

METAL COATING—Galvanizing Bath. Nicholas King Turnbull, Manchester, England. (U. S. No. 1,151,629; Aug. 31, 1915.)

NODULIZING—Method of Treating Ores. Louis C. Drefahl, Cleveland, Ohio, assignor to the Grasselli Chemical Co., Cleveland, Ohio. (U. S. No. 1,153,203; Sept. 14, 1915.)

OIL-BURNING SMELTING FURNACE. Oliver P. Moore, Spokane, Wash. (U. S. No. 1,153,561; Sept. 14, 1915.)

PEAT—Method of Removing Water from Peat. Thomas Rigby, Dumfries, Scotland, assignor to Wetcarbonizing Ltd., London, England. (U. S. No. 1,151,825; Aug. 31, 1915.)

PHOSPHORUS—Process of Producing Sulphides of Phosphorus. Francis C. Frary, Minneapolis, Minn. (U. S. No. 1,153,051; Sept. 7, 1915.)

PNEUMATIC TOOL. George H. Gilman, Claremont, N. H., assignor, by mesne assignments, to Sullivan Machinery Co., Boston, Mass. (U. S. No. 1,152,624; Sept. 7, 1915.)

PUMP—Balanced Centrifugal Pump. Ferdinand W. Krogh, San Francisco, Calif. (U. S. No. 1,153,321; Sept. 14, 1915.)

REGENERATIVE FURNACES—Improvements in and Relating to Reversing Regenerative Furnaces. L. L. Knox, Pittsburgh, Penn. (Brit. No. 17,584 of 1914.)

ROASTING—Improvements Relating to the Roasting of Sulphide Ores and Similar Metallurgical Products. W. Baudeus, Charlottenberg, Germany. (Brit. No. 29,042 of 1913.)

SAMPLING—Automatic Sampling Device. Robert Hamilton, Birmingham, Ala. (U. S. No. 151,682; Aug. 31, 1915.)

SCRAP—Apparatus for Recovering Metal Scrap. George E. Wisener, Steubenville, Ohio. (U. S. No. 1,152,867; Sept. 7, 1915.)

SCREEN for Ores and Coal and Other Material. Edward S. McKinlay, Steamboat Springs, Colo. (U. S. No. 1,153,804; Sept. 14, 1915.)

SCREEN—Pulsating Screen. Edgar B. Symons, Chicago, Ill. (U. S. No. 1,151,976; Aug. 31, 1915.)

SEPARATION—Apparatus for Separating Minerals and Like Materials. Friedrich Arthur Maximilian Schiechel, Frankfort-on-the-Main, Germany. (U. S. No. 1,151,722; Aug. 31, 1915.)

SEPARATOR—Fine Coal and Ore Separator. John Marriott Draper, Manchester, England. (U. S. No. 1,151,448; Aug. 24, 1915.)

SEPARATOR—Ore Separator. Charles H. Brown and Charles C. Parker, Eureka, Utah. (U. S. No. 1,152,351; Aug. 31, 1915.)

SKIP DUMP. Charles L. Lawton, Hancock, Mich. (U. S. No. 1,151,955; Aug. 31, 1915.)

SLIMES—A Process for the Treatment of Slimes and Colloidal Masses and for the Recovery of the Metalliferous Contents of Ores, Tailings, Middlings and Concentrates. A. A. Lockwood, Surrey, England. (Brit. No. 174 of 1915.)

SLIMES—Apparatus for Thickening Slimes. William Armor Stedman, Wonder, Nev. (U. S. No. 1,153,722; Sept. 14, 1915.)

SLIMES—Improvements in and Relating to the Filtration and Treatment of Ore Slimes. C. Butters, Oakland, Calif. (Brit. No. 9921 of 1914.)

STAMP MILLING—Cam for Stamp Batteries. Arthur B. Foote, Grass Valley, Calif. (U. S. No. 1,152,161; Aug. 31, 1915.)

STEEL—Improvements in or Relating to the Production of High-Grade Steel and Slag Rich in Soluble Phosphates. Deutsche-Luxemburgische Berg Werks- und Hütten Akt., Bochum, Germany. (Brit. No. 27,885 of 1913.)

STEEL—Improvements in Reversible Regenerative Furnaces for Use in the Manufacture of Steel and the Like. J. S. Atkinson, Ditton Coke-Oven Machinery Co., Ltd., and K. Huessener. (Brit. No. 27,678 of 1913.)

SULPHATES—Process of Extracting Sulphurous Acid and Oxides from Sulphates. A. Bambach, Cologne, Germany. (Brit. No. 3,174 of 1914.)

SULPHIDES—Process for Treating Metallic Sulphides or Sulphide Ores. N. M. Hooton, Burton-on-Trent, England. (Brit. No. 18,007 of 1914.)

SULPHUR MINING. Herman Frasch, New York, N. Y., assignor, by mesne assignments, to Union Sulphur Co., Jersey City, N. J. (U. S. No. 1,152,499; Sept. 7, 1915.)

SULPHURIC ACID—Improvements in the Manufacture of Sulphuric Acid. Fr. Curtius & Co., Duisburg, Germany. (Brit. No. 28,550 of 1913.)

TEMPERING—Method and Apparatus for Tempering Metals. Julius A. Dyblie, Joliet, Ill. (U. S. No. 1,151,675; Aug. 31, 1915.)

TUNGSTEN—Method of Treating Tungsten Ores. Frederick M. Becket, Niagara Falls, N. Y., assignor to Electro Metallurgical Co., Niagara Falls, N. Y. (U. S. No. 1,153,594; Sept. 14, 1915.)

WASHER—Magnetic Ore Washer. Edward W. Davis, Minneapolis, Minn. (U. S. No. 1,153,037; Sept. 7, 1915.)

WASTE HEAT—Recovering the Waste Heat of Smelters and Kindred Plants. Carl Semmler, Wiesbaden, Germany. (U. S. No. 1,151,831; Aug. 31, 1915.)

WELDING—Electric Welding Machine. Friederich Müller, Hartford, Conn., assignor to Pratt & Whitney Co., Hartford, Conn. (U. S. No. 1,151,706; Aug. 31, 1915.)

WELDING—Method of Welding. Jean Hubert Louis De Bats, Zelienople, Penn. (U. S. No. 1,152,610; Sept. 7, 1915.)

ZINC—Arrangement for Preventing the Formation of Smoke in the Production of Zinc. Alexander Roitzheim, Duisburg-Ruhrort, Germany. (U. S. No. 1,152,050; Aug. 31, 1915.)

ZINC—Improved Process for the Manufacture of Metallic Zinc or Zinc Oxide. H. W. Baron de Stuckle, Dieuze, Alsace-Lorraine, Germany. (Brit. No. 28,188 of 1913.)

ZINC—Improved Process for the Manufacture of Receivers for Zinc Furnaces and the Like. Tellus Akt. f. Bergbau und Hüttenindustries, Frankfurt a. M., Germany. (Brit. No. 17,557 of 1914.)

ZINC—Reduction of Metallic Oxides and the Like. Frank William Highfield, Caversham, England. (U. S. No. 1,153,786; Sept. 14, 1915.)

ZIRCONIUM ALLOY and Process of Producing the Same. John Louis Brown, Baltimore, Md., assignor to Edward R. Cooper, Baltimore, Md. (U. S. No. 1,151,160; Aug. 24, 1915.)

PERSONALS

F. W. Harbord is now chief metallurgist to the British Ministry of Munitions.

F. R. Weekes will be in Darwin, Calif., for the next two months on professional business.

Robert M. Keeney has taken a position with the Standard Chemical Co., Canonsburg, Penn.

Edward L. Brayton, president Pelton Water Wheel Co., San Francisco, was in New York last week.

R. B. Lamb, formerly of Toronto, has moved his office temporarily to Room 1615, 27 Cedar St., New York.

L. V. Emanuel is now with the River Smelting & Refining Co., Florence, Colo. H. H. Utley is manager of the company.

Andrew C. Lawson, professor of geology, has been appointed dean of the College of Mining, University of California.

George H. Garrey is in Goldfield, Nev., to make a geological study of conditions in the property of the Goldfield Merger Mines Co. there.

R. O. Hocking has accepted a position as inspector of mining operations with the Meriden Iron Co., Hibbing, Minn., on the Mesabi Range.

Charles Perkins, purchasing agent of the Russian government, who is also an oil expert, recently visited the oil fields in South Alberta, Canada.

Montrose L. Lee sailed from Rio de Janeiro, Brazil, on Sept. 8 on his way to Bordeaux, France. He will spend two or three months in Europe, principally in Spain and France.

Homer D. Williams, now general superintendent of the Duquesne Works, will be president of the Carnegie Steel Co. in place of Alva C. Dinkey, who goes to the new Midvale company.

E. P. Earle and David Fasken, directors, and R. B. Watson, engineer, of the Nipissing Mines Co., have gone to inspect a gold discovery recently made north of Le Pas, Manitoba, which is reported to be remarkably rich.

Charles Sagert has been made superintendent of the open-hearth steel plant of the Brier Hill Steel Co., Youngstown, Ohio, to succeed Edward Bailey, who has gone with the Algoma Steel Co. at Sault Ste. Marie, Ontario.

Alva C. Dinkey, for a number of years president of the Carnegie Steel Co., has resigned and has been chosen president of the Midvale Steel Co. as reorganized. William E. Corey, who was chosen president last week, becomes chairman of the board.

B. B. Thayer, who was invited to sit on the Board of Engineers to investigate the conditions in the New York subway after the accident, declined, saying that his duties as member of the new Naval Advisory Board prevents his taking up the work.

Harry Huntington Miller, manager of the Compañia Anonima Minera lo Increible, has returned from a recent trip to Caracas and New York, and is again in charge of operations at the company's mines in El Callao district, Yuruary, Venezuela.

Dr. James Douglas, of New York, has made a donation of $150,000 to McGill University, Montreal, for the erection of a students' residence. Dr. Douglas has been offered the position of Chancellor of Queen's University, Kingston, Ont., and it is understood that he will accept it.

Russell A. Cowles has resigned his position with the American Brass Co. and has been elected a director and vice-president of the Buffalo Copper and Brass Rolling Mill, operating a brass and copper rolling plant at Buffalo, N. Y. Mr. Cowles has also been elected recently president of the Metals Trading Corporation.

Joseph W. Richards, professor of metallurgy at Lehigh University, South Bethlehem, Penn., was the guest of the Lehigh Intermountain Alumni Association at a luncheon at the University Club, Salt Lake City, Sept. 27. Professor Richards stopped over in S. It Lake on his way east from San Francisco. Nine alumni were present.

B. L. Miller, professor of Geology of Lehigh University, and Jos. T. Singewald, Jr., of Johns Hopkins, are making an extended tour, covering a period of 10 months through South America examining mines and deposits. Their trip includes a visit to the iron mines of Tofo, operated by the Bethlehem Chile Iron Mines Co., situated in the province of Coquimbo, Chile.

OBITUARY

John G. Bright died in Pittsburgh, Sept. 23, aged 79 years. He had lived in or near Pittsburgh for 61 years. He was for many years connected with the iron industry and assisted in the establishment of the first tinplate plant in Ohio.

William L. Hurd died at his country residence, near Valencia, Sept. 26, aged 68 years. He was born at Port Lavaca, Tex., and educated at Brown University, Providence, R. I. For 12 years he was with the National Tube Works Co. at McKeesport. He then connected himself with the Continental Tube Co., and later held a leading position with the Duquesne Tube Works Co. In 1897 he engaged in the iron and steel commission business at Pittsburgh with Hugh H. Davis, as Hurd, Davis & Co., and in 1899 organized and became president of the Monongahela Tube Co., which position he filled at the time of his death.

John W. Bookwalter, whose name was quite prominent in the steel trade about 25 years ago, died Sept. 27 at San Remo, Italy, aged 77 years. While engaged in the manufacture of the Leffel turbine water wheel at Springfield, Ohio, in 1888, he introduced from France the Robert-Bessemer process, installing a converter in the plant of the Bookwalter Casting Co., established for the manufacture of steel castings. The converter of this type attained considerable popularity, and it was introduced into quite a number of steel foundries in various parts of the country. For the past 15 years Mr. Bookwalter has spent most of his time in Europe.

SOCIETIES

American Institute of Mining Engineers—The first annual meeting of the Utah Section was held Oct. 4, at Salt Lake City. The order of procedure was as follows: Dinner (informal) and election of officers. Paper, "Notes on Flotation," by J. M. Callow. Paper, "Underground Mining at Utah Copper Mine," by T. S. Carnahan. Moving pictures of copper mining, milling and smelting. The officers chosen were: C. W. Whitley, chairman; Walter Fitch, vice-chairman; Ernest Gayford, secretary and treasurer.

Utah Society of Engineers—Following the summer intermission, this society has resumed its regular meetings, which are held monthly, every third Friday. The papers for four successive meetings—including the first, of Sept. 17—are as follows. "Engineering and Architecture," by H. D. Bowman, engineer of building construction; "Irrigation Pumping," by W. H. Trask, irrigation engineer, Utah Power & Light Co.; Nov. 19, "Coal-Dust Firing," by F. M. Seddon, superintendent of the Portland Cement Co.; "The Possibilities of Smoke Prevention by the Use of Powdered Coal," by W. H. Kelsey, smoke inspector; Dec. 17, "The East Cañon Creek Dam," from the construction standpoint, by A. F. Parker; from the designers' standpoint, by C. J. Ullrich. The meetings are held at the Consolidated Music Hall. Recently a stereopticon was purchased by the society.

American Mining Congress—The report of the Utah committee on freight and ore treatment rates, read at the American Mining Congress in San Francisco, recommends a getting closer together of operators and smelter men; that there be closer cooperation between ore shippers and the railroad companies in disputes relative to freight rates. Before the report was submitted efforts had been made to ascertain definitely if any ore shipper had not received proper treatment at the hands of either smelters or railroad companies; and mine operators throughout Utah were requested to report any grievances to the Utah Chapter of the American Mining Congress. No replies of any kind were received by the committee. Efforts are being made to show the railroad companies that a reduction in rates upon low-grade ores would result in an opening up of ores of higher grade, which would give the railroads the advantage and opportunity of charging higher rates, which the ore could stand. The Tintic district of Utah is referred to in illustration. The committee recommends that assayers be instructed to refer small producers to smelters for the actual market value of ores, based on smelting rates, instead of on the gross value of the metals, based on hand samples as given by the assayers. The committee was composed of I. Pett, H. S. Joseph, George H. Dern, W. M. Ferry, and Arthur Thomas.

Columbia University—Courses leading to the degree of Chemical Engineer have been offered in the Department of

Chemistry of Columbia University for the past 10 years but, in recognition of the rapidly increasing importance of those industries based upon the applications of chemistry, and the consequent demand for men specially trained in the fundamental engineering practices as applied to the problems of industrial chemistry, the trustees of Columbia University have established a separate Department of Chemical Engineering upon the same plane of importance in the graduate engineering school as mining, civil, electrical and mechanical engineering. The head of the new department will be M. C. Whitaker, who has been professor of chemical engineering at Columbia University for the past five years. The new chemical-engineering laboratories which were recently installed, where the students are taught to use engineering methods and engineering appliances in the study and development of chemical industry, will be provided with still further equipment during the present summer. These laboratories are equipped with apparatus to illustrate the various fundamental operations of chemical and electro-chemical processes, and the student learns by actual contact to apply fundamental scientific principles to industrial problems. Here research may be conducted on such a scale as to establish the dependable engineering data necessary for intelligent and accurate process design.

INDUSTRIAL NEWS

The Asbestos Protected Metal Co., of Pittsburgh, Penn., announces the removal of its Detroit office to 2011 Dime Bank Building.

William Jay Turner has been appointed general counsel of the Lehigh Coal and Navigation Co., effective Oct. 1, 1915, vice Samuel Dickson, deceased.

The American Steel Foundries has installed a six-ton electric furnace of the Heroult design at its Indiana Harbor, Ind., plant for the manufacture of extra-quality steel castings.

The American Steel and Wire Co. has been awarded a grand prize by the Panama-Pacific International Exposition for the superiority of its products and the high character of its exhibit.

W. E. Hardy, for the last 11 years connected with the Diamond Rubber Co. and the B. F. Goodrich Co., has been appointed sales manager of the Boston Belting Co., Boston, Mass., manufacturers of mechanical rubber goods.

The Bucyrus Co. announces the appointment of the Union Construction Co., 604 Mission St., San Francisco, Calif., as its agent for the sale of placer dredges in western United States, western Canada and Alaska.

The Hardinge Conical Mill Co. has received an order from the Nevada Consolidated Copper Co. for two 8-ft. Hardinge mills, to be used with iron balls, also an order from the Dome Mines Co., Ltd., of South Porcupine, Ont., Canada, for two 8-ft. ball mills. These ball mills are to take the place of stamps now in use at the Dome company's plant.

Frederick T. Snyder, president of the Snyder Electric Furnace Co., 53 W. Jackson Blvd., Chicago, Ill., will deliver a paper before the October meeting of the American Chemical Society in Pittsburgh, describing an electric furnace for carrying out industrial operations at temperatures above 2,000° C., with a holding capacity of 10 cu.ft. of charge.

Bausch & Lomb Surveying Instruments received the Grand Prix at the Panama-Pacific Exposition for "general design and excellence of quality." Among the features of these instruments which secured for them the highest award are: recalculated lens system with maximum apertures; interior focusing; water-proof construction; tarnish-proof graduations and the tubular tungsten magnetic needle.

The Nordberg Mfg. Co., Milwaukee, Wis., announces that it has recently received orders for electric hoists from the following mining companies: Anaconda Copper Mining Co., Canadian Copper Co., Mond Nickel Co., Ray Consolidated Copper Co., United Verde Extension Mining Co., Consolidated Arizona Smelting Co., Magma Copper Co., Cerro de Pasco Mining Co. and Morococha Mining Co.

New Heroult electric furnaces have been contracted for as follows: The Latrobe Electric Steel Co., Latrobe, Penn., will add a 3-ton furnace to its equipment. It is operating a 6-ton Heroult furnace for producing special and tool steels. The Belle City Malleable Iron Co., Racine, Wis., is to install a 3-ton furnace in its steel castings department to make steel castings. It is now using the crucible process. The Buchanan Electric Steel Co., Buchanan, Mich., will add a 2-ton furnace. It is now operating a 3-ton Heroult furnace. The Buckeye Steel Castings Co., Columbus, Ohio, has contracted for a 6-ton furnace.

A new publication has just been issued by the Bureau of Foreign and Domestic Commerce, Department of Commerce, which should be of a high degree of interest to all who are giving attention to the problem of the extension of our trade abroad. It is entitled "Financial Developments in South American Countries," and reviews in about 10 pages of a clear and forcible style the situation as regards the currency, the money market, the principal banks, and the general condition of business in Argentina, Bolivia, Brazil, Chile, Peru, and Uruguay, during the last two or three years. Especial emphasis is placed on the results of the European war and the measures taken by the various governments, financial institutions, and commercial communities to meet the situation thus created. The author of this publication is William H. Lough, vice-president of the Alexander Hamilton Institute, who has recently made a trip through the countries treated. It is to be had from the superintendent of documents, Government Printing Office, Washington, D. C., for the price of 5 cents.

TRADE CATALOGS

The Connersville Blower Co., Connersville, Ind. Catalog No. 17. Gas Pumps, Exhausters. 64 pp., illus., 8x12 inches.

Tate, Jones & Co., Inc., Pittsburgh, Penn. Circular No. 148, October, 1915. Shells and Shell Furnaces. 8 pp., illus., 11x8½ inches.

Alberger Pump and Condenser Co., 140 Cedar St., New York. Bulletin No. 20. Hammond Water Meters. 24 pages, illus., 6x9 inches.

A. D. Granger Co., 90 West St., New York. Bulletin No. 2. Oswego Internally Fired Water-Tube Boilers. 16 pp., illus., 8x10½ inches.

The Denver Engineering Works Co., Denver, Colo. Bulletin No. 1064, "Dewco" Sample Grinder. 4 pp., 8½x11 inches, illus. Bulletin No. 1073. Richards Pulsator Riffle. 8 pp., illus., 8½x11 inches.

Link-Belt Co., 39th St. and Stewart Ave., Chicago, Ill. General Catalog No. 110. Elevating and Conveying Machinery, Power Transmission Machinery, Crushers, Etc. 576 pages, illus., 6½x9½ inches.

Allis-Chalmers Mfg. Co., Milwaukee, Wis. Bulletin No. 1096, Direct Current Motors and Generators. 16 pages, illus., 8x10½ in. Bulletin No. 1412-A. Crushing Rolls. 32 pages, illus., 8x10½ in. Bulletin No. 1625. Hydro-electric Plant of the Cerro de Pasco Mining Co. 16 pages, illus., 8x10½ inches.

International High Speed Steel Co., 99 Nassau St., New York, N. Y. Catalog Mining and Rock Drill Steel. Hollow and Solid. 56 pp., illus.; 6x4¾ inches.

While this is primarily a catalog of tool steels, including drill steel, there is a great deal of information in the general subject of annealing and tempering that makes it a small "tool-steel handbook." Every user of tool steel ought to have it.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., OCTOBER 1, 1915.

of The Engineering and Mining Journal, published weekly at New York, N. Y., required by the act of August 24, 1912.

Editor, Walter Renton Ingalls, 10th Ave. at 36th St., New York, N. Y.

Managing Editor, Donald M. Liddell, 10th Ave. at 36th St., New York, N. Y.

Business Manager, L. E. Ives, 10th Ave. at 36th St., New York, N. Y.

Publisher, Hill Publishing Company, 10th Ave. at 36th St., New York, N. Y.

Owner, Hill Publishing Company, 10th Ave. at 36th St., New York, N. Y.

Owners of 1% or more of Stock Issued.

John A. Hill, 10th Ave. at 36th St., New York, N. Y.
Fred R. Low, 10th Ave. at 36th St., New York, N. Y.
John McGhie, 10th Ave. at 36th St., New York, N. Y.
Fred S. Weatherby, 1600 Beacon St., Brookline, Mass.
Frederick A. Halsey, 356 W. 120th St., New York, N. Y.
G. Eugene Sky, 50 Union Sq., New York, N. Y.
Frederick W. Gross, 215 E. 11th St., Erie, Pa.
Alfred E. Kornfeld, 10th Ave. at 36th St., New York, N. Y.
Emma B. Hill, 80 Munn Ave., East Orange, N. J.

The balance of the stock issued (less than 1% each) is owned by 70 employees, 4 ex-employees, and 13 others who are wives, daughters or relatives of employees.

Known bondholders, mortgagees, and other security holders holding 1 per cent. or more of total amount of bonds, mortgages or other securities. Mortgage on building held by Dime Savings Bank, Brooklyn, N. Y.

C. W. Dibble, Vice-President.
HILL PUBLISHING COMPANY

Sworn to and subscribed before me this 30th day of September, 1915.

Notary Public
(My commission expires March 30, 1917.)

Editorial Correspondence

SAN FRANCISCO—Sept. 29

The Mine in the Mines and Metallurgy Building at the Panama-Pacific Exposition has from the opening day attracted a large number of visitors, particularly at the hour when the mine rescue work is demonstrated. The numerous underground features in gold, copper and coal mining and the various installations of mining machinery, most of which are operated for demonstration, afford to the lay visitor an opportunity to form a fairly good idea of what an actual underground mine is like. It was believed that this exhibit would attract only the lay visitor but the records show that not only a large number of mining engineers, but engineers and managers in high position have also availed themselves of the opportunity of observation and study. Young mining engineers and students found many features of practical mining detail here demonstrated much to their edification. The surface equipment of The Mine is not so complete in suggestion as it might have been, but the Bureau of Mines was obliged to work with such facilities and appropriation as were available. The wooden headframe is a fairly good one, but it is by no means a model. In fact there should have been a steel headframe instead and there might have been, had the builders been alive to the opportunity offered by this exhibit. There are few steel headframes in use at California mines, and this state is not alone in this lack of advancement. There are many small operators in the Pacific Coast mining regions who have never seen a steel headframe, who would have been glad to see an example in the Mines and Metallurgy Building at the Exposition. Another disadvantage in the surface suggestions is that while there are plentiful examples of coal there are no metal-bearing ores displayed, so that the visitor unacquainted with the situation underground forms an idea that he is going into a coal mine only. That is the fault of mining men who failed to provide a display of ores. But beyond this the exhibit as a whole is very creditable and of value to the mining industry as well as of interest to those who go merely to see what a mine looks like. The moving pictures of mining and metallurgical methods are also a feature that can be enjoyed by the lay visitor and studied with profit by the miner.

DENVER—Oct. 1

Nederland, only a small mining camp in the Rockies, has become famous through the prevailing and unusual market prices for tungsten ores. This is the chief settlement in the Boulder County tungsten belt and is teeming with activity. There is not a vacant house and hotel space is at a premium. Two lines of auto stages run daily between Nederland and Boulder, while the Denver, Boulder & Western Ry.—the Switzerland Trail—carries more pasengers than ever before if we except tourist travel. Miners are even giving renewed attention to a portion of northern Gilpin County (immediately south of the Boulder County line) where they recall having noticed a heavy black unidentified mineral in their early-day prospecting for gold.

W. S. Van Sant, general manager of the Copeland Ore Sampling Co., Victor, disappeared a week ago and thereby caused considerable gossip in the district. He is remembered as having driven away from Victor in his auto with a party of friends but his whereabouts is a mystery. Van Sant's predecessor was G. E. Copeland, then proprietor of the establishment, who was accidentally shot, a few years ago, in the Brown Palace Hotel, Denver, by Frank H. Henwood. Last winter, at the time of the first carload shipment of very rich ore from the famous Cresson "vug," the press of the country carried reproductions of the famous check issued in payment for this ore by the Copeland company, bearing Van Sant's signature.

SALT LAKE CITY—Sept. 30

A Greater Interest in Unlisted Stocks is being shown in the trading on the Salt Lake Stock and Mining Exchange. The total weekly business transacted in unlisted stocks during the past 3 weeks was: For the week ended Sept. 11, 204,739 shares, valued at $48,854; for the week ended Sept. 18, 211,550 shares, valued at $57,852; and for the week ended Sept. 25, 414,845 shares, valued at $100,037.

A New Dividend Payer has been added to Utah mines in the Cardiff, situated near the head of Big Cottonwood, which has just declared the initial dividend of 25c. a share, payable Oct. 1. Dividend aggregated $125,000 on the 500,000 shares issued. Shipments of 160 tons of ore a day, valued at between $4,000 and $5,000, are being made, but the average output is around 125 tons daily. The Cardiff opened ore last October, and has developed an orebody 225 ft. long by 20 ft. wide by 200 ft. on the dip.

Shipments from Alta now amount to three and four cars daily, or about 120 tons of ore, which is sent out over the Salt Lake & Alta R.R. The South Hecla is shipping 80 tons, including shipments by leasers; the Michigan-Utah, Wasatch Mines, and Alta Consolidated are also shipping. There has been some talk recently of building a narrow-gage cog railroad from Wasatch to Alta over the former narrow-gage grade a distance of 8 mi. Of greater immediate interest, however, is the possibility of an aërial tramway, which is being seriously considered. Two plans are under consideration: One for a tramway 8 mi. long from Wasatch to Alta, and the other for a tramway, about 4½ mi. long from Alta to a short distance below Tanners' Flat. The Salt Lake & Alta R.R. has a switchback at the granite quarries at Wasatch, and the railroad could be extended with a moderate grade to the latter point. Surveys for this have already been made, and the plan is found to be feasible at a moderate cost. This 4½-mi. tramway and extension of the railroad appears to meet with greater favor. It is estimated that such a tramway could be built at a cost, not exceeding $60,000 to $80,000. The season is rather far advanced for construction work, although the lower part of the cañon will probably be free from snow up to November or December. The plans under consideration call for the best material obtainable, and a good substantial tramway.

SEATTLE—Sept. 29

Nome Placer Mining Season, lasting usually about 100 days, was cut short this year for nearly the entire month of August on account of a long dry spell. This has not affected the average production which has been maintained by the district since 1898, with the exception of three years when the annual output went to nearly $6,000,000, due to the strike on the third beach line which is 4 mi. long. Many individual miners are operating placers this year on the tundra, the work extending over a strip of territory 10 mi. long and 4 mi. wide. The placer mining season is now closed permitting of an accurate estimate of the year's yield which is placed at close to $3,450,000.

Development Proves Permanency of Valdez Mines. Many events which loom big in the mining industry of Valdez have transpired recently. The big tram of the Granby mine has been started up and in a short time 300 men will be employed in the copper mine four miles from there. The Granite mine has struck a 4-ft. lead on the 600-ft. level and the output of the property will be more than doubled, with cheaper cost of handling the ore. The lead was struck on the Three-In-One property near Shoup Bay, and the future of the claims seems assured. The Fidalgo-Alaska copper claims on Shoup Bay have been turned to a syndicate of Spokane, Wash., mining men. The Valdez Mining Co. will let a contract soon for the extension of their lower tunnel. While the Granite mine has been a big producer for months, the striking of the lead in the 600-ft. tunnel adds greatly to the value of the property, insuring ore for many years, and allowing for more economical working of the claims. Operations on this group are being pushed rapidly by Superintendent W. R. Millard. The Granby mines are in charge of Superintendent Smith who has a large crew at work, and will continue development and the work of putting the properties on a shipping basis. The wharf and bunkers have been completed and the first ore sent down to the smeltery. Enough ore has been blocked out to last for several years. Jeff Devinney and M. F. Hendricksen are the principles in the bonding of the Three-In-One properties. E. D. Reiter, who is in charge of the work at the Fidalgo-Alaska claims, is making arrangements for the purchase of considerable additional equipment. A new wharf and bunkers are now under way. Many other claims are working. The Rutherford & Ramsay mine is being worked night and day, with the output heavy, and will continue working until the end of the season. H. Ellis has a crew on the Cliff mine and

a new lead has been uncovered and ore is now being crushed at the mill. The Dickey property on Landlock Bay and the McIntosh copper claims on Fidalgo Bay are producing steadily.

Sluicing Nome Tundra from the present beach line to the foot of Anvil Mountain, a distance of more than 10 mi. is the latest plan of interests in Nome backed by the Pioneer Mining Co. of which Jafet Lindeberg, discoverer of Nome, is the president. It is planned to strip each one of the seven beach lines so far uncovered and practically sluice them into Bering Sea. Arrangements are now being made for the carrying out of what will be the largest hydraulicking job ever undertaken in Alaska. Large reservoirs will be constructed in the Grand Central Basin on the east side of Anvil Mountain through which the water will be carried by tunnel to penstocks on the mountain which will give it a head of 340 ft. From here a ditch will be constructed from 20 to 100 ft. deep running to the seashore, part of this emptying into the present Miocene ditch, now one of the largest in the country, having a capacity of several thousand inches. This ditch picks up the water at the head of Nome River and delivers it to Anvil Creek. Below the tundra from Snake River to Hastings Creek, a distance of about 12 mi., and from the present seaboard back to the foothills, a distance of about 4 mi., the ground is seamed with auriferous sands. In many places these sands are not sufficiently rich to warrant their operation by the ordinary methods and in other places where they are fabulously rich, they cannot be worked by ordinary methods because of the inflow of water. All, however, are amenable to profitable operation by hydraulicking, and the big waterway will be used to obtain the gold that is now unobtainable. One of the ancient beach deposits which was discovered in 1904 yielded many millions of dollars, but a large portion of the streak has never been operated because it is impossible to shut off the flow of water. By cutting a bedrock ditch through the tundra to the sea, a task made possible by the conversion of the Grand Central waters, the overflow from which will be turned into Nome River, all of this ground will be drained. The Pioneer Mining Co., which is conceded the biggest placer mining company in Alaska, will start active work the first part of next season and will work a crew of about 300 men on the ditch and the necessary reservoirs.

KELLOGG, IDA.—Sept. 27

The Old English Board of Directors of the Northport Smelting and Refining Co. resigned in a body on Sept. 23. The new board elected immediately at Wallace is composed of E. K. Knight, Jerome J. Day, Eugene R. Day, Edward Boyce, and F. M. Rothrock. Jerome J. Day was elected president and Eugene R. Day secretary-treasurer, thus linking the management very closely with the Tamarack-Custer and Hercules mines and recalling a previous report that the $600,000 surplus of the Tamarack-Custer would be used by the new owners to finance the reconstruction of the smeltery. The work of overhauling plant is proceeding rapidly, 150 men being employed. A new flume is being built to supply water to the town of Northport and the works. New lead furnaces of 600 tons daily capacity are planned. Two largest of old copper furnaces, capacity 150 tons each, are being repaired. The equipment has been ordered from the Traylor Engineering Co. The Northport smeltery besides treating the Hercules and Tamarack-Custer ores will do a custom business, as is indicated by the installation of copper furnaces. Although it is hoped to have part of plant ready in 60 days, at least four or five months will be required to finish rebuilding.

Mines on the North Fork of the Coeur d'Alene River are making steady progress, and an effort is being made to secure daily train service to the junction at Enaville in place of the tri-weekly service now maintained by the O.-W. R & N. The Empire Copper Mining Co., operating the Horst-Powell mine on the Little North Fork, is shipping three cars of copper ore a week. Development work extending over several years has disclosed a large orebody that can be shipped. A wagon road has recently been built from the mine to the mouth of Little North Fork at a cost of $10,000 and it is believed that the railway will soon extend a branch up the creek to the mine. Ore from both the Tuscumbia and the Idora is concentrated at the Idora mill and the concentrate is hauled 9 mi. to the railway at the mouth of Beaver Creek. The Tuscumbia is shipping eight cars of lead concentrate a month and the Idora two. Charles Conn, lessee on the Terrible Edith, last week shipped two cars of zinc ore and expects to send out a car a week hereafter. The Chicago-London company, which has the Black Horse mill under lease, is temporarily closed down on account of a shortage of water. They have until recently shipped four cars of zinc concentrate a month and expect to do better when milling is resumed. Shipments from this district will be greatly increased when the Ray-Jefferson completes its 250-ton mill at the forks of Beaver and Carbon creeks. It is rumored that the O.-W. R. & N. railway will build a branch to the mill.

HOUGHTON—Oct. 5

Production of Copper from Michigan Mines will run over 24,000,000 lb. for September, keeping close to the sustained high figures of last six months. Calumet & Hecla may run a little more than last month because the regrinding plants are again in full swing. Copper Range continues at its record-breaking output for 1915, running the highest percentage of copper ever secured from the Champion mine and far above any other mine in the district. Champion is making better than 50 lb. copper to the ton; Baltic and Trimountain close to 30. Total rock output from these mines is not so large, all rock being handled at two stamp mills, practically, but the selection is careful and close. Quincy's deeper levels are showing higher copper returns. South Kearsarge is furnishing the richest and largest tonnage from the Osceola Consolidated and the rock tonnage from the various mines of this corporation is limited only by mill capacity, everything working to the limit. Wolverine may show a slight increase for September; Isle Royale likely will run up to 900,000 lb. and Allouez's output will be at least 875,000 lb. for the month. It is considered the best of the Calumet & Hecla subsidiary investments at the present time. Franklin is increasing shipments steadily now, running average of 450 tons of rock daily and there is an improvement in the average of copper content. Franklin's conglomerate is running 20 lb. to the ton. Shipments are about 1,100 tons daily. More Calumet & Hecla shafts will go on three shifts this week. On Oct. 10 No. 13 and No. 16, on the Osceola lode, Calumet & Hecla, will go on three shifts. There has been a notable increase in the shipments of silver to the mint from the Calumet & Hecla. The figures will prove interesting if the increase in silver continues in 1916 as it has this year.

HIBBING, MINN.—Oct. 2

Upwards of 130,000 Tons Per Day being shipped from Hibbing district, of which Hull-Rust and Mahoning pits jointly contribute one-half. Figured into 50-ton cars, this daily tonnage means 2,600 carloads. At that, operations are somewhat curtailed because of lack of vessel capacity at docks. Next week's shipments will exceed above figures if weather conditions permit.

BRAINERD, MINN.—Oct. 2

Much Activity on the Cuyuna Range is manifest in the district, but the greater part of this is being exercised in an endeavor to uncover known tonnage; but little exploratory drill work is under way. Inside the village limits of Ironton, in Sec 3, 46-29, a prospect shaft is going down on the June Lake property. The Adbar Development Co. is sinking a plank-lined operating shaft 4 mi. east of Brainerd, not far distant from the Wilcox. The Adams shaft, at Orelands, is being unwatered. At the Mahnomen and Hill Crest pits, stripping is being rushed. The small concentrator at the Cuyuna-Sultana is in operation and some shipments have been made. The Croft shaft at Crosby is cutting a station.

TORONTO—Sept. 27

An Extensive Deposit of Zinc Ore is reported to have been discovered by Denis Callahan, a Haileybury, Ont., prospector, near Burbridge Lake in the Upper Gatineau district of Quebec. John D. Macfarlane, mining engineer, has gone to inspect the discovery and bring out samples.

An Important Gold Discovery on the west side of the Pinewood River, 10 mi. from Athapapuska Lake, in northern Manitoba, by Don Messiers and Ralph Hammel, two former Cobalt prospectors, is reported to the Manitoba government. The prospectors are stated to have uncovered a rich lode of sulphide ore assaying $25 to the ton. The veins are said to be 2,000 ft. long and of remarkable width.

In the Kowkash Gold Field a number of new discoveries are reported, indicating that the gold belt is at least 25 mi. in length. Gold has been found near Redmond Station on the National Transcontinental Ry., 12 mi. west of Kowkash Station, and discoveries have also been made at a point about 5 mi. northeast from the original find, and near the shores of O'Sullivan's Lake an additional 5 mi. further on in the same direction. Free gold has been found along Gold Creek 2 mi. southwest of the King Dodds claims. Development is being pushed by the Syndicate which holds the option on the latter and some promising veins have been uncovered. The surrounding claims are being worked and many quartz veins and stringers have been exposed. A rich discovery of silver is reported at Collins near Armstrong on the National Transcontinental about 100 mi. from Kowkash. The government is preparing a map and report on the Kowkash country.

The Mining News

ALASKA

KENNECOTT COPPER (Kennecott)—Mine production for four months ended Sept. 30 was 31,000,000 lb., or at the rate of more than 90,000,000 lb. a year. Production in September was approximately 9,000,000 lb. Alaska Steamship Co. has bought two steamers, which will be used to carry Kennecott's ore now being shipped to Tacoma and Garfield plants of American Smelting and Refining Co.; Tacoma plant unable to handle mine's entire output. Some of the ore is being sent to Perth Amboy for smelting.

CALIFORNIA

Amador County

KEYSTONE (Sutter Creek)—Eighty men are employed and 40 stamps are dropping on good ore. C. R. Downs is manager.

PINE GROVE (Pine Grove)—Shoot of ore 4 to 6 ft. wide reported. Development of property is in progress. Russell Robinson is superintendent.

PLYMOUTH CONSOLIDATED (Plymouth)—Company report for August shows 10,800 tons of ore milled yielding total value of $53,236 or average of $4.93 per ton. Operating expense $29,158; development $1,906, total $31,104, leaving surplus of $22,132. James E. Park is superintendent.

Butte County

GOLDEN BANK-GOLDEN QUEEN (Forbestown)—Extraction and milling of ore has been resumed under lease by Charles W. Reese. Lease carries purchase option on which payment must be made in October. Property is largest of old producers in Forbestown and was reopened about four years ago by M. J. Cooney after being idle for about 18 years. Large amount of development was done and property examined by large investors and would probably have been sold but for advent of European war. Reconstructed 20-stamp mill is driven by water power, as mills were in the early days in Forbestown district. Should this property be sold and operated on proper scale an electric power plant will be necessary. If this property is reopened and operated reopening of entire district will follow.

Calaveras County

ROUGH DIAMOND (Angels Camp)—This gravel mine has been developed to bed rock, to depth of 61 ft. Gravel is dark blue and prospects from 5c. to 15c. per pan. An incline is being sunk to follow bedrock into channel believed to be old Murphy's channel.

Eldorado County

MOREY (Placerville)—Property is being worked by Elwood Morey. A 5-stamp mill which is one of oldest in state and is said to have been running almost continuously for 45 years. Ore is high-grade.

BLACK SAND discovered in the bed of Hanktown Creek within limits of Placerville recently gave return of $110.90 from 97 lb. of sand. It is believed there is large deposit of high-grade black sand in creek.

MOUNT PLEASANT (Placerville)—This old mine near Grizzly Flats is being unwatered with view of resuming development in lower levels, lowest being at 1,100-ft. depth. Assessment of 5c. per share has been levied on the capital stock, delinquent Oct 7. Mine was good producer years ago but was never worked extensively below 600 level.

W. S. DAY (Placerville)—A purchase bond has been taken by Nipissing Mining Co. at price reported to be $100,000. Reported that prospecting will be done with diamond drill. Ore is generally good-grade, running as high as $20 per ton. If development warrants purchase and operation it is probable that concentration will be introduced. H. E. Bush is superintendent.

MIOCENE OIL (Maricopa)—Gusher was brought in on 4, 11-23 recently and when it became evident that big producer was about to be finished, work was stopped and preparations made to bring well under control. Company has thus avoided large immediate production without tankage. Oil sand was entered at depth of 1,704 ft. Well is situated on Pat Welch lease.

Mariposa County

HART (Madera)—High-grade ore reported to have been disclosed in 2-ft. ledge extending for 30 ft. Ore contains copper as well as gold. Sample shipped to Selby. Property is owned by S. D. Hart.

Mono County

STANDARD (Bodie)—Work of treating old dumps is said to be preliminary to resumption of development of this and other mines in Bodie district.

Monterey County

PATRIQUIN (Parkfield)—Mine is producing about 1½ tons of ore per day. Recovery of about 60 flasks of quicksilver per month is reported.

Nevada County

THOMAS (Colfax)—Irving F. Smith and associates, of Oakland, have taken over the property and will begin development immediately.

EMPIRE AND GOLDEN CENTER threatened litigation reported settled out of court. It is also reported that negotiations have been resumed for settlement of Empire-North Star controversy out of court.

WALKESHAW (North Bloomfield)—In driving new drift Nels Jepsen and Theodore Larsen opened up large volume of water from which they escaped by being warned of approach by seepage through drill holes. They were compelled to run distance of 1,000 ft.

CARTER (Nevada City)—Reported that Haggin and Hearst interests have made an inspection of these claims at Missouri Bar on South Yuba River. Large ledge recently disclosed which produced good ore. Development will proceed under superintendency of Stuart Rawlings.

UNION HILL (Nevada City)—Fourth battery of mill in commission, making total of 20 stamps dropping on ore. Most of the ore comes from 700 level and 770 intermediate level, averaging about $7.50 per ton. Monthly output of bullion $12,000 to $15,000. Small amount of tungsten.

Plumas County

HENRY TAUNT AND J. P. BUTRE, operating gravel claims on Squirrel Creek, recently cleaned up $900 in coarse gold, one of pieces weighing about 9 oz. This district has produced large amount of coarse gold, recent slug valued at $700.

San Luis Obispo County

AVILA REFINERY has been removed to Casmalia in northern part of Santa Barbara County where it will be used in manufacture of asphalt from heavy grade of oil produced in that field which had been abandoned by fuel-oil producers.

COLORADO

Boulder County

WHITE RAVEN (Ward)—In sinking shaft below 240-ft. level body of rich silver and bismuth ore has been opened, at what appears to be convergence of two oreshoots which have been opened in higher levels.

BOULDER TUNGSTEN (Nederland)—Work on Clark tunnel is well under way and timbering of loose ground near portal is in progress. Machine drills will be used as soon as new compressor plant has been installed. Foundations for compressor and mine buildings have been laid and buildings are under construction. Portal of the tunnel is located below the Nederland dam of the Colorado Power Co. and line of tunnel is directed in northwesterly course which will intersect veins at depth of 1,000 ft. below the surface. F. H. Nye is superintendent.

Clear Creek County

WYOMING VALLEY TUNNEL (Idaho Springs)—The company plans to resume active development work. New 8-drill air compressor is to be installed.

VINDICATOR TUNNEL (Idaho Springs)—The 6-ft. vein in Tom Tuck property has been opened for distance of 250 ft. Arrangements are in progress to provide capital for extensive development, and to cover cost of machinery to complete equipment of old Gold Hill mill, which is to be remodeled to treat ore from tunnel.

Lake County

LEADVILLE DISTRICT MILL (Leadville)—Zinc tails from old Adams mill in Strayhorse gulch are being hauled by Horrigan Bros. and are treated by flotation in this reconstructed mill now operated by Pingree Mining and Milling Co. Estimates place dump tonnage at 10,000.

San Juan County

CARLSON (Silverton)—Main adit on sulphide vein has opened large body of soft sulphide ore, much of which is high grade and can be shipped crude.

KITTIMAC (Eureka)—Manager Walter, of Denver, and Superintendent Card have decided to install flotation in the mill in addition to Huff electrostatic process.

HAMLET (Middleton)—Remodeled mill is now in operation. Ore is trammed from mine 200 ft. through snow shed to mill storage bins. Ore is broken in Blake crusher and passed to two sets of rolls and revolving screens; then treated on roughing table to eliminate part of gangue and passed to Hardinge mill. Pulp goes to classifier and thence to four sets of Wilfley tables. Slime is pumped to Callow tank for dewatering and thence to 6-cell flotation machine. E. A. Ritter is consulting engineer.

Summit County

NO. 2 BOAT OF THE TONOPAH PLACERS CO. exposed four different veins in the bed of Swan River recently and prospectors have staked out claims along the extensions up Muggins Gulch.

Teller County

WAR EAGLE (Altman)—After lying idle for 10 years, this mine in highest part of district is being reopened by Charles Dougherty. It produced high-grade liberally in former operations.

MORNING GLORY (Anaconda)—New leasing concern is pushing development on 225 level after installing electric hoist and laying compressed-air pipeline from Doctor-Jack Pot power plant.

TORNADO (Cripple Creek)—Development will soon be resumed in this Raven Hill property belonging to Elkton estate. Surface equipment is being installed and shaft will be repaired and placed in working order.

IDAHO

Shoshone County

GUELPH (Wallace)—Caledonia compressor, motor and hoist have been purchased for this company and connections are being made with power mains

INTERSTATE-CALLAHAN (Wallace)—For 26 days ending Sept. 5, this company shipped 4,600 tons of concentrate and crude ore, averaging about 19% zinc.

OOM PAUL (Burke)—Company will use 500-ft. Echo tunnel as start for 1,000-ft. crosscut adit. New buildings, including bunkhouse, mess-house, and compressor-house, have been completed.

NORTHERN LIGHT (Pine Creek)—Crosscut and drift from bottom of 200-ft. shaft has exposed vein 6 ft. in width, nearly all of which is commercial ore, with 15 in. of shipping ore along foot wall. Ore is both lead and zinc, former predominating.

OOM PAUL (Burke)—Crosscut 1,000 ft. in length is now being driven to cut vein 1,000 ft. below old shaft workings on opposite side of mountain. New and permanent buildings have been completed and company is well equipped to make rapid progress. Crosscut will run through ground of Echo Mining Co. and will cut vein on that property at great depth.

EMPIRE COPPER (Little North Fork)—Empire Copper Mining Co., which owns property formerly known as the Horst-Howell, is shipping three cars of copper ore per week, hauling by wagon five miles to railroad Company spent $10,000 building wagon road, which is built on railroad grade, and it is believed that O.-W. R. & N. company will extend branch to mine next year.

LITTLE PITTSBURG (Pine Creek)—Gus Smith has just bonded Little Pittsburgh group of claims to J. D. and Watson Beebe, who have incorporated Colonial Mining Co. for purpose of development. Ledge is open at depth 400 ft. by crosscut and drift of 25 ft. has exposed 14 ft. of zinc ore that averages 25%; 7 ft. of which averages 45%. Compressor has been ordered and electric power line is being extended to property.

FRISCO (Gem)—Mine closed down three weeks to install new crusher, rolls and other machinery in mill. Owned by Federal company. Working zinc ore left in mine years ago by former owners when zinc was of little value. Extensive experiments operating during past year or more said to be successful. Mill processes include concentration, magnetic separation and flotation. New body of lead and zinc recently struck on 2,200 level.

SNOWSTORM (Mullan)—Mine exhausted ore reserves and suspended operations several months ago, having surplus of $160,000 in treasury. Reliably reported today that surplus will be used to take over Banner lead property near Troy, Mont., which has been under development for several years by Leo Greenough, manager of Snowstorm. Fred McCormick, formerly superintendent of Snowstorm, has gone to Troy to take charge of property

NATIONAL (Mullan)—Crosscut from bottom of 200-ft winze sunk from inner end of the old working adit has entered vein 35 ft., opening highest-grade copper ore ever found in mine. There is no indication of hanging wall, but no further crosscutting will be done till new pumps have been installed to handle increased flow of water expected when hanging wall is reached. The 500-ton mill will soon be ready to operate and there is said to be sufficient ore broken in stopes to keep it running at capacity for several months.

CALEDONIA (Kellogg)—Connection between upper workings and Keating tunnel has opened orebodies at considerably greater depth and is said to have assured sufficient ore to maintain dividends at present rate of 3c. a share, or $78,150 a month, for at least five years. Four feet of lead-silver ore assaying higher than any considerable body heretofore discovered in mine has been opened by new level 70 ft. above Keating tunnel. Where raise cut vein a foot of first-class copper ore was found, and this is said to have widened to several feet of milling ore, with stringers of shipping ore.

INDEPENDENCE-GETTYSBURG (Mullan)—Independence-Gettysburg group of claims, adjoining Morning mine of Federal company, was recently taken over by Independence Lead Mines Corporation, of which Maurice W. Bacon, general manager for Stewart Mining Co., is president. More than 4,000 ft of development has been done. Fifteen men are employed, stripping apex of supposed extension of Morning vein, driving on Independence at depth of 600 ft. and on Gettysburg at 150 ft. It is rumored that eastern capitalists are negotiating for two-thirds of 1,000,000 shares issued, on basis of 25c. per share.

MICHIGAN

Copper

AHMEEK (Ahmeek)—Has foundations in for new shaft rockhouse at No. 2. This will not interfere with hoisting but will give greater capacity when completed.

SOUTH LAKE (Houghton)—South Lake's suspension of rock shipments is due simply to desire to accumulate dozen cars at time to facilitate railway transportation from Copper Range to Hancock and Calumet roads.

HOUGHTON (Houghton)—Has resumed hoisting rock and shipping to Winona mill. Winze will be sunk from 10th to 12th level. Best showing is south of 6th level. Practically all copper rock is coming from that point now.

CALUMET & HECLA (Calumet)—Two-men machines are entirely out of use excepting in some pillar work. While the "one-man" drill was made an issue in strike two years ago no man would go back to old drill now. Calumet & Hecla now has on payrolls over 10,000 men

WHITE PINE (ONTONGAN)—Last Friday made its record showing for a single day since operations started. The mill turned out 40 bbl. of mineral, each barrel weighing 1,300 lb. of mineral or 52,000 lb. per day. Assuming that mineral shows a refined return of 70%, an assumption warranted by facts, product for one day's operation is shown to be 36,000 lb. refined copper. Mill was not then operating to complete capacity.

Iron

SALISBURY (Ishpeming)—Long drift to new orebody to south has been completed. Raising is now in progress. Exact size of deposit is unknown as only one drill showed ore.

FORBES (Iron River)—New blacksmith and machine shop to be erected soon. Present structures are entirely inadequate. Electric hoist, pump and underground haulage to be installed.

NORTH LAKE (Ishpeming)—Contract has been let for power house at new Section 6 mine of North Lake group. First cut has been made in pit. Stripping should be finished early in year. Ore will be mulled. Deposit contains about 250,000 tons

VOLUNTEER (Palmer)—Mine was reopened this week. Had been closed more than year but pumps had been kept going. New shaft has been raised. Drilling disclosed fine, new deposit. About 150 men will be employed when mine gets going well. Shipping also started this week.

JONES & LAUGHLIN (Ishpeming)—Small pit at Iron Mountain Lake has been opened again. Some work done here four years ago. About 12,000 tons will be shipped. Some exploratory work will also be done. Work on new underground property, short distance away, will probably be resumed in November. More drilling will be done on this property.

LAKE ANGELINE (Ishpeming)—Cleveland-Cliffs Iron Co. making surface survey of this property, which was bought at auction from Pittsburg & Lake Angeline Iron Co., Sept. 15. Old workings will be scrammed. Development campaign will be planned shortly. Believed there is ore to be found there. Machinery is almost worthless. Lucien Eaton, superintendent of Ishpeming district, will have charge.

PENN IRON (Vulcan)—Hydro-electric shovel has been loading ore from stockpiles for some time and is giving excellent satisfaction. It operates very smoothly and is said to be a big improvement over straight electric shovels. There is not wear and tear on motors when maximum load is on, as is case with electric machines. Patents have been secured by Frank Armstrong, designer.

MINNESOTA

Duluth

MINNESOTA STEEL (Duluth)—Officials state that plant will be in readiness to start on schedule time, Nov. 1. After month's firing with fuel oil, coke ovens are nearly ready. Although no ore shipments are yet arriving, upward of 300 cars of limestone and coal are being received daily. Blast furnace and hot-blast stove linings now being dried, as well as openhearth furnaces. Company recently contracted for erection of $50,000 hospital and $40,000 store building. Hospital will be 4-story structure, and store building will be 187x187 ft., two stories. Both will be of concrete blocks.

Mesabi Range

MORTON (Hibbing)—A new shaft has been completed.

ALEXANDRIA (Chisholm)—Arthur Iron Mining Co., employing 40 men on shift, now down 52 ft.

HILL ANNEX (Calumet)—About 300 ft. of trestle collapsed Sept. 25, carrying down ten cars. No fatalities.

THORNE (Buhl)—This new underground mine of Steel Corporation made its first shipment Sept. 23.

SUSQUEHANNA (Hibbing)—New shaft completed and drifting started. This main drift runs directly under openpit.

QUINN-HARRISON (Nashwauk)—Much rock being encountered in stripping operations. Eight shovels working.

LEETONIA (Hibbing)—Oliver Iron Mining Co. has completed new shaft and is now preparing to drift under Carson Lake.

MAHONING (Hibbing)—On Oct. 1 mine passed the 1,800,000-ton mark for season. Either Mahoning or Hull pit will be season's biggest shipper.

VICTORIA (Virginia)—Republic Iron & Steel Co. has started diamond-drill operations on property, immediately east of Norman mine

TIOGA (Chisholm)—Contract for furnishing light and power to this new operation of Shenango Furnace Co. has been awarded to Chisholm Electric Co. Latter company is building an addition to its plant for this purpose.

OLIVER IRON MINING (Chisholm)—Is shipping complete outfit for exploratory shaft sinking from its Sec. 27 shaft at Chisholm to Schulsburg, Wis., at which point shaft will be put down in zinc district. At Sec. 27 mine temporary equipment has been superseded by permanent installation.

HAWKINS (Nashwauk)—Company has notified all its surface lessees to remove their buildings by Nov. 1 as the company plans stripping west bank. This will bring openpit within few feet of town's principal business street, Central Ave. Overburden at point is 40 ft. deep.

Missouri—Kansas—Oklahoma

ATHLETIC MINING (Duenweg, Mo.)—To enlarge mill to 350 tons capacity. Larger compressor also to be installed. After contemplated improvements plant will be largest and most complete in district.

HANFORD MINING (Joplin, Mo.)—Is sinking new shaft east of its plant in Jackson Hollow, southwest of Joplin. Has made several improvements in plant recently and is now making about 60 tons of ore weekly.

GRAY CAT MINING (Galena, Kan.)—Started up last week after shut down of month, installing new steam hoist and making some repairs on mill. Made two cars of [illegible] assayed 61%, sold for $80 on 60% base.

JAMES MURPHY LAND (Galena, Kan.)—Mine practically flooded by heavy rains; hundred of miners out of work. Large concrete flume in Short Creek which crosses this land, insufficient to carry water off, arrangement being made to [illegible] install two Texas Wonder pumps, expect to have [illegible] out in about six weeks.

MONTANA

Jefferson County

KING SALOMON (Clancy)—This property, located in Clancy district, has been taken over by Monarch Mining and Smelting Co., with ample capital for financing property, which is one of old producers of district. Large amount of ore is blocked out in 400-ft. level for stoping. On 600-ft. level ore will be tapped by drift and crosscut. Mine is equipped with modern machinery good for depth of 1,200 ft. Regular shipments will begin shortly.

Silver Bow County

TUOLUMNE (Butte)—Strike of rich copper glance running as high as 40% copper was made Sept. 28 on 2,600-ft. level about 50 ft. from station.

NETTIE (Butte)—Pumping capacity at this mine, one of Anaconda company's properties in western section of Butte district, has been increased to take care of entire flow of water from underground workings, which is at present between 1,400 and 1,500 gal. per minute

BUTTE-DULUTH (Butte)—On Sept. 29 Judge George M. Bourquin of the United States district court rendered a decision that the Butte-Duluth mining company of Butte is not bankrupt. Although company admitted that it was unable to meet its obligations as they matured, it did not admit that its liabilities exceeded assets.

BUTTE & LONDON (Butte)—Shaft sinking at this property has met with set-back through trouble with installation of new electric pump on 1,100-ft. level to take care of flow of water in mine. In meantime shaft is kept clear of water by use of pump on 800-ft. level and by supplementing with tank-skips whenever water makes any gains.

DAVIS-DALY (Butte)—Hesperus vein, opened on new 2,500-ft. level of Colorado mine, has been drifted on 150 ft. and ore is holding out well. Vein averages 12 ft. in width, and the commercial ore, which contains a good sprinkling of copper glance, is about 5½ ft. wide. Smelter returns showing an average copper content of 5½ per cent.

NORTH BUTTE (Butte)—Encouraged by steady increase in surplus, company is making preparations for development of some of its new properties purchased in Butte district in past two years. Regular quarterly dividend of 50c. was ordered paid, but there will be no advance of dividend rate as surplus will be kept for proposed improvements and developing of new properties. It is understood that cost of producing copper by North Butte has dropped below 10c. a pound. With new shaft in operation monthly output should increase to at least 2,250,000 lb. of copper, raising production to 27,000,000 lb. per annum.

NEVADA

Clark County

SULTAN (Goodsprings)—Henry Robbins, owner of this property, has announced his intention to erect 50-ton dry-concentrating plant at mine. Mill is to treat mixed lead and zinc carbonates, of which there is considerable tonnage blocked out in mine. Experiments are also to be made on concentration of low-grade zinc carbonates.

MOBILE (Goodsprings)—Now shipping about 250 tons of zinc-carbonate ore monthly. Owners have taken option on Doran & Zenzen property on Big Devil Mountain. Force of men are to be put to work at once. Property has considerable tonnage of ore exposed, carrying lead and silver. It is probable that mill will be erected in near future.

Douglas County

BUCKSKIN NATIONAL (Buckskin)—Has 5,000 tons ore on dumps. Will build mill as soon as sufficient depth is attained in mine to determine permanent character of ore.

Esmeralda County

DIAMONDFIELD BLACK BUTTE (Diamondfield)—The Howard Marine lease on 110-ft. level has cut rich ore. Face of drift said to average $240 per ton in gold and silver.

GOLDFIELD CONS. (Goldfield)—During August total production was 32,100 tons from which net realization was $106,624. During month lessees produced 992 tons of total gross value $23,085.

Humboldt County

SEVEN TROUGHS COALITION (Seven Troughs)—Reported that on south 1,200 level strike of 14 in. of $10,000 ore has been made. Is thought to be same streak which was 8 in. wide and assayed $5,300 on both 1,200 and 1,300 levels.

ROCHESTER MINES (Rochester)—Big Friedman tunnel is progressing at rate of 15 ft. a day and is now in 920 ft. Low-grade vein matter is being encountered. Ore zone expected to be encountered at depth of from 1,000 to 1,200 ft. according to original estimates when figuring dip of veins at 400 level. Tunnel will hit ledges at depth of 1,200 ft.

Mineral County

BELLEVILLE TAILINGS ASSOCIATION (Belleville)—This association composed of Goldfield mining men has been working on tailings from ores of Candelaria milled in early days of camp, since July of last year, laying off only during winter months. Plant cost $25,000 and has treated to date 20,000 tons of tailings. There remains at least 150,000 tons averaging around $5 to be treated. Force consists of 18 men and the plant treats about 115 tons daily. C. Beedle is manager.

Nye County

TONOPAH ORE PRODUCTION for week ended Sept. 25 was 9,629 tons, valued at $199,282 compared to 9,861 tons week previous. Producers were: Tonopah Belmont, 2,833 tons; Tonopah Mining, 2,850; Tonopah Extension, 1,850; West End, 839; Jim Butler, 1,050; miscellaneous leasers, 207 tons.

TONOPAH BELMONT (Tonopah)—Combined statement of Development and Milling companies for quarter ended Aug. 31, shows receipts from ore and bullion $586,480; mining, milling, and administration expenses, $371,867. Total net income, including miscellaneous, for three months, $226,864.

Storey County

MEXICAN (Virginia)—South drift No. 3 on 2,500 level in porphyry and quartz. Mill treated Mexican and Union wedge rock.

BELCHER-CROWN POINT (Gold Hill)—Water at incline lowered 45 ft. and held at 170 ft. below the 1,500 level. Saved 20 cars of mill rock. Jacket mill received 977 tons of dump rock and shipped one bar of bullion.

CON. VIRGINIA AND OPHIR (Virginia)—Air and water pipe placed for a distance of 186 ft. below 2,500 level. Ophir continued raising to third floor in vein. Ophir saved 309 cars of ore from all work and milled 250 tons.

White Pine County

GIROUX CON. (Kimberley)—Col. E. A. Wall, of Salt Lake City, has filed petition at Reno, Nev., asking for receiver for Giroux Consolidated. He alleges conspiracy on part of Thomas F. Cole and others to depreciate value of property and asks for accounting. Restraining order issued. Hearing set for Nov. 10 at Carson City.

NORTH DAKOTA

LIGNITE OPERATORS of Burlington, N. D., have lodged complaint with state railway commission against the short haul rates recently promulgated. Date of hearing not yet set.

SOUTH DAKOTA

Lawrence County

HIDDEN TREASURE (Deadwood)—Crosscutting easterly and westerly on 200 level is revealing highly mineralized formations. Some native copper has been found.

MOGUL (Terry)—New De La Vergne engine has been put in commission, raising capacity of plant to 200 tons daily. Custom ore is treated for $1.50 per ton; settlement is made upon 75% of gold assay.

UTAH

Beaver County

CONSIDERABLE MINING AND DEVELOPMENT is being done in the vicinity of Milford. The Moscow, Cedar-Talisman, Lady Bryan, of the Utah Mining, Milling and Transportation Co., and Majestic mines are producing; and the Leonora, Paloma, and others are developing ore. It is reported that the Horn Silver dumps at Frisco will probably be turned over to a leasing company. The dumps contain over 200,000 tons, and some of the material carries about 7% lead, 6% zinc, and 6 oz. silver. The mill at the South Utah at Newhouse, which will treat the Cactus dumps by flotation is expected to start up in the near future.

Juab County

TINTIC ORE SHIPMENTS for week ended Sept. 25 totaled 130 carloads estimated at 6,500 tons, valued at $163,000, compared with 121 carloads week previous.

Summit County

PARK CITY ORE PRODUCTION for week ended Sept. 25 totaled 2,634 tons valued at $105,000, compared with 1,727 tons week previous. There were 5 shippers.

Tooele County

INTERNATIONAL SMELTING (Tooele)—A. J. Bruneau, representing 25 Tooele Valley farmers, has filed suit in United States Court at Salt Lake City against International Smelting Co. for specific performance of contracts to purchase lands near smelter. Suit involves $265,000 and $39,000 attorney fees. Contracts were made prior to building of smeltery and were to be exercised should damage by smelter smoke be proven.

CANADA

British Columbia

GRANBY CONSOLIDATED (Grand Forks)—Has taken bond on Gloucester group of claims in Gloucester camp, about 55 mi. from Grand Forks, and about 30 mi. from end of Kettle Valley R.R., to complete which an extension of time was granted by Government.

Ontario

BEAVER (Cobalt)—Diamond-drilling to depth of 1,700 ft. has proved occurrence of rich ore below present workings, and shaft is being sunk rapidly.

CHAMBERS FERLAND (Cobalt)—Has found vein carrying high-grade ore on 275-ft. level. Extension of this vein in Nipissing has been profitable producer.

SMITH-LEBINE CLAIMS (Sesekinika Lake)—Have been purchased by Montreal syndicate, headed by A. M. Bilsky. They have an area of 120 acres on which 18 veins have been uncovered.

DOMINION REDUCTION (Cobalt)—Has taken option on Brennan property at Goodfish Lake, and has also taken more options in Munro Township, where it already owns rich Dobie-Leyson property.

NIPISSING (Cobalt)—Has dropped its option on claims in Munro Township, near the Dobie-Leyson. Company has an option on property in California. Financial statement shows cash on hand $655,403 and ore and bullion on hand and in transit, $731,572.

MEXICO

Pachuca

SANTA GERTRUDIS (Pachuca)—Ore crushed during August amounted to 13,338 tons; estimated profit, £5,280.

AFRICA

Transvaal

GOLD OUTPUT IN AUGUST is reported at 778,763 oz. fine, which is 8,208 oz. more than in July, and 66,845 oz. more than in August, 1914. For the eight months ended Aug. 31 the total production was 5,530,165 oz. in 1914, and 5,957,167 oz., or $123,134,642, in 1915; an increase of 427,002 oz. this year. The number of negro laborers employed at the end of August was 206,809, an increase of 7,412 over July.

The Market Report

Metal Markets

NEW YORK—Oct. 6

There was not much change in the metal markets last week, save in the case of copper where some pressure to sell began to be exhibited. Lead was a little weaker in tone. The peculiar condition in spelter continued.

Replying to an inquirer, "regular terms" in the sale of copper mean that the seller delivers the copper to the buyer, paying the freight on it, and allows him 30 days after his receipt of the copper in which to make payment, or if he chooses to pay cash the bill is discounted at the rate of ½%. To arrive at the difference between a sale upon these terms and a cash sale, f.o.b. refinery, which is regarded as being f.o.b. New York, the interest on the value of the copper while in transit is commonly reckoned. This is a matter of 10 days. When copper sells at 18¼c., regular terms, the equivalent net price is therefore about 18.03c., there being 0.09125c. discount, 0.1c. freight, and 0.0304c. loss of interest, a total of 0.22c. The freight rate is naturally a variable, being less to some near-by factories and more to some of the more remote ones. About 10c. per 100 lb. is regarded as being an average transportation cost.

Copper, Tin, Lead and Zinc

Copper—Some of the principal producers who had made liberal sales at 18c., regular terms, raised their asking price to 18¼c., but the market never became established at that figure. At the beginning of our week of record several sales of one million pound lots were made to domestic consumers at 17⅞c., regular terms, at least two agencies participating in this business. At the same time producers made sales of considerable tonnages for export at prices netting above 18c. Later, foreign business was done in considerable volume at higher prices, but, at the same time, foreign business was taken at lower prices. With respect to this business much depended upon the points for which sales were made and the conditions otherwise. Some producers were fortunate in having copper already available on the other side, and others were fortunate in having contracted for freight room in advance. In the meanwhile the domestic market became rather dull and the producers of electrolytic copper began to feel keenly the competition of the Lake producers. The latter realized high premiums several months ago and have had dreams of getting them again, but apparently giving up such hopes, they have lately been offering Lake upon the same terms as electrolytic. Even so, they found the going not quite easy. During the time when Lake was so scarce, the producers of electrolytic took some trouble to find a foothold for their product in quarters where previously it had not been used. Now, when the Lake producers are trying to get back their old customers they are told in some cases, so it is said, that electrolytic copper is liked better. At the close of the week copper was offered in many quarters at 18c., regular terms, and in some quarters at 17⅞c., with intimations that even the latter price might be shaded.

The volume of business transacted during the week was moderately large. Sales to domestic consumers were probably in excess of 10,000,000 lb., and foreign business was probably larger than that.

Copper Sheets are quoted about 23c. per lb. for hot rolled and 24c. for cold rolled, with usual extras. Wire prices are unsettled; quotations may be put at 19½@20c. per lb. at mill. The chief maker does not quote base price.

Tin—The market was dull up to Oct. 5, when rumors began to be circulated that the government of the Federated Malay States was going to put an export duty on tin. This news, which was first published in a New York daily paper, became the subject of cable inquiries to Europe which led dealers over there to surmise that something was in the air, and considerable excitement ensued. On Oct. 5 tin opened in this market at 32c. and closed at 32½c. On Oct. 6 there was a sharp rise in the London price, which was reflected by an advance in the price here.

Lead—At the opening of the week some lead realized a premium, but this could not be maintained in view of the free offerings by several large interests at the old price. Meanwhile the market in St. Louis became a little weaker. There was a good deal of inquiry for large tonnages of lead but these were freely met.

Spelter—The only change in conditions from our last report was the doing of considerable business for such deliveries as October-March, November-March, etc. Such business was done at about 11¾@12c. The total volume of business was rather large, and it was almost entirely for export, domestic consumers apparently having no interest in the market. A relatively trifling amount of business for early deliveries was done, the price for October being about 13¾c., for November, 13¾@13½c., for December, 13@13¼c. Sales were made for the first quarter of 1916 at 10½@11½c.

Zinc Sheets—Business has been active, sales good but with no material change in quotations. The base price for carload lots is $16 per 100 lb. f.o.b. Peru, Ill., less 8% discount.

DAILY PRICES OF METALS IN NEW YORK

			Copper	Tin	Lead		Zinc
Sept Oct	Sterling Exchange	Silver, Cts. per Oz.	Electrolytic, Cts. per Lb.	Spot, Cts. per Lb.	New York, Cts. per Lb.	St. Louis, Cts. per Lb.	St. Louis, Cts. per Lb.

The quotations herein are our appraisal of the average markets for copper, lead, spelter and tin based on wholesale contracts for the ordinary deliveries of the trade as made by producers and agencies; and represent, to the best of our judgment, the prevailing values of the metals, reduced to basis of New York, cash, except where St. Louis is given as the basing point. St. Louis and New York are normally quoted 0.17c. apart.

The quotations for electrolytic copper are for cakes, ingots and wirebars. Electrolytic copper is commonly sold at prices including delivery to the consumers and is subject to discounts, etc. The price quoted for copper on "regular terms" is the gross price including freight to the buyer's works and is subject to a discount for cash. The difference between the price delivered and the New York cash equivalent is at present about 0.20c. on domestic business. The price of electrolytic cathodes is 0.05 to 0.10c. below that of electrolytic. Quotations for lead represent wholesale transactions in the open market for good ordinary brands. Quotations for spelter are for ordinary Prime Western brands. Only the St. Louis price is herein quoted, St. Louis being the basing market. We quote the New York price at 15c. per 100 lb. above the St. Louis price.

Silver quotations are in cents per troy ounce of fine silver.

Some current freight rates on metals per 100 lb. are: St. Louis-New York 17c.; St. Louis-Chicago, 6.3c.; St. Louis-Pittsburgh, 13.1c.

LONDON

		Copper				Tin		Lead		Zinc	
		Standard		Electrolytic							
Sept Oct	Silver	Spot	3 Mos.	£ per Ton	Cts. per Lb.	Spot	3 Mos.	£ per Ton	Cts. per Lb.	£ per Ton	Cts. per Lb.
30	23⅜	72	73	87½	18 43	151¼	152½	23¾	5 02	65	13 70
1	23⅜	73	73⅛	87½	18 44	150	151¼	24¼	5 08	67¼	14 22
2	23⅜										
4	23⅜	72⅞	73⅛	88	18 53	149¾	150¾	23¾	4 98	67½	14 19
5	23⅜	72⅞	73⅜	88	18 45	148¾	149¾	23 7/16	4 92	69	14 35
6	23⅜	71	72	88	18 47	151¼	152¼	23¼	4 91	69	14 30

The above table gives the closing quotations on London Metal Exchange. All prices are in pounds sterling per ton of 2240 lb., except silver which is quoted in pence per troy ounce of sterling silver, 0.925 fine. Copper quotations are for standard copper, spot and three months, and for electrolytic, price for the London delivery, subject to 3 per cent. discount. For convenience in comparison of London prices, in pounds sterling per 2240 lb., with American prices in cents per pound, the following approximate ratios are given, reckoning exchange at 4.80: £10 = 4.21c.; £20 = 4.29c.; £30 = 6.43c.; £40 = 8.57c.; £60 = 12.85c. Various items, £1 = 0.21½c.

Other Metals

NEW YORK—Oct. 6

Aluminum—The demand continues good and the scarcity of metal for spot and early deliveries has been accentuated. Sales are reported as high as 49@51c. per lb. for No. 1 ingots. No quotations on futures are being made.

Antimony—A fair business has been done and there is a good lot of inquiries. Reports of large demand for war orders are current, but not especially credited. Ordinary brands, chiefly Chinese, bring 28@29c. per lb., New York; while 45@46c. per lb. is asked for Cookson's.

Nickel—Quotations for ordinary forms nominally are 45@50c. per lb., according to size and terms of order. A premium of 3c. per lb. is charged for electrolytic nickel.

Quicksilver—Stocks are reported rather low, and the market is active and stronger. New York quotations are $90 per flask of 75 lb. for large lots, $91@92 for smaller orders. San Francisco reports by telegraph a brisk market, with sales early in the week at $85, the price hardening to $87.50@90 at the close. London price is unchanged at £16 per flask, with no discount from second hands.

Minor Metals—Current quotations for **Bismuth** are $3 per lb., New York.—**Cadmium** is quoted at 7s. per lb. in London; $1.75@1.90 per lb., New York.—**Chromium** metal, 75c. per lb., New York.—**Cobalt** metal, 97% pure, is sold at $2 per lb.—**Magnesium**, pure, has gone to a high price, $6 per lb. being asked.—**Selenium** varies from $2.50@3 per lb., New York, for large lots, $4.50@5 for retail quantities.—**Tellurium** is quoted at 8os. per lb. in London.

Gold, Silver and Platinum

NEW YORK—Oct. 6

Gold sales from the United States Assay Office in New York in September were $3,020,719, being $498,497 less than in August. For the nine months ended Sept. 30, the total sales were $48,409,521 in 1914, and $24,420,943 in 1915; a decrease of $23,988,578 this year.

Gold Imports in Great Britain eight months ended Aug. 31 were £6,934,244, exports, £6,679,991, excess of imports, £254,253. The receipts are apparently very much less than in 1914 owing to the arrangements by which gold in the Transvaal and Australia is held in those countries.

Platinum—The market is entirely in the air owing to the scarcity of supplies. Dealers are reluctant to quote, even to regular customers. On a nominal base of $50 per oz. sales have been made up to $58 and even $60. Quotations may be put at $57@60 per oz. for refined platinum, and $61@65 per oz. for hard metal.

Silver has been steady in London, and the amounts on the market have been absorbed at slightly advancing prices. There is no news, however, to indicate any material advance.

Silver Imports in Great Britain eight months ended Aug. 31 were valued at £6,479,285, exports, £5,426,759, excess of imports, £1,052,526, which compares with an excess of exports of £1,130,571 last year.

METAL EXPORTS AND IMPORTS

Imports and exports of minor metals in the United States, seven months ended July 31, in pounds, except platinum, which is in ounces:

	Imports		Exports	
	1914	1915	1914	1915
Nickel	24,000,060	20,057,243	17,845,959	18,463,253
Antimony	8,775,391	11,509,034	3,675	662,492
Aluminum	9,087,575	5,842,129	18,939	40,102
Quicksilver			9,141	128,837
Platinum	38,715	12,779	143	9

Nickel and antimony include contents of ore, matte, etc. Exports of aluminum manufactures not included above, were valued at $533,927 in 1914, and $2,124 this year. Exports include reexports of foreign material. Imports of quicksilver not reported separately.

Exports and imports of the Principal Metals, other than iron and steel, in the United States, seven months ended July 31:

	Exports		Imports	
	1914	1915	1914	1915
Copper, long tons	266,063	180,145	93,056	73,741
Tin, long tons	455	472	27,198	38,005
Lead, short tons	11,009	79,846	13,576	29,671
Zinc, short tons	1,014	77,928	560	549

Exports include reexports of foreign material. Copper includes contents of ore and matte. Imports of zinc ore in 1915 were 69,854 tons, estimated to contain 29,049 tons metallic zinc. Exports of domestic zinc ore were 605 tons.

Zinc and Lead Ore Markets

PLATTEVILLE, WIS.—Oct. 2

The open market base price paid this week for 60% zinc ore advanced from $72 to $76.50 per ton. Ore taken under contract sold up to $85 per ton. Medium grades sold in the open market at $68@72 base. One lot of 150 tons assaying 50% zinc and carrying 8% carbonate sold at $45 per ton. The base price paid for 80% lead ore was $50 per ton.

SHIPMENTS, WEEK ENDED OCT. 2

	Zinc Ore, Lb.	Lead Ore, Lb.	Sulphur Ore, Lb.
Week	4,694,440	238,460	473,880
Year	148,206,040	4,781,620	20,494,190

Shipped during week to separating plants, 4,311,280 lb. zinc ore.

JOPLIN, MO.—Oct. 2

Blende, high price, $90, base, per ton of 60% zinc, premium ore, $87.50, medium grades, $85@85; lower, $84@80; calamine base, $60@56 cut lots and ton lots, $55@50; average, all grades of zinc, $79.62. Lead, high price, $56.10; base, $55@50 per ton 80% metal content, average, all grades of lead, $50.62 per ton.

SHIPMENTS WEEK ENDED OCT. 2

	Blende	Calamine	Lead	Values
Totals this week	12,299,300	711,100	2,380,240	$578,220
Totals this year	433,005,410	33,645,780	67,721,880	$19,033,410

Blende value, the week, $198,690; 40 weeks, $16,488,510.

Calamine value, the week, $19,290; 40 weeks, $767,060.

Lead value, the week, $60,240; 40 weeks, $1,777,840.

Nearly 60 in. of rain this year is the government record for Joplin. Other portions of the district have experienced several heavy rains that did not visit Joplin. There has been no rain of importance since Tuesday, when a 3-in. fall visited the district east of Joplin, but was very light here. The water is very heavy in the mines, but the present outlook is more favorable for settled clear weather than any prospect this fall. All ore outside Granby has been sold, the shipment representing over 1,000 tons in excess of the production, while large quantities of ore were being contracted for future delivery today and tonight.

Iron Trade Review

NEW YORK—Oct. 6

The iron and steel trades show increasing activity and a stronger position. This is not due altogether to export business, since domestic orders are growing in volume. Structural-steel orders are coming in more freely, as building and bridge business seems to improve, the railroads are ordering more cars, and there is a considerable volume of orders for plates, shapes and other material for ship building. In some lines, such as bars, the orders exceed the capacity of the mills.

Under these conditions is is to be expected that the advances in price on finished steel should be held, and more are expected to be made soon.

There is a shortage of billets, blooms and half-finished steel and mills using purchased billets are anxiously looking for supplies.

Pig iron is stronger, though not yet as active as finished steel. The chief demand just now is for basic iron, foundry grades being rather quiet. The market is strong enough, however, to enable furnace managers to hold the advances they have already asked and to suggest further advances on first-quarter business.

Exports from Baltimore for the week included 5,450 tons billets, bars, wire rods and skelp steel to Great Britain; 2,501 tons steel rails to Archangel; 5,637 tons steel scrap to Naples.

Imports at Baltimore for the week included 322 tons ferromanganese from Great Britain, 6,900 tons manganese ore from Brazil.

It is now stated with some authority that Charles M. Schwab, president of the Bethlehem Steel Co., is negotiating for the purchase of the stock in the Pennsylvania Steel Co., the majority of which is owned by the Pennsylvania R.R. There are also reports that negotiations are going on for the sale of the majority stock in the Cambria Steel Co., an option on which is held by W. H. Donner and Henry C. Frick.

Foreign Trade of the United States in iron and steel, including machinery, is valued as below by the Department of Commerce for the seven months ended July 31:

	1914	1915	Changes
Exports	$120,816,919	$174,970,645	I. $45,153,726
Imports	18,752,973	11,731,263	D. 7,021,710
Excess, exports	$111,063,946	$163,239,382	I. $52,175,436

The increase in exports has been chiefly in the later months. In July the total exports were valued at $35,891,575, against $16,737,552 in July of last year.

the Wilfley No. 5 head motion in conjunction with vertical supports, and these gave better results in the treatment of the slimes. Any type of head motion may be used.

The feed trough consists of a band of sheet iron 1 bent to form the front and side of the trough, which is about 1 m. long and 8 cm. wide. The back of the trough is the backboard of the table, and the bottom of the trough is the surface of the table which, however, within this inclosure, is raised toward the back by the insertion of a wedge-shaped strip of wood 2 under the linoleum. The distribution of the feed onto the table is through a row of small holes 3 at or near the bottom of front side of the trough. To check the flow of the water in the feed as it enters the trough and to cause a classification of the material in the feed, several small screens 4 are secured in the trough perpendicular to the sides. The best results are obtained when the tops of these screens are inclined toward the feed entrance. From this type of feed trough the coarse ore is discharged through holes nearest the head of the table and the slimes nearest the concentrate end. Wash water is supplied through the pipe *m*, and *n* is a stanchion to support it.

The Arrangement of the Riffles

As to the riffles, the arrangement used on the Wilfley tables with diagonal line of termination was first tried, the riffles being high at feed and tapering to 0 toward the concentrate end. This height was gradually cut down and the spacing reduced. The present size of riffle is 3 to 4 mm. in height, 6 mm. in width and spaced 15 to 20 mm. c. to c. and tapered only near the ends. With the diagonal termination of the riffles it was found that the middlings, which are usually coarser than the concentrates, discharged onto the smooth surface of the table at the ends of the riffles and formed a narrow diagonal band, dragging along under them in their downward course a portion of the concentrates. At the point of division where the concentrates and middlings discharge from the table, the separation was not distinct and the result was that some middlings would go with the concentrates and some concentrates with the middlings.

Ending the riffles or grooves so that their termination points on the upper half of the table form a diagonal line and those on the lower half form a curved line, as indicated, holds the concentrates higher on the table and spreads them over a wider area of smooth surface at the concentrate end, besides forcing the middlings to work down more rapidly toward the lower side of the table. Thus the fine concentrates in the middlings have a chance to push out from under them and continue to the concentrate edge. The line of division between concentrates and middlings is thus widened, and a more perfect separation takes place.

This practice of carrying the concentrates higher on the table and thus widening the bands of concentrates on the smooth portion of the table surface is important in the separation of complex ores like cerussite and calamine or galena and blende such as we have to treat here in Sardinia. The use of low riffles closely spaced is also important, as it allows a bed of sand to spread well down on the table, and thus the fine concentrates, which are often carried away in the flow of feed water over the table, are caught in this sand bed and travel under it to the concentrate end. The use of high riffles usually causes the ore to crowd forward in a narrow band and to leave the portion of the table below the feed box bare of material, so that the feed water has only the riffles to pass over and the fine mineral in it cannot be caught.

For treatment of slimes, grooves cut into the linoleum are preferable to riffles. In this case a linoleum of 6 mm. thickness is used and grooves 2 to 3 mm. deep and about 6 to 8 mm. apart are cut. The ends of the grooves are tapered to 0 and the points of termination form a diagonal for the upper grooves and a curved line for the lower grooves as shown on plan for riffles.

A Simple Table-Tilting Device

Another feature of the table is the tilting device, which consists of a double wedge *u* inserted between the two central supports of the table. This is entirely carried by the table top, and thus a tilting frame or rods connecting with the foundation or other complicated devices are avoided.

The bars *b* rest on the upper face of the double wedge, while the lower-wedge surfaces rest on bolts *t* carried by the supports *p*, these bolts passing through slots *s* in the vertical web of the angle-bars *c*.

To adjust the table, the bolts *t* at the top of the supports *p* should be loosened slightly, and when the table is adjusted these should be tightened again. The adjustment is effected by rotating the rod *r*, secured at its inner end to the wedge *u* and having near its outer end a screw engaging a nut secured to the frame *a* of the table. A handle *w* is attached to the end of the rod *r*. By moving the wedge, the table can be given the desired inclination. As the central member, or rod, passing through the center of the table is pivoted in the grooves of the central supports and the end of this rod is suitably connected with the head motion, the table may be tilted to any desired extent without affecting the driving mechanism or the supports.

Tilting devices as a rule make a table less rigid and often cause it to lose its proper adjustment, since they give the millmen something to fool with. The mill superintendent should be the only one to readjust a table, and when running properly the tilting devices should be so clamped that they cannot be moved.

Application of the Wash Water

The distribution of the wash water is through an adjustable perforated pipe *m*, as shown on the sketch. In case the line of concentrates is high on the table, the end of the wash-water pipe can be moved down and the line of the concentrates will move down accordingly. Thus with the wash-water pipe alone the necessary small adjustments for the position of the line of concentrates or middlings can be made immediately. The lower half of the concentrate edge is cut off at an angle *o* as indicated, so that the flow of wash water keeps the entire edge wet.

It has been found that a stroke of 12 mm. and a velocity of 300 r.p.m. are best for the finest ores, of 80 mesh and less, while a stroke of 18 mm. and a velocity of 240 r.p.m. are best for ores from 1 mm. and under, or from 16 to 80 mesh.

The advantages of this new table are its regular shape and rigidity, its light weight, small floor space required, simplicity of foundation, free space under table for launders or boxes for products, and its very low cost. Th

Mining & Metallurgical Machinery

Wright Concentrating Table

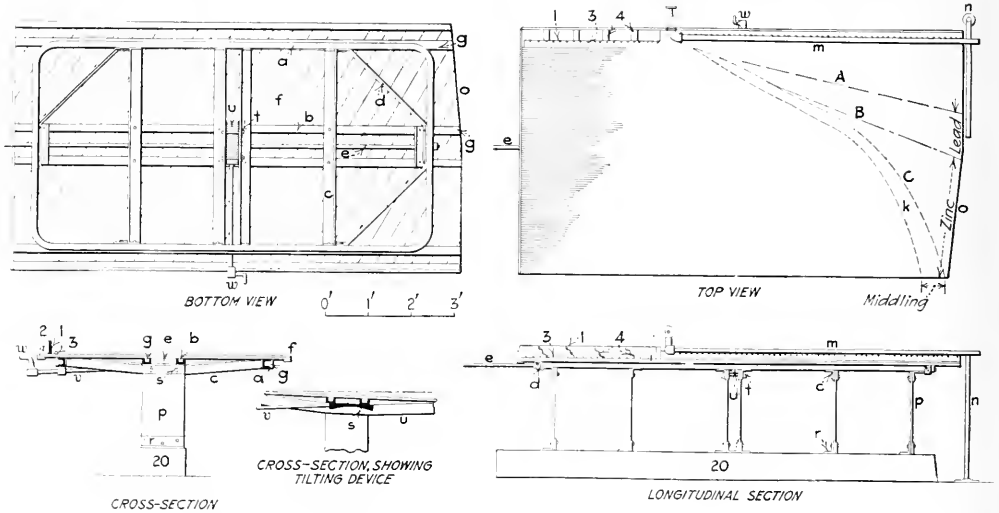
By C. W. Wright*

Table treatment of crushed ore is a simple process and one that requires a simple machine to secure best results. Most manufacturers of milling machinery make a type of table with some special improvement not found on others. There are tables of various shapes with many forms of grooves and riffles, and some tables having doubly inclined surfaces that attempt to treat an unclassified feed of sands and slimes on the same deck. Often several different types of tables may be seen in the same mill, especially when the millman has been anxious to have the best. They all do good work if run properly. It is more often the fault of the mill foreman than of the table if good results are not obtained. In many mills the tables have little chance to do efficient work because of the criminal amount of water in their feed. This is often due to the mill design, which does not allow sufficient grades for the launders, making necessary the use of an excessive amount of water.

The type of table to be described is one which we have had in use in Sardinia in some of our lead-zinc mills for four years. All of our mills are equipped with them, a total of about 60 being in use. Six years ago there were no tables used and the streams below the mills were sparkling with galena. It was not a pleasing sight, and I found it necessary to design and build tables on the ground. The machines have been modified somewhat each year, and the final result is the one now in use.

*Mining engineer, Ingurtosu, Sardinia, Italy.

The details of construction are shown in the accompanying drawings. The rectangular frame *a* is made of channel iron 60 mm. high by 40 mm. wide, and two longitudinal channels *b*. Small angle irons *d* placed diagonally across each corner are bolted to the frame to give rigidity. Large angle irons *c* constitute the transverse members of the frame, and to these the supports and tilting device are attached. An iron rod, or bolt, *e* passes longitudinally through the center of the frame, serving to clamp the entire frame rigidly together. The end of this rod extends beyond the end of the table and to it the head motion is attached. This central longitudinal member is important, as it distributes the pull of the head motion over the entire length of the table and also acts as a pivot for tilting the table on its supports. The table top *f* is made of 1-in. boards spaced $^1/_{12}$ in. apart to allow for swelling. These are screwed to four longitudinal stringers *g* of pitch pine which are bolted to the channels. There are six flexible supports *p* 30 cm. wide for the table with notches at the top in which the central rod rests. These supports are bolted to the transverse angle irons *c* of the frame and to angle-iron plates *r* bolted to the foundation beam 20.



DETAILS OF CONSTRUCTION OF THE WRIGHT CONCENTRATING TABLE

Head Motion and Feed

On the first tables built a simple eccentric head motion was used in conjunction with the flexible supports, which were inclined so as to impart a throwing motion to the table, this being the patented principle of the Ferraris table. Tables with this motion give satisfactory results, especially in the treatment of sands. Later we adopted

crucible or in a crucible heated by the oxyacetylene flame. The alloys are said to be particularly valuable as filaments for electric lights. Those covered by the patent contain not less than 40% or over 90% of zirconium.

Failure of Structural Brasses*

In an investigation of the season-cracking of brass, by P. D. Merica and R. W. Woodward, the following conclusions were reached:

Season-cracking and similar failures occur in brass materials that are under initial stress, provided these stresses average over 5,000 to 6,000 lb. per sq.in.

These stresses may be almost entirely removed by annealing at temperatures of about 300° C. to 400° C., which temperatures do not affect sensibly the ordinary physical properties.

No certain indication of the magnitude or even presence of such stresses has so far been found in a study of (a) the action of etching agents such as $HgNO_3$ or NH_4OH on brass, or (b) the micro- or macro-structure.

Brass may be manufactured practically free from stresses, and still retain excellent mechanical properties; that is, be not too soft.

Thus it would seem that from the standpoint of the user of brass further investigation should continue to correlate the service behavior of brasses with their physical properties and initial stresses so that it may finally be possible to decide what are the magnitude and the distribution of initial stresses which are allowable in such materials. Further, the most convenient method of measuring or obtaining an indication of the value of these stresses should be sought. At present this is the elongation method, which is a fairly tedious one.

From the standpoint of the manufacturer, investigation should concern the influence of the mode of manufacture on the initial stresses, the influence of other chemical elements in producing hot or cold shortness and a study of the best manner of annealing such materials. To anneal brass at 300° to 400° is not convenient with the ordinary brass-rolling mill equipment, and it is possible that some higher temperature might be used without softening the material unduly.

Sampling Lead Bullion at the El Paso Smelting Works

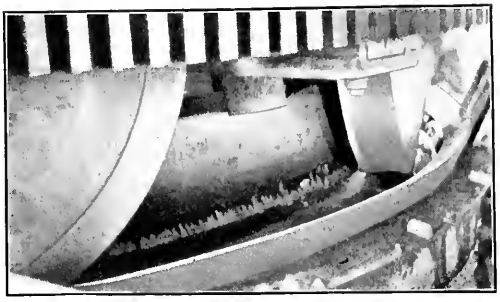
In discussing the lead-smelting practice at the El Paso Smelting Works, El Paso, Texas, H. F. Easter describes[1] the sampling of the base bullion as follows:

Whether drossed at the blast furnace or at the remelting furnace, the bullion is tapped into a cast-iron cooling pot. The dross is skimmed off carefully and thoroughly. Before the final skimming the contents of the kettle are well stirred and the dross thereby raised is taken off completely. After skimming, the contents of the cooler are stirred again and, while the lead is still in motion, gum-drop samples are dipped. A few more gum drops are taken than it is expected to make into bars of lead, to insure having a gum drop for each bar of lead.

The bullion is ladled into molds, and after the pot is empty all extra gum drops over the number of bars produced are thrown out. These gum drops are held and delivered to the assay office whenever the bullion corresponding to them is removed. A shipping lot consists of 780 bars (about 42 tons), and, when complete, the 780 gum drops corresponding are placed in a graphite crucible and melted at as low a temperature as will give a homogeneous mass from which to dip the final gum-drop samples, upon which the actual assay of the lot is made. Great care is taken not to get the sample hot enough to oxidize the lead during the process. The gum drops, which weigh about 10 grams each, are assayed without clipping and the gold and silver calculated to an assay-ton basis.

Amalgamating in a Lane Mill

The accompanying photograph shows the condition of the inside of a Lane slow-speed chilean mill in which amalgamation is taking place. The clustering of the amalgam to the ring and close to the roller shows that the agitation, even at that point, is not severe enough to



AMALGAM IN 10-FT. LANE MILL

The overflow is removed ready to clean up. The amalgam builds up as an inner mud ring

scour the amalgam off and indicates extremely favorable conditions. This installation is at the McCausland plant, Death Valley, Calif., where mills of this type have proved satisfactory in all respects.

Bacon's Precipitation Method for Copper Solutions

A cyclic process for the recovery of copper from copper-leaching operations has been patented by Raymond F. Bacon, of Pittsburgh, Penn., assignor to Metals Research Co., of New York (U. S. Pat. 1,151,234). In this process, the solutions from the leaching operations are treated with hydrogen sulphide, producing cupric sulphide and regenerating the solution for further leaching operations. The cupric sulphide, together with a quantity of elemental sulphur equal to one-half its sulphur contents is then treated in a still with hydrocarbon gases which convert the elemental sulphur and one-half the sulphur in the cupric sulphide to hydrogen sulphide. This may then be used as a precipitant.

The production of the elemental sulphur is covered by U. S. Pat. 1,151,236, sulphur dioxide from roasting the ores preparatory to leaching being mixed with the hydrogen sulphide produced as specified above, water and sulphur being formed. This action goes on either in the mixed gases, or when they are in solution.

Magnalium Turnings Should Be Melted by forcing them down into a pool of the molten metal, according to John Coulson, at the Institute of Metals meeting

*From a paper presented before the Atlantic City meeting of the American Institute of Metals, September, 1915.

[1]Excerpt from a paper entitled "Lead Smelting at El Paso," presented at the San Francisco meeting of the American Institute of Mining Engineers, September, 1915.

Details of Milling and Smelting

Intermittent Discharge on Dorr Thickener

At the plant of the Bunker Hill & Sullivan Mining and Concentrating Co., at Kellogg, Idaho, the equipment includes several 40X12-ft. Dorr thickeners. Since some difficulty has been encountered through the plugging and stopping of the discharge pipe, due to thick pulp and the introduction of some foreign material, it was thought better greatly to increase the size of this pipe. To do this, however, without providing some means of reducing the quantity of material discharged would have been calamitous.

The difficulty was solved by providing a simple intermittent discharge from the delivery pipe. The pipe was carried from the center of the bottom of the tank to the outside, and there an equipment similar to an ordinary gate valve with a long stem was provided. The stem of this valve was connected to an eccentric taken from a worn-out jig and so arranged that the throw of the eccentric opened and closed the valve. The arrangement is perfectly simple and accomplishes the desired result without any trouble. Of course the size of the discharge pipe and the number of openings of the valve per minute can be arranged to suit any local requirements. The speed of opening and closing may be anything between 15 and 25 per min.

Vanadium in Nonferrous Alloys

In a paper read before the Atlantic City convention of the American Institute of Metals, on alumino-vanadium, W. W. Clark reaches the following conclusions:

"It is doubtful whether small amounts of vanadium will increase the tensile strength of nonferrous metals beyond that due to its powerful deoxidizing properties. Vanadium is a scavenger which unites with the oxygen in the metals and, as claimed by some investigators, the nitrogen. It, however, should not be used as a scavenger, as there are a number of as good and cheaper ones available. If one of these is used to cleanse the metal before adding the vanadium, the latter is retained and its full alloying effect is available. Vanadium in small amounts does increase the elongation, and I have no doubt that if it were produced and sold at a price that would make it available it would come into general use."

Old Car Wheels for Sheaves

By Jesse Simmons*

Old car wheels make excellent sheaves and carriers for haulage ropes, according to Edward Manion, superintendent of the Wasp No. 2 property, Flatiron, S. D. At this property two old wheels are bolted together with three bolts, with the flanges on the outside. The old axles may be used for shafts. When used as sheaves, as in Fig. 1, the shaft is provided with a single collar at the bottom and extends downward into the foundation timber—usually a 2x8—and upward into a wooden support. When used as carriers, as in Fig. 2, they give equally satisfactory service.

FIG. 1. OLD CAR WHEELS AS SHEAVES

FIG. 2. OLD WHEELS AS CARRIERS

The chilled treads of the wheels form ideal surfaces for the rope to travel on and are much harder and more durable than the carriers and sheaves ordinarily sold for this purpose. As any mine has at all times a more or less liberal supply of old car wheels and axles, it may never want for carriers and sheaves if this plan is followed.

Zirconium-Iron Alloys

According to John L. Brown, of Baltimore, Md., alloys of zirconium and iron can readily be produced by the reduction of a mixture of the oxides of the two metals (U. S. Pat. 1,151,160, assigned to Edward R. Cooper, of Baltimore, Md.). Especially is this reaction easily carried on in the presence of a little titanium oxide, which is likewise reduced, the titanium giving valuable qualities to the product. The reduction may be carried on by aluminum, or by carbon in an electrically heated

*Deadwood, S. D.

dotted curve on this same chart is the efficiency that should be obtained when burning the coal under good conditions, and the lower curve, "Efficient B.t.u.," shows what to expect from good operation.

On the right-hand side of the diagram various kinds of coal are shown and lines point to the evaporation that could be expected from this coal, so that the chart can be used without following through the entire diagram. For example, Hocking Valley (Ohio) coal is shown to have an evaporation of 8.1 lb. of water per pound of coal.

The basis for this chart was loaned the committee by W. H. Schott, of Chicago. The evaporation factors and the cost of steam per 1,000 lb. have been worked up by the committee. It will be interesting to notice that the curve shows nicely that the highest thermo-value occurs when the volatile matter in the combustible is somewhere around 20%, ranging possibly from 16 to 24; or in other words, in the highest thermo-value coal the fixed carbon in the combustible ranges from 76 to 84%.—*Power,* Sept. 28, 1915.

Box-Car Dimensions

A proposed standard box car of steel construction has been designed by the Committee on Car Construction of the Master Car Builders' Association and was reported at the annual convention at Atlantic City for criticism. The cubic volume of the car body under the carlines is 3,096 cu.ft. The principal dimensions are as given in the accompanying table, taken from *Engineering News.*

	Ft.	In.
Length of frame over striking casting	42	6
Width over sheathing	9	1½
Length, inside	10	6½
Width, inside	8	6
Height, inside	9	0
Height, from rail to bottom of bolster	2	6
Height, from rail to floor	3	8½
Height, from rail to top of running board	13	4½
Height, from rail to top of brake staff	14	2
Width, at eaves	9	2¾
Height, at eaves	12	5¾

Ore-Loading Rate on the Gogebic Range

At the Colby mine a 70-ton Bucyrus shovel loaded 150 cars, a total of 6,615 tons, of ore from stockpile in 10 hr. Later at the Newport mine a 70-C Bucyrus shovel loaded 162 cars, a total of 8,094 tons, of ore in 10 hr.—*The Excavating Engineer,* Aug., 1915.

Mine Accidents in New York

There were 41 mines and 135 quarries operated in the State of New York during the year 1914, according to the report of the state mine inspector. A steady decrease in fatality rate per thousand employed per annum in these mines is noted during the last three years—from 6.27 in 1912 to 5.6 in 1913 and to 3.77 in 1914. The total number of men employed in mines was 3,033, of whom 1,855 were employed in iron mines; the quarries employed 4,855, making the total number employed in mines and quarries in the state for the year 7,888.

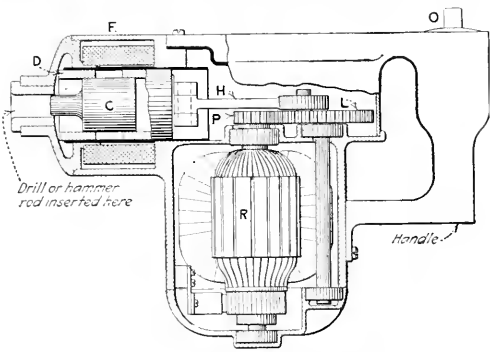
The limestone quarries were the largest employers of this class of labor, with a total of 2,607 men; the iron-mining industry was next, with 1,855; sandstone and granite quarries followed, with 584 and 554 respectively; the gypsum and rock-salt mines employed 378 and 376 respectively; bluestone quarries employed 267; the balance of the total was divided variously among the pyrites, graphite, garnet, talc, natural-cement and zinc mines, and marble, slate, spar, shale, trap and millstone quarries.

New Electric Hammer Drill

The Western Electric Co. has placed on the market an electric hammer drill that may be operated at small cost from any convenient light-socket.

The principle upon which this hammer works is as simple as it is effective. The main parts of the machine are the motor, a drill or hammer, and the magnetic clutch plunger. The motor *R* in the accompanying drawing transmits motion through the hardened gears *P* and *L* and the connecting-rod *H* to the cylindrical sleeve *D*, which has two relatively thick end sections with a thin center section connecting them. This center section is as thin as is consistent with mechanical strength.

The plunger *C*, which delivers the blow to the drill, lies loosely within this cylinder and is not mechanically connected to it or to any other part of the mechanism. Outside of the sleeve is placed the magnet coil *F*. This coil is stationary, the sleeve moving backward and forward within it. The coil is in series with the motor, and the current traversing it is always steady and in the same direction.



CROSS-SECTION OF THE DRILL, SHOWING THE ARRANGEMENT OF PARTS

As soon as the circuit is switched on (by the button *O* conveniently arranged on the handle) a magnetic circuit is created with the thick sections of the sleeve as the poles and the plunger as the armature. As the sleeve is oscillated back and forth by the motor, the effect is that of moving the polepieces of the magnet back and forth, and the plunger clutched across the poles moves similarly, transferring its energy to the drill when the two parts come in contact, which takes place near the end of the stroke. The plunger is slightly longer than the thin section of the sleeve, which gives it a certain amount of overtravel and an elasticity of connection that entirely removes the stress and jar of the blow from the machine.

The motor is series-wound and the gears are of oil-hardened special gear steel, while ball bearings are employed throughout.

A number of these drills have for some time been in successful use in coal mines, where they have been employed not only for taking down top and lifting bottom, but also for drilling the coal face preparatory to shooting.

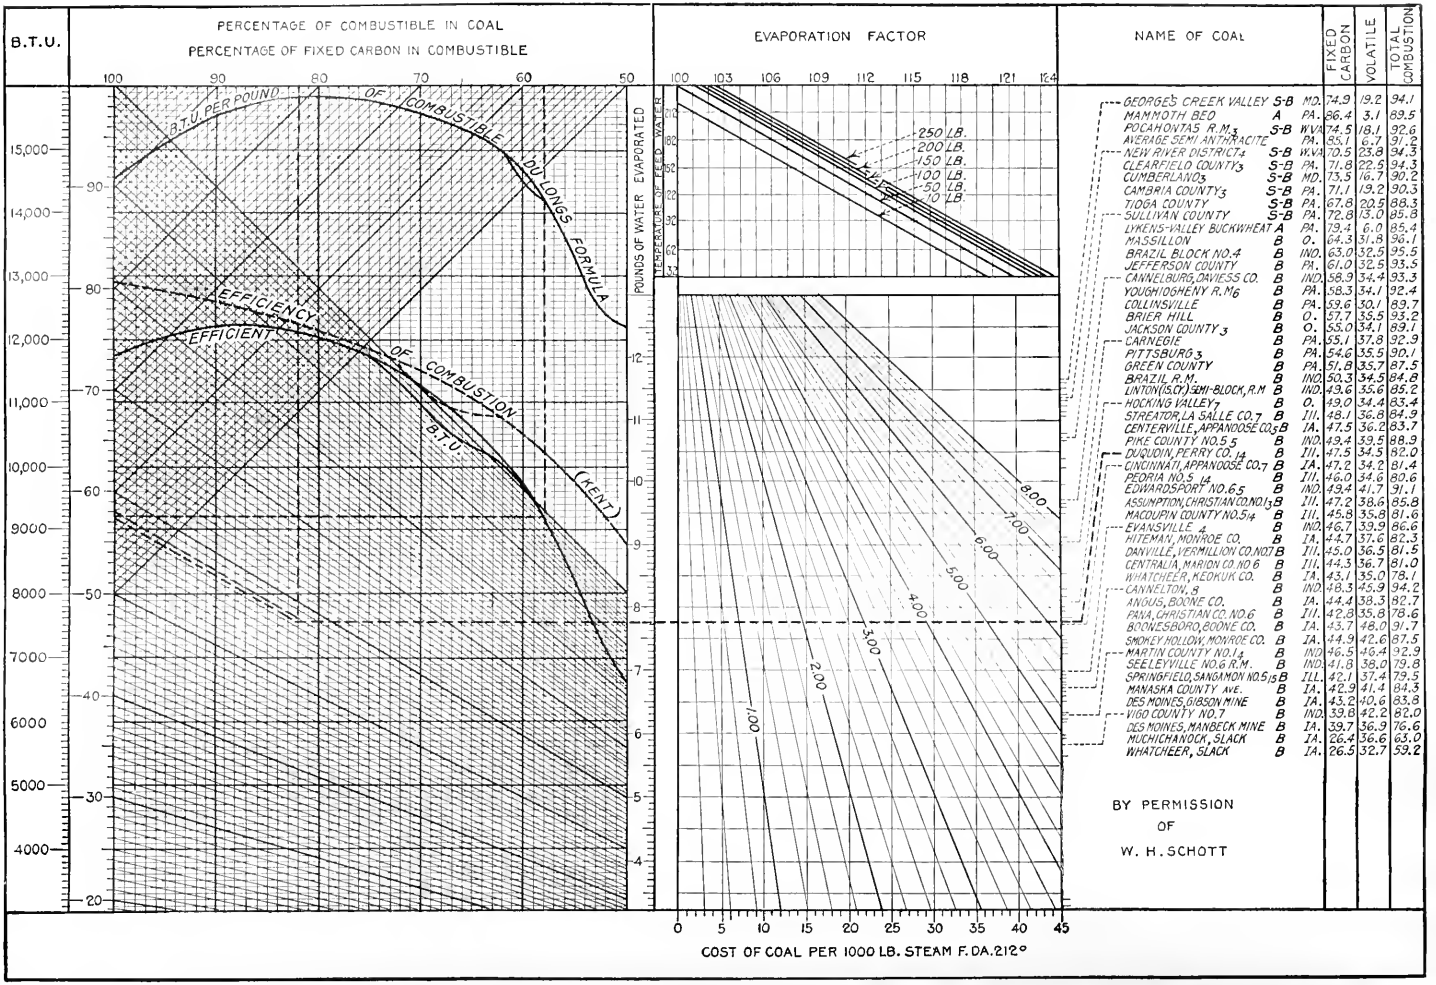


CHART SHOWING THE COST OF STEAM FROM A GIVEN GRADE OF COAL UNDER VARIOUS CONDITIONS

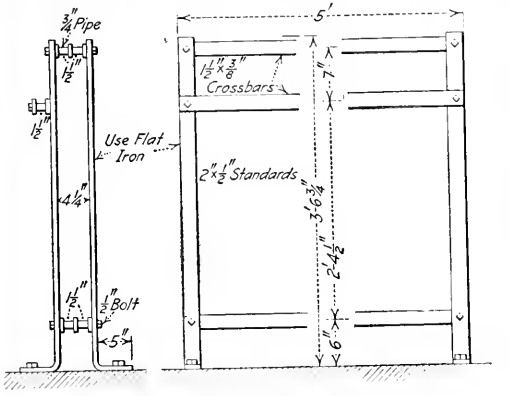
Details of Practical Mining

Blacksmith-Shop Tool Rack

By D. E. Charlton*

At mine blacksmith shops, where the space is small and it is necessary to keep the floor clear of tools, the rack illustrated has proved satisfactory. The construction is simple. The contrivance consists essentially of four standards, the lower ends of which are turned over, as shown in the sketch, to form a means of fastening the rack to a base, and six crossbars 5 ft. long, made of 1½x⅜-in. flat iron held to the standards by means of ½-in. bolts. The standards are made of 2x½-in. flat iron, each 3 ft. 11¾ in. long. Between the crossbars are placed 1½-in. lengths of ¾-in. pipe, to make the



TOOL RACK FOR BLACKSMITH SHOP

spaces in which the tools are placed. The upper spaces can be used for hammers, the outside one farther down for tongs and the lower ones for swages. The length of the rack may be increased or decreased. If it is desired to lengthen it, an additional set of standards should be placed half-way between the end standards. The rack is bolted to a base on a level with the floor.

Angove Skip-Dumping System

In the Copper Range mines the filling system makes necessary the dumping of poor rock at various levels. The Angove system of dumping is employed, pockets being attached beneath the skipway to receive the rock and lead it into chutes. Naturally, if the strain on the skip rope at this point continued, should the engineer happen to hoist his skip too far, the skip would keep on turning and instead of dumping its rock into the pocket would dump it back down the shaft, endangering life as well as the operation of the shaft. Angove has forestalled this possibility by a very simple device.

At each of the dumping stations he has placed a hinged bar across the skipway, high enough to clear the skip in its ordinary passage. But when the dumping device is in place at any of these points the engineer cannot now hoist his skip too far because if he does so the rear of the skip will strike this bar and will be prevented from rising. The continuing strain on the rope will pull the skip through, and it will go up the shaft in its natural position.

The device has greatly facilitated the dumping of poor rock in the Copper Range mines. It is in line with the "safety-first" principle, as well as that of efficiency.

*Mining engineer, Virginia, Minn.

A Serviceable Coal Chart

In its report to the National District Heating Association at Chicago, June 1-3, the Station Operating Committee incorporated the accompanying coal chart.

From the proximate analysis of the coals given the chart may be used to determine the cost of steam per 1,000 lb. with various grades of coal at prices ranging from $8 to 25c. per ton and the evaporation to expect. Take, for example, Duquoin (Ill.), coal. The analysis shows that this has 82% combustible; the remaining 18% is ash, moisture and other noncombustible materials. The analysis at the right of the table also shows that this coal has 47½% of fixed carbon and 34½% volatile matter.

Referring to the left-hand side of the chart at the top, under "Percentage of Combustible in Coal" find the dotted line starting at 82. Follow this line down until a point on the vertical scale is reached reading 47½, which is the fixed carbon in the coal. Then by reading the slanting line to the left, it is found that there is 58% of fixed carbon in the combustible. From here the dotted line reaches the point 58 at the top of the chart and then passes down to the heavy line "Efficient B.t.u." Then by reading to the left it is found that a pound of combustible should contain about 9,200 B.t.u. As this coal has only 82% combustible, the line sloping downward is followed until it intersects the 82% on the horizontal scale. Then by reading to the right it is found that the evaporation should be about 7.8 lb. of water per pound of coal. Follow this line on through to the $2 line in the center diagram of the chart, and the price of the coal in the bin is found. From the intersection read down to the bottom of the center diagram, which shows that the coal would cost 14½c. per 1,000 lb. of steam.

At the top of the center diagram the evaporation factors have been graphically displayed. Assuming that water at 62 deg. F. is evaporated into steam at 150 lb. pressure and no superheat, it will be found by reading to the right from 62 to the slanting line representing 150 lb. that the evaporation factor is 120%; consequently the cost of steam per 1,000 lb. will be increased 20%. The steam would then cost approximately 17½c. per 1,000 lb.

This chart is based on high-class operation. The top curve on the left-hand chart is based upon Dulong's formula for figuring the B.t.u. in the combustible. The

2,524 long tons; magnesite (crude), 14,086 long tons; alum, 7,742 cwt.; clay, 47,422 long tons; chromite, 5,676 long tons; corundum, 7,960 cwt.; diamonds, 116 carats; garnet, 334 cwt.; gypsum, 24,961 long tons; bauxite, 1,184 long tons; amber, 10 cwt.

These figures differ from those already issued by the Chief Inspector of Mines and given by the *Journal*. This is due to the fact that the inspector includes in his report only the production from those mines which come under the Indian Mine Act of 1901, while the figures just quoted give the complete returns collected from all sources.

Zinc Concentrates in the British Prize Courts

Several cases arising out of shipments of zinc concentrates from Australia, either captured or diverted to English ports as a result of the war, were heard by the President of the Probate, Divorce and Admiralty Division of the High Court during the week of Sept. 25, says the *Mining Journal*. In all there are five cases to be tried, involving something like €1,000,000. During the course of the hearing much important information as to the interrelation of various firms connected with the zinc industry was disclosed. The circumstances with regard to the various ships concerned vary.

Where the consignments were, on the face of them, to Aron Hirsch & Sohn, the property was condemned, but a lengthy argument was addressed to the Court, both on behalf of the Crown and on behalf of the firms concerned, with regard to parcels claimed by Henry R. Merton & Co., Vivian, Younger & Bond, the Australian Metal Co., and the Cie. des Minerais. The solicitor-general argued that the charterers were the Metallgesellschaft, and that the Australian Metal Co. and the Cie. des Minerais were its puppets. From the correspondence it was to be inferred that the Australian company purchased the concentrates on behalf of the Metallgesellschaft, which took entire control of the sale of the leady concentrates, and merely informed its English partners of what had been done. The so-called British firm, Henry R. Merton & Co., with its intimate German commitments and German origin, came to ask the court to help it to set up a partnership in a business mainly carried on in an enemy country.

Shipments Made Before War Broke Out

Maurice Hill, K.C., for the claimants, said this was no question of trading with the enemy, as it was concerned with shipments made before the war. The only question was as to the enemy or non-enemy character of the goods. The solicitor-general had referred to a German octopus which had spread its tentacles over the metal trade of the world, but it would be just as true and just as false to say that an English octopus had spread its tentacles over the German trade. Mr. Merton started the London business of Merton & Co. in 1860. He was born in Germany of English parents, and in 1899 or 1900 H. R. Merton & Co., Ltd., was formed. Mr. Merton had carried on business in England for 20 years before the Metallgesellschaft was formed in Germany. That was also a company in which Mr. Merton was interested, but to represent the whole concern as a German firm which was gradually, by means of subsidiary companies, getting its grasp on the metal trade of the world was wholly misleading. The majority of the shareholders in H. R. Merton & Co., Ltd., were English. Of the directors all except two were British. The Metallgesellschaft was formed in 1882, and the directors of H. R. Merton & Co. were the holders of a very large quantity of the shares. One shareholder, a Mr. Zuny, who died a short time back, by his will left the income on 300,000 shares to British charities.

The firm of Vivian, Younger & Bond was a partnership firm. At the beginning of the war two of the partners were British born, and the third, who afterward resigned, was a naturalized British subject. As to the Australian Metal Co., the shareholders in the majority were German—26,700 out of 50,000. The directors also at the beginning of the war were in the majority Germans—four against three. The Cie. des Minerais was formed in 1900, and of its shareholders about 60% were German and the rest mainly Belgian and French. As to the Ore Trading Co., which came into the matter as merchants for dealing with certain ore on behalf of all these companies and firms, the large majority of the shareholders were British, American and German. Mr. Hill submitted that the evidence showed that the property in the zinc concentrates in question was in the Cie. des Minerais, and the property in the leady concentrates was jointly in the Metallgesellschaft, H. R. Merton & Co., Vivian, Younger & Bond, and the Australian Metal Co. Therefore, applying the test of property, the proper order to make was to release the zinc concentrates altogether and to release the leady concentrates as to three-fourths and to condemn it as to one-fourth—the fourth share belonging to the Metallgesellschaft.

Belgian Testimony Unfavorable to Defendants

At this point the solicitor-general interposed, as a witness as to the constitution of the Cie. des Minerais, J. C. Van der Taelen, a Belgian, managing a leading Belgian metal company in Antwerp, but at present connected with Peters & Co., of London. He stated that the company did not smelt or work the zinc, but sold the ore to the smelters and bought back the metal produced. So far as he knew, most of the directors were associated with the Metallgesellschaft and the company was practically German.

In the course of cross-examination, W. M. Wilson, a director of Henry R. Merton & Co., stated that his firm acted as bankers for the Australian Metal Co. and the Cie. des Minerais and that the Gesellschaft supplied them with money to meet these charges. Since the war they had received no remittances from the Continent, and he feared at the end of the war it would be impossible for Germany to remit in full, if at all.

Further hearing was adjourned.

Utah Apex Quarterly Report

The report of the Utah Apex Mining Co., Bingham, Utah, for the quarter ended June 30, 1915, shows net earnings of $12,154. Gross receipts were $233,822; mining expenses, $118,980; development, $38,214; and accrued bond interest and all other expenses, $4,474. The company had about $200,000 cash on hand. A dividend of 12.5c. a share was declared payable on Oct. 1. Out of an original bond issue of $350,000 all bonds but $36,000 have been retired, and the treasurer is prepared to purchase these bonds at par and accrued interest.

in appearance of which seems to indicate its value, in a measure. It contains variable amounts of lead and zinc sulphides which do not, however, constitute controlling factors in its mining and milling, except at infrequent intervals. The stringers are irregular in dip, being nearly vertical in the Davis and vicinity and flat in some instances near the Gold King, one vein being designated by its dip the "Flat Vein." In the Davis vein the free gold is usually associated with blende, while in the other veins it occurs more often with the iron pyrite and galena, and in both localities it is found in white quartz.

Nearly all of the work at present is confined to Nos. 2, 3 and 4 levels, and about 70 men are engaged in ore production.

The ore is mined by the lessees and sublessees and delivered to separate chutes passing down to No. 7 level, or the "American Tunnel," below. A vertical shaft connects Nos. 1 and 7 levels, and a cage with hoist in No. 1 level is used to handle men, tools, supplies, etc.

The operating lessees, who handle the tramway and mill and who are responsible for the management of the property, take the ore from the chutes on No. 7 level and bring it to surface by mule train, where it is dumped into the tramway-loading bin of 250 tons' capacity. It is there loaded by chutes into the tramway buckets of 850-lb. capacity and transported to the mill at Gladstone.

Here it passes through gyratory crusher and stamps and is concentrated on Wilfley tables and by a flotation scheme developed by Louis C. Bastian, the present mill superintendent, formerly with the American Smelting and Refining Co. in the same capacity, and construction superintendent of the Silver Lake mill near Silverton.

The experiments conducted by Mr. Bastian alone, resulting in the present successful operation, were begun a year ago in February and constitute the first successful treatment by flotation of San Juan County ores.

The accompanying flow sheet describes the general mill practice, which needs no special mention at this time outside of the flotation plant.

The Flotation Plant

The material treated in this plant is the middling and slimes product of the second retreatment tables. They are pumped into a square stock tank which has a capacity of 100 tons of pulp. Thence they pass to an 8-ft. Callow cone, the overflow from which joins the overflow of the stock tank, running to waste.

The thickened product is pumped to the first agitating compartment and passes through this and two other similar ones before it enters the first frothing compartment through a gate about 6 in. below the water level. Here it is skimmed by a revolving drag, and the underflow passes to the fourth agitating compartment and similarly diagonally through the five remaining frothing and four remaining agitating compartments. The underflow from the last frothing compartment runs to waste.

A cone plug regulates the flow of pulp from each frothing compartment and consequently the capacity of the plant. To maintain a uniform pulp level for successful skimming, Mr. Bastian has provided a 2-in. pipe, connected to the discharge pipe, which is fed from the lower strata in the frothing compartment by a surrounding 3-in. pipe, rising above the water and froth levels, which serves to hold back the froth. The concentrate froth discharged from the first three frothing compartments is sent over Wilfley and Card tables to aid in breaking it down and thence to a 10-ft. settling trough. Two tons of final concentrate are produced from each 30 tons of pulp handled.

Carbolic oil is fed to the pump used to hoist the pulp to the stock tank. Creosote oil is fed to the first compartment agitator, and pine oil is fed to the fourth compartment agitator, 300 c.c. of total oil per ton of pulp being used. No acid is found necessary. At the mine there is sufficient sulphuric acid in the mine water, the amount of which is not great, to destroy the air pipes and rails, which must be protected by splash boards, and it is probable that this preliminary treatment by nature renders further acid treatment unnecessary. For feeding the oil to the pulp Madison-Kipp No. 50 lubricators are used.

Experiments being conducted at present indicate that more of the mill products can be successfully treated through finer grinding, and plans now laid include the installation of Hardinge mills or the use of tube mills already installed but not used under the present system. Dorr thickeners will in all probability also be used.

The flotation and mill table concentrates run about the same, or in the neighborhood of $40 per ton. They contain in excess of 28% silica. The saving of metallic is said to be in excess of 85%.

Shannon Copper Co.

The quarterly report of the Shannon Copper Co., Metcalf, Ariz., for quarter ended June 30, 1915, shows a production of 2,867,000 lb. of copper, 320 oz. of gold and 16,100 oz. of silver. During this period 62,913 tons of ore was treated from the Shannon mine and 10,086 tons from the company's outside properties. The average price received for copper was 16.811c. in April, 18.506c. in May and 19.477c. in June. The average price received for the quarter was 18.398c. per lb. The net profits for the period were $164,648, of which $4,388 represented railroad earnings. The following table shows a comparison of operating costs for the quarter and for 1914:

	Quarter Ended June 30,1915	Year 1914
Mining cost per ton Shannon ore, including development	$1.74	$2.32
Concentrating cost per ton concentrated	.67	.85
Smelting cost per ton of burden	1.86	1.95
Converting cost per ton of fine copper	7.85	10.56

A plant of 150 tons' capacity for leaching the slimes and tailings will be constructed, and if this is operated successfully it will be increased to 500 or 600 tons' daily capacity. Quick assets amounted to $507,674 in excess of current liabilities at the end of the quarter.

Mineral Production of India in 1913

The following figures of mineral production in 1913 are given in *Records* of the Geological Survey of India, Vol. XLVI, 1915, the items being arranged in order of descending value: Coal, 16,208,009 long tons; gold, 595,761 oz.; manganese ore, 815,047 long tons; petroleum, 277,555,225 gal.; salt, 1,473,189 long tons; mica, 45,422 cwt.; saltpeter (exports, fiscal year 1912-13), 296,928 cwt.; tungsten ore, 1,688 long tons; lead ore and slag, 20,299 long tons; ruby, sapphire and spinel, 278,706 carats; tin ore and tin, 7,062 cwt.; monazite (value), £42,012; iron ore, 370,845 long tons; laterite, 292,985 long tons; silver, 125,209 oz.; copper ore, 3,810 long tons; steatite,

ations. A subsidence of a foot or two in the tailings stack will not affect the alignment or running of the conveyor, because it is self-contained.

Several of the local mills practice sluicing out tailings. In most cases water is expensive, the cost for one 125-ton plant exceeding $500 per month. Construction and maintenance of dams, etc., are costly, and to this is added annoying litigation brought by owners of property damaged by tailings. Much greater space is required to contain tailings in dams than is needed to pile them semi-dry at a steep angle. Sluicing demands constant attendance, whereas the excavator and conveyor system is automatic. The high-pressure stream necessary for effective sluicing damages filter bottoms, whereas the excavator has stops which absolutely prevent damage to the filter canvas.

Precipitation and Recovery of Gold

But one strength of solution is used with this low-grade ore. Time is saved in applying solution and wash water by having extra-large pipes for these purposes. A charge of sand is thus saturated with solution almost as fast as it is placed in the tank. Zinc dust is used for precipitation, which takes place in a circular, locked compartment in the gold tank. Precipitate is cleaned up daily, the operation requiring not more than five minutes. The zinc-dust feeder and precipitating apparatus are my invention.
